1 PRECALCULUS REVIEW

1.1 Real Numbers, Functions, and Graphs

Preliminary Questions

1. Give an example of numbers a and b such that $a < b$ and $|a| > |b|$.

SOLUTION Take $a = -3$ and $b = 1$. Then $a < b$ but $|a| = 3 > 1 = |b|$.

2. Which numbers satisfy $|a| = a$? Which satisfy $|a| = -a$? What about $|-a| = a$?

SOLUTION The numbers $a \geq 0$ satisfy $|a| = a$ and $|-a| = a$. The numbers $a \leq 0$ satisfy $|a| = -a$.

3. Give an example of numbers a and b such that $|a + b| < |a| + |b|$.

SOLUTION Take $a = -3$ and $b = 1$. Then

$$|a + b| = |-3 + 1| = |-2| = 2, \qquad \text{but} \qquad |a| + |b| = |-3| + |1| = 3 + 1 = 4.$$

Thus, $|a + b| < |a| + |b|$.

4. What are the coordinates of the point lying at the intersection of the lines $x = 9$ and $y = -4$?

SOLUTION The point $(9, -4)$ lies at the intersection of the lines $x = 9$ and $y = -4$.

5. In which quadrant do the following points lie?

(a) $(1, 4)$ **(b)** $(-3, 2)$ **(c)** $(4, -3)$ **(d)** $(-4, -1)$

SOLUTION

(a) Because both the x- and y-coordinates of the point $(1, 4)$ are positive, the point $(1, 4)$ lies in the first quadrant.

(b) Because the x-coordinate of the point $(-3, 2)$ is negative but the y-coordinate is positive, the point $(-3, 2)$ lies in the second quadrant.

(c) Because the x-coordinate of the point $(4, -3)$ is positive but the y-coordinate is negative, the point $(4, -3)$ lies in the fourth quadrant.

(d) Because both the x- and y-coordinates of the point $(-4, -1)$ are negative, the point $(-4, -1)$ lies in the third quadrant.

6. What is the radius of the circle with equation $(x - 9)^2 + (y - 9)^2 = 9$?

SOLUTION The circle with equation $(x - 9)^2 + (y - 9)^2 = 9$ has radius 3.

7. The equation $f(x) = 5$ has a solution if (choose one):

(a) 5 belongs to the domain of f.

(b) 5 belongs to the range of f.

SOLUTION The correct response is **(b)**: the equation $f(x) = 5$ has a solution if 5 belongs to the range of f.

8. What kind of symmetry does the graph have if $f(-x) = -f(x)$?

SOLUTION If $f(-x) = -f(x)$, then the graph of f is symmetric with respect to the origin.

Exercises

1. Use a calculator to find a rational number r such that $|r - \pi^2| < 10^{-4}$.

SOLUTION r must satisfy $\pi^2 - 10^{-4} < r < \pi^2 + 10^{-4}$, or $9.869504 < r < 9.869705$. $r = 9.8696 = \frac{12337}{1250}$ would be one such number.

2. Which of (a)–(f) are true for $a = -3$ and $b = 2$?

(a) $a < b$ **(b)** $|a| < |b|$ **(c)** $ab > 0$

(d) $3a < 3b$ **(e)** $-4a < -4b$ **(f)** $\frac{1}{a} < \frac{1}{b}$

SOLUTION

(a) True.
(b) False, $|a| = 3 > 2 = |b|$.
(c) False, $(-3)(2) = -6 < 0$.
(d) True.
(e) False, $(-4)(-3) = 12 > -8 = (-4)(2)$.
(f) True.

In Exercises 3–8, express the interval in terms of an inequality involving absolute value.

3. $[-2, 2]$

SOLUTION $|x| \le 2$

4. $(-4, 4)$

SOLUTION $|x| < 4$

5. $(0, 4)$

SOLUTION The midpoint of the interval is $c = (0 + 4)/2 = 2$, and the radius is $r = (4 - 0)/2 = 2$; therefore, $(0, 4)$ can be expressed as $|x - 2| < 2$.

6. $[-4, 0]$

SOLUTION The midpoint of the interval is $c = (-4 + 0)/2 = -2$, and the radius is $r = (0 - (-4))/2 = 2$; therefore, the interval $[-4, 0]$ can be expressed as $|x + 2| \le 2$.

7. $[1, 5]$

SOLUTION The midpoint of the interval is $c = (1 + 5)/2 = 3$, and the radius is $r = (5 - 1)/2 = 2$; therefore, the interval $[1, 5]$ can be expressed as $|x - 3| \le 2$.

8. $(-2, 8)$

SOLUTION The midpoint of the interval is $c = (8 - 2)/2 = 3$, and the radius is $r = (8 - (-2))/2 = 5$; therefore, the interval $(-2, 8)$ can be expressed as $|x - 3| < 5$

In Exercises 9–12, write the inequality in the form $a < x < b$.

9. $|x| < 8$

SOLUTION $-8 < x < 8$

10. $|x - 12| < 8$

SOLUTION $-8 < x - 12 < 8$ so $4 < x < 20$

11. $|2x + 1| < 5$

SOLUTION $-5 < 2x + 1 < 5$ so $-6 < 2x < 4$ and $-3 < x < 2$

12. $|3x - 4| < 2$

SOLUTION $-2 < 3x - 4 < 2$ so $2 < 3x < 6$ and $\frac{2}{3} < x < 2$

In Exercises 13–18, express the set of numbers x satisfying the given condition as an interval.

13. $|x| < 4$

SOLUTION $(-4, 4)$

14. $|x| \le 9$

SOLUTION $[-9, 9]$

15. $|x - 4| < 2$

SOLUTION The expression $|x - 4| < 2$ is equivalent to $-2 < x - 4 < 2$. Therefore, $2 < x < 6$, which represents the interval $(2, 6)$.

16. $|x + 7| < 2$

SOLUTION The expression $|x + 7| < 2$ is equivalent to $-2 < x + 7 < 2$. Therefore, $-9 < x < -5$, which represents the interval $(-9, -5)$.

17. $|4x - 1| \leq 8$

SOLUTION The expression $|4x - 1| \leq 8$ is equivalent to $-8 \leq 4x - 1 \leq 8$ or $-7 \leq 4x \leq 9$. Therefore, $-\frac{7}{4} \leq x \leq \frac{9}{4}$, which represents the interval $[-\frac{7}{4}, \frac{9}{4}]$.

18. $|3x + 5| < 1$

SOLUTION The expression $|3x + 5| < 1$ is equivalent to $-1 < 3x + 5 < 1$ or $-6 < 3x < -4$. Therefore, $-2 < x < -\frac{4}{3}$ which represents the interval $(-2, -\frac{4}{3})$

In Exercises 19–22, describe the set as a union of finite or infinite intervals.

19. $\{x : |x - 4| > 2\}$

SOLUTION $x - 4 > 2$ or $x - 4 < -2 \Rightarrow x > 6$ or $x < 2 \Rightarrow (-\infty, 2) \cup (6, \infty)$

20. $\{x : |2x + 4| > 3\}$

SOLUTION $2x + 4 > 3$ or $2x + 4 < -3 \Rightarrow 2x > -1$ or $2x < -7 \Rightarrow (-\infty, -\frac{7}{2}) \cup (-\frac{1}{2}, \infty)$

21. $\{x : |x^2 - 1| > 2\}$

SOLUTION $x^2 - 1 > 2$ or $x^2 - 1 < -2 \Rightarrow x^2 > 3$ or $x^2 < -1$ (this will never happen) $\Rightarrow x > \sqrt{3}$ or $x < -\sqrt{3} \Rightarrow$ $(-\infty, -\sqrt{3}) \cup (\sqrt{3}, \infty)$.

22. $\{x : |x^2 + 2x| > 2\}$

SOLUTION $x^2 + 2x > 2$ or $x^2 + 2x < -2 \Rightarrow x^2 + 2x - 2 > 0$ or $x^2 + 2x + 2 < 0$. For the first case, the zeroes are

$$x = -1 \pm \sqrt{3} \Rightarrow (-\infty, -1 - \sqrt{3}) \cup (-1 + \sqrt{3}, \infty).$$

For the second case, note there are no real zeros. Because the parabola opens upward and its vertex is located above the x-axis, there are no values of x for which $x^2 + 2x + 2 < 0$. Hence, the solution set is $(-\infty, -1 - \sqrt{3}) \cup (-1 + \sqrt{3}, \infty)$.

23. Match (a)–(f) with (i)–(vi).

(a) $a > 3$

(b) $|a - 5| < \dfrac{1}{3}$

(c) $\left|a - \dfrac{1}{3}\right| < 5$

(d) $|a| > 5$

(e) $|a - 4| < 3$

(f) $1 \leq a \leq 5$

(i) a lies to the right of 3.
(ii) a lies between 1 and 7.
(iii) The distance from a to 5 is less than $\frac{1}{3}$.
(iv) The distance from a to 3 is at most 2.
(v) a is less than 5 units from $\frac{1}{3}$.
(vi) a lies either to the left of -5 or to the right of 5.

SOLUTION

(a) On the number line, numbers greater than 3 appear to the right; hence, $a > 3$ is equivalent to the numbers to the right of 3: **(i)**.

(b) $|a - 5|$ measures the distance from a to 5; hence, $|a - 5| < \frac{1}{3}$ is satisfied by those numbers less than $\frac{1}{3}$ of a unit from 5: **(iii)**.

(c) $|a - \frac{1}{3}|$ measures the distance from a to $\frac{1}{3}$; hence, $|a - \frac{1}{3}| < 5$ is satisfied by those numbers less than 5 units from $\frac{1}{3}$: **(v)**.

(d) The inequality $|a| > 5$ is equivalent to $a > 5$ or $a < -5$; that is, either a lies to the right of 5 or to the left of -5: **(vi)**.

(e) The interval described by the inequality $|a - 4| < 3$ has a center at 4 and a radius of 3; that is, the interval consists of those numbers between 1 and 7: **(ii)**.

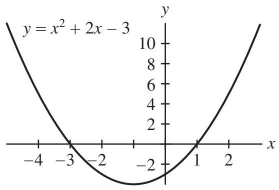
(f) The interval described by the inequality $1 < x < 5$ has a center at 3 and a radius of 2; that is, the interval consists of those numbers less than 2 units from 3: **(iv)**.

24. Describe $\left\{x : \dfrac{x}{x+1} < 0\right\}$ as an interval.

SOLUTION Case 1: $x < 0$ and $x + 1 > 0$. This implies that $x < 0$ and $x > -1 \Rightarrow -1 < x < 0$.
Case 2: $x > 0$ and $x < -1$ for which there is no such x. Thus, solution set is therefore $(-1, 0)$.

25. Describe $\{x : x^2 + 2x < 3\}$ as an interval. *Hint:* Plot $y = x^2 + 2x - 3$.

SOLUTION The inequality $x^2 + 2x < 3$ is equivalent to $x^2 + 2x - 3 < 0$. In the figure below, we see that the graph of $y = x^2 + 2x - 3$ falls below the x-axis for $-3 < x < 1$. Thus, the set $\{x : x^2 + 2x < 3\}$ corresponds to the interval $-3 < x < 1$.



26. Describe the set of real numbers satisfying $|x - 3| = |x - 2| + 1$ as a half-infinite interval.

SOLUTION We will break the problem into three cases: $x \ge 3$, $2 \le x < 3$ and $x < 2$. For $x \ge 3$, both $x - 3$ and $x - 2$ are greater than or equal to 0, so $|x - 3| = x - 3$ and $|x - 2| = x - 2$. The equation $|x - 3| = |x - 2| + 1$ then becomes $x - 3 = x - 2 + 1$, which is equivalent to $-1 = 1$. Thus, for $x \ge 3$, there are no solutions. Next, we consider $2 \le x < 3$. Now, $x - 3 < 0$, so $|x - 3| = 3 - x$, but $x - 2 \ge 0$, so $|x - 2| = x - 2$. The equation $|x - 3| = |x - 2| + 1$ then becomes $3 - x = x - 2 + 1$, which is equivalent to $x = 2$. Thus, $x = 2$ is a solution. Finally, consider $x < 2$. Both $x - 3$ and $x - 2$ are negative, so $|x - 3| = 3 - x$ and $|x - 2| = 2 - x$. The equation $|x - 3| = |x - 2| + 1$ then becomes $3 - x = 2 - x + 1$, which is equivalent to $1 = 1$. Hence, every $x < 2$ is a solution. Bringing all three cases together, it follows that $|x - 3| = |x - 2| + 1$ is satisfied for all $x \le 2$, or for all x on the half-infinite interval $(-\infty, 2]$.

27. Show that if $a > b$, then $b^{-1} > a^{-1}$, provided that a and b have the same sign. What happens if $a > 0$ and $b < 0$?

SOLUTION Case 1a: If a and b are both positive, then $a > b \Rightarrow 1 > \frac{b}{a} \Rightarrow \frac{1}{b} > \frac{1}{a}$.

Case 1b: If a and b are both negative, then $a > b \Rightarrow 1 < \frac{b}{a}$ (since a is negative) $\Rightarrow \frac{1}{b} > \frac{1}{a}$ (again, since b is negative).

Case 2: If $a > 0$ and $b < 0$, then $\frac{1}{a} > 0$ and $\frac{1}{b} < 0$ so $\frac{1}{b} < \frac{1}{a}$. (See Exercise 2f for an example of this).

28. Which x satisfy both $|x - 3| < 2$ and $|x - 5| < 1$?

SOLUTION $|x - 3| < 2 \Rightarrow -2 < x - 3 < 2 \Rightarrow 1 < x < 5$. Also $|x - 5| < 1 \Rightarrow 4 < x < 6$. Since we want an x that satisfies both of these, we need the intersection of the two solution sets, that is, $4 < x < 5$.

29. Show that if $|a - 5| < \frac{1}{2}$ and $|b - 8| < \frac{1}{2}$, then $|(a + b) - 13| < 1$. *Hint:* Use the triangle inequality.

SOLUTION

$$\begin{aligned} |a + b - 13| &= |(a - 5) + (b - 8)| \\ &\le |a - 5| + |b - 8| \quad \text{(by the triangle inequality)} \\ &< \frac{1}{2} + \frac{1}{2} = 1. \end{aligned}$$

30. Suppose that $|x - 4| \le 1$.

(a) What is the maximum possible value of $|x + 4|$?

(b) Show that $|x^2 - 16| \le 9$.

SOLUTION

(a) $|x - 4| \le 1$ guarantees $3 \le x \le 5$. Thus, $7 \le x + 4 \le 9$, so $|x + 4| \le 9$.

(b) $|x^2 - 16| = |x - 4| \cdot |x + 4| \le 1 \cdot 9 = 9$.

31. Suppose that $|a - 6| \le 2$ and $|b| \le 3$.

(a) What is the largest possible value of $|a + b|$?

(b) What is the smallest possible value of $|a + b|$?

SOLUTION $|a - 6| \le 2$ guarantees that $4 \le a \le 8$, while $|b| \le 3$ guarantees that $-3 \le b \le 3$. Therefore $1 \le a + b \le 11$. It follows that

(a) the largest possible value of $|a + b|$ is 11; and

(b) the smallest possible value of $|a + b|$ is 1.

32. Prove that $|x| - |y| \le |x - y|$. *Hint:* Apply the triangle inequality to y and $x - y$.

SOLUTION First note

$$|x| = |x - y + y| \le |x - y| + |y|$$

by the triangle inequality. Subtracting $|y|$ from both sides of this inequality yields

$$|x| - |y| \le |x - y|.$$

33. Express $r_1 = 0.\overline{27}$ as a fraction. *Hint:* $100r_1 - r_1$ is an integer. Then express $r_2 = 0.2666\ldots$ as a fraction.

SOLUTION Let $r_1 = .\overline{27}$. We observe that $100r_1 = 27.\overline{27}$. Therefore, $100r_1 - r_1 = 27.\overline{27} - .\overline{27} = 27$ and

$$r_1 = \frac{27}{99} = \frac{3}{11}.$$

Now, let $r_2 = 0.2\overline{666}$. Then $10r_2 = 2.\overline{666}$ and $100r_2 = 26.\overline{666}$. Therefore, $100r_2 - 10r_2 = 26.\overline{666} - 2.\overline{666} = 24$ and

$$r_2 = \frac{24}{90} = \frac{4}{15}.$$

34. Represent $1/7$ and $4/27$ as repeating decimals.

SOLUTION $\frac{1}{7} = 0.\overline{142857}$; $\frac{4}{27} = 0.\overline{148}$

35. The text states: *If the decimal expansions of numbers a and b agree to k places, then* $|a - b| \le 10^{-k}$. Show that the converse is false: For all k there are numbers a and b whose decimal expansions *do not agree at all* but $|a - b| \le 10^{-k}$.

