

EEM16 Midterm

TOTAL POINTS

46 / 65

QUESTION 1

1 Problem #1 13 / 18

- ✓ - 0 a) is Correct
- ✓ - 0 b) is correct
- ✓ - 0 c) is correct
 - 0 d) is correct
 - 0 e) is correct
- 1 a) added don't cares as minterms
- 3 a) is incorrect
- 2 b) is partially correct
- 5 b) is incorrect
- 3 c) is incorrect
- 3 d) is incorrect
- 2 e) is partially incorrect
- ✓ - 4 e) is incorrect
- ✓ - 1 d) partially incorrect
 - 2 c) partially incorrect

QUESTION 2

2 Problem #2 8 / 14

- 0 all correct
- ✓ - 2 Part (a): answer other than 2, 3 or 4
 - 1 Part (b): deduct for wrong demorgan
 - 0.5 Part(b): partial improper SoP
- ✓ - 1 Part(b): For improper SoP form
 - 2 Part(b) quite wrong SoP
 - 4 Part(b): all wrong
 - 1.5 Part(c): if Not distributive
- ✓ - 2 Part(c) no 6 SoP
 - 1 Part(c). For each wrong SoP term
 - 4 Part(c): all wrong
 - 0.5 Part(d): Partial wrong reduced expression
 - 1 Part(d): quite wrong reduced expression
- ✓ - 1 Part(d): For one missing property
 - 2 Part(d): For two missing properties

QUESTION 3

3 Problem #3 16.5 / 22

- 0 Correct. Good Job.
- 1 (a) math error
- 2 (a) incorrect
- 1 (a) (b) or (c) math error
- 2 (b) incorrect
- 2 (c) incorrect = -105
- ✓ - 0.5 (c) negative error for 2's complement
 - 2 (d) incorrect hex
 - 2 (e) incorrect BCD
 - 1 (f) partial credit
 - 2 (f) incorrect
 - 2 (g) incorrect bias
 - 2 (g) incorrect real number
 - 1 (g) partial credit for error
 - 6 (h) incorrect
- ✓ - 2 (h) incorrect floating point choice
 - 1 (h) partially incorrect min bits for mantissa
- ✓ - 2 (h) incorrect min bits for mantissa
- ✓ - 1 (h) partially incorrect min bits for exponent
 - 2 (h) incorrect min bits for exponent

QUESTION 4

4 Problem #5 8.5 / 11

- ✓ - 0 (a) Correct. Nice Job!
 - 7 (a) incorrect
 - 5.5 (a) partial for ok attempt
 - 3 (a) Too much excessive logic
 - 0 (a) No or incorrect Hit logic
 - 0.5 (a) Some unnecessary logic
 - 0 (b) Correct. Nice Job!
 - 4 (b) incorrect
 - 3.5 (b) Partial credit for attempt
 - 1 (b) incorrect bit weight (hop and adder cnt)
- ✓ - 1 (b) no or incorrect adder count or hop

- **0.5** (b) Good attempt but slightly too many FA
- ✓ - **1.5** (b) **ok attempt but incorrect design**
- **3** (b) partial credit for attempt

Midterm Exam

Name (Last, First):

Student Id #:

Do not start working until instructed to do so.

1. You must answer in the **space provided** for answers after every question. We will ignore answers written anywhere else in the booklet. **All pages in this booklet must be accounted** for otherwise it will not be graded.
2. You are permitted 1 page of notes 8.5x11 (front and back).
3. You may not use any electronic device.

Following table to be filled by course staff only

	Maximum Score	Your Score
Question 1		
Question 2		
Question 3		
Question 4		
Question 5		
TOTAL	100	

Question #1

Consider the Boolean function defined by the truth table below where A, B, C, and D are inputs, and Y is the sole output.

1
A
0
~A
~A
1
1
1

	A	B	C	D	Y
✓ 0	0	0	0	0	1
1	0	0	0	1	0
2	0	0	1	0	0
3	0	0	1	1	0
✓ 4	0	1	0	0	1
✓ 5	0	1	0	1	1
✓ 6	0	1	1	0	1
✓ 7	0	1	1	1	1
✓ 8	1	0	0	0	1
✓ 9	1	0	0	1	1
10	1	0	1	0	0
✓ 11	1	0	1	1	1
12	1	1	0	0	0
13	1	1	0	1	X
✓ 14	1	1	1	0	1
15	1	1	1	1	X

(a) Complete the following statements

$$Y = \sum m(0, 4, 5, 6, 7, 8, 9, 11, 14)$$

(b) Complete the Karnaugh Map shown below, **circle** the prime implicants.

		AB			
		"00"	"01"	"11"	"10"
CD	"00"	1	0	0	0
	"01"	1	1	1	1
	"11"	0	X	X	1
	"10"	1	1	1	0

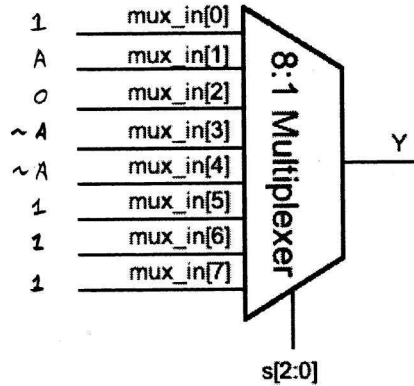

How many prime implicants are there? 7

(c) Write the Boolean (sum-of-product) expression for the essential prime implicants (if any).

