| Name: | |
|-------|--|
| UID: | |

Rules/Instructions:

• All of your answers go into red tables like this:

| What's the answer | Your answer here |
|-------------------|------------------|
|-------------------|------------------|

- When complete, save the exam as a PDF. (if there is a technical problem, just save as docx)
- Turn the exam in on CCLE, before 2:30pm PST (normal time), 9:30pm PST (makeup time). The exam is designed for 2 hours, but we are giving you an extra 30 minutes in case you have any technical difficulties.
- This is an open notes exam. By the honor system, you may not discuss exam questions/solutions/experiences/thoughts/etc. with any person for 12 hours after the exam start time.
- Please do not alter which page each question is on, or you will be penalized. This is for compatibility with gradescope.

Notes:

- There are 60 points total, but the exam is graded out of 50. (ie. the exam is pre-curved so that there are 10 extra credit points possible)
- You may ask for questions on the Piazza (private posts only). We will make public the
 questions which are relevant to the whole class. TAs and I will post any clarifications to
 the Piazza live Q&A, so it may be a good idea to check for clarifications before the exam
 is over.
- If the architecture of the machine is not specified, assume that the question is being asked in the context of a 64-bit little endian x86 machine.

Finally, please follow the university guidelines in reporting academic misconduct.

You may begin once you have read the rules above.

Question 1. Multiple Choice (12 pts)

For the following multiple choice questions, select all that apply. If none of the answers are correct, simply leave the question blank. (2pts each, no partial credit)

- 1. Why do machines store information with binary (ie. base 2) instead of another base?
 - a. Binary is more compact (eg. than decimal), so it saves memory space.
 - b. Many circuit components are bistable, making it convenient for circuit design.
 - c. Computer arithmetic is more efficient with a binary representation at the circuit level.
 - d. Using higher bases makes it difficult to store numbers defined in lower bases.
- 2. What kind of data isn't stored within the address space of a program?
 - a. Register Values
 - b. Stack
 - c. Heap
 - d. Global Variables
 - e. Program Binary
- 3. Suppose the variable "x" was defined as an "unsigned int" in C, and is stored in the "a" register (rax/eax/ax, etc.).

Which of the following instructions correctly implements "x * 2"?

- a. leal (%eax, %eax, 1), %eax
- b. movl (%eax, %eax), %eax
- c. addl (%eax), %eax
- d. addl (,%eax, 1), %eax
- e. addl %eax, %eax
- f. sall 2, %eax
- g. mulw 2, %ax
- 4. Suppose the variable "x" was defined as an "unsigned int" in C, and is stored in the "a" register (rax/eax/ax, etc.).

Which of the following instructions correctly implements "x / 2"?

- a. sall 2, %eax
- b. sarl 2, %eax
- c. sall 2, %eax (typo, yes it's the same as a)
- d. sarl 1, %eax
- e. divq 2, %rax

- 5. Which of the following registers are guaranteed to have a different value before and after a call instruction in x86-64?
 - a. rax
 - b. rbx
 - c. rdi
 - d. rbp
 - e. rsp
- 6. Which of the following C statements are true?
 - a. (8/5) == (8.0/5.0)
 - b. (8/5) == (long) (8.0/5.0)
 - c. (float) (8/5) == (8.0/5.0)
 - d. (float) (8/5) == (long) (8.0/5.0)

| Multiple Choice Question Number | Write your answers here: (eg: a,b,d) |
|------------------------------------|---|
| 1. | b (c is okay) |
| 2. | a |
| 3. | ae |
| 4. | [blank] or e (since Tony formatted the instruction wrong) |
| 5. | [blank] |
| 6. | bd |

Question 2. A Bit of Manipulation (8 Pts)

Your friend gave you the solution to two of the datalab questions (nice friend!), but forgot to tell you which they were. Try to decipher them!

1. func1 (4 Pts)

Hint: 1<=b<=31

```
func1(int a, int b) {
  int P = a << b;
  int Q = a >> (33 + ~b);
  int mask = ~0 << b;
  Q &= ~mask;
  return P|Q;
}</pre>
```

| | Your answer in the cell below: |
|---|--------------------------------|
| What does this function do? Please use only one or at most two sentences. | Rotate a left by b |

2. func2 (4 Pts)

```
func2(int x) {
  int m = x>>31;
  return (x ^ m) + ~m + 1;
}
```

| | Your answer in the cell below: |
|---|--------------------------------|
| What does this function do? Please use only one or at most two sentences. | abs(x) |

Question 3. Novel Numbers (7 pts)

Suppose we have a new machine where bytes are only 7 bits long, and there are no other datatypes. Luckily, we can still represent integer and floating point numbers easily.