SOLUTION Let $a = 1$ and $b = 0.\overline{9}$ (see the discussion before Example 1). The decimal expansions of a and b do not agree, but $|1 - 0.\overline{9}| < 10^{-k}$ for all k.

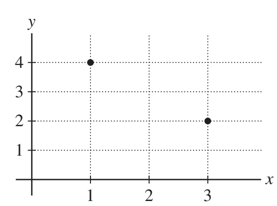
36. Plot each pair of points and compute the distance between them:

(a) $(1, 4)$ and $(3, 2)$
(b) $(2, 1)$ and $(2, 4)$
(c) $(0, 0)$ and $(-2, 3)$
(d) $(-3, -3)$ and $(-2, 3)$

SOLUTION

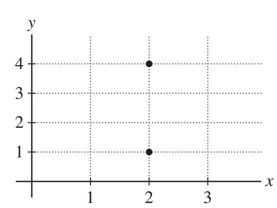
(a) The points $(1, 4)$ and $(3, 2)$ are plotted in the figure below. The distance between the points is

$$d = \sqrt{(3-1)^2 + (2-4)^2} = \sqrt{2^2 + (-2)^2} = \sqrt{8} = 2\sqrt{2}.$$



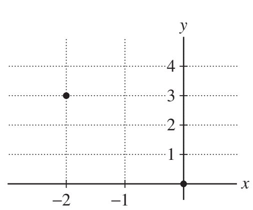
(b) The points $(2, 1)$ and $(2, 4)$ are plotted in the figure below. The distance between the points is

$$d = \sqrt{(2-2)^2 + (4-1)^2} = \sqrt{9} = 3.$$



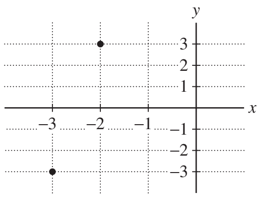
(c) The points $(0, 0)$ and $(-2, 3)$ are plotted in the figure below. The distance between the points is

$$d = \sqrt{(-2-0)^2 + (3-0)^2} = \sqrt{4+9} = \sqrt{13}.$$



(d) The points $(-3, -3)$ and $(-2, 3)$ are plotted in the figure below. The distance between the points is

$$d = \sqrt{(-3 - (-2))^2 + (-3 - 3)^2} = \sqrt{1 + 36} = \sqrt{37}.$$



37. Find the equation of the circle with center $(2, 4)$:

(a) with radius $r = 3$.

(b) that passes through $(1, -1)$.

SOLUTION

(a) The equation of the indicated circle is $(x - 2)^2 + (y - 4)^2 = 3^2 = 9$.

(b) First determine the radius as the distance from the center to the indicated point on the circle:

$$r = \sqrt{(2 - 1)^2 + (4 - (-1))^2} = \sqrt{26}.$$

Thus, the equation of the circle is $(x - 2)^2 + (y - 4)^2 = 26$.

38. Find all points with integer coordinates located at a distance 5 from the origin. Then find all points with integer coordinates located at a distance 5 from $(2, 3)$.

SOLUTION

- To be located a distance 5 from the origin, the points must lie on the circle $x^2 + y^2 = 25$. This leads to 12 points with integer coordinates:

$(5, 0)$	$(-5, 0)$	$(0, 5)$	$(0, -5)$
$(3, 4)$	$(-3, 4)$	$(3, -4)$	$(-3, -4)$
$(4, 3)$	$(-4, 3)$	$(4, -3)$	$(-4, -3)$

- To be located a distance 5 from the point $(2, 3)$, the points must lie on the circle $(x - 2)^2 + (y - 3)^2 = 25$, which implies that we must shift the points listed above two units to the right and three units up. This gives the 12 points:

$(7, 3)$	$(-3, 3)$	$(2, 8)$	$(2, -2)$
$(5, 7)$	$(-1, 7)$	$(5, -1)$	$(-1, -1)$
$(6, 6)$	$(-2, 6)$	$(6, 0)$	$(-2, 0)$

39. Determine the domain and range of the function

$$f : \{r, s, t, u\} \to \{A, B, C, D, E\}$$

defined by $f(r) = A$, $f(s) = B$, $f(t) = B$, $f(u) = E$.

SOLUTION The domain is the set $D = \{r, s, t, u\}$; the range is the set $R = \{A, B, E\}$.

40. Give an example of a function whose domain D has three elements and whose range R has two elements. Does a function exist whose domain D has two elements and whose range R has three elements?

SOLUTION Define f by $f : \{a, b, c\} \to \{1, 2\}$ where $f(a) = 1$, $f(b) = 1$, $f(c) = 2$.

There is no function whose domain has two elements and range has three elements. If that happened, one of the domain elements would get assigned to more than one element of the range, which would contradict the definition of a function.

In Exercises 41–48, find the domain and range of the function.

41. $f(x) = -x$

SOLUTION D : all reals; R : all reals

42. $g(t) = t^4$

SOLUTION D : all reals; R : $\{y : y \geq 0\}$

43. $f(x) = x^3$

SOLUTION D : all reals; R : all reals

44. $g(t) = \sqrt{2-t}$

SOLUTION $D : \{t : t \leq 2\}$; $R : \{y : y \geq 0\}$

45. $f(x) = |x|$

SOLUTION D : all reals; $R : \{y : y \geq 0\}$

46. $h(s) = \dfrac{1}{s}$

SOLUTION $D : \{s : s \neq 0\}$; $R : \{y : y \neq 0\}$

47. $f(x) = \dfrac{1}{x^2}$

SOLUTION $D : \{x : x \neq 0\}$; $R : \{y : y > 0\}$

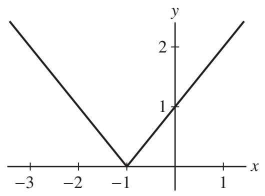
48. $g(t) = \cos \dfrac{1}{t}$

SOLUTION $D : \{t : t \neq 0\}$; $R : \{y : -1 \leq y \leq 1\}$

In Exercises 49–52, determine where $f(x)$ is increasing.

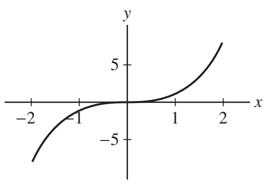
49. $f(x) = |x+1|$

SOLUTION A graph of the function $y = |x+1|$ is shown below. From the graph, we see that the function is increasing on the interval $(-1, \infty)$.



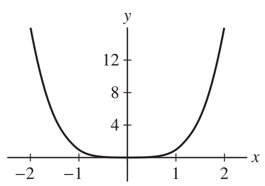
50. $f(x) = x^3$

SOLUTION A graph of the function $y = x^3$ is shown below. From the graph, we see that the function is increasing for all real numbers.



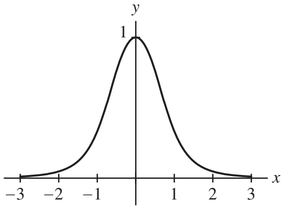
51. $f(x) = x^4$

SOLUTION A graph of the function $y = x^4$ is shown below. From the graph, we see that the function is increasing on the interval $(0, \infty)$.



52. $f(x) = \dfrac{1}{x^4 + x^2 + 1}$

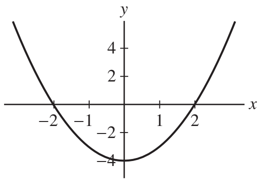
SOLUTION A graph of the function $y = \dfrac{1}{x^4 + x^2 + 1}$ is shown below. From the graph, we see that the function is increasing on the interval $(-\infty, 0)$.



In Exercises 53–58, find the zeros of $f(x)$ and sketch its graph by plotting points. Use symmetry and increase/decrease information where appropriate.

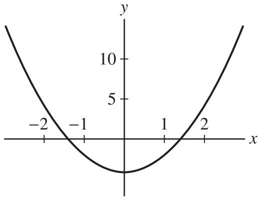
53. $f(x) = x^2 - 4$

SOLUTION Zeros: ± 2
Increasing: $x > 0$
Decreasing: $x < 0$
Symmetry: $f(-x) = f(x)$ (even function). So, y-axis symmetry.



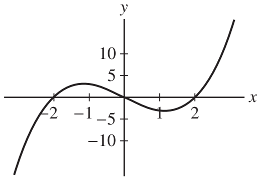
54. $f(x) = 2x^2 - 4$

SOLUTION Zeros: $\pm\sqrt{2}$
Increasing: $x > 0$
Decreasing: $x < 0$
Symmetry: $f(-x) = f(x)$ (even function). So, y-axis symmetry.



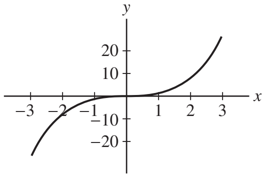
55. $f(x) = x^3 - 4x$

SOLUTION Zeros: $0, \pm 2$; Symmetry: $f(-x) = -f(x)$ (odd function). So origin symmetry.



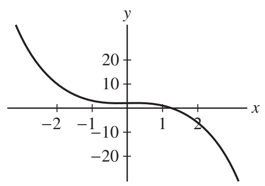
56. $f(x) = x^3$

SOLUTION Zeros: 0; Increasing for all x; Symmetry: $f(-x) = -f(x)$ (odd function). So origin symmetry.



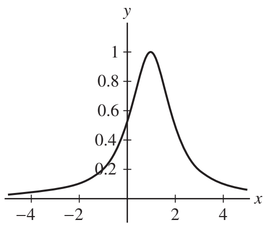
57. $f(x) = 2 - x^3$

SOLUTION This is an x-axis reflection of x^3 translated up 2 units. There is one zero at $x = \sqrt[3]{2}$.



58. $f(x) = \dfrac{1}{(x-1)^2 + 1}$

SOLUTION This is the graph of $\dfrac{1}{x^2+1}$ translated to the right 1 unit. The function has no zeros.



59. Which of the curves in Figure 26 is the graph of a function?

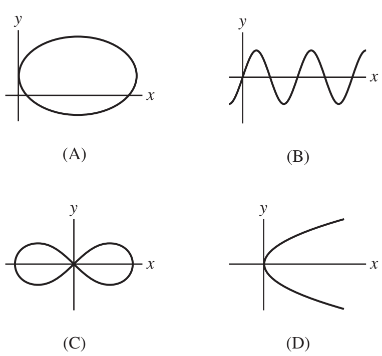


FIGURE 26

SOLUTION (B) is the graph of a function. (A), (C), and (D) all fail the vertical line test.

60. Determine whether the function is even, odd, or neither.

(a) $f(x) = x^5$

(b) $g(t) = t^3 - t^2$

(c) $F(t) = \dfrac{1}{t^4 + t^2}$

SOLUTION

(a) $f(-x) = (-x)^5 = -x^5 = -f(x)$, so this function is odd.

(b) $g(-t) = (-t)^3 - (-t)^2 = -t^3 - t^2$ which is equal to neither $g(t)$ nor $-g(t)$, so this function is neither odd nor even.

(c) This function is even because

$$F(-t) = \frac{1}{(-t)^4 + (-t)^2} = \frac{1}{t^4 + t^2} = F(t).$$

61. Determine whether the function is even, odd, or neither.

(a) $f(t) = \dfrac{1}{t^4+t+1} - \dfrac{1}{t^4-t+1}$

(b) $g(t) = 2^t - 2^{-t}$

(c) $G(\theta) = \sin\theta + \cos\theta$

(d) $H(\theta) = \sin(\theta^2)$

SOLUTION

(a) This function is odd because

$$\begin{aligned} f(-t) &= \frac{1}{(-t)^4+(-t)+1} - \frac{1}{(-t)^4-(-t)+1} \\ &= \frac{1}{t^4-t+1} - \frac{1}{t^4+t+1} = -f(t). \end{aligned}$$

(b) $g(-t) = 2^{-t} - 2^{-(-t)} = 2^{-t} - 2^t = -g(t)$, so this function is odd.

(c) $G(-\theta) = \sin(-\theta) + \cos(-\theta) = -\sin\theta + \cos\theta$ which is equal to neither $G(\theta)$ nor $-G(\theta)$, so this function is neither odd nor even.

(d) $H(-\theta) = \sin((-\theta)^2) = \sin(\theta^2) = H(\theta)$, so this function is even.

62. Write $f(x) = 2x^4 - 5x^3 + 12x^2 - 3x + 4$ as the sum of an even and an odd function.

SOLUTION Let $g(x) = 2x^4 + 12x^2 + 4$ and $h(x) = -5x^3 - 3x$, so that $f(x) = g(x) + h(x)$. Observe

$$g(-x) = 2(-x)^4 + 12(-x)^2 + 4 = 2x^4 + 12x^2 + 4 = g(x),$$

while

$$h(-x) = -5(-x)^3 - 3(-x) = 5x^3 + 3x = -h(x).$$

Thus, $g(x)$ is an even function, and $h(x)$ is an odd function.

63. Show that $f(x) = \ln\left(\dfrac{1-x}{1+x}\right)$ is an odd function.

SOLUTION

$$\begin{aligned} f(-x) &= \ln\left(\frac{1-(-x)}{1+(-x)}\right) \\ &= \ln\left(\frac{1+x}{1-x}\right) = -\ln\left(\frac{1-x}{1+x}\right) = -f(x), \end{aligned}$$

so this is an odd function.

64. State whether the function is increasing, decreasing, or neither.

(a) Surface area of a sphere as a function of its radius

(b) Temperature at a point on the equator as a function of time

(c) Price of an airline ticket as a function of the price of oil

(d) Pressure of the gas in a piston as a function of volume

SOLUTION

(a) Increasing **(b)** Neither **(c)** Increasing **(d)** Decreasing

In Exercises 65–70, let $f(x)$ be the function shown in Figure 27.

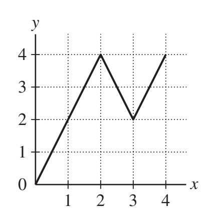

FIGURE 27

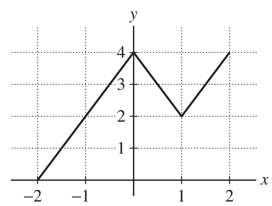
65. Find the domain and range of $f(x)$?

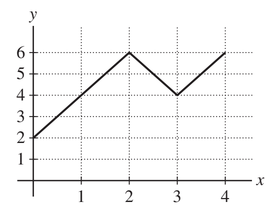
SOLUTION $D : [0, 4]$; $R : [0, 4]$

66. Sketch the graphs of $f(x+2)$ and $f(x)+2$.

SOLUTION The graph of $y = f(x+2)$ is obtained by shifting the graph of $y = f(x)$ two units to the left (see the graph below on the left). The graph of $y = f(x) + 2$ is obtained by shifting the graph of $y = f(x)$ two units up (see the graph below on the right).



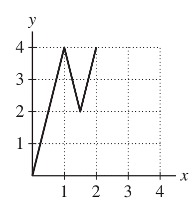
$f(x+2)$



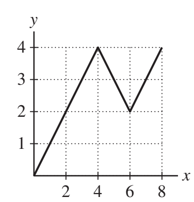
$f(x)+2$

67. Sketch the graphs of $f(2x)$, $f\left(\frac{1}{2}x\right)$, and $2f(x)$.

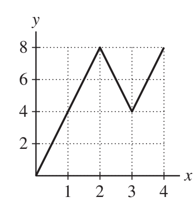
SOLUTION The graph of $y = f(2x)$ is obtained by compressing the graph of $y = f(x)$ horizontally by a factor of 2 (see the graph below on the left). The graph of $y = f(\frac{1}{2}x)$ is obtained by stretching the graph of $y = f(x)$ horizontally by a factor of 2 (see the graph below in the middle). The graph of $y = 2f(x)$ is obtained by stretching the graph of $y = f(x)$ vertically by a factor of 2 (see the graph below on the right).



$f(2x)$



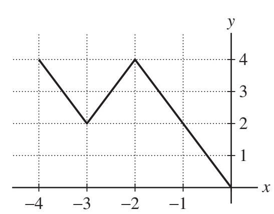
$f(x/2)$



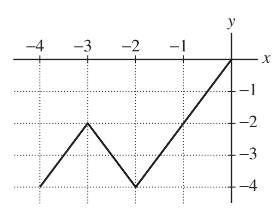
$2f(x)$

68. Sketch the graphs of $f(-x)$ and $-f(-x)$.

SOLUTION The graph of $y = f(-x)$ is obtained by reflecting the graph of $y = f(x)$ across the y-axis (see the graph below on the left). The graph of $y = -f(-x)$ is obtained by reflecting the graph of $y = f(x)$ across both the x- and y-axes, or equivalently, about the origin (see the graph below on the right).



