# 1. Signal and System Properties + Convolution (35 points).

- (a) (15 points) Determine if each of the following statements is true or false. Briefly explain your answer to receive full credit.
  - i. (5 points)  $x(t) = \cos(\sqrt{3}t) + \sin(-3t)$  is a periodic signal.

$$\begin{aligned} \chi(t) &= (os(J_3 t) - sin(3t)) \\ \chi_1(t) &= \chi_2(t) \\ \chi_1(t) &= \chi_2(t) \\ \chi_1 &= J_3 &= J_2 \\ T_1 &= J_3 &= J_2 \\ T_1 &= \frac{21}{J_3} &= J_2 \\ T_1 &= \frac{21}{J_3} &= J_2 \\ T_1 &= \frac{21}{J_3} &= J_3 \\ T_2 &= J_3 \\ T_2 &= J_3 \\ Since \frac{11}{J_2} &= J_3 is no rallonal phase is no romanon period for this signal and the signal is not period it. \end{aligned}$$

ii. (5 points) A signal can be neither energy signal nor power signal.

iii. (5 points) Let f(t) \* g(t) denote the convolution of two signals, f(t) and g(t). Then,

$$f(t)[\delta(t) * g(t)] = [f(t)\delta(t)] * g(t)$$

$$L1+15 = J(H) (S(H) \times g(H)) = f(H) g(H)$$
  
identify  
elemen

$$\begin{array}{rcl}
(2HS = (fH) S(H)) & g(H) \\
= (f(N) S(H)) & g(H) \\
&= f(O) g(H) & \neq LHS
\end{array}$$

The statement is false.

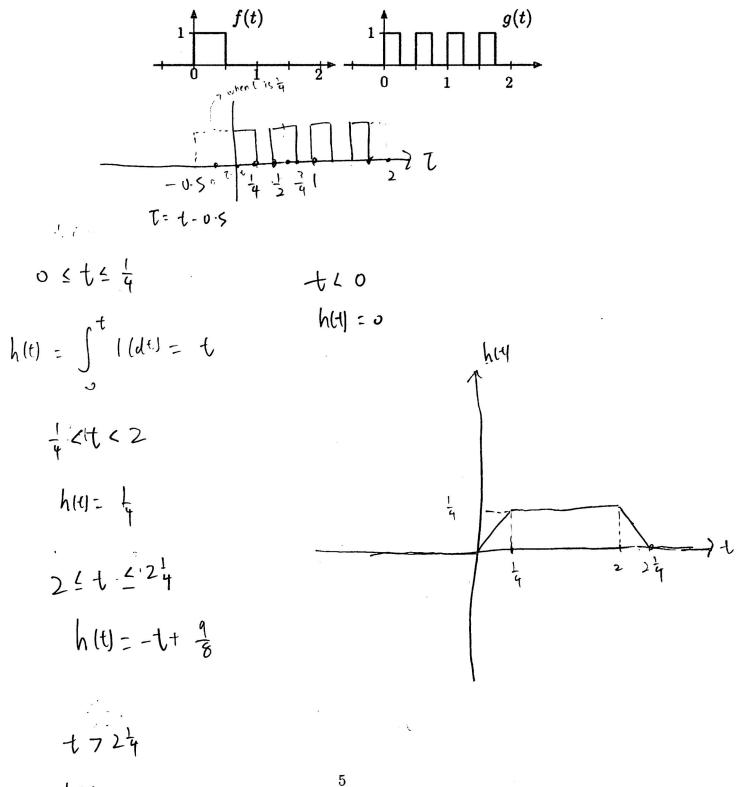

٠.