2 essential prime implicants

EssentialPrimeImplicants = $(c \wedge b) \vee (d \wedge a)$

(d) Implement the function Y using an 8-input multiplexer. The select signal is $s[2:0]=\{B,C,D\}$ where $s=3'b100$ is $B=1$ and $C=D=0$ selecting the input $mux_in[4]$. A or $\sim A$ are permissible as inputs, $mux_in[7:0]$. Write the desired inputs on the figure below.

(e) Implement $\sim Y$ using the minimum # of NOR gates with fewest # of inputs (minimize literals and terms).

→ product of sums with NOR gates, you can use complement of inputs

NOR gates means get product of sums, =

$$= (\overline{c} \vee \overline{a} \vee \overline{b}) \wedge (\overline{d} \vee a) \wedge (\overline{d} \vee b) \wedge (c \vee b) \wedge (c \vee \overline{d} \vee a)$$

$$(\overline{c} \vee \overline{a} \vee \overline{b}) \vee (\overline{d} \vee a) \vee (\overline{d} \vee b) \wedge (c \vee b) \vee (c \vee \overline{d} \vee a)$$

$$0X00 \wedge X11X \wedge X1X1 \wedge 1XX1 \wedge 100X$$

$$(A \wedge A) \vee \dots$$

$$\overline{((A \wedge \bar{B}) \vee (C \wedge \bar{D} \wedge \bar{E}))}$$

UCLA | EEM16/CSM51A | Spring 2017
Question #2

$$\overline{(A \wedge \bar{B}) \vee (C \wedge \bar{D} \wedge \bar{E})}$$

Prof. C.K. Yang

$$Y = \neg(\neg(a \wedge \neg b) \vee (c \wedge \neg(d \vee e)))$$

(a) For the above Boolean function, if you were to convert the above expression into a sum-of-product representation, how many times did you have to apply DeMorgan's theorem?

1

(b) For part (a), what is the resulting function?

$$\overline{(A \wedge \bar{B}) \vee (C \wedge \bar{D} \wedge \bar{E})}$$

$$(A \wedge \bar{B}) \wedge (\bar{C} \vee \overline{\bar{D} \wedge \bar{E}}) = (A \wedge \bar{B}) \wedge (\bar{C} \vee D \vee E)$$

$$Y = \overline{(A \wedge \bar{B}) \vee (C \wedge \bar{D} \wedge \bar{E})}$$

$$a \wedge (a \vee \neg b \vee \neg c)$$

$$\overline{\overline{a \vee b}} \rightarrow \overline{\bar{a} \bar{b}} \wedge a$$

(c) The following expression can be written as a 6-term sum-of-product,

$$Y = (a \vee b) \wedge (a \vee \neg b \vee \neg c) \leftarrow \text{product of sums}$$

What Boolean property do you need to apply to do this?

Distributive

Without reducing, what are the 6 product terms?

$$(a \wedge b \wedge c) \vee (a \wedge b \wedge \neg c) \vee (a \wedge \neg b \wedge c) \vee (a \wedge \neg b \wedge \neg c) \vee (\neg a \wedge b \wedge c) \vee (\neg a \wedge b \wedge \neg c)$$

a	b	c	output
0	0	0	0
0	0	1	0
0	1	0	1
0	1	1	0
1	0	0	1
1	0	1	1
1	1	0	1
1	1	1	1

(d) The 6-term sum-of-product of part (c) can obviously be reduced. What is the reduced expression?

$$\underline{a \vee (b \wedge \neg c)}$$

What Boolean axioms or properties are needed for the reduction?

Absorption, combining

ab	c	0	1
00		0	0
01		1	0
11		1	1
10		1	1

$$1xx \vee x10$$

0.25 = min magnitude

Question #3

(a) The following 8 bits can be used to represent different numbers depending on the encoding
8b'10010111

If this was unsigned, what is the corresponding integer? 151

(b) If the 8 bits in (a) was sign magnitude, what is the corresponding integer? -23

(c) If the 8 bits in (a) was 2's complement, what is the corresponding integer? 105

(d) If the 8 bits in (a) was hexadecimal, what is the corresponding hexadecimal? 0x97

(e) If the 8 bits in (a) was binary coded decimal, what is the corresponding integer? 97

(f) If the 8 bits is fixed point 1001.0111, what is the corresponding number? 9.4375

(g) If the 8 bits in (a) was a 4E3 floating point number (IEEE format S+EEE+MMMM),

What is the bias? $2^{3-1} - 1 = 3$

What is the corresponding real number? ≈ -0.359

$2+4+1+16$

(h) Military temperature range is -55°C to +125°C with 1% accuracy.

