**EXAMINATION I**

**CLOSED BOOK**

Answer each of the following questions on the answer sheet provided. The point value for each question is given in parentheses before the question number. There are a total of 100 points on the examination. All numbers are decimal integers unless otherwise indicated in a specific problem.

Only the answers on the answer sheet will be graded. Every numerical answer is either completely correct or wrong. No partial credit will be given on numerical problems. If a problem specifies operands with a given bit width, the result must have the same number of bits or it will be incorrect.

- (2) 1. What are the four major components of von Neumann computer architecture?
- (2) 2. What are the three major sections of a Central Processing Unit (CPU)?
- (2) 3. What is the purpose of the Program Counter in a computer CPU?
- (2) 4. What is the purpose of the Instruction Register in a computer control unit?
- (2) 5. What is the hardware function for Register 31 in a MIPS processor?
- (2) 6. What is the purpose for the set instructions in a MIPS processor?
- (2) 7. What is the address mode for branch instructions?
- (2) 8. What is usually the first operand in a MIPS assembly language instruction?
- (2) 9. What is the difference between an assembler and a compiler?
- (2) 10. What are the primary function of Pass 2 in a two-pass assembler?

- $\frac{4096}{23} = 12288$      $4096$      $\frac{16}{16} = 1$      $96$      $256$      $\frac{2560}{1536} = 1.67$      $9+48+$      $\frac{12288}{57} = 2145$
- $\sqrt{6657}$
- $\frac{14}{4} = 3.5$     7. 1  
3.
- (4) 11. Convert the unsigned decimal number 145 to binary.
  - (4) 12. Convert the unsigned hexadecimal number 3039 to decimal.
  - (4) 13. Convert the unsigned decimal number 2842.125 to octal.
  - (4) 14. Convert the unsigned 21-bit octal number 3726355 to 20-bit hexadecimal.
  - (4) 15. Convert the decimal number -16657 to 32-bit two's-complement hexadecimal.
  - (4) 16. Generate the negative of the 16-bit two's-complement hexadecimal number 415213.
  - (4) 17. Add the unsigned 8-bit binary numbers: 0011 1010 + 1000 1001.
  - (4) 18. State whether or not the calculation in the problem above generates an overflow.
  - (4) 19. Add the unsigned 24-bit hexadecimal numbers: FEDCBA + D01133.
  - (4) 20. State whether or not the calculation in the problem above generates an overflow.
  - (4) 21. Add the two's-complement 24-bit hexadecimal numbers: 654321 + 7987BD.
  - (4) 22. State whether or not the calculation in the problem above generates an overflow.
  - (4) 23. Add the two's-complement 18-bit octal numbers: 122457 + 531642.
  - (4) 24. State whether or not the calculation in the problem above generates an overflow.
  - (4) 25. Subtract the two's-complement 24-bit hexadecimal numbers: 654321 - 867843.
  - (4) 26. Subtract the two's-complement 8-bit binary numbers: 0110 1010 - 1010 0111.
  - (4) 27. Compute the **AND** of the 16-bit hexadecimal numbers: BFEF **AND** ABFD.
  - (4) 28. Compute the **OR** of the 18-bit octal numbers: 254120 **OR** 410201.
  - (4) 29. Compute the **XOR** (Exclusive-Or) of the 16-bit hex numbers: DEED **XOR** 1413.
  - (4) 30. Compute the **NOR** of the 8-bit binary numbers: 1011 0001 **NOR** 0010 1000.

## EXAMINATION I ANSWER SHEET

- 521
- input, CPU, output, program and data memory
  - ~~Control unit, arithmetic unit, register file~~ (control unit, arithmetic unit, register file)
  - keeping track of current line of instruction
  - loading single lines of instructions for use
  - It is the program counter
  - changing values of a register to a desired value
  - base counter
  - destination
  - Compiler converts high level language to assembly language  
Assembler generates object code from assembly language  
generate binary machine code.
  - ~~making and storing into memory~~

hold bits  
hold func. call return address  
Compare register values