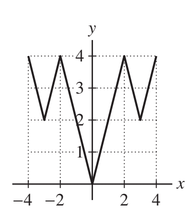
$f(-x)$



$-f(-x)$

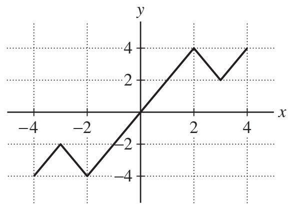
69. Extend the graph of $f(x)$ to $[-4, 4]$ so that it is an even function.

SOLUTION To continue the graph of $f(x)$ to the interval $[-4, 4]$ as an even function, reflect the graph of $f(x)$ across the y-axis (see the graph below).



70. Extend the graph of $f(x)$ to $[-4, 4]$ so that it is an odd function.

SOLUTION To continue the graph of $f(x)$ to the interval $[-4, 4]$ as an odd function, reflect the graph of $f(x)$ through the origin (see the graph below).



71. Suppose that $f(x)$ has domain $[4, 8]$ and range $[2, 6]$. Find the domain and range of:

(a) $f(x) + 3$ **(b)** $f(x + 3)$
(c) $f(3x)$ **(d)** $3f(x)$

SOLUTION

(a) $f(x) + 3$ is obtained by shifting $f(x)$ upward three units. Therefore, the domain remains $[4, 8]$, while the range becomes $[5, 9]$.

(b) $f(x + 3)$ is obtained by shifting $f(x)$ left three units. Therefore, the domain becomes $[1, 5]$, while the range remains $[2, 6]$.

(c) $f(3x)$ is obtained by compressing $f(x)$ horizontally by a factor of three. Therefore, the domain becomes $[\frac{4}{3}, \frac{8}{3}]$, while the range remains $[2, 6]$.

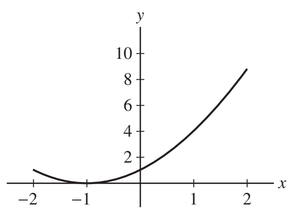
(d) $3f(x)$ is obtained by stretching $f(x)$ vertically by a factor of three. Therefore, the domain remains $[4, 8]$, while the range becomes $[6, 18]$.

72. Let $f(x) = x^2$. Sketch the graph over $[-2, 2]$ of:

(a) $f(x + 1)$ **(b)** $f(x) + 1$
(c) $f(5x)$ **(d)** $5f(x)$

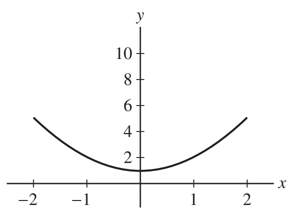
SOLUTION

(a) The graph of $y = f(x + 1)$ is obtained by shifting the graph of $y = f(x)$ one unit to the left.



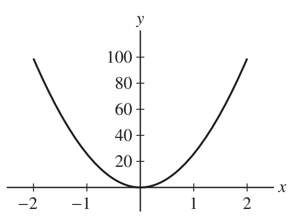
$f(x + 1)$

(b) The graph of $y = f(x) + 1$ is obtained by shifting the graph of $y = f(x)$ one unit up.



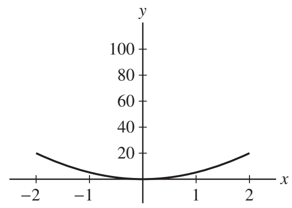
$f(x) + 1$

(c) The graph of $y = f(5x)$ is obtained by compressing the graph of $y = f(x)$ horizontally by a factor of 5.



$f(5x)$

(d) The graph of $y = 5f(x)$ is obtained by stretching the graph of $y = f(x)$ vertically by a factor of 5.



$5f(x)$

73. Suppose that the graph of $f(x) = \sin x$ is compressed horizontally by a factor of 2 and then shifted 5 units to the right.

(a) What is the equation for the new graph?

(b) What is the equation if you first shift by 5 and then compress by 2?

(c) $\boxed{\text{GU}}$ Verify your answers by plotting your equations.

SOLUTION

(a) Let $f(x) = \sin x$. After compressing the graph of f horizontally by a factor of 2, we obtain the function $g(x) = f(2x) = \sin 2x$. Shifting the graph 5 units to the right then yields

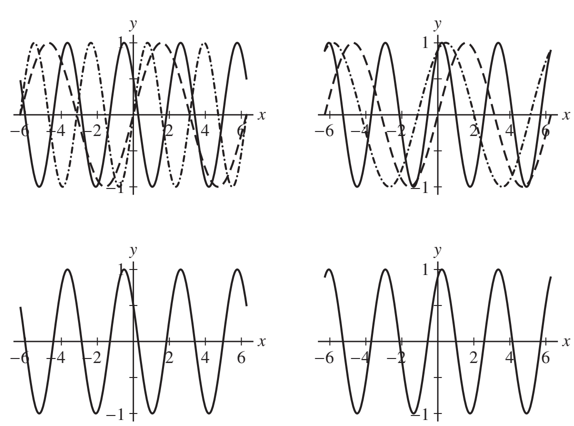
$$h(x) = g(x - 5) = \sin 2(x - 5) = \sin(2x - 10).$$

(b) Let $f(x) = \sin x$. After shifting the graph 5 units to the right, we obtain the function $g(x) = f(x - 5) = \sin(x - 5)$. Compressing the graph horizontally by a factor of 2 then yields

$$h(x) = g(2x) = \sin(2x - 5).$$

(c) The figure below at the top left shows the graphs of $y = \sin x$ (the dashed curve), the sine graph compressed horizontally by a factor of 2 (the dash, double dot curve) and then shifted right 5 units (the solid curve). Compare this last graph with the graph of $y = \sin(2x - 10)$ shown at the bottom left.

The figure below at the top right shows the graphs of $y = \sin x$ (the dashed curve), the sine graph shifted to the right 5 units (the dash, double dot curve) and then compressed horizontally by a factor of 2 (the solid curve). Compare this last graph with the graph of $y = \sin(2x - 5)$ shown at the bottom right.



74. Figure 28 shows the graph of $f(x) = |x| + 1$. Match the functions (a)–(e) with their graphs (i)–(v).

(a) $f(x - 1)$

(b) $-f(x)$

(c) $-f(x) + 2$

(d) $f(x - 1) - 2$

(e) $f(x + 1)$

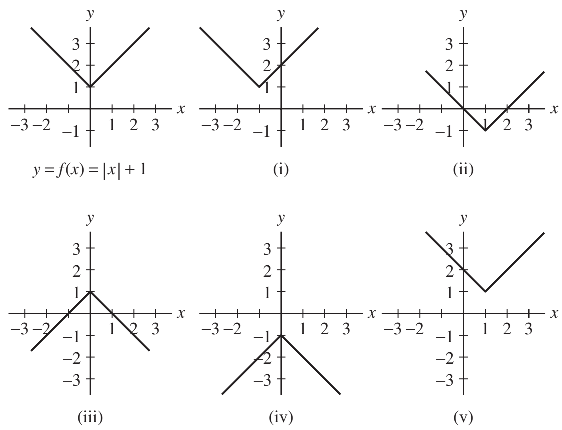


FIGURE 28

SOLUTION

(a) Shift graph to the right one unit: (v)

(b) Reflect graph across x-axis: (iv)

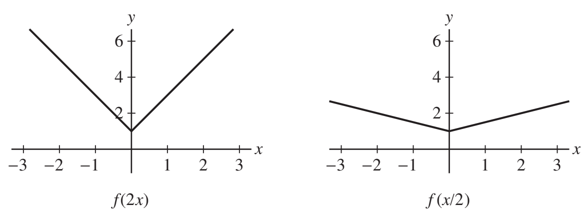
(c) Reflect graph across x-axis and then shift up two units: (iii)

(d) Shift graph to the right one unit and down two units: (ii)

(e) Shift graph to the left one unit: (i)

75. Sketch the graph of $f(2x)$ and $f\left(\frac{1}{2}x\right)$, where $f(x) = |x| + 1$ (Figure 28).

SOLUTION The graph of $y = f(2x)$ is obtained by compressing the graph of $y = f(x)$ horizontally by a factor of 2 (see the graph below on the left). The graph of $y = f(\frac{1}{2}x)$ is obtained by stretching the graph of $y = f(x)$ horizontally by a factor of 2 (see the graph below on the right).



76. Find the function $f(x)$ whose graph is obtained by shifting the parabola $y = x^2$ three units to the right and four units down, as in Figure 29.

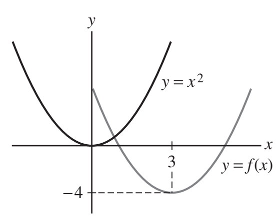


FIGURE 29

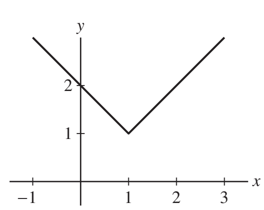
SOLUTION The new function is $f(x) = (x - 3)^2 - 4$

77. Define $f(x)$ to be the larger of x and $2 - x$. Sketch the graph of $f(x)$. What are its domain and range? Express $f(x)$ in terms of the absolute value function.

SOLUTION



The graph of $y = f(x)$ is shown above. Clearly, the domain of f is the set of all real numbers while the range is $\{y \mid y \geq 1\}$. Notice the graph has the standard V-shape associated with the absolute value function, but the base of the V has been translated to the point $(1, 1)$. Thus, $f(x) = |x - 1| + 1$.

78. For each curve in Figure 30, state whether it is symmetric with respect to the y-axis, the origin, both, or neither.

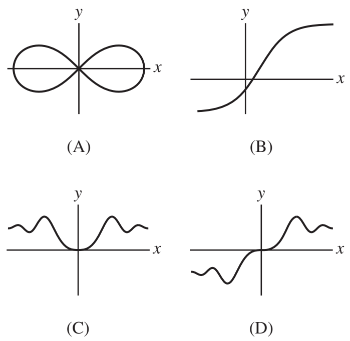


FIGURE 30

SOLUTION

(A) Both

(B) Neither

(C) y-axis

(D) Origin

79. Show that the sum of two even functions is even and the sum of two odd functions is odd.

SOLUTION Even: $(f+g)(-x) = f(-x) + g(-x) \overset{\text{even}}{=} f(x) + g(x) = (f+g)(x)$

Odd: $(f+g)(-x) = f(-x) + g(-x) \overset{\text{odd}}{=} -f(x) + -g(x) = -(f+g)(x)$

80. Suppose that $f(x)$ and $g(x)$ are both odd. Which of the following functions are even? Which are odd?

(a) $f(x)g(x)$

(b) $f(x)^3$

(c) $f(x) - g(x)$

(d) $\dfrac{f(x)}{g(x)}$

SOLUTION

(a) $f(-x)g(-x) = (-f(x))(-g(x)) = f(x)g(x) \Rightarrow$ Even

(b) $f(-x)^3 = [-f(x)]^3 = -f(x)^3 \Rightarrow$ Odd

(c) $f(-x) - g(-x) = -f(x) + g(x) = -(f(x) - g(x)) \Rightarrow$ Odd

(d) $\dfrac{f(-x)}{g(-x)} = \dfrac{-f(x)}{-g(x)} = \dfrac{f(x)}{g(x)} \Rightarrow$ Even

81. Prove that the only function whose graph is symmetric with respect to both the y-axis and the origin is the function $f(x) = 0$.

SOLUTION Suppose f is symmetric with respect to the y-axis. Then $f(-x) = f(x)$. If f is also symmetric with respect to the origin, then $f(-x) = -f(x)$. Thus $f(x) = -f(x)$ or $2f(x) = 0$. Finally, $f(x) = 0$.

Further Insights and Challenges

82. Prove the triangle inequality by adding the two inequalities

$$-|a| \leq a \leq |a|, \qquad -|b| \leq b \leq |b|$$

SOLUTION Adding the indicated inequalities gives

$$-(|a| + |b|) \leq a + b \leq |a| + |b|$$

and this is equivalent to $|a + b| \leq |a| + |b|$.

83. Show that a fraction $r = a/b$ in lowest terms has a *finite* decimal expansion if and only if

$$b = 2^n 5^m \quad \text{for some } n, m \geq 0.$$

Hint: Observe that r has a finite decimal expansion when $10^N r$ is an integer for some $N \geq 0$ (and hence b divides 10^N).

SOLUTION Suppose r has a finite decimal expansion. Then there exists an integer $N \geq 0$ such that $10^N r$ is an integer, call it k. Thus, $r = k/10^N$. Because the only prime factors of 10 are 2 and 5, it follows that when r is written in lowest terms, its denominator must be of the form $2^n 5^m$ for some integers $n, m \geq 0$.

Conversely, suppose $r = a/b$ in lowest with $b = 2^n 5^m$ for some integers $n, m \geq 0$. Then $r = \dfrac{a}{b} = \dfrac{a}{2^n 5^m}$ or $2^n 5^m r = a$. If $m \geq n$, then $2^m 5^m r = a 2^{m-n}$ or $r = \dfrac{a 2^{m-n}}{10^m}$ and thus r has a finite decimal expansion (less than or equal to m terms, to be precise). On the other hand, if $n > m$, then $2^n 5^n r = a 5^{n-m}$ or $r = \dfrac{a 5^{n-m}}{10^n}$ and once again r has a finite decimal expansion.

84. Let $p = p_1 \dots p_s$ be an integer with digits $p_1, \dots, p_s$. Show that

$$\frac{p}{10^s - 1} = 0.\overline{p_1 \dots p_s}$$

Use this to find the decimal expansion of $r = \frac{2}{11}$. Note that

$$r = \frac{2}{11} = \frac{18}{10^2 - 1}$$

SOLUTION Let $p = p_1 \dots p_s$ be an integer with digits $p_1, \dots, p_s$, and let $\overline{p} = .\overline{p_1 \dots p_s}$. Then

$$10^s \overline{p} - \overline{p} = p_1 \dots p_s.\overline{p_1 \dots p_s} - .\overline{p_1 \dots p_s} = p_1 \dots p_s = p.$$

Thus,

$$\frac{p}{10^s - 1} = \overline{p} = .\overline{p_1 \dots p_s}.$$

Consider the rational number $r = 2/11$. Because

$$r = \frac{2}{11} = \frac{18}{99} = \frac{18}{10^2 - 1},$$

it follows that the decimal expansion of r is $0.\overline{18}$.

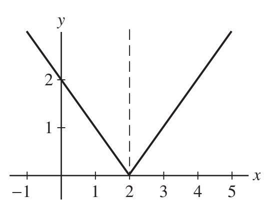
85. A function $f(x)$ is symmetric with respect to the vertical line $x = a$ if $f(a - x) = f(a + x)$.

(a) Draw the graph of a function that is symmetric with respect to $x = 2$.

(b) Show that if $f(x)$ is symmetric with respect to $x = a$, then $g(x) = f(x + a)$ is even.

SOLUTION

(a) There are many possibilities, one of which is



$y = |x - 2|$

(b) Let $g(x) = f(x + a)$. Then

$$\begin{aligned} g(-x) = f(-x + a) &= f(a - x) \\ &= f(a + x) \qquad \text{symmetry with respect to } x = a \\ &= g(x) \end{aligned}$$

Thus, $g(x)$ is even.

86. Formulate a condition for $f(x)$ to be symmetric with respect to the point $(a, 0)$ on the x-axis.

SOLUTION In order for $f(x)$ to be symmetrical with respect to the point $(a, 0)$, the value of f at a distance x units to the right of a must be opposite the value of f at a distance x units to the left of a. In other words, $f(x)$ is symmetrical with respect to $(a, 0)$ if $f(a + x) = -f(a - x)$.

1.2 Linear and Quadratic Functions

Preliminary Questions

1. What is the slope of the line $y = -4x - 9$?

SOLUTION The slope of the line $y = -4x - 9$ is -4, given by the coefficient of x.

2. Are the lines $y = 2x + 1$ and $y = -2x - 4$ perpendicular?

SOLUTION The slopes of perpendicular lines are negative reciprocals of one another. Because the slope of $y = 2x + 1$ is 2 and the slope of $y = -2x - 4$ is -2, these two lines are *not* perpendicular.

3. When is the line $ax + by = c$ parallel to the y-axis? To the x-axis?

SOLUTION The line $ax + by = c$ will be parallel to the y-axis when $b = 0$ and parallel to the x-axis when $a = 0$.

4. Suppose $y = 3x + 2$. What is Δy if x increases by 3?

SOLUTION Because $y = 3x + 2$ is a linear function with slope 3, increasing x by 3 will lead to $\Delta y = 3(3) = 9$.

5. What is the minimum of $f(x) = (x + 3)^2 - 4$?

SOLUTION Because $(x + 3)^2 \geq 0$, it follows that $(x + 3)^2 - 4 \geq -4$. Thus, the minimum value of $(x + 3)^2 - 4$ is -4.

6. What is the result of completing the square for $f(x) = x^2 + 1$?

SOLUTION Because there is no x term in $x^2 + 1$, completing the square on this expression leads to $(x - 0)^2 + 1$.

