

- a) (10 pts) A thin nonconducting rod is bent to form a circular arc of radius  $R$  that subtends an angle  $2\theta_0$  as shown in the diagram on the left. If that rod carries a charge  $Q$  (uniformly distributed), show that the magnitude of the electric field at point  $A$  will be  $E = \frac{Q}{4\pi\epsilon_0 R^2 \theta_0}$ . Show your work!
- b) (10 pts) Now consider the wedge in the center diagram. If a charge  $q$  is uniformly distributed over the region that extends from  $R_1$  to  $R_2$  (subtending an angle  $2\theta_0$ ), what is the magnitude of the electric field at point  $B$  [See the hint in the right diagram]
- c) (5 pts) Suppose a small non-uniform but spherically-symmetric charge distribution of total charge  $Q$  is placed at point  $B$ . What is the magnitude of the force that the charge  $Q$  will exert on the wedge?

Handwritten calculations on the right side of the page:

$$\frac{q}{2\theta_0} \lambda dl$$

$$= \frac{q}{2\theta_0} R d\theta$$

$$\frac{q}{2\theta_0} \frac{R}{R^2} \langle \cos\theta \hat{i} + \sin\theta \hat{j} \rangle$$

$$\frac{q}{2\theta_0} \frac{R}{R^2} \int_{-\theta_0}^{\theta_0} (\cos\theta \hat{i} + \sin\theta \hat{j}) d\theta$$

$$= \frac{q}{4\pi\epsilon_0 R^2} \int_{-\theta_0}^{\theta_0} (\cos\theta \hat{i} + \sin\theta \hat{j}) d\theta$$

$$= \frac{q}{4\pi\epsilon_0 R^2} [\sin\theta \hat{i} - \cos\theta \hat{j}]_{-\theta_0}^{\theta_0}$$

$$= \frac{q}{4\pi\epsilon_0 R^2} (2\sin\theta_0 \hat{i} - 2\cos\theta_0 \hat{j})$$

$$= \frac{2q}{4\pi\epsilon_0 R^2} (\sin\theta_0 \hat{i} - \cos\theta_0 \hat{j})$$

3)  $d\vec{E} = \frac{k dq}{r^2} \hat{r}$   $r = R$

$$d\vec{E} = \frac{k \lambda R d\theta}{R^2} (\sin\theta \hat{i} - \cos\theta \hat{j}) \quad \lambda = \frac{Q}{2\pi R \theta_0}$$

$$d\vec{E} = \frac{k Q d\theta}{2\pi R \theta_0} (\sin\theta \hat{i} - \cos\theta \hat{j})$$

$$\vec{E} = \int d\vec{E} = \frac{k Q}{2\pi R \theta_0} \int_{-\theta_0}^{\theta_0} (\sin\theta \hat{i} - \cos\theta \hat{j}) d\theta$$

$$\vec{E} = \frac{k Q}{4\pi R \theta_0} (\sin 2\theta_0 \hat{i} - \cos 2\theta_0 \hat{j})$$

$$|\vec{E}| = \frac{k Q \sin 2\theta_0}{4\pi R \theta_0}$$

$$dA = r(\theta_0) d\theta$$

$$dA = 2R \sin\theta d\theta$$

$$Q = \frac{q}{2\pi R \theta_0} \int_{-\theta_0}^{\theta_0} 2R \sin\theta d\theta$$

$$Q = \frac{q}{\pi \theta_0} \int_{-\theta_0}^{\theta_0} \sin\theta d\theta$$

**EXTRA PAGE**

b) Build the wedge up of infinitesimal arcs

$$d\vec{E} = \frac{k dq}{r^2} \hat{r} \quad dq = \sigma dr = \frac{q}{2\pi R} \frac{R d\theta}{R}$$

$$\vec{E} = \int d\vec{E} = \frac{k q}{2\pi R} \int_{-\theta_0}^{\theta_0} \frac{R d\theta}{R^2} (\sin\theta \hat{i} - \cos\theta \hat{j})$$

$$|\vec{E}| = \frac{k q \sin 2\theta_0}{4\pi R \theta_0} \ln\left(\frac{R_2}{R_1}\right)$$

c) By Newton's third law, the force exerted on the charge  $Q$  is equal in magnitude and opposite in direction to the force exerted on the wedge.

$$|\vec{F}| = |Q\vec{E}|$$

$$|\vec{F}| = \frac{Q k q \sin 2\theta_0}{4\pi R \theta_0} \ln\left(\frac{R_2}{R_1}\right)$$