Would you choose floating point or fixed point? fixed point

If you are to represent this in floating point,
what is the minimum # of bits for mantissa? 2

$0.01 \quad 1.01 = 1.25$

And, what is the minimum # of bits for exponent? 3

10010111

1.0111

1 - bias = 1 - 3 = -2

$1.0111 \cdot 2^{-2} = 0.010111$

$\uparrow \quad \uparrow$
0.25 0.125 0.0625

$125 < 128 = 2^7$

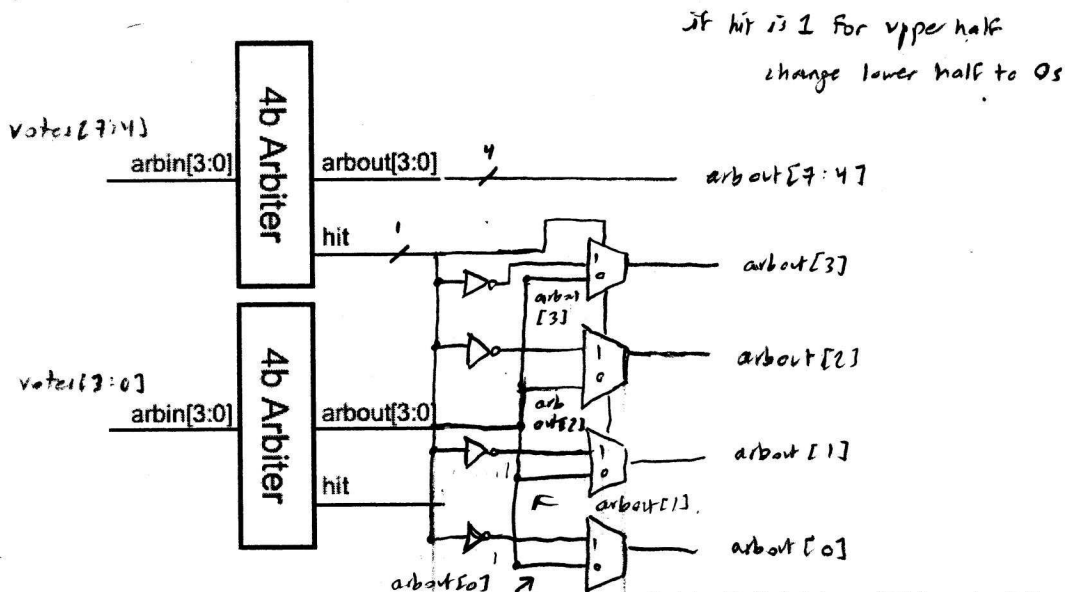

3 bits to write 7

7 - 2 = 4

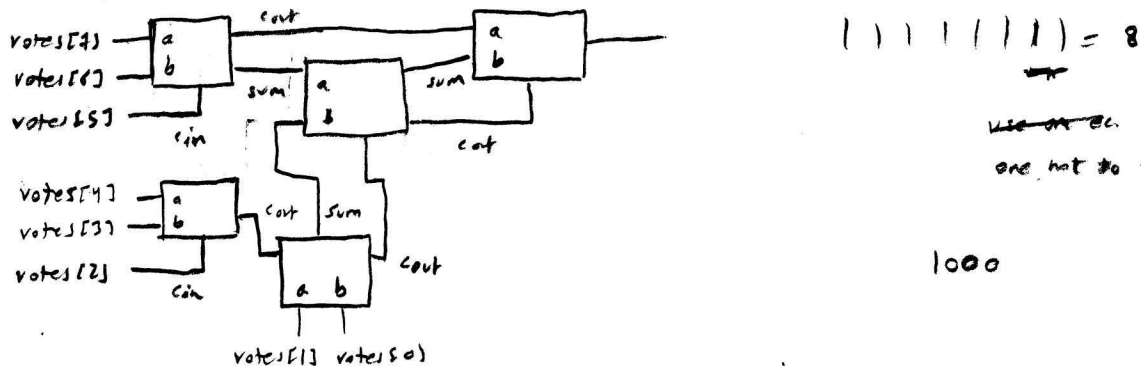

0110 0010
0100 0010

Question #5

(a) Given 8-bit input, $votes[7:0]$, in which any number of the inputs can be a 1'b1. Build an **arbiter** that provides an 8-bit output, $arbout[7:0]$, that is 1-hot. The hot signal corresponds to the position with the highest priority. Note that $votes[7]$ has higher priority than $votes[6]$ etc. You have available to you a module ARB that is a 4-bit arbiter already built that you **must** use. ARB accepts as inputs $arbin[3:0]$ and outputs $arbout[3:0]$ and a *hit* signal to indicate that one or more of the signals is a 1'b1. You also have available to you INV (inverters), and 2-input MUX (multiplexers). Recall that you can implement considerable arbitrary logic with 2-input MUXs.

(b) Now, the $votes[7:0]$ need to be counted. You have available Full Adders (FA) as building blocks for implementing a design. If the delay of the logic is determined by the number of hops where each hop is the traversal of a Full-Adder from any input ($a, b,$ and c) to any output ($sum, carry$). Design your block to minimize this delay. Note that your design should output 4 bits to indicate the binary count, $cnt[3:0]$.