Exercises

In Exercises 1–4, find the slope, the y-intercept, and the x-intercept of the line with the given equation.

1. $y = 3x + 12$

SOLUTION Because the equation of the line is given in slope-intercept form, the slope is the coefficient of x and the y-intercept is the constant term: that is, $m = 3$ and the y-intercept is 12. To determine the x-intercept, substitute $y = 0$ and then solve for x: $0 = 3x + 12$ or $x = -4$.

2. $y = 4 - x$

SOLUTION Because the equation of the line is given in slope-intercept form, the slope is the coefficient of x and the y-intercept is the constant term: that is, $m = -1$ and the y-intercept is 4. To determine the x-intercept, substitute $y = 0$ and then solve for x: $0 = 4 - x$ or $x = 4$.

3. $4x + 9y = 3$

SOLUTION To determine the slope and y-intercept, we first solve the equation for y to obtain the slope-intercept form. This yields $y = -\frac{4}{9}x + \frac{1}{3}$. From here, we see that the slope is $m = -\frac{4}{9}$ and the y-intercept is $\frac{1}{3}$. To determine the x-intercept, substitute $y = 0$ and solve for x: $4x = 3$ or $x = \frac{3}{4}$.

4. $y - 3 = \frac{1}{2}(x - 6)$

SOLUTION The equation is in point-slope form, so we see that $m = \frac{1}{2}$. Substituting $x = 0$ yields $y - 3 = -3$ or $y = 0$. Thus, the x- and y-intercepts are both 0.

In Exercises 5–8, find the slope of the line.

5. $y = 3x + 2$

SOLUTION $m = 3$

6. $y = 3(x - 9) + 2$

SOLUTION $m = 3$

7. $3x + 4y = 12$

SOLUTION First solve the equation for y to obtain the slope-intercept form. This yields $y = -\frac{3}{4}x + 3$. The slope of the line is therefore $m = -\frac{3}{4}$.

8. $3x + 4y = -8$

SOLUTION First solve the equation for y to obtain the slope-intercept form. This yields $y = -\frac{3}{4}x - 2$. The slope of the line is therefore $m = -\frac{3}{4}$.

In Exercises 9–20, find the equation of the line with the given description.

9. Slope 3, y-intercept 8

SOLUTION Using the slope-intercept form for the equation of a line, we have $y = 3x + 8$.

10. Slope -2, y-intercept 3

SOLUTION Using the slope-intercept form for the equation of a line, we have $y = -2x + 3$.

11. Slope 3, passes through $(7, 9)$

SOLUTION Using the point-slope form for the equation of a line, we have $y - 9 = 3(x - 7)$ or $y = 3x - 12$.

12. Slope -5, passes through $(0, 0)$

SOLUTION Using the point-slope form for the equation of a line, we have $y - 0 = -5(x - 0)$ or $y = -5x$.

13. Horizontal, passes through $(0, -2)$

SOLUTION A horizontal line has a slope of 0. Using the point-slope form for the equation of a line, we have $y - (-2) = 0(x - 0)$ or $y = -2$.

14. Passes through $(-1, 4)$ and $(2, 7)$

SOLUTION The slope of the line that passes through $(-1, 4)$ and $(2, 7)$ is

$$m = \frac{7 - 4}{2 - (-1)} = 1.$$

Using the point-slope form for the equation of a line, we have $y - 7 = 1(x - 2)$ or $y = x + 5$.

15. Parallel to $y = 3x - 4$, passes through $(1, 1)$

SOLUTION Because the equation $y = 3x - 4$ is in slope-intercept form, we can readily identify that it has a slope of 3. Parallel lines have the same slope, so the slope of the requested line is also 3. Using the point-slope form for the equation of a line, we have $y - 1 = 3(x - 1)$ or $y = 3x - 2$.

16. Passes through $(1, 4)$ and $(12, -3)$

SOLUTION The slope of the line that passes through $(1, 4)$ and $(12, -3)$ is

$$m = \frac{-3 - 4}{12 - 1} = \frac{-7}{11}.$$

Using the point-slope form for the equation of a line, we have $y - 4 = -\frac{7}{11}(x - 1)$ or $y = -\frac{7}{11}x + \frac{51}{11}$.

17. Perpendicular to $3x + 5y = 9$, passes through $(2, 3)$

SOLUTION We start by solving the equation $3x + 5y = 9$ for y to obtain the slope-intercept form for the equation of a line. This yields

$$y = -\frac{3}{5}x + \frac{9}{5},$$

from which we identify the slope as $-\frac{3}{5}$. Perpendicular lines have slopes that are negative reciprocals of one another, so the slope of the desired line is $m_{\perp} = \frac{5}{3}$. Using the point-slope form for the equation of a line, we have $y - 3 = \frac{5}{3}(x - 2)$ or $y = \frac{5}{3}x - \frac{1}{3}$.

18. Vertical, passes through $(-4, 9)$

SOLUTION A vertical line has the equation $x = c$ for some constant c. Because the line needs to pass through the point $(-4, 9)$, we must have $c = -4$. The equation of the desired line is then $x = -4$.

19. Horizontal, passes through $(8, 4)$

SOLUTION A horizontal line has slope 0. Using the point slope form for the equation of a line, we have $y - 4 = 0(x - 8)$ or $y = 4$.

20. Slope 3, x-intercept 6

SOLUTION If the x-intercept is 6, then the line passes through the point $(6, 0)$. Using the point-slope form for the equation of a line, we have $y - 0 = 3(x - 6)$ or $y = 3x - 18$.

21. Find the equation of the perpendicular bisector of the segment joining (1, 2) and (5, 4) (Figure 11). *Hint:* The midpoint Q of the segment joining (a, b) and (c, d) is $\left(\frac{a+c}{2}, \frac{b+d}{2}\right)$.

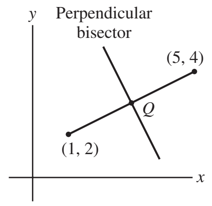


FIGURE 11

SOLUTION The slope of the segment joining (1, 2) and (5, 4) is

$$m = \frac{4-2}{5-1} = \frac{1}{2}$$

and the midpoint of the segment (Figure 11) is

$$\text{midpoint} = \left(\frac{1+5}{2}, \frac{2+4}{2}\right) = (3, 3)$$

The perpendicular bisector has slope $-1/m = -2$ and passes through (3, 3), so its equation is: $y - 3 = -2(x - 3)$ or $y = -2x + 9$.

22. Intercept-Intercept Form Show that if $a, b \neq 0$, then the line with x-intercept $x = a$ and y-intercept $y = b$ has equation (Figure 12)

$$\frac{x}{a} + \frac{y}{b} = 1$$

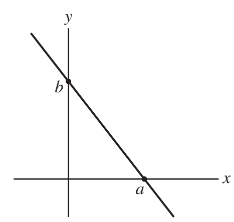

FIGURE 12

SOLUTION The line passes through the points $(a, 0)$ and $(0, b)$. Thus $m = -\frac{b}{a}$. Using the point-slope form for the equation of a line yields $y - 0 = -\frac{b}{a}(x - a) \Rightarrow y = -\frac{b}{a}x + b \Rightarrow \frac{b}{a}x + y = b \Rightarrow \frac{x}{a} + \frac{y}{b} = 1$.

23. Find an equation of the line with x-intercept $x = 4$ and y-intercept $y = 3$.

SOLUTION From Exercise 22, $\frac{x}{4} + \frac{y}{3} = 1$ or $3x + 4y = 12$.

24. Find y such that $(3, y)$ lies on the line of slope $m = 2$ through (1, 4).

SOLUTION In order for the point $(3, y)$ to lie on the line through (1, 4) of slope 2, the slope of the segment connecting (1, 4) and $(3, y)$ must have slope 2. Therefore,

$$m = \frac{y-4}{3-1} = \frac{y-4}{2} = 2 \Rightarrow y - 4 = 4 \Rightarrow y = 8.$$

25. Determine whether there exists a constant c such that the line $x + cy = 1$:

(a) Has slope 4
(b) Passes through (3, 1)
(c) Is horizontal
(d) Is vertical

SOLUTION

(a) Rewriting the equation of the line in slope-intercept form gives $y = -\frac{x}{c} + \frac{1}{c}$. To have slope 4 requires $-\frac{1}{c} = 4$ or $c = -\frac{1}{4}$.

(b) Substituting $x = 3$ and $y = 1$ into the equation of the line gives $3 + c = 1$ or $c = -2$.

(c) From (a), we know the slope of the line is $-\frac{1}{c}$. There is no value for c that will make this slope equal to 0.

(d) With $c = 0$, the equation becomes $x = 1$. This is the equation of a vertical line.

26. Assume that the number N of concert tickets that can be sold at a price of P dollars per ticket is a linear function $N(P)$ for $10 \le P \le 40$. Determine $N(P)$ (called the demand function) if $N(10) = 500$ and $N(40) = 0$. What is the decrease ΔN in the number of tickets sold if the price is increased by $\Delta P = 5$ dollars?

SOLUTION We first determine the slope of the line:

$$m = \frac{500 - 0}{10 - 40} = \frac{500}{-30} = -\frac{50}{3}.$$

Knowing that $N(40) = 0$, it follows that

$$N(P) = -\frac{50}{3}(P - 40) = -\frac{50}{3}P + \frac{2000}{3}.$$

Because the slope of the demand function is $-\frac{50}{3}$, a 5 dollar increase in price will lead to a decrease in the number of tickets sold of $\frac{50}{3}(5) = \frac{250}{3} = 83\frac{1}{3}$, or about 83 tickets.

27. Materials expand when heated. Consider a metal rod of length L_0 at temperature T_0. If the temperature is changed by an amount ΔT, then the rod's length changes by $\Delta L = \alpha L_0 \Delta T$, where α is the thermal expansion coefficient. For steel, $\alpha = 1.24 \times 10^{-5}\,{}^\circ\mathrm{C}^{-1}$.

(a) A steel rod has length $L_0 = 40$ cm at $T_0 = 40^\circ$C. Find its length at $T = 90^\circ$C.

(b) Find its length at $T = 50^\circ$C if its length at $T_0 = 100^\circ$C is 65 cm.

(c) Express length L as a function of T if $L_0 = 65$ cm at $T_0 = 100^\circ$C.

SOLUTION

(a) With $T = 90^\circ$C and $T_0 = 40^\circ$C, $\Delta T = 50^\circ$C. Therefore,

$$\Delta L = \alpha L_0 \Delta T = (1.24 \times 10^{-5})(40)(50) = .0248 \qquad \text{and} \qquad L = L_0 + \Delta L = 40.0248 \text{ cm}.$$

(b) With $T = 50^\circ$C and $T_0 = 100^\circ$C, $\Delta T = -50^\circ$C. Therefore,

$$\Delta L = \alpha L_0 \Delta T = (1.24 \times 10^{-5})(65)(-50) = -.0403 \qquad \text{and} \qquad L = L_0 + \Delta L = 64.9597 \text{ cm}.$$

(c) $L = L_0 + \Delta L = L_0 + \alpha L_0 \Delta T = L_0(1 + \alpha \Delta T) = 65(1 + \alpha(T - 100))$

28. Do the points (0.5, 1), (1, 1.2), (2, 2) lie on a line?

SOLUTION Examine the slope between consecutive data points. The first pair of data points yields a slope of

$$\frac{1.2 - 1}{1 - 0.5} = \frac{0.2}{0.5} = 0.4,$$

while the second pair of data points yields a slope of

$$\frac{2 - 1.2}{2 - 1} = \frac{0.8}{1} = 0.8.$$

Because the slopes are not equal, the three points do not lie on a line.

29. Find b such that $(2, -1)$, $(3, 2)$, and $(b, 5)$ lie on a line.

SOLUTION The slope of the line determined by the points $(2, -1)$ and $(3, 2)$ is

$$\frac{2 - (-1)}{3 - 2} = 3.$$

To lie on the same line, the slope between $(3, 2)$ and $(b, 5)$ must also be 3. Thus, we require

$$\frac{5 - 2}{b - 3} = \frac{3}{b - 3} = 3,$$

or $b = 4$.

30. Find an expression for the velocity v as a linear function of t that matches the following data.

t (s)	0	2	4	6
v (m/s)	39.2	58.6	78	97.4

SOLUTION Examine the slope between consecutive data points. The first pair of data points yields a slope of

$$\frac{58.6 - 39.2}{2 - 0} = 9.7,$$

while the second pair of data points yields a slope of

$$\frac{78 - 58.6}{4 - 2} = 9.7,$$

and the last pair of data points yields a slope of

$$\frac{97.4 - 78}{6 - 4} = 9.7$$

Thus, the data suggests a linear function with slope 9.7. Finally,

$$v - 39.2 = 9.7(t - 0) \Rightarrow v = 9.7t + 39.2$$

31. The period T of a pendulum is measured for pendulums of several different lengths L. Based on the following data, does T appear to be a linear function of L?

L (cm)	20	30	40	50
T (s)	0.9	1.1	1.27	1.42

SOLUTION Examine the slope between consecutive data points. The first pair of data points yields a slope of

$$\frac{1.1 - 0.9}{30 - 20} = 0.02,$$

while the second pair of data points yields a slope of

$$\frac{1.27 - 1.1}{40 - 30} = 0.017,$$

and the last pair of data points yields a slope of

$$\frac{1.42 - 1.27}{50 - 40} = 0.015$$

Because the three slopes are not equal, T does not appear to be a linear function of L.

32. Show that $f(x)$ is linear of slope m if and only if

$$f(x+h) - f(x) = mh \quad \text{(for all } x \text{ and } h\text{)}$$

SOLUTION First, suppose $f(x)$ is linear. Then the slope between $(x, f(x))$ and $(x+h, f(x+h))$ is

$$m = \frac{f(x+h) - f(x)}{h} \Rightarrow mh = f(x+h) - f(x).$$

Conversely, suppose $f(x+h) - f(x) = mh$ for all x and for all h. Then

$$m = \frac{f(x+h) - f(x)}{h} = \frac{f(x+h) - f(x)}{x+h-x},$$

which is the slope between $(x, f(x))$ and $(x+h, f(x+h))$. Since this is true for all x and h, f must be linear (it has constant slope).

33. Find the roots of the quadratic polynomials:

(a) $4x^2 - 3x - 1$

(b) $x^2 - 2x - 1$

SOLUTION

(a) $x = \dfrac{3 \pm \sqrt{9 - 4(4)(-1)}}{2(4)} = \dfrac{3 \pm \sqrt{25}}{8} = 1 \text{ or } -\dfrac{1}{4}$

(b) $x = \dfrac{2 \pm \sqrt{4 - (4)(1)(-1)}}{2} = \dfrac{2 \pm \sqrt{8}}{2} = 1 \pm \sqrt{2}$

In Exercises 34–41, complete the square and find the minimum or maximum value of the quadratic function.

34. $y = x^2 + 2x + 5$

SOLUTION $y = x^2 + 2x + 1 - 1 + 5 = (x + 1)^2 + 4$; therefore, the minimum value of the quadratic polynomial is 4, and this occurs at $x = -1$.

35. $y = x^2 - 6x + 9$

SOLUTION $y = (x - 3)^2$; therefore, the minimum value of the quadratic polynomial is 0, and this occurs at $x = 3$.

36. $y = -9x^2 + x$

SOLUTION $y = -9(x^2 - x/9) = -9(x^2 - \frac{x}{9} + \frac{1}{324}) + \frac{9}{324} = -9(x - \frac{1}{18})^2 + \frac{1}{36}$; therefore, the maximum value of the quadratic polynomial is $\frac{1}{36}$, and this occurs at $x = \frac{1}{18}$.

37. $y = x^2 + 6x + 2$

SOLUTION $y = x^2 + 6x + 9 - 9 + 2 = (x + 3)^2 - 7$; therefore, the minimum value of the quadratic polynomial is -7, and this occurs at $x = -3$.

38. $y = 2x^2 - 4x - 7$

SOLUTION $y = 2(x^2 - 2x + 1 - 1) - 7 = 2(x^2 - 2x + 1) - 7 - 2 = 2(x - 1)^2 - 9$; therefore, the minimum value of the quadratic polynomial is -9, and this occurs at $x = 1$.

39. $y = -4x^2 + 3x + 8$

SOLUTION $y = -4x^2 + 3x + 8 = -4(x^2 - \frac{3}{4}x + \frac{9}{64}) + 8 + \frac{9}{16} = -4(x - \frac{3}{8})^2 + \frac{137}{16}$; therefore, the maximum value of the quadratic polynomial is $\frac{137}{16}$, and this occurs at $x = \frac{3}{8}$.