1. Assuming standard two's complement representation, what are the following values: (assume 7-bit numbers)

| | Binary | Decimal |
|------|-------------------------------|---------|
| Tmin | 1000000 | -64 |
| Tmax | 0111111 | 63 |
| -1 | 1111111 | |
| -0 | 0000000 (or impossible, etc.) | |
| +0 | 0000000 | |

2. Assume we have a 7-bit floating point representation with 3 bits for the exponent, and otherwise we follow the normal floating point representation. (please remember that E=111 and E=000 is reserved for infinity/nan/denorm) What are the following values:

| | Binary | Decimal |
|--|-----------|---------|
| Largest Normalized Number | 0 110 111 | 15 |
| Smallest Positive Normalized Number | 0 001 000 | 0.25 |
| -1 | 1 011 000 | |
| -0 | 1 000 000 | |
| +0 | 0 000 000 | |

Question 4. How pointy is your rax? (7 pts)

Based on each instruction individually, determine whether you think %rax is a pointer *before* the instruction is executed.

You have three options:

Yes -- There is evidence that %rax is a pointer.

No -- There is evidence that %rax is not a pointer.

Maybe -- There isn't evidence that %rax is a pointer or not a pointer.

| | Is rax a pointer? (Options: Yes, No, Maybe) |
|----------------------------|---|
| addq %rax, %rax | No |
| addq %rbx, %rax | Maybe |
| leaq (%rbx, %rax, 4), %rcx | No |
| leaq (%rax, %rbx, 4), %rcx | Maybe |
| movq (%rbx, %rax, 4), %rcx | No |
| movq (%rax, %rbx, 4), %rcx | Yes |
| cmpq \$5, %rax | No |

Question 5. Structures and Unions (10 pts)

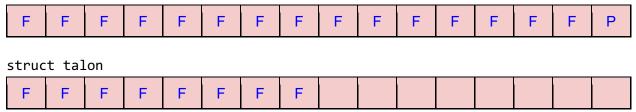

Use the following structure definitions to answer the questions in this section.

```
struct overwatch {
   long* tracer;
   int mercy;
   union {
      char winston;
      short mei;
   } slot3;
   char brigite;
};

struct talon {
   int moira;
   short reaper;
   char sombra;
   char widowmaker;
};
```

1. Each cell in the following tables represents a byte. Each byte that is part of the struct can be part of a field (F) or padding (P). You need to fill out the table with letters (F or P) categorizing each byte. If a cell represents a byte that is not part of the data structure, leave it blank. (4pts)

struct overwatch

2. Given the following output from gdb, what will be printed out by the last gdb command? (2pts)

```
(gdb) p buf
$1 = (unsigned char *) 0x8402260
(gdb) x/40xb buf
0x8402260:
                0x67
                       0xc6
                              0x69
                                     0x73
                                            0x51
                                                   0xff
                                                          0x4a
                                                                   0xec
0x8402268:
                0x29
                       0xcd
                                                          0xe3
                                                                   0x46
                              0xba
                                     0xab
                                            0xf2
                                                   0xfb
0x8402270:
                0x7c
                       0xc2
                              0x54
                                     0xf8
                                                   0xe8
                                                          0xe7
                                                                   0x8d
                                            0x1b
0x8402278:
                0x76
                       0x5a
                              0x2e
                                     0x63
                                            0x33
                                                   0x9f
                                                          0xc9
                                                                   0x9a
0x8402280:
                0x66
                       0x32
                              0x0d
                                     0xb7
                                            0x31
                                                   0x58
                                                          0xa3
                                                                   0x5a
(gdb) p/x ((struct overwatch*)buf)->slot3.mei
$2 = .....
```

```
What is printed: $2 = 0Xfbf2
```

3. Based on the following assembly code and incomplete C code. Please fill out the table with the missing C code that corresponds to the blanks in the C code. (4 pts)

```
00000000000005fa <capture the flag>:

```

1. Suppose you call the recursive function func(3). Draw the stack when func(1) is entered. If you don't know a value, write "old" and then the value name. (eg. old %rax). (5pts)

| [Return Address for Calling Function] |
|---------------------------------------|
| old rbx |
| 0x400b73 |
| 3 |
| 0x400b73 |
| |
| |
| |
| |

(Assume each entry is 8 bytes, and don't use spaces you don't need!)

2. Figure out what this function is doing. (3pts)

| What does this function do? | |
|-----------------------------|------|
| (no more than one sentence) | (x!) |

Question 7. The Phantom 33 (8 pts)

Dear CS33: Attached is the final phase, removed from the bomblab because I couldn't solve it.

```

```

Also, I doubt this will be useful, but %rsp is 0x00676f7479610d0a when you enter phase 8.

Please let me know which input string will defuse this phase, and also how to find the secret phase. Return this table to me at your earliest convenience:

| String to defuse: | 400bbe |
|--------------------|--------|
| String for s3cr3t: | 8 |

Sincerely, Prof. Tony

PS: I found this online, this actually might be useful.

unsigned long int strtoul (const char* str, char** endptr, int base);

| Tarses the C-samp str, interpreting its content as an integral number of the specified base, which is returned a specified base in the specified base, which is returned a specified base in the specified base, which is returned a specified base in the specified base, which is returned a specified base in the specified base, which is returned a specified base, which is returned as a problem in the specified base, which is returned a specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, which is returned as a problem in the specified base, are specified base, and is a problem in the specified base, are specified base, and is a problem in the specified base, are speci | unsigned | 1 Tong In | it strtoul (const ch | | Idl. | enaptr, | Int base); | | | | | |