How many Full Adders do you need? 5
How many hops is your design? 4

Blank page for scratch work

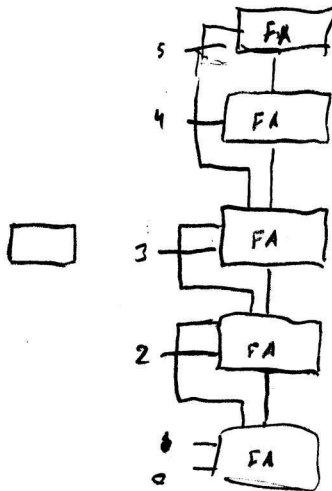

$1011 = 0011$

$1111 = 0100$

$1111 = 4$

$a+b =$

QUESTION 1

1 20 pts

1.1 1.1 (TCP as a transport) 3 / 3

- ✓ - 0 correct
- 0.5 Incorrectly select
- 0.5 Incorrectly select
- 0.5 Incorrectly select
- 1 should select 3 correct options
- 1 should select 3 options
- 1 should select 3 options

1.2 1.2 (stateful) 2.5 / 3

- 0 Correct
- ✓ - 0.5 Select a wrong answer
- 0.5 Select a wrong answer
- 0.5 Select a wrong answer
- 3 Wrong answer, leave blank

1.3 1.3 (p2p) 1 / 1

- ✓ - 0 Correct
- 1 Incorrect (b is not chosen)
- 0.5 At least one other (incorrect) options selected

1.4 1.4 (HTTP request/response info) 2 / 3

- 0 Correct
- 1 missing d
- 1 missing e
- ✓ - 0 missing f
- ✓ - 1 One wrong answer (a-c)
- 2 Two or more wrong answers (a-c)

1.5 Protocol is ... 1 / 2

- ✓ - 1 At least one correct (format/order/actions)
- 0 Two or more correct (format/order/actions)
- 2 Incorrect

1.6 Most common HTTP method 2 / 2

- ✓ + 1 GET
- ✓ + 1 POST

+ 0 Incorrect/Blank

1.7 DNS and HTTP 2 / 2

- ✓ + 0.5 replicated
- ✓ + 0.5 cached
- ✓ + 0.5 replicated
- ✓ + 0.5 cached
- + 0 Incorrect

1.8 Common TCP/UDP functions, unique TCP functions 4 / 4

- ✓ + 2 multiplexing/demultiplexing/error detection
- + 1 half credit to common function
- + 1 delivery guarantee
- ✓ + 1 flow control
- ✓ + 1 congestion control
- + 0 Incorrect
- + 1 Incorrect: send/connect/accept/listen calls

QUESTION 2

2 20 pts

2.1 2.1 Delay for 12th packet 0 / 6

- + 6 Correct
- + 3 Correct transmission delay
- ✓ - 1 Incorrect number of RTTs
- + 0 Incorrect

2.2 2.2 Total delay 0.75 / 2

- + 2 Correct 501ms, accepted answer if +-100ms
- + 0.75 Correct transmission delay
- ✓ + 0.75 Correct total number of packets
- + 0 Math problem
- + 0 Incorrect

2.3 2.3 Total delay with 100ms propagation delay 3 / 6

- 0 Correct (correct 2.64s, accepted 2-3s)
- 1 No or incorrect explanation provided

✓ - 3 Wrong value, but within reasonable range from the correct (1-2, 3-5)

- 0.5 Incorrect RTT calculation

- 6 Incorrect

2.4 2.4 Shortest delay / adjust window 4 / 6

- 0 Correct (20-21, delay ~600ms)

✓ - 0.5 No (or incorrect) optimal delay calculated

✓ - 1.5 Mentioned value >21, but no or incorrect explanation provided

- 6 Incorrect

- 3 Mentioned to increase window, but <21 or way too many

QUESTION 3

3 20 pts

3.1 3.1 Query for amazon.com/A 2 / 4

- 0 Correct

✓ - 2 Second query incorrect

- 1 Problem with one of the queries

- 4 Incorrect / no answer

3.2 3.2 Query for google.com/MX 3 / 3

✓ - 0 Correct

- 1 Issue with the answer (one unnecessary query)

- 1.5 Didn't include query t google.com NS

- 3 Incorrect / missing / more than one unnecessary query

3.3 3.3 Query for

mail/hangout.google.com/AAAA 3 / 5

- 0 Correct

- 1 Extra (or missing) query for 1st query

- 1 Extra (or missing) query for 2nd query

✓ - 2 No more than two unnecessary queries for one of the queries

- 3 More than 2 unnecessary queries for one

- 5 Incorrect / missing

3.4 3.4 List cached records 2.25 / 5

+ 2 google.com/MX, primary.google.com/A, backup.google.com/A (from 3.2)