40. $y = 3x^2 + 12x - 5$

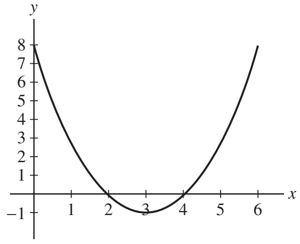
SOLUTION $y = 3(x^2 + 4x + 4) - 5 - 12 = 3(x + 2)^2 - 17$; therefore, the minimum value of the quadratic polynomial is -17, and this occurs at $x = -2$.

41. $y = 4x - 12x^2$

SOLUTION $y = -12(x^2 - \frac{x}{3}) = -12(x^2 - \frac{x}{3} + \frac{1}{36}) + \frac{1}{3} = -12(x - \frac{1}{6})^2 + \frac{1}{3}$; therefore, the maximum value of the quadratic polynomial is $\frac{1}{3}$, and this occurs at $x = \frac{1}{6}$.

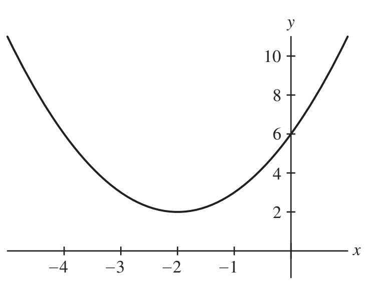
42. Sketch the graph of $y = x^2 - 6x + 8$ by plotting the roots and the minimum point.

SOLUTION $y = x^2 - 6x + 9 - 9 + 8 = (x - 3)^2 - 1$ so the vertex is located at $(3, -1)$ and the roots are $x = 2$ and $x = 4$. This is the graph of x^2 moved right 3 units and down 1 unit.



43. Sketch the graph of $y = x^2 + 4x + 6$ by plotting the minimum point, the y-intercept, and one other point.

SOLUTION $y = x^2 + 4x + 4 - 4 + 6 = (x + 2)^2 + 2$ so the minimum occurs at $(-2, 2)$. If $x = 0$, then $y = 6$ and if $x = -4$, $y = 6$. This is the graph of x^2 moved left 2 units and up 2 units.



44. If the alleles A and B of the cystic fibrosis gene occur in a population with frequencies p and $1 - p$ (where p is a fraction between 0 and 1), then the frequency of heterozygous carriers (carriers with both alleles) is $2p(1 - p)$. Which value of p gives the largest frequency of heterozygous carriers?

SOLUTION Let

$$f = 2p - 2p^2 = -2\left(p^2 - p + \frac{1}{4}\right) + \frac{1}{2} = -2\left(p - \frac{1}{2}\right)^2 + \frac{1}{2}.$$

Then $p = \frac{1}{2}$ yields a maximum.

45. For which values of c does $f(x) = x^2 + cx + 1$ have a double root? No real roots?

SOLUTION A double root occurs when $c^2 - 4(1)(1) = 0$ or $c^2 = 4$. Thus, $c = \pm 2$.

There are no real roots when $c^2 - 4(1)(1) < 0$ or $c^2 < 4$. Thus, $-2 < c < 2$.

46. Let $f(x)$ be a quadratic function and c a constant. Which of the following statements is correct? Explain graphically.

(a) There is a unique value of c such that $y = f(x) - c$ has a double root.

(b) There is a unique value of c such that $y = f(x - c)$ has a double root.

SOLUTION First note that because $f(x)$ is a quadratic function, its graph is a parabola.

(a) This is true. Because $f(x) - c$ is a vertical translation of the graph of $f(x)$, there is one and only one value of c that will move the vertex of the parabola to the x-axis.

(b) This is false. Observe that $f(x - c)$ is a horizontal translation of the graph of $f(x)$. If $f(x)$ has a double root, then $f(x - c)$ will have a double root for any value of c; on the other hand, if $f(x)$ does not have a double root, then there is no value of c for which $f(x - c)$ will have a double root.

47. Prove that $x + \frac{1}{x} \geq 2$ for all $x > 0$. *Hint:* Consider $(x^{1/2} - x^{-1/2})^2$.

SOLUTION Let $x > 0$. Then

$$\left(x^{1/2} - x^{-1/2}\right)^2 = x - 2 + \frac{1}{x}.$$

Because $(x^{1/2} - x^{-1/2})^2 \geq 0$, it follows that

$$x - 2 + \frac{1}{x} \geq 0 \qquad \text{or} \qquad x + \frac{1}{x} \geq 2.$$

48. Let $a, b > 0$. Show that the *geometric mean* $\sqrt{ab}$ is not larger than the *arithmetic mean* $(a + b)/2$. *Hint:* Use a variation of the hint given in Exercise 47.

SOLUTION Let $a, b > 0$ and note

$$0 \leq \left(\sqrt{a} - \sqrt{b}\right)^2 = a - 2\sqrt{ab} + b.$$

Therefore,

$$\sqrt{ab} \leq \frac{a + b}{2}.$$

49. If objects of weights x and w_1 are suspended from the balance in Figure 13(A), the cross-beam is horizontal if $bx = aw_1$. If the lengths a and b are known, we may use this equation to determine an unknown weight x by selecting w_1 such that the cross-beam is horizontal. If a and b are not known precisely, we might proceed as follows. First balance x by w_1 on the left as in (A). Then switch places and balance x by w_2 on the right as in (B). The average $\bar{x} = \frac{1}{2}(w_1 + w_2)$ gives an estimate for x. Show that $\bar{x}$ is greater than or equal to the true weight x.

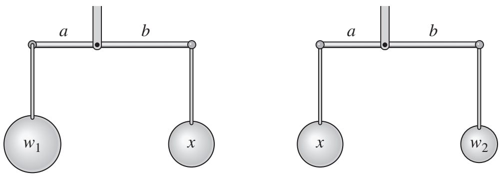


FIGURE 13

SOLUTION First note $bx = aw_1$ and $ax = bw_2$. Thus,

$$\bar{x} = \frac{1}{2}(w_1 + w_2)$$

$$\begin{aligned} &= \frac{1}{2}\left(\frac{bx}{a} + \frac{ax}{b}\right) \\ &= \frac{x}{2}\left(\frac{b}{a} + \frac{a}{b}\right) \\ &\geq \frac{x}{2}(2) \qquad \text{by Exercise 47} \\ &= x \end{aligned}$$

50. Find numbers x and y with sum 10 and product 24. *Hint:* Find a quadratic polynomial satisfied by x.

SOLUTION Let x and y be numbers whose sum is 10 and product is 24. Then $x + y = 10$ and $xy = 24$. From the second equation, $y = \frac{24}{x}$. Substituting this expression for y in the first equation gives $x + \frac{24}{x} = 10$ or $x^2 - 10x + 24 = (x-4)(x-6) = 0$, whence $x = 4$ or $x = 6$. If $x = 4$, then $y = \frac{24}{4} = 6$. On the other hand, if $x = 6$, then $y = \frac{24}{6} = 4$. Thus, the two numbers are 4 and 6.

51. Find a pair of numbers whose sum and product are both equal to 8.

SOLUTION Let x and y be numbers whose sum and product are both equal to 8. Then $x + y = 8$ and $xy = 8$. From the second equation, $y = \frac{8}{x}$. Substituting this expression for y in the first equation gives $x + \frac{8}{x} = 8$ or $x^2 - 8x + 8 = 0$. By the quadratic formula,

$$x = \frac{8 \pm \sqrt{64 - 32}}{2} = 4 \pm 2\sqrt{2}.$$

If $x = 4 + 2\sqrt{2}$, then

$$y = \frac{8}{4 + 2\sqrt{2}} = \frac{8}{4 + 2\sqrt{2}} \cdot \frac{4 - 2\sqrt{2}}{4 - 2\sqrt{2}} = 4 - 2\sqrt{2}.$$

On the other hand, if $x = 4 - 2\sqrt{2}$, then

$$y = \frac{8}{4 - 2\sqrt{2}} = \frac{8}{4 - 2\sqrt{2}} \cdot \frac{4 + 2\sqrt{2}}{4 + 2\sqrt{2}} = 4 + 2\sqrt{2}.$$

Thus, the two numbers are $4 + 2\sqrt{2}$ and $4 - 2\sqrt{2}$.

52. Show that the parabola $y = x^2$ consists of all points P such that $d_1 = d_2$, where d_1 is the distance from P to $\left(0, \frac{1}{4}\right)$ and d_2 is the distance from P to the line $y = -\frac{1}{4}$ (Figure 14).

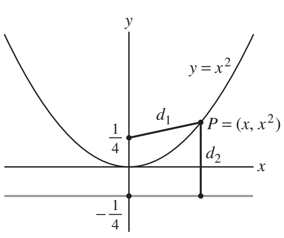

FIGURE 14

SOLUTION Let P be a point on the graph of the parabola $y = x^2$. Then P has coordinates (x, x^2) for some real number x. Now $d_2 = x^2 + \frac{1}{4}$ and

$$d_1 = \sqrt{(x-0)^2 + \left(x^2 - \frac{1}{4}\right)^2} = \sqrt{x^2 + x^4 - \frac{1}{2}x^2 + \frac{1}{16}} = \sqrt{\left(x^2 + \frac{1}{4}\right)^2} = x^2 + \frac{1}{4} = d_2.$$

Further Insights and Challenges

53. Show that if $f(x)$ and $g(x)$ are linear, then so is $f(x) + g(x)$. Is the same true of $f(x)g(x)$?

SOLUTION If $f(x) = mx + b$ and $g(x) = nx + d$, then

$$f(x) + g(x) = mx + b + nx + d = (m+n)x + (b+d),$$

which is linear. $f(x)g(x)$ is not generally linear. Take, for example, $f(x) = g(x) = x$. Then $f(x)g(x) = x^2$.

54. Show that if $f(x)$ and $g(x)$ are linear functions such that $f(0) = g(0)$ and $f(1) = g(1)$, then $f(x) = g(x)$.

SOLUTION Suppose $f(x) = mx + b$ and $g(x) = nx + d$. Then $f(0) = b$ and $g(0) = d$, which implies $b = d$. Thus $f(x) = mx + b$ and $g(x) = nx + b$. Now, $f(1) = m + b$ and $g(1) = n + b$ so $m + b = n + b$ and $m = n$. Thus $f(x) = g(x)$.

55. Show that $\Delta y/\Delta x$ for the function $f(x) = x^2$ over the interval $[x_1, x_2]$ is not a constant, but depends on the interval. Determine the exact dependence of $\Delta y/\Delta x$ on x_1 and x_2.

SOLUTION For x^2, $\dfrac{\Delta y}{\Delta x} = \dfrac{x_2^2 - x_1^2}{x_2 - x_1} = x_2 + x_1$.

56. Use Eq. (2) to derive the quadratic formula for the roots of $ax^2 + bx + c = 0$.

SOLUTION Consider the equation $ax^2 + bx + c = 0$. First, complete the square to obtain

$$a\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a} = 0.$$

Then

$$\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2} \qquad \text{and} \qquad \left|x + \frac{b}{2a}\right| = \sqrt{\frac{b^2 - 4ac}{4a^2}} = \frac{\sqrt{b^2 - 4ac}}{2a}.$$

Dropping the absolute values yields

$$x + \frac{b}{2a} = \pm\frac{\sqrt{b^2 - 4ac}}{2a} \qquad \text{or} \qquad x = \frac{-b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a} = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

57. Let $a, c \neq 0$. Show that the roots of

$$ax^2 + bx + c = 0 \qquad \text{and} \qquad cx^2 + bx + a = 0$$

are reciprocals of each other.

SOLUTION Let r_1 and r_2 be the roots of $ax^2 + bx + c$ and r_3 and r_4 be the roots of $cx^2 + bx + a$. Without loss of generality, let

$$r_1 = \frac{-b + \sqrt{b^2 - 4ac}}{2a} \Rightarrow \frac{1}{r_1} = \frac{2a}{-b + \sqrt{b^2 - 4ac}} \cdot \frac{-b - \sqrt{b^2 - 4ac}}{-b - \sqrt{b^2 - 4ac}}$$
$$= \frac{2a(-b - \sqrt{b^2 - 4ac})}{b^2 - b^2 + 4ac} = \frac{-b - \sqrt{b^2 - 4ac}}{2c} = r_4.$$

Similarly, you can show $\dfrac{1}{r_2} = r_3$.

58. Show, by completing the square, that the parabola

$$y = ax^2 + bx + c$$

is congruent to $y = ax^2$ by a vertical and horizontal translation.

SOLUTION

$$y = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) + c - \frac{b^2}{4a} = a\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a}.$$

Thus, the first parabola is just the second translated horizontally by $-\frac{b}{2a}$ and vertically by $\frac{4ac-b^2}{4a}$.

59. Prove **Viète's Formulas**: The quadratic polynomial with α and β as roots is $x^2 + bx + c$, where $b = -\alpha - \beta$ and $c = \alpha\beta$.

SOLUTION If a quadratic polynomial has roots α and β, then the polynomial is

$$(x - \alpha)(x - \beta) = x^2 - \alpha x - \beta x + \alpha\beta = x^2 + (-\alpha - \beta)x + \alpha\beta.$$

Thus, $b = -\alpha - \beta$ and $c = \alpha\beta$.

1.3 The Basic Classes of Functions

Preliminary Questions

1. Give an example of a rational function.

SOLUTION One example is $\dfrac{3x^2-2}{7x^3+x-1}$.

2. Is $|x|$ a polynomial function? What about $|x^2+1|$?

SOLUTION $|x|$ is not a polynomial; however, because $x^2+1>0$ for all x, it follows that $|x^2+1| = x^2+1$, which is a polynomial.

3. What is unusual about the domain of the composite function $f \circ g$ for the functions $f(x) = x^{1/2}$ and $g(x) = -1-|x|$?

SOLUTION Recall that $(f \circ g)(x) = f(g(x))$. Now, for any real number x, $g(x) = -1-|x| \le -1 < 0$. Because we cannot take the square root of a negative number, it follows that $f(g(x))$ is not defined for any real number. In other words, the domain of $f(g(x))$ is the empty set.

4. Is $f(x) = \left(\frac{1}{2}\right)^x$ increasing or decreasing?

SOLUTION The function $f(x) = (\frac{1}{2})^x$ is an exponential function with base $b = \frac{1}{2} < 1$. Therefore, f is a decreasing function.

5. Give an example of a transcendental function.

SOLUTION One possibility is $f(x) = e^x - \sin x$.

Exercises

In Exercises 1–12, determine the domain of the function.

1. $f(x) = x^{1/4}$

SOLUTION $x \ge 0$

2. $g(t) = t^{2/3}$

SOLUTION All reals

3. $f(x) = x^3 + 3x - 4$

SOLUTION All reals

4. $h(z) = z^3 + z^{-3}$

SOLUTION $z \ne 0$

5. $g(t) = \dfrac{1}{t+2}$

SOLUTION $t \ne -2$

6. $f(x) = \dfrac{1}{x^2+4}$

SOLUTION All reals

7. $G(u) = \dfrac{1}{u^2-4}$

SOLUTION $u \ne \pm 2$

8. $f(x) = \dfrac{\sqrt{x}}{x^2-9}$

SOLUTION $x \ge 0, x \ne 3$

9. $f(x) = x^{-4} + (x-1)^{-3}$

SOLUTION $x \ne 0, 1$

10. $F(s) = \sin\left(\dfrac{s}{s+1}\right)$

SOLUTION $s \ne -1$

11. $g(y) = 10^{\sqrt{y}+y^{-1}}$

SOLUTION $y > 0$

12. $f(x) = \dfrac{x + x^{-1}}{(x-3)(x+4)}$

SOLUTION $x \neq 0, 3, -4$

In Exercises 13–24, identify each of the following functions as polynomial, rational, algebraic, or transcendental.

13. $f(x) = 4x^3 + 9x^2 - 8$

SOLUTION Polynomial

14. $f(x) = x^{-4}$

SOLUTION Rational

15. $f(x) = \sqrt{x}$

SOLUTION Algebraic

16. $f(x) = \sqrt{1 - x^2}$

SOLUTION Algebraic

17. $f(x) = \dfrac{x^2}{x + \sin x}$

SOLUTION Transcendental

18. $f(x) = 2^x$

SOLUTION Transcendental

19. $f(x) = \dfrac{2x^3 + 3x}{9 - 7x^2}$

SOLUTION Rational

20. $f(x) = \dfrac{3x - 9x^{-1/2}}{9 - 7x^2}$

SOLUTION Algebraic

21. $f(x) = \sin(x^2)$

SOLUTION Transcendental

22. $f(x) = \dfrac{x}{\sqrt{x} + 1}$

SOLUTION Algebraic

23. $f(x) = x^2 + 3x^{-1}$

SOLUTION Rational

24. $f(x) = \sin(3^x)$

SOLUTION Transcendental

25. Is $f(x) = 2^{x^2}$ a transcendental function?

SOLUTION Yes.