(b) (10 points) Determine if the following system is an LTI system. Explain your answer.

$$y(t) = \frac{x(t-1)}{t} + x(t-2)$$
(1)

Showing Lincarity  
PHS = 
$$S(ax + b\tilde{x}) = \frac{ax(t-1) + b\tilde{x}(t-1)}{-t} + ax(t-2) + b\tilde{x}(t-2)$$
  
LHS =  $aS(x) + bS(\tilde{x}) = ax(t-1) + ax(t-2) + b\tilde{x}(t-1) + b\tilde{x}(t-2)$   
=  $\frac{ax(t-1) + b\tilde{x}(t-1)}{-t} + ax(t-2) + b\tilde{x}(t-2)$   
=  $\frac{ax(t-1) + b\tilde{x}(t-1)}{-t} + ax(t-2) + b\tilde{x}(t-2)$ 

Chowing time invariance  $RHS = y(1-1) = \frac{x(t-1-1)}{t-1} + x((t-1)-2)$   $= \frac{x(t-2)}{t-1} + x(t-3)$   $LHS = when input is x(t-1) = \frac{x(t-1-1)}{t} + x(t-2-1)$   $= \frac{x(t-2)}{t} + x(t-3) \neq PHS$ The system is not time invariant. The system is not time invariant. False since system is linear but not Time invariant. (c) (10 points) For signals f(t) and g(t) plotted below, graphically compute the convolution signal h(t) = f(t) \* g(t). To receive partial credit, you may show h(0), h(1/4) and h(5/8) in the graph when illustrating the convolution using the "flip and drag" technique.

h(t) = 0

# 2. LTI Systems (20 points).

Consider the following LTI system S:

$$x(t) \xrightarrow{\qquad S \\ \text{LTI} \qquad } y(t)$$

Consider an input signal  $x_1(t) = e^{-2t}u(t-2)$ . It is given that

$$\frac{x_1(t) \xrightarrow{S} y_1(t)}{\frac{\mathrm{d}x_1(t)}{\mathrm{d}t} \xrightarrow{S} -2y_1(t) + e^{-2t}u(t)}$$

(a) (4 points) Show that:

$$\frac{dx_{1}(t)}{dt} = -2x_{1}(t) + e^{-2t}\delta(t-2)$$

$$[Hs = \frac{d}{at!}e^{-2t}u(t-2) - -2y_{1}t^{-1} + e^{-2t}u(t)$$

$$\bigvee_{u} \bigvee_{v}$$

$$v = u(t-2)$$

$$\frac{du}{dt} = -2e^{-2t}\frac{dv}{dt} = \delta(t-2)$$

$$\frac{du}{dt} = -2e^{-2t}u(t-2) - \delta(t-2)e^{-2t}$$

$$\int \frac{du}{dt} + u\frac{dv}{dt} = -2e^{-2t}u(t-2) - \delta(t-2)e^{-2t}$$

$$= -2z_{1}(t) + \zeta(t-2)e^{-2t} = 2H\zeta(chown)$$

# (b) (10 points) Find the impulse response h(t) of S.

*Hint*: Since we have not provided S, we cannot straightforwardly input an impulse into the system and measure the output. One approach is to solve for h(t) by writing the output of S in terms of a convolution when the input is  $dx_1(t)/dt$ , i.e.,

$$\frac{\mathrm{d}x_1(t)}{\mathrm{d}t} * h(t)$$

(c) (6 points) Consider a new system,  $S_2$ , whose impulse response is  $h_2(t) = e^{-3t}u(t+3)$ . Find this system's output to the following input signal:

$$x_2(t) = \cos\left(\frac{\pi}{4}t\right)\delta(t-1)$$

$$\begin{aligned} x_{2}(t) &= (\delta) \left( \frac{T_{1}}{4} t \right) S(t-1) \\ &= (\delta) \left( \frac{T_{1}}{4} t \right) S(t-1) \\ X_{2}(t) &= (\delta) \left( \frac{T_{1}}{4} t \right) S(t-1) \\ &= (\delta) \left( \frac{T_{1}}{4} t \right) \\ &=$$

- 3. Fourier Series (20 points).

**Bonus** (6 points) Suppose  $x(t) = \cos(\omega_0 t)$  is an eigenfunction of an LTI system S for any  $\omega_0$ , and S cannot be defined as S[x(t)] = ax(t) for some constant a. Is the system S causal? Justify your answer.