✓ + 1 google.com/NS

✓ + 2 mail.google.com/AAAA,

hangout.google.com/AAAA

✓ - 0.75 One wrong domain

- 1.5 Two wrong domains

- 1 Type of records not specified

+ 0 Incorrect / missing

3.5 3.5 Reachable 3 / 3

✓ - 0 Correct

QUESTION 4

4 20 pts

4.1 4.1 Sequence numbers 10 / 10

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

✓ + 1 One correct sequence number of flag

+ 0 Incorrect/blank

4.2 4.2 Missing exchange 5 / 5

✓ - 0 Correct

- 0.5 One or more incorrect / unnecessary / missing exchanges

- 0.75 One flag or sequence number is wrong

- 1.5 More than one flag or sequence number is wrong

- 2.5 Sequence numbers / flags (or their relation) not shown

- 5 Incorrect / missing

4.3 4.3 Max TCP pipeline 3 / 5

- 0 Correct (or close)

- 2 Too large or too small

- 2 Incorrect statement that there is no limit

✓ - 2 The result is not throughput (bit/s or byte/s)

- 0.5 Right direction, but didn't give complete answer

- 5 No attempt

- 3 Attempted, but didn't give the answer

QUESTION 5

5 20 pts

5.1 5.1 UDP checksum 2.5 / 5

- ✓ + 1.5 Found checksum in the packet
 - + 4 Attempted to calculate 1-complement of 1-complement sum of 16-bits
- ✓ + 1 Gave an answer without basis
 - + 2.5 Calculated sum, but didn't indicate 1-complement of 1-complement / not correct items added
 - + 2.5 Attempted calculate but not 1-complement of 1-complement sum or not 16-bit numbers
 - + 0 No attempt / incorrect

5.2 5.2 IPv4 header checksum 2.5 / 5

- ✓ + 1.5 Found checksum in the packet
 - + 4 Attempted to calculate 1-complement of 1-complement sum of 16-bits
- ✓ + 1 Gave an answer without basis
 - + 2.5 Calculated sum, but didn't indicate 1-complement of 1-complement / not correct items added
 - + 2.5 Attempted calculate but not 1-complement of 1-complement sum or not 16-bit numbers
 - + 2 Give semi-valid answer not to the question asked
 - + 0 No attempt / Incorrect

5.3 5.3 Demultiplex 6 / 6

- ✓ - 0 Correct
 - 0 Not mentioned that OS uses UDP-specific lookup table to find app socket
 - 3 Incorrect mentioning of sourceIP/sourcePort as part of the lookup
 - 1 Didn't mention destination IP for demultiplexing
 - 3 Didn't mention use of destination ip&port to lookup in kernel's UDP socket-app table
 - 4 Only showed port number
 - 6 Incorrect / missing

5.4 5.4 UDP facts 3 / 4

- + 1 UDP payload (2^{16})
- ✓ + 1 Port numbers (0, $2^{16}-1$), ok if start 1024
- ✓ + 1 Number of distinct apps ($2 \cdot 2^{16}$)

✓ + 1 Number of apps to prevent (2^{16})

+ 0 Incorrect

QUESTION 6

6 20 pts

6.1 6.1 Secret message 3 / 4

- 0 Correct
- ✓ - 1 Mentioned public key encryption, but didn't discuss how to get public key for a person you never met before
 - 0.5 Mentioned how to get public key, but didn't define why it should be trusted
 - 4 Incorrect / missing
 - 3 Mention PGP, but in incorrect context

6.2 6.2 Info from email 2 / 4

- + 4 Correct
- ✓ + 2 Mentioned PGP signing and telling (out-of-band) your key (key fingerprint) to the professor / out-of-band acknowledging sending email
 - + 2 At least two objective info items listed
 - + 1 At least one objective info listed
 - + 0 Incorrect / missing

6.3 6.3 Invalid HTTPS 4 / 4

- ✓ - 0 Correct (At least 2 reasons listed)
 - 2 Only one correct reason listed
 - 4 Invalid / missing answer

6.4 6.4 Multiple DNS records for youtube.com/A 4 / 4

- ✓ - 0 Correct (at least 3 correct reasons listed)
 - 1 Only two correct reasons listed
 - 2 Only one correct reason listed
 - 0 Incorrect/missing answer

6.5 6.5 HTTP/2 vs QUIC 4 / 4

- ✓ - 0 Correct
 - 1.5 Only one reason listed
 - 4 Incorrect/missing answer

CS118
Spring 2017 Midterm Exam

1 hour 50 minutes
Close book and closed notes,
except a SINGLE piece of paper as a cheat sheet.

NO use of any device except calculators.

- This exam has 7 pages, including this cover page. Do all your work on these exam sheets. NO EXTRA PIECES OF PAPER WILL BE ALLOWED.
- Cross out all the scratch work that you do not want to be counted as part of your answer before you submit the exam.
- Be *specific, clear, concise* in your answers, and explain your answers.
- When the answer to a problem is not immediately clear, do not simply dump everything, relevant or irrelevant, on the paper. Irrelevant answers may lead to point-deduction as they show the lack of understanding of the problem.