26. Show that $f(x) = x^2 + 3x^{-1}$ and $g(x) = 3x^3 - 9x + x^{-2}$ are rational functions—that is, quotients of polynomials.

SOLUTION
$$f(x) = x^2 + 3x^{-1} = x^2 + \frac{3}{x} = \frac{x^3 + 3}{x}$$
$$g(x) = 3x^3 - 9x + x^{-2} = \frac{3x^5 - 9x^3 + 1}{x^2}$$

In Exercises 27–34, calculate the composite functions $f \circ g$ and $g \circ f$, and determine their domains.

27. $f(x) = \sqrt{x}, \quad g(x) = x + 1$

SOLUTION $f(g(x)) = \sqrt{x+1}$; D: $x \geq -1$, $\quad g(f(x)) = \sqrt{x} + 1$; D: $x \geq 0$

28. $f(x) = \frac{1}{x}, \quad g(x) = x^{-4}$

SOLUTION $f(g(x)) = x^4$; D: $x \neq 0$, $\quad g(f(x)) = x^4$: D: $x \neq 0$

29. $f(x) = 2^x, \quad g(x) = x^2$

SOLUTION $f(g(x)) = 2^{x^2}$; D: $\mathbf{R}$, $\quad g(f(x)) = (2^x)^2 = 2^{2x}$; D: $\mathbf{R}$

30. $f(x) = |x|, \quad g(\theta) = \sin\theta$

SOLUTION $f(g(\theta)) = |\sin\theta|$; D: $\mathbf{R}$, $\quad g(f(x)) = \sin|x|$; D: $\mathbf{R}$

31. $f(\theta) = \cos\theta, \quad g(x) = x^3 + x^2$

SOLUTION $f(g(x)) = \cos(x^3 + x^2)$; D: $\mathbf{R}$, $\quad g(f(\theta)) = \cos^3\theta + \cos^2\theta$; D: $\mathbf{R}$

32. $f(x) = \frac{1}{x^2+1}, \quad g(x) = x^{-2}$

SOLUTION $f(g(x)) = \frac{1}{(x^{-2})^2 + 1} = \frac{1}{x^{-4}+1}$; D: $x \neq 0$, $\quad g(f(x)) = \left(\frac{1}{x^2+1}\right)^{-2} = (x^2+1)^2$; D: $\mathbf{R}$

33. $f(t) = \frac{1}{\sqrt{t}}, \quad g(t) = -t^2$

SOLUTION $f(g(t)) = \frac{1}{\sqrt{-t^2}}$; D: Not valid for any t, $\quad g(f(t)) = -\left(\frac{1}{\sqrt{t}}\right)^2 = -\frac{1}{t}$; D: $t > 0$

34. $f(t) = \sqrt{t}, \quad g(t) = 1 - t^3$

SOLUTION $f(g(t)) = \sqrt{1-t^3}$; D: $t \leq 1$, $\quad g(f(t)) = 1 - t^{3/2}$; D: $t \geq 0$

35. The population (in millions) of a country as a function of time t (years) is $P(t) = 30.2^{0.1t}$. Show that the population doubles every 10 years. Show more generally that for any positive constants a and k, the function $g(t) = a2^{kt}$ doubles after $1/k$ years.

SOLUTION Let $P(t) = 30 \cdot 2^{0.1t}$. Then

$$P(t+10) = 30 \cdot 2^{0.1(t+10)} = 30 \cdot 2^{0.1t+1} = 2(30 \cdot 2^{0.1t}) = 2P(t).$$

Hence, the population doubles in size every 10 years. In the more general case, let $g(t) = a2^{kt}$. Then

$$g\left(t + \frac{1}{k}\right) = a2^{k(t+1/k)} = a2^{kt+1} = 2a2^{kt} = 2g(t).$$

Hence, the function g doubles after $1/k$ years.

36. Find all values of c such that $f(x) = \frac{x+1}{x^2+2cx+4}$ has domain $\mathbf{R}$.

SOLUTION The domain of f will consist of all real numbers provided the denominator has no real roots. The roots of $x^2 + 2cx + 4 = 0$ are

$$x = \frac{-2c \pm \sqrt{4c^2 - 16}}{2} = -c \pm \sqrt{c^2 - 4}.$$

There will be no real roots when $c^2 < 4$ or when $-2 < c < 2$.

Further Insights and Challenges

In Exercises 37–43, we define the first difference δf *of a function* $f(x)$ *by* $\delta f(x) = f(x+1) - f(x)$.

37. Show that if $f(x) = x^2$, then $\delta f(x) = 2x + 1$. Calculate δf for $f(x) = x$ and $f(x) = x^3$.

SOLUTION $f(x) = x^2$: $\delta f(x) = f(x+1) - f(x) = (x+1)^2 - x^2 = 2x + 1$
$f(x) = x$: $\delta f(x) = x + 1 - x = 1$
$f(x) = x^3$: $\delta f(x) = (x+1)^3 - x^3 = 3x^2 + 3x + 1$

38. Show that $\delta(10^x) = 9 \cdot 10^x$ and, more generally, that $\delta(b^x) = (b-1)b^x$.

SOLUTION $\delta(10^x) = 10^{x+1} - 10^x = 10 \cdot 10^x - 10^x = 10^x(10-1) = 9 \cdot 10^x$
$\delta(b^x) = b^{x+1} - b^x = b^x(b-1)$

39. Show that for any two functions f and g, $\delta(f+g) = \delta f + \delta g$ and $\delta(cf) = c\delta(f)$, where c is any constant.

SOLUTION $\delta(f+g) = (f(x+1)+g(x+1)) - (f(x) - g(x))$

$$= (f(x+1) - f(x)) + (g(x+1) - g(x)) = \delta f(x) + \delta g(x)$$

$$\delta(cf) = cf(x+1) - cf(x) = c(f(x+1) - f(x)) = c\delta f(x).$$

40. Suppose we can find a function $P(x)$ such that $\delta P = (x+1)^k$ and $P(0) = 0$. Prove that $P(1) = 1^k$, $P(2) = 1^k + 2^k$, and, more generally, for every whole number n,

$$P(n) = 1^k + 2^k + \cdots + n^k \qquad \boxed{1}$$

SOLUTION Suppose we have found a function $P(x)$ such that $\delta P(x) = (x+1)^k$ and $P(0) = 0$. Taking $x = 0$, we have $\delta P(0) = P(1) - P(0) = (0+1)^k = 1^k$. Therefore, $P(1) = P(0) + 1^k = 1^k$. Next, take $x = 1$. Then $\delta P(1) = P(2) - P(1) = (1+1)^k = 2^k$, and $P(2) = P(1) + 2^k = 1^k + 2^k$.

To prove the general result, we will proceed by induction. The basis step, proving that $P(1) = 1^k$ is given above, so we move on to the induction step. Assume that, for some integer j, $P(j) = 1^k + 2^k + \cdots + j^k$. Then $\delta P(j) = P(j+1) - P(j) = (j+1)^k$ and

$$P(j+1) = P(j) + (j+1)^k = 1^k + 2^k + \cdots + j^k + (j+1)^k.$$

Therefore, by mathematical induction, for every whole number n, $P(n) = 1^k + 2^k + \cdots + n^k$.

41. First show that

$$P(x) = \frac{x(x+1)}{2}$$

satisfies $\delta P = (x+1)$. Then apply Exercise 40 to conclude that

$$1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}$$

SOLUTION Let $P(x) = x(x+1)/2$. Then

$$\delta P(x) = P(x+1) - P(x) = \frac{(x+1)(x+2)}{2} - \frac{x(x+1)}{2} = \frac{(x+1)(x+2-x)}{2} = x+1.$$

Also, note that $P(0) = 0$. Thus, by Exercise 40, with $k = 1$, it follows that

$$P(n) = \frac{n(n+1)}{2} = 1 + 2 + 3 + \cdots + n.$$

42. Calculate $\delta(x^3)$, $\delta(x^2)$, and $\delta(x)$. Then find a polynomial $P(x)$ of degree 3 such that $\delta P = (x+1)^2$ and $P(0) = 0$. Conclude that $P(n) = 1^2 + 2^2 + \cdots + n^2$.

SOLUTION From Exercise 37, we know

$$\delta x = 1, \qquad \delta x^2 = 2x + 1, \qquad \text{and} \qquad \delta x^3 = 3x^2 + 3x + 1.$$

Therefore,

$$\frac{1}{3}\delta x^3 + \frac{1}{2}\delta x^2 + \frac{1}{6}\delta x = x^2 + 2x + 1 = (x+1)^2.$$

Now, using the properties of the first difference from Exercise 39, it follows that

$$\frac{1}{3}\delta x^3 + \frac{1}{2}\delta x^2 + \frac{1}{6}\delta x = \delta\left(\frac{1}{3}x^3\right) + \delta\left(\frac{1}{2}x^2\right) + \delta\left(\frac{1}{6}x\right) = \delta\left(\frac{1}{3}x^3 + \frac{1}{2}x^2 + \frac{1}{6}x\right) = \delta\left(\frac{2x^3 + 3x^2 + x}{6}\right).$$

Finally, let

$$P(x) = \frac{2x^3 + 3x^2 + x}{6}.$$

Then $\delta P(x) = (x+1)^2$ and $P(0) = 0$, so by Exercise 40, with $k = 2$, it follows that

$$P(n) = \frac{2n^3 + 3n^2 + n}{6} = 1^2 + 2^2 + 3^2 + \cdots + n^2.$$

43. This exercise combined with Exercise 40 shows that for all whole numbers k, there exists a polynomial $P(x)$ satisfying Eq. (1). The solution requires the Binomial Theorem and proof by induction (see Appendix C).

(a) Show that $\delta(x^{k+1}) = (k+1)\,x^k + \cdots$, where the dots indicate terms involving smaller powers of x.

(b) Show by induction that there exists a polynomial of degree $k+1$ with leading coefficient $1/(k+1)$:

$$P(x) = \frac{1}{k+1}x^{k+1} + \cdots$$

such that $\delta P = (x+1)^k$ and $P(0) = 0$.

SOLUTION

(a) By the Binomial Theorem:

$$\begin{aligned}\delta(x^{n+1}) = (x+1)^{n+1} - x^{n+1} &= \left(x^{n+1} + \binom{n+1}{1}x^n + \binom{n+1}{2}x^{n-1} + \cdots + 1\right) - x^{n+1} \\ &= \binom{n+1}{1}x^n + \binom{n+1}{2}x^{n-1} + \cdots + 1\end{aligned}$$

Thus,

$$\delta(x^{n+1}) = (n+1)\,x^n + \cdots$$

where the dots indicate terms involving smaller powers of x.

(b) For $k = 0$, note that $P(x) = x$ satisfies $\delta P = (x+1)^0 = 1$ and $P(0) = 0$.

Now suppose the polynomial

$$P(x) = \frac{1}{k}x^k + p_{k-1}x^{k-1} + \cdots + p_1 x$$

which clearly satisfies $P(0) = 0$ also satisfies $\delta P = (x+1)^{k-1}$. We try to prove the existence of

$$Q(x) = \frac{1}{k+1}x^{k+1} + q_k x^k + \cdots + q_1 x$$

such that $\delta Q = (x+1)^k$. Observe that $Q(0) = 0$.

If $\delta Q = (x+1)^k$ and $\delta P = (x+1)^{k-1}$, then

$$\delta Q = (x+1)^k = (x+1)\delta P = x\delta P(x) + \delta P$$

By the linearity of δ (Exercise 39), we find $\delta Q - \delta P = x\delta P$ or $\delta(Q-P) = x\delta P$. By definition,

$$Q - P = \frac{1}{k+1}x^{k+1} + \left(q_k - \frac{1}{k}\right)x^k + \cdots + (q_1 - p_1)x,$$

so, by the linearity of δ,

$$\delta(Q-P) = \frac{1}{k+1}\delta(x^{k+1}) + \left(q_k - \frac{1}{k}\right)\delta(x^k) + \cdots + (q_1 - p_1) = x(x+1)^{k-1} \qquad \boxed{1}$$

By part (a),

$$\begin{aligned}\delta(x^{k+1}) &= (k+1)x^k + L_{k-1,k-1}x^{k-1} + \ldots + L_{k-1,1}x + 1 \\ \delta(x^k) &= kx^{k-1} + L_{k-2,k-2}x^{k-2} + \ldots + L_{k-2,1}x + 1 \\ &\vdots \\ \delta(x^2) &= 2x + 1\end{aligned}$$

where the $L_{i,j}$ are real numbers for each i, j.

To construct Q, we have to group like powers of x on both sides of Eq. (1). This yields the system of equations

$$\begin{aligned}\frac{1}{k+1}\left((k+1)x^k\right) &= x^k \\ \frac{1}{k+1}L_{k-1,k-1}x^{k-1} + \left(q_k - \frac{1}{k}\right)kx^{k-1} &= (k-1)x^{k-1} \\ &\vdots \\ \frac{1}{k+1} + \left(q_k - \frac{1}{k}\right) + (q_{k-1} - p_{k-1}) + \cdots + (q_1 - p_1) &= 0.\end{aligned}$$

The first equation is identically true, and the second equation can be solved immediately for q_k. Substituting the value of q_k into the third equation of the system, we can then solve for q_{k-1}. We continue this process until we substitute the values of $q_k, q_{k-1}, \dots q_2$ into the last equation, and then solve for q_1.

1.4 Trigonometric Functions

Preliminary Questions

1. How is it possible for two different rotations to define the same angle?

SOLUTION Working from the same initial radius, two rotations that differ by a whole number of full revolutions will have the same ending radius; consequently, the two rotations will define the same angle even though the measures of the rotations will be different.

2. Give two different positive rotations that define the angle $\pi/4$.

SOLUTION The angle $\pi/4$ is defined by any rotation of the form $\frac{\pi}{4} + 2\pi k$ where k is an integer. Thus, two different positive rotations that define the angle $\pi/4$ are

$$\frac{\pi}{4} + 2\pi(1) = \frac{9\pi}{4} \qquad \text{and} \qquad \frac{\pi}{4} + 2\pi(5) = \frac{41\pi}{4}.$$

3. Give a negative rotation that defines the angle $\pi/3$.

SOLUTION The angle $\pi/3$ is defined by any rotation of the form $\frac{\pi}{3} + 2\pi k$ where k is an integer. Thus, a negative rotation that defines the angle $\pi/3$ is

$$\frac{\pi}{3} + 2\pi(-1) = -\frac{5\pi}{3}.$$

4. The definition of $\cos\theta$ using right triangles applies when (choose the correct answer):

(a) $0 < \theta < \dfrac{\pi}{2}$ **(b)** $0 < \theta < \pi$ **(c)** $0 < \theta < 2\pi$

SOLUTION The correct response is **(a)**: $0 < \theta < \frac{\pi}{2}$.

5. What is the unit circle definition of $\sin\theta$?

SOLUTION Let O denote the center of the unit circle, and let P be a point on the unit circle such that the radius $\overline{OP}$ makes an angle θ with the positive x-axis. Then, $\sin\theta$ is the y-coordinate of the point P.

6. How does the periodicity of $\sin\theta$ and $\cos\theta$ follow from the unit circle definition?

SOLUTION Let O denote the center of the unit circle, and let P be a point on the unit circle such that the radius $\overline{OP}$ makes an angle θ with the positive x-axis. Then, $\cos\theta$ and $\sin\theta$ are the x- and y-coordinates, respectively, of the point P. The angle $\theta + 2\pi$ is obtained from the angle θ by making one full revolution around the circle. The angle $\theta + 2\pi$ will therefore have the radius $\overline{OP}$ as its terminal side. Thus

$$\cos(\theta + 2\pi) = \cos\theta \qquad \text{and} \qquad \sin(\theta + 2\pi) = \sin\theta.$$

In other words, $\sin\theta$ and $\cos\theta$ are periodic functions.

Exercises

1. Find the angle between 0 and 2π equivalent to $13\pi/4$.

SOLUTION Because $13\pi/4 > 2\pi$, we repeatedly subtract 2π until we arrive at a radian measure that is between 0 and 2π. After one subtraction, we have $13\pi/4 - 2\pi = 5\pi/4$. Because $0 < 5\pi/4 < 2\pi$, $5\pi/4$ is the angle measure between 0 and 2π that is equivalent to $13\pi/4$.

2. Describe $\theta = \pi/6$ by an angle of negative radian measure.

SOLUTION If we subtract 2π from $\pi/6$, we obtain $\theta = -11\pi/6$. Thus, the angle $\theta = \pi/6$ is equivalent to the angle $\theta = -11\pi/6$.

3. Convert from radians to degrees:

(a) 1 **(b)** $\dfrac{\pi}{3}$ **(c)** $\dfrac{5}{12}$ **(d)** $-\dfrac{3\pi}{4}$

SOLUTION

(a) $1\left(\dfrac{180^\circ}{\pi}\right) = \dfrac{180^\circ}{\pi} \approx 57.3^\circ$ **(b)** $\dfrac{\pi}{3}\left(\dfrac{180^\circ}{\pi}\right) = 60^\circ$

(c) $\dfrac{5}{12}\left(\dfrac{180^\circ}{\pi}\right) = \dfrac{75^\circ}{\pi} \approx 23.87^\circ$ **(d)** $-\dfrac{3\pi}{4}\left(\dfrac{180^\circ}{\pi}\right) = -135^\circ$

4. Convert from degrees to radians:

(a) 1° **(b)** 30° **(c)** 25° **(d)** 120°

SOLUTION

(a) $1^\circ\left(\dfrac{\pi}{180^\circ}\right)=\dfrac{\pi}{180}$ **(b)** $30^\circ\left(\dfrac{\pi}{180^\circ}\right)=\dfrac{\pi}{6}$ **(c)** $25^\circ\left(\dfrac{\pi}{180^\circ}\right)=\dfrac{5\pi}{36}$ **(d)** $120^\circ\left(\dfrac{\pi}{180^\circ}\right)=\dfrac{2\pi}{3}$

5. Find the lengths of the arcs subtended by the angles θ and ϕ radians in Figure 20.

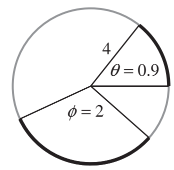

FIGURE 20 Circle of radius 4.

SOLUTION $s = r\theta = 4(.9) = 3.6$; $s = r\phi = 4(2) = 8$

6. Calculate the values of the six standard trigonometric functions for the angle θ in Figure 21.

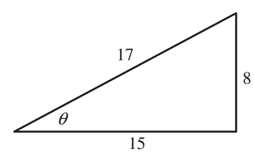

FIGURE 21

SOLUTION Using the definition of the six trigonometric functions in terms of the ratio of sides of a right triangle, we find $\sin\theta = 8/17$; $\cos\theta = 15/17$; $\tan\theta = 8/15$; $\csc\theta = 17/8$; $\sec\theta = 17/15$; $\cot\theta = 15/8$.

7. Fill in the remaining values of $(\cos\theta, \sin\theta)$ for the points in Figure 22.

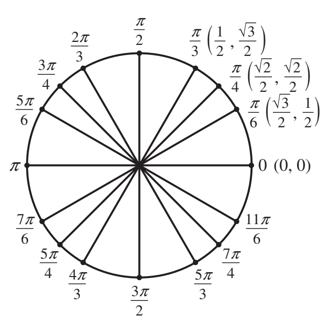

FIGURE 22

SOLUTION

θ	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$
$(\cos\theta, \sin\theta)$	$(0, 1)$	$\left(\frac{-1}{2}, \frac{\sqrt{3}}{2}\right)$	$\left(\frac{-\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$	$\left(\frac{-\sqrt{3}}{2}, \frac{1}{2}\right)$	$(-1, 0)$	$\left(\frac{-\sqrt{3}}{2}, \frac{-1}{2}\right)$

θ	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$
$(\cos\theta, \sin\theta)$	$\left(\frac{-\sqrt{2}}{2}, \frac{-\sqrt{2}}{2}\right)$	$\left(\frac{-1}{2}, \frac{-\sqrt{3}}{2}\right)$	$(0, -1)$	$\left(\frac{1}{2}, \frac{-\sqrt{3}}{2}\right)$	$\left(\frac{\sqrt{2}}{2}, \frac{-\sqrt{2}}{2}\right)$	$\left(\frac{\sqrt{3}}{2}, \frac{-1}{2}\right)$

8. Find the values of the six standard trigonometric functions at $\theta = 11\pi/6$.

SOLUTION From Figure 22, we see that

$$\sin\frac{11\pi}{6} = -\frac{1}{2} \qquad \text{and} \qquad \cos\frac{11\pi}{6} = \frac{\sqrt{3}}{2}.$$

Then,

$$\tan\frac{11\pi}{6} = \frac{\sin\frac{11\pi}{6}}{\cos\frac{11\pi}{6}} = -\frac{\sqrt{3}}{3};$$

$$\cot \frac{11\pi}{6} = \frac{\cos \frac{11\pi}{6}}{\sin \frac{11\pi}{6}} = -\sqrt{3};$$

$$\csc \frac{11\pi}{6} = \frac{1}{\sin \frac{11\pi}{6}} = -2;$$

$$\sec \frac{11\pi}{6} = \frac{1}{\cos \frac{11\pi}{6}} = \frac{2\sqrt{3}}{3}.$$

In Exercises 9–14, use Figure 22 to find all angles between 0 *and* 2π *satisfying the given condition.*

9. $\cos\theta = \frac{1}{2}$

SOLUTION $\theta = \frac{\pi}{3}, \frac{5\pi}{3}$

10. $\tan\theta = 1$

SOLUTION $\theta = \frac{\pi}{4}, \frac{5\pi}{4}$

11. $\tan\theta = -1$

SOLUTION $\theta = \frac{3\pi}{4}, \frac{7\pi}{4}$

12. $\csc\theta = 2$

SOLUTION $\theta = \frac{\pi}{6}, \frac{5\pi}{6}$

13. $\sin x = \frac{\sqrt{3}}{2}$

SOLUTION $x = \frac{\pi}{3}, \frac{2\pi}{3}$

14. $\sec t = 2$

SOLUTION $t = \frac{\pi}{3}, \frac{5\pi}{3}$

15. Fill in the following table of values:

θ	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
$\tan\theta$							
$\sec\theta$							

SOLUTION

θ	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
$\tan\theta$	$\frac{1}{\sqrt{3}}$	1	$\sqrt{3}$	und	$-\sqrt{3}$	-1	$-\frac{1}{\sqrt{3}}$
$\sec\theta$	$\frac{2}{\sqrt{3}}$	$\sqrt{2}$	2	und	-2	$-\sqrt{2}$	$-\frac{2}{\sqrt{3}}$

16. Complete the following table of signs:

θ	$\sin\theta$	$\cos\theta$	$\tan\theta$	$\cot\theta$	$\sec\theta$	$\csc\theta$
$0 < \theta < \frac{\pi}{2}$	+	+				
$\frac{\pi}{2} < \theta < \pi$						
$\pi < \theta < \frac{3\pi}{2}$						
$\frac{3\pi}{2} < \theta < 2\pi$						

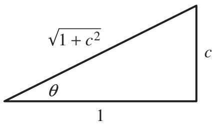
SOLUTION

θ	sin	cos	tan	cot	sec	csc
$0 < \theta < \dfrac{\pi}{2}$	$+$	$+$	$+$	$+$	$+$	$+$
$\dfrac{\pi}{2} < \theta < \pi$	$+$	$-$	$-$	$-$	$-$	$+$
$\pi < \theta < \dfrac{3\pi}{2}$	$-$	$-$	$+$	$+$	$-$	$-$
$\dfrac{3\pi}{2} < \theta < 2\pi$	$-$	$+$	$-$	$-$	$+$	$-$

17. Show that if $\tan\theta = c$ and $0 \le \theta < \pi/2$, then $\cos\theta = 1/\sqrt{1+c^2}$. *Hint:* Draw a right triangle whose opposite and adjacent sides have lengths c and 1.

SOLUTION Because $0 \le \theta < \pi/2$, we can use the definition of the trigonometric functions in terms of right triangles. $\tan\theta$ is the ratio of the length of the side opposite the angle θ to the length of the adjacent side. With $c = \frac{c}{1}$, we label the length of the opposite side as c and the length of the adjacent side as 1 (see the diagram below). By the Pythagorean theorem, the length of the hypotenuse is $\sqrt{1+c^2}$. Finally, we use the fact that $\cos\theta$ is the ratio of the length of the adjacent side to the length of the hypotenuse to obtain

$$\cos\theta = \frac{1}{\sqrt{1+c^2}}.$$



18. Suppose that $\cos\theta = \frac{1}{3}$.

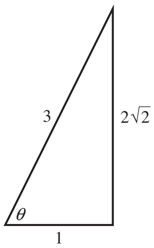
(a) Show that if $0 \le \theta < \pi/2$, then $\sin\theta = 2\sqrt{2}/3$ and $\tan\theta = 2\sqrt{2}$.

(b) Find $\sin\theta$ and $\tan\theta$ if $3\pi/2 \le \theta < 2\pi$.

SOLUTION

(a) Because $0 \le \theta < \pi/2$, we can use the definition of the trigonometric functions in terms of right triangles. $\cos\theta$ is the ratio of the length of the side adjacent to the angle θ to the length of the hypotenuse, so we label the length of the adjacent side as 1 and the length of the hypotenuse as 3 (see the diagram below). By the Pythagorean theorem, the length of the side opposite the angle θ is $\sqrt{3^2 - 1^2} = 2\sqrt{2}$. Finally, we use the definitions of $\sin\theta$ as the ratio of the length of the opposite side to the length of the hypotenuse and of $\tan\theta$ as the ratio of the length of the opposite side to the length of the adjacent side to obtain

$$\sin\theta = \frac{2\sqrt{2}}{3} \qquad \text{and} \qquad \tan\theta = \frac{2\sqrt{2}}{1} = 2\sqrt{2}.$$



(b) If $3\pi/2 \le \theta < 2\pi$, then θ is in the fourth quadrant and $\sin\theta$ and $\tan\theta$ are negative but have the same magnitude as found in part (a). Thus,

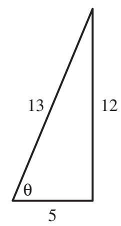
$$\sin\theta = -\frac{2\sqrt{2}}{3} \qquad \text{and} \qquad \tan\theta = -2\sqrt{2}.$$

In Exercises 19–24, assume that $0 \leq \theta < \pi/2$.

19. Find $\sin\theta$ and $\tan\theta$ if $\cos\theta = \frac{5}{13}$.

SOLUTION Consider the triangle below. The lengths of the side adjacent to the angle θ and the hypotenuse have been labeled so that $\cos\theta = \frac{5}{13}$. The length of the side opposite the angle θ has been calculated using the Pythagorean theorem: $\sqrt{13^2 - 5^2} = 12$. From the triangle, we see that

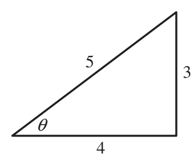
$$\sin\theta = \frac{12}{13} \quad \text{and} \quad \tan\theta = \frac{12}{5}.$$



20. Find $\cos\theta$ and $\tan\theta$ if $\sin\theta = \frac{3}{5}$.

SOLUTION Consider the triangle below. The lengths of the side opposite the angle θ and the hypotenuse have been labeled so that $\sin\theta = \frac{3}{5}$. The length of the side adjacent to the angle θ has been calculated using the Pythagorean theorem: $\sqrt{5^2 - 3^2} = 4$. From the triangle, we see that

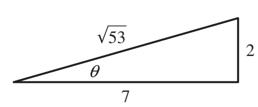
$$\cos\theta = \frac{4}{5} \quad \text{and} \quad \tan\theta = \frac{3}{4}.$$



21. Find $\sin\theta$, $\sec\theta$, and $\cot\theta$ if $\tan\theta = \frac{2}{7}$.

SOLUTION If $\tan\theta = \frac{2}{7}$, then $\cot\theta = \frac{7}{2}$. For the remaining trigonometric functions, consider the triangle below. The lengths of the sides opposite and adjacent to the angle θ have been labeled so that $\tan\theta = \frac{2}{7}$. The length of the hypotenuse has been calculated using the Pythagorean theorem: $\sqrt{2^2 + 7^2} = \sqrt{53}$. From the triangle, we see that

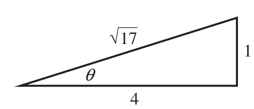
$$\sin\theta = \frac{2}{\sqrt{53}} = \frac{2\sqrt{53}}{53} \quad \text{and} \quad \sec\theta = \frac{\sqrt{53}}{7}.$$



22. Find $\sin\theta$, $\cos\theta$, and $\sec\theta$ if $\cot\theta = 4$.

SOLUTION Consider the triangle below. The lengths of the sides opposite and adjacent to the angle θ have been labeled so that $\cot\theta = 4 = \frac{4}{1}$. The length of the hypotenuse has been calculated using the Pythagorean theorem: $\sqrt{4^2 + 1^2} = \sqrt{17}$. From the triangle, we see that

$$\sin\theta = \frac{1}{\sqrt{17}} = \frac{\sqrt{17}}{17}, \quad \cos\theta = \frac{4}{\sqrt{17}} = \frac{4\sqrt{17}}{17} \quad \text{and} \quad \sec\theta = \frac{\sqrt{17}}{4}.$$



23. Find $\cos 2\theta$ if $\sin\theta = \frac{1}{5}$.

SOLUTION Using the double angle formula $\cos 2\theta = \cos^2\theta - \sin^2\theta$ and the fundamental identity $\sin^2\theta + \cos^2\theta = 1$, we find that $\cos 2\theta = 1 - 2\sin^2\theta$. Thus, $\cos 2\theta = 1 - 2(1/25) = 23/25$.

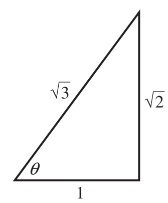
24. Find $\sin 2\theta$ and $\cos 2\theta$ if $\tan\theta = \sqrt{2}$.

SOLUTION By the double angle formulas, $\sin 2\theta = 2\sin\theta\cos\theta$ and $\cos 2\theta = \cos^2\theta - \sin^2\theta$. We can determine $\sin\theta$ and $\cos\theta$ using the triangle shown below. The lengths of the sides opposite and adjacent to the angle θ have been labeled so that $\tan\theta = \sqrt{2}$. The hypotenuse was calculated using the Pythagorean theorem: $\sqrt{1^2 + (\sqrt{2})^2} = \sqrt{3}$. Thus,

$$\sin\theta = \frac{\sqrt{2}}{\sqrt{3}} = \frac{\sqrt{6}}{3} \qquad \text{and} \qquad \cos\theta = \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}.$$

Finally,

$$\sin 2\theta = 2\frac{\sqrt{6}}{3}\cdot\frac{\sqrt{3}}{3} = \frac{2\sqrt{2}}{3}$$
$$\cos 2\theta = \frac{1}{3} - \frac{2}{3} = -\frac{1}{3}.$$



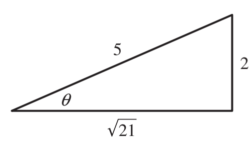
25. Find $\cos\theta$ and $\tan\theta$ if $\sin\theta = 0.4$ and $\pi/2 \le \theta < \pi$.

SOLUTION We can determine the "magnitude" of $\cos\theta$ and $\tan\theta$ using the triangle shown below. The lengths of the side opposite the angle θ and the hypotenuse have been labeled so that $\sin\theta = 0.4 = \frac{2}{5}$. The length of the side adjacent to the angle θ was calculated using the Pythagorean theorem: $\sqrt{5^2 - 2^2} = \sqrt{21}$. From the triangle, we see that

$$|\cos\theta| = \frac{\sqrt{21}}{5} \qquad \text{and} \qquad |\tan\theta| = \frac{2}{\sqrt{21}} = \frac{2\sqrt{21}}{21}.$$

Because $\pi/2 \le \theta < \pi$, both $\cos\theta$ and $\tan\theta$ are negative; consequently,

$$\cos\theta = -\frac{\sqrt{21}}{5} \qquad \text{and} \qquad \tan\theta = -\frac{2\sqrt{21}}{21}.$$



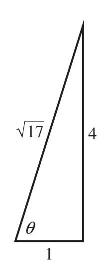
26. Find $\cos\theta$ and $\sin\theta$ if $\tan\theta = 4$ and $\pi \le \theta < 3\pi/2$.

SOLUTION We can determine the "magnitude" of $\cos\theta$ and $\sin\theta$ using the triangle shown below. The lengths of the sides opposite and adjacent to the angle θ have been labeled so that $\tan\theta = 4 = \frac{4}{1}$. The length of the hypotenuse was calculated using the Pythagorean theorem: $\sqrt{1^2 + 4^2} = \sqrt{17}$. From the triangle, we see that

$$|\cos\theta| = \frac{1}{\sqrt{17}} = \frac{\sqrt{17}}{17} \qquad \text{and} \qquad |\sin\theta| = \frac{4}{\sqrt{14}} = \frac{4\sqrt{17}}{17}.$$

Because $\pi \le \theta < 3\pi/2$, both $\cos\theta$ and $\sin\theta$ are negative; consequently,

$$\cos\theta = -\frac{\sqrt{17}}{17} \qquad \text{and} \qquad \sin\theta = -\frac{4\sqrt{17}}{17}.$$



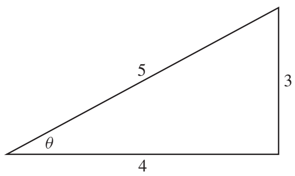
27. Find $\cos\theta$ if $\cot\theta = \frac{4}{3}$ and $\sin\theta < 0$.