Your name: _____

Student ID: _____

Problem 1 (20 points)

1.1 Circle zero or several application-layer protocols that use only TCP as their transport layer protocols?

- (a) HTTP 1.1/2 (c) SMTP (e) BitTorrent (g) MPEG/DASH
(b) QUIC (d) IMAP/POP3 (f) DNS (h) Skype/VoIP

1.2 Circle zero or several application-layer protocols that are stateful?

- (a) HTTP 1.1/2 ✗ (c) SMTP (e) BitTorrent (g) MPEG/DASH
(b) QUIC ✗ (d) IMAP/POP3 (f) DNS (h) Skype/VoIP

1.3 Circle zero or several statements that are **TRUE** for a peer-to-peer system?

- (a) All systems always need to be on ✗
(b) Transferring a file is faster than an equivalent client-server architecture
(c) They are not as scalable as client server architecture ✗
(d) Are easier to implement than client-server systems ✗

1.4 Circle zero or several pieces of information one **CANNOT** get by looking at an HTTP request message?

- (a) Name of the web-page (c) Server's port number (e) Requester's IP address
(b) Server's host name (d) Server's IP address (f) Full URL of the request

1.5 Fill in the blanks:

The network protocols (and protocols in general) define

_____ how to communicate _____,
_____ how to deliver data _____, and _____ determine resource availability _____
_____ how to _____.

The most common HTTP method types are

_____ GET _____ and _____ POST _____.

DNS protocol is a highly available database because DNS zone information (resource records) can be

_____ replicated _____ and _____ cached _____.

HTTP protocol can scale because WEB data can be

_____ be cached _____ and _____ replicated _____.

The common function (at least one) between TCP and UDP transport-layer protocol is

_____ multiplexing, demultiplexing _____.

In addition to this function, TCP also provides

_____ congestion control _____, _____ flow control _____ and _____ connection establishment _____.

$$500000 / 10000 = 50$$

Problem 2 (20 points) Two hosts A and B are connected by a link with bandwidth of 1 Mbps (10^6 bits-per-second) and propagation delay between A and B is 1 millisecond. Host A has a 500,000-bit file to send to host B. A uses GoBackN reliable transport protocol and divides the file into 10,000-bit packets. The GoBackN protocol uses a fixed window size of 4 packets. You may assume the *transmission time* of ACK packets is negligible and no data or ACK packet ever gets lost.

2.1 (6 points) How long will it take before the 12th packet has completely arrived at Host B? (drawing a diagram may help answer this question).

$$\frac{50000 \text{ bit file}}{10000 \text{ bit packets}} = 50 \text{ packets}$$

$$\frac{12}{4} \cdot 1 \text{ ms} = 3 \text{ milliseconds}$$

2.2 (6 points) How long will it take before the entire file is received by Host B?

$$\frac{50}{4} \cdot 1 \text{ ms} = \frac{25}{2} = 12.5 \text{ milliseconds}$$

2.3 (6 points) How long will it take before the entire file is received by Host B if propagation delay is increased to 100 milliseconds?

$$\frac{50}{4} \cdot 100 = 1250 \text{ milliseconds}$$

2.4 (8 points) Assuming propagation delay stays 100 milliseconds, is there a way for the file to be delivered to the host B faster by adjusting the window size? If so, what is the minimal window size that would allow the file to be received at B with shortest possible time (assume no other settings are changed)?

Link capacity = 1 Mbps $\rightarrow 10^6$ bits/s $\approx 10^6 / 10000 = 100$ packets/second

$$\frac{50}{50} \cdot 1 = 1 \text{ millisecond}, \text{ window size of } 50$$

Problem 3 (20 points) Consider the following environment with a local DNS caching resolver and a set of authoritative DNS name servers.

Assume that initially,

- the caching resolver cache is **empty**,
- TTL values for all records is **1 hour**,
- RTT between stub resolvers (hosts A, B, and C) and the caching resolver is **20 ms**,
- RTT between the caching resolver and any of the authoritative name servers is **150 ms**
- There are **no packet losses**
- All processing delays are **0 ms**

3.1 (4 points) At $T=0$ min, Host-A sends a query for "A record for amazon.com", and after receiving the answer sends a query for "A record for www.amazon.com". How long did it take to receive all the answers?

$$\text{cache}(20) + \text{root}(150) + \text{com}(150) + \text{amazon.com}(150) + \text{cache}(20) = \boxed{490 \text{ ms}}$$

3.2 (3 points) At $T=40$ min, Host-B sends a query for "MX record for google.com" that returns

google.com.	3600	IN	MX	10	primary.google.com.
google.com.	3600	IN	MX	30	backup.google.com.
primary.google.com.	3600	IN	A	74.125.28.27	
backup.google.com.	3600	IN	A	173.194.211.27	

(Similar to NS records, the DNS server may return "glue" A/AAAA records in addition to the requested MX records.)
How long did it take to get the answer?

$$\text{query.com for google.com}(150) + \text{query google.com}(150) + \text{cache}(20) = \boxed{320 \text{ ms}}$$

3.3 (5 points) At $T=70$ min, Host-C sends a query for "AAAA (IPv6) record for mail.google.com", following at $T=75$ mins with a query for "AAAA (IPv6) record for hangout.google.com". How long did it take for Host-C to receive each of the answers (i.e., relative to $T=70$ min for the first, and relative to $T=75$ mins for the second)?

a) $\text{cache}(20) + \text{root}(150) + \text{com}(150) + \text{google.com}(150) = \underline{470 \text{ ms}}$

b) $\text{google.com}(150) + \text{cache}(20) = \underline{170 \text{ ms}}$

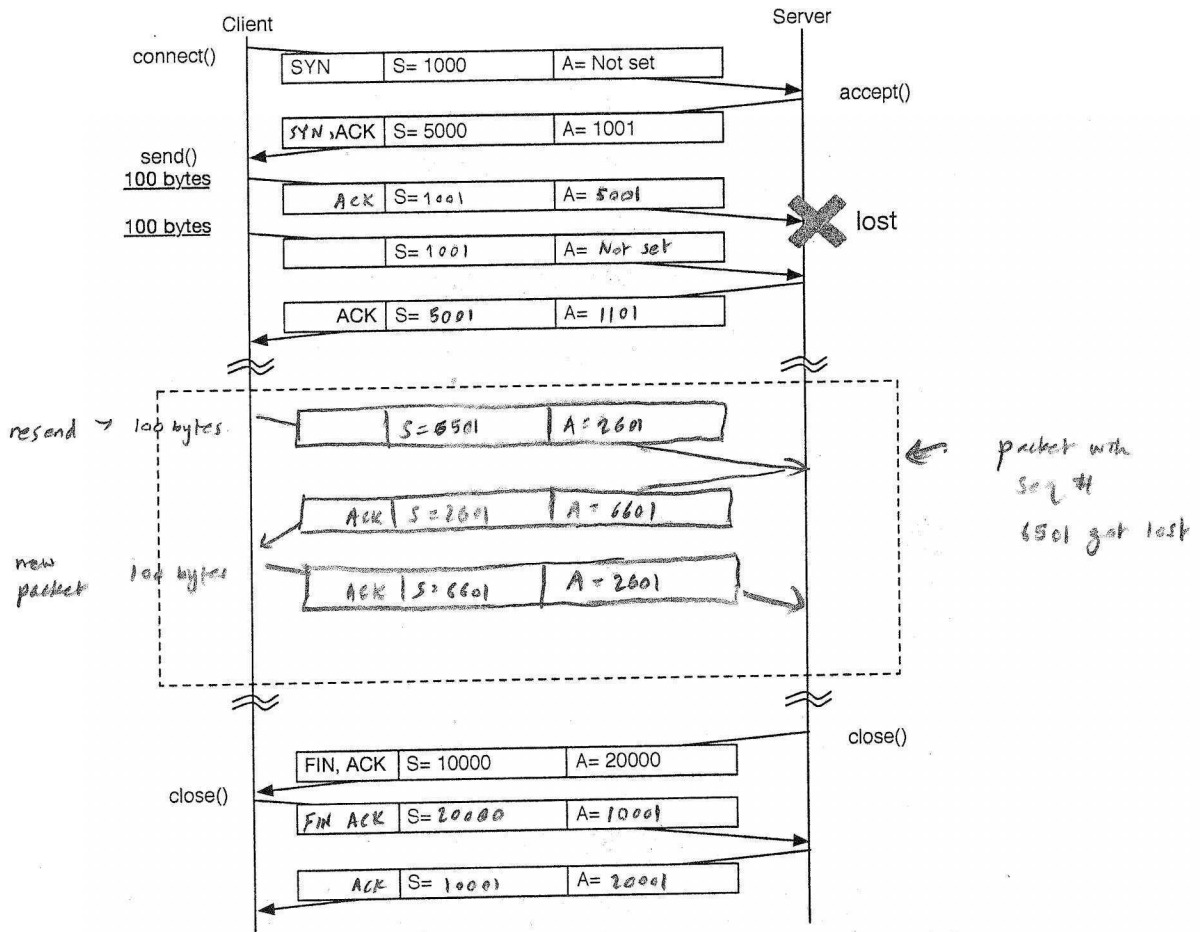

3.4 (5 points) List DNS records that the caching resolver has at $T=90$ minutes

NS for root, NS for .com, NS for google.com
AAAA records for mail.google.com, hangout.google.com

3.5 (3 points) At $T=100$ minutes, all the authoritative servers for .com go offline. Circle the domain names that can be resolved by Host-A?

- (a) www.google.com (b) hangout.google.com (c) doc.google.com
(d) www.amazon.com (e) video.amazon.com (f) aws.amazon.com

Problem 4 (20 points) The following diagram shows a sequence of TCP packets for a client/server from your project 1, which include some of the sequence, acknowledgement numbers, and flags.

4.1 (10 points) In the figure above, fill in all the missing values for sequence, acknowledgement numbers and flags (SYN, ACK, FIN). For acknowledgement number write "Not set" if acknowledgment flag not set.

4.2 (5 points) One of the packets got lost. In the dotted box above, add the missing exchanges between the client and the server just after the loss has been detected. In the exchange, include flags, sequence number, and acknowledgement number (if applicable).

4.3 (5 points) What is the theoretical maximum of the TCP pipeline? For a link with 500ms round trip delay imaginary 1000 Tbits/s link bandwidth, what is the maximum throughput that TCP protocol can sustain for that link (assume maximum packet size is 1000 bytes, hosts have infinite amount of buffering memory)?

0		8		16		24		31	
Source Port				Destination Port					
Sequence Number									
Acknowledgment Number									
Offset	Reserved	Flags			Receiver Window				
Checksum		Urgent pointer							
TCP Options (variable length, optional)									
Payload									

$$\begin{aligned}
 \text{Throughput} &= 1000 \text{ bytes} \rightarrow 8000 \text{ bits / packet} \\
 \frac{8000 \text{ bits}}{500 \text{ ms}} &= \frac{8000 \text{ bits}}{0.5 \text{ s}} = 16000 \text{ bits/s} \rightarrow \frac{1000 \times 10^{12} \text{ bits/s}}{16000 \text{ bits/s}} \\
 &= 0.25 \times 10^{10} \text{ packets}
 \end{aligned}$$

Problem 5 (20 points): The following diagram shows the UDP packet header and HEX value of one of the captured UDP packets.

0	8	16	24	31	
Version	IHL	DS fields	ECN	Total Length	
Identification			Flags	Fragment Offset	
Time to Live	Protocol		Header Checksum		
Source Address					
Destination Address					
Source Port			Destination Port		
Length			Checksum		
Payload					

45 00	00 22
23 c5	00 00
40 11	00 00
7f 00	00 01
7f 00	00 01
c2 6e	03 e8
00 0e	fe 21
48 65	6c 6c
6f 0a	

Pseudo-header format for UDP/IPv4

5.1 (5 points) Check correctness of UDP checksum. If it is incorrect, what should be the correct checksum?

$$\text{UDP checksum} = \text{UDP header} + \text{segment} + \text{pseudo header}$$

$$= 00 \text{ No, } 0hdc$$

5.2 (5 points) Check correctness of IPv4 checksum. If it is incorrect, what should be the correct checksum?

$$\begin{array}{r} 11111110 \\ 00100100 \\ \hline 00100010 \rightarrow 0h23 \end{array}$$

 complement: $11011100 \rightarrow 0hdc$

 $0hdc \oplus 0h23 = 0h30$

5.3 (6 points) Please describe how this packet can be delivered to the destination application (i.e., how OS de-multiplex this packet) and on which port number this application should be listening on.

This On UDP, sockets can be fully identified with destination IP and dest port.
 In this case the destination IP is given by hex 7f00 0001 and port is 03e8 which is 1000.
 127.0.0.1

5.4 (4 points) Finish the following statements about UDP protocol:

The maximum size of a UDP payload is 4 bytes

The range for UDP port numbers is 65536

For a computer with two IP addresses (e.g., one for wireless and one for wired), there could be 231072 maximum number of distinct UDP server applications.

To prevent anybody else to start a UDP server application, one need to start at least 65536 number of applications, each creating one socket, binding, and listening on a single port.

Problem 6 (20 points)

6.1 (4 points) Assume that you want to send a secret message over email using PGP/GPG to a person you just googled on the Internet (you found his email and have a secret question to ask). Will you be able to do that? If yes, how (conceptually), if no, why?

You can encrypt your email with either symmetric key or the recipient's public key. The recipient can decrypt it with symmetric key or his/her private key. For authentication you can send a digital certificate with your email.

6.2 (4 points) Let's say you sent an email to the professor. If you haven't used PGP/GPG, he will not be able to know for sure that it came from you. List **at least two** facts that he can learn from the received email that the sender couldn't fake. What can you do to ensure that the email is from you, including any **out-of-band** process that may be needed.

- 1) If you signed it with your private key, he can use your public key to verify that the email is from you.
 to create a digital signature
- 2) But anyone can share their public key and pretend to be you. Solution: use certificate authority such as PGP to prove that the public key is yours.

6.3 (4 points) Let's say you go to a website over HTTPS protocol and get a warning that something is wrong with the certificate and browser rejects to proceed. List **at least four** reasons what can be wrong with a brief explanation what could have happened.

- 1) Expired certificate
- 2) Revoked certificate
- 3) Wrong host (applicant may not have right to access domain name)
- 4) Untrusted root (root may not be trusted)

6.4 (4 points) Your professor travels a lot and whenever he has a chance he issues a DNS query for "A record for youtube.com". So far, he collected quite a bit of a collection of different responses. List **at least four** reasons why he gets different responses.

- ↳ Abuse of DNS because of
- 1) replicated authoritative servers
 - 2) IPs are changed for security purposes, 3) CDNs may manage servers in multiple regions around the world
 - 4) caching resolvers may lie (e.g. Web portal)

6.5 (4 points) HTTP/2 supports multiple streams and proactive push of data by the server. Give at least 2 reasons why people decided to develop QUIC.

↳ doesn't have to establish connection

QUIC runs over UDP and has app-controlled congestion control. It has multiplexing and flow control similar to HTTP2 and also has security equivalent to TLS. Also has forward error correction, connection migration and server push.