SOLUTION We can determine the "magnitude" of $\cos\theta$ using the triangle shown below. The lengths of the sides opposite and adjacent to the angle θ have been labeled so that $\cot\theta = \frac{4}{3}$. The length of the hypotenuse was calculated using the Pythagorean theorem: $\sqrt{3^2 + 4^2} = 5$. From the triangle, we see that

$$|\cos\theta| = \frac{4}{5}.$$

Because $\cot\theta = \frac{4}{3} > 0$ and $\sin\theta < 0$, the angle θ must be in the third quadrant; consequently, $\cos\theta$ will be negative and

$$\cos\theta = -\frac{4}{5}.$$



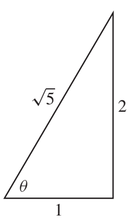
28. Find $\tan\theta$ if $\sec\theta = \sqrt{5}$ and $\sin\theta < 0$.

SOLUTION We can determine the "magnitude" of $\tan\theta$ using the triangle shown below. The lengths of the side adjacent to the angle θ and the hypotenuse have been labeled so that $\sec\theta = \sqrt{5}$. The length of the side opposite the angle θ was calculated using the Pythagorean theorem: $\sqrt{(\sqrt{5})^2 - 1^2} = 2$. From the triangle, we see that

$$|\tan\theta| = 2.$$

Because $\sec\theta = \sqrt{5} > 0$ and $\sin\theta < 0$, the angle θ must be in the fourth quadrant; consequently, $\tan\theta$ will be negative and

$$\tan\theta = -2.$$



29. Find the values of $\sin\theta$, $\cos\theta$, and $\tan\theta$ for the angles corresponding to the eight points in Figure 23(A) and (B).

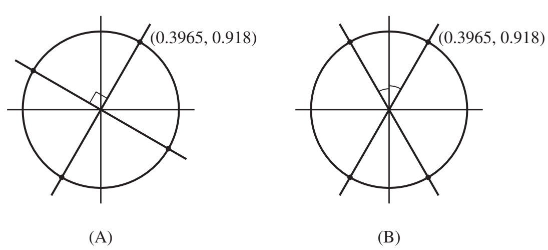


FIGURE 23

SOLUTION Let's start with the four points in Figure 23(A).

- The point in the first quadrant has coordinates $(0.3965, 0.918)$. Therefore,

$$\sin\theta = 0.918, \quad \cos\theta = 0.3965, \quad \text{and} \quad \tan\theta = \frac{0.918}{0.3965} = 2.3153.$$

- The coordinates of the point in the second quadrant are $(-0.918, 0.3965)$. Therefore,

$$\sin\theta = 0.3965, \quad \cos\theta = -0.918, \quad \text{and} \quad \tan\theta = \frac{0.3965}{-0.918} = -0.4319.$$

- Because the point in the third quadrant is symmetric to the point in the first quadrant with respect to the origin, its coordinates are $(-0.3965, -0.918)$. Therefore,

$$\sin\theta = -0.918, \quad \cos\theta = -0.3965, \quad \text{and} \quad \tan\theta = \frac{-0.918}{-0.3965} = 2.3153.$$

- Because the point in the fourth quadrant is symmetric to the point in the second quadrant with respect to the origin, its coordinates are $(0.918, -0.3965)$. Therefore,

$$\sin\theta = -0.3965, \quad \cos\theta = 0.918, \quad \text{and} \quad \tan\theta = \frac{-0.3965}{0.918} = -0.4319.$$

Now consider the four points in Figure 23(B).

- The point in the first quadrant has coordinates $(0.3965, 0.918)$. Therefore,

$$\sin\theta = 0.918, \quad \cos\theta = 0.3965, \quad \text{and} \quad \tan\theta = \frac{0.918}{0.3965} = 2.3153.$$

- The point in the second quadrant is a reflection through the y-axis of the point in the first quadrant. Its coordinates are therefore $(-0.3965, 0.918)$ and

$$\sin\theta = 0.918, \quad \cos\theta = -0.3965, \quad \text{and} \quad \tan\theta = \frac{0.918}{0.3965} = -2.3153.$$

- Because the point in the third quadrant is symmetric to the point in the first quadrant with respect to the origin, its coordinates are $(-0.3965, -0.918)$. Therefore,

$$\sin\theta = -0.918, \quad \cos\theta = -0.3965, \quad \text{and} \quad \tan\theta = \frac{-0.918}{-0.3965} = 2.3153.$$

- Because the point in the fourth quadrant is symmetric to the point in the second quadrant with respect to the origin, its coordinates are $(0.3965, -0.918)$. Therefore,

$$\sin\theta = -0.918, \quad \cos\theta = 0.3965, \quad \text{and} \quad \tan\theta = \frac{-0.918}{0.3965} = -2.3153.$$

30. Refer to Figure 24(A). Express the functions $\sin\theta$, $\tan\theta$, and $\csc\theta$ in terms of c.

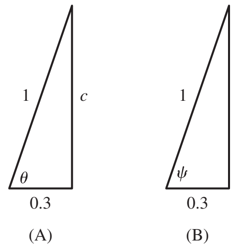

FIGURE 24

SOLUTION By the Pythagorean theorem, the length of the side adjacent to the angle θ in Figure 24(A) is $\sqrt{1-c^2}$. Consequently,

$$\sin\theta = \frac{c}{1} = c, \quad \cos\theta = \frac{\sqrt{1-c^2}}{1} = \sqrt{1-c^2}, \quad \text{and} \quad \tan\theta = \frac{c}{\sqrt{1-c^2}}.$$

31. Refer to Figure 24(B). Compute $\cos\psi$, $\sin\psi$, $\cot\psi$, and $\csc\psi$.

SOLUTION By the Pythagorean theorem, the length of the side opposite the angle ψ in Figure 24(B) is $\sqrt{1-0.3^2} = \sqrt{0.91}$. Consequently,

$$\cos\psi = \frac{0.3}{1} = 0.3, \quad \sin\psi = \frac{\sqrt{0.91}}{1} = \sqrt{0.91}, \quad \cot\psi = \frac{0.3}{\sqrt{0.91}} \qquad \text{and} \qquad \csc\psi = \frac{1}{\sqrt{0.91}}.$$

32. Express $\cos\left(\theta + \frac{\pi}{2}\right)$ and $\sin\left(\theta + \frac{\pi}{2}\right)$ in terms of $\cos\theta$ and $\sin\theta$. *Hint:* Find the relation between the coordinates (a, b) and (c, d) in Figure 25.

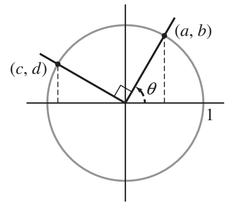

FIGURE 25

SOLUTION Note the triangle in the second quadrant in Figure 25 is congruent to the triangle in the first quadrant rotated 90° clockwise. Thus, $c = -b$ and $d = a$. But $a = \cos\theta$, $b = \sin\theta$, $c = \cos\left(\theta + \frac{\pi}{2}\right)$ and $d = \sin\left(\theta + \frac{\pi}{2}\right)$; therefore,

$$\cos\left(\theta + \frac{\pi}{2}\right) = -\sin\theta \qquad \text{and} \qquad \sin\left(\theta + \frac{\pi}{2}\right) = \cos\theta.$$

33. Use the addition formula to compute $\cos\left(\frac{\pi}{3} + \frac{\pi}{4}\right)$ exactly.

SOLUTION

$$\begin{aligned}\cos\left(\frac{\pi}{3} + \frac{\pi}{4}\right) &= \cos\frac{\pi}{3}\cos\frac{\pi}{4} - \sin\frac{\pi}{3}\sin\frac{\pi}{4}\\ &= \frac{1}{2}\cdot\frac{\sqrt{2}}{2} - \frac{\sqrt{3}}{2}\cdot\frac{\sqrt{2}}{2} = \frac{\sqrt{2}-\sqrt{6}}{4}.\end{aligned}$$

34. Use the addition formula to compute $\sin\left(\frac{\pi}{3} - \frac{\pi}{4}\right)$ exactly.

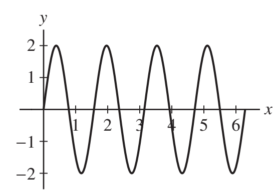
SOLUTION

$$\begin{aligned}\sin\left(\frac{\pi}{3} - \frac{\pi}{4}\right) &= \sin\frac{\pi}{3}\cos\frac{\pi}{4} - \cos\frac{\pi}{3}\sin\frac{\pi}{4}\\ &= \frac{\sqrt{3}}{2}\cdot\frac{\sqrt{2}}{2} - \frac{1}{2}\cdot\frac{\sqrt{2}}{2} = \frac{\sqrt{6}-\sqrt{2}}{4}.\end{aligned}$$

In Exercises 35–38, sketch the graph over $[0, 2\pi]$.

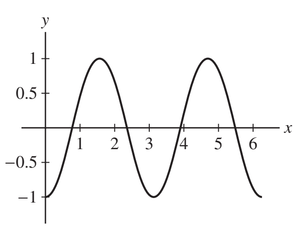
35. $2\sin 4\theta$

SOLUTION



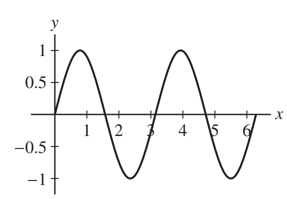
36. $\cos\left(2\left(\theta - \frac{\pi}{2}\right)\right)$

SOLUTION



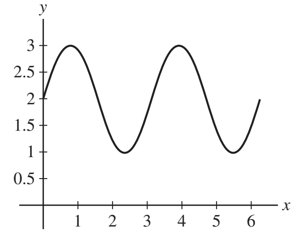
37. $\cos\left(2\theta - \frac{\pi}{2}\right)$

SOLUTION



38. $\sin\left(2\left(\theta - \frac{\pi}{2}\right) + \pi\right) + 2$

SOLUTION



39. How many points lie on the intersection of the horizontal line $y = c$ and the graph of $y = \sin x$ for $0 \le x < 2\pi$? *Hint:* The answer depends on c.

SOLUTION Recall that for any x, $-1 \le \sin x \le 1$. Thus, if $|c| > 1$, the horizontal line $y = c$ and the graph of $y = \sin x$ never intersect. If $c = +1$, then $y = c$ and $y = \sin x$ intersect at the peak of the sine curve; that is, they intersect at $x = \frac{\pi}{2}$. On the other hand, if $c = -1$, then $y = c$ and $y = \sin x$ intersect at the bottom of the sine curve; that is, they intersect at $x = \frac{3\pi}{2}$. Finally, if $|c| < 1$, the graphs of $y = c$ and $y = \sin x$ intersect twice.

40. How many points lie on the intersection of the horizontal line $y = c$ and the graph of $y = \tan x$ for $0 \le x < 2\pi$?

SOLUTION Recall that the graph of $y = \tan x$ consists of an infinite collection of "branches," each between two consecutive vertical asymptotes. Because each branch is increasing and has a range of all real numbers, the graph of the horizontal line $y = c$ will intersect each branch of the graph of $y = \tan x$ once, regardless of the value of c. The interval $0 \le x < 2\pi$ covers the equivalent of two branches of the tangent function, so over this interval there are two points of intersection for each value of c.

In Exercises 41–44, solve for $0 \le \theta < 2\pi$ *(see Example 4).*

41. $\sin 2\theta + \sin 3\theta = 0$

SOLUTION $\sin\alpha = -\sin\beta$ when $\alpha = -\beta + 2\pi k$ or $\alpha = \pi + \beta + 2\pi k$. Substituting $\alpha = 2\theta$ and $\beta = 3\theta$, we have either $2\theta = -3\theta + 2\pi k$ or $2\theta = \pi + 3\theta + 2\pi k$. Solving each of these equations for θ yields $\theta = \frac{2}{5}\pi k$ or $\theta = -\pi - 2\pi k$. The solutions on the interval $0 \le \theta < 2\pi$ are then

$$\theta = 0, \frac{2\pi}{5}, \frac{4\pi}{5}, \pi, \frac{6\pi}{5}, \frac{8\pi}{5}.$$

42. $\sin\theta = \sin 2\theta$

SOLUTION Using the double angle formula for the sine function, we rewrite the equation as $\sin\theta = 2\sin\theta\cos\theta$ or $\sin\theta(1 - 2\cos\theta) = 0$. Thus, either $\sin\theta = 0$ or $\cos\theta = \frac{1}{2}$. The solutions on the interval $0 \le \theta < 2\pi$ are then

$$\theta = 0, \frac{\pi}{3}, \pi, \frac{5\pi}{3}.$$

43. $\cos 4\theta + \cos 2\theta = 0$

SOLUTION $\cos\alpha = -\cos\beta$ when $\alpha + \beta = \pi + 2\pi k$ or $\alpha = \beta + \pi + 2\pi k$. Substituting $\alpha = 4\theta$ and $\beta = 2\theta$, we have either $6\theta = \pi + 2\pi k$ or $4\theta = 2\theta + \pi + 2\pi k$. Solving each of these equations for θ yields $\theta = \frac{\pi}{6} + \frac{\pi}{3}k$ or $\theta = \frac{\pi}{2} + \pi k$. The solutions on the interval $0 \le \theta < 2\pi$ are then

$$\theta = \frac{\pi}{6}, \frac{\pi}{2}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{3\pi}{2}, \frac{11\pi}{6}.$$

44. $\sin\theta = \cos 2\theta$

SOLUTION Solving the double angle formula $\sin^2\theta = \frac{1}{2}(1 - \cos 2\theta)$ for $\cos 2\theta$ yields $\cos 2\theta = 1 - 2\sin^2\theta$. We can therefore rewrite the original equation as $\sin\theta = 1 - 2\sin^2\theta$ or $2\sin^2\theta + \sin\theta - 1 = 0$. The left-hand side of this latter equation factors as $(2\sin\theta - 1)(\sin\theta + 1)$, so we have either $\sin\theta = \frac{1}{2}$ or $\sin\theta = -1$. The solutions on the interval $0 \le \theta < 2\pi$ are

$$\theta = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{3\pi}{2}.$$

In Exercises 45–54, derive the identity using the identities listed in this section.

45. $\cos 2\theta = 2\cos^2\theta - 1$

SOLUTION Starting from the double angle formula for cosine, $\cos^2\theta = \frac{1}{2}(1 + \cos 2\theta)$, we solve for $\cos 2\theta$. This gives $2\cos^2\theta = 1 + \cos 2\theta$ and then $\cos 2\theta = 2\cos^2\theta - 1$.

46. $\cos^2 \dfrac{\theta}{2} = \dfrac{1+\cos\theta}{2}$

SOLUTION Substitute $x = \theta/2$ into the double angle formula for cosine, $\cos^2 x = \frac{1}{2}(1+\cos 2x)$ to obtain $\cos^2\left(\dfrac{\theta}{2}\right) = \dfrac{1+\cos\theta}{2}$.

47. $\sin \dfrac{\theta}{2} = \sqrt{\dfrac{1-\cos\theta}{2}}$

SOLUTION Substitute $x = \theta/2$ into the double angle formula for sine, $\sin^2 x = \frac{1}{2}(1-\cos 2x)$ to obtain $\sin^2\left(\dfrac{\theta}{2}\right) = \dfrac{1-\cos\theta}{2}$. Taking the square root of both sides yields $\sin\left(\dfrac{\theta}{2}\right) = \sqrt{\dfrac{1-\cos\theta}{2}}$.

48. $\sin(\theta+\pi) = -\sin\theta$

SOLUTION From the addition formula for the sine function, we have

$$\sin(\theta+\pi) = \sin\theta\cos\pi + \cos\theta\sin\pi = -\sin\theta$$

49. $\cos(\theta+\pi) = -\cos\theta$

SOLUTION From the addition formula for the cosine function, we have

$$\cos(\theta+\pi) = \cos\theta\cos\pi - \sin\theta\sin\pi = \cos\theta(-1) = -\cos\theta$$

50. $\tan x = \cot\left(\dfrac{\pi}{2} - x\right)$

SOLUTION Using the Complementary Angle Identity,

$$\cot\left(\frac{\pi}{2} - x\right) = \frac{\cos(\pi/2 - x)}{\sin(\pi/2 - x)} = \frac{\sin x}{\cos x} = \tan x.$$

51. $\tan(\pi - \theta) = -\tan\theta$

SOLUTION Using Exercises 48 and 49,

$$\tan(\pi-\theta) = \frac{\sin(\pi-\theta)}{\cos(\pi-\theta)} = \frac{\sin(\pi+(-\theta))}{\cos(\pi+(-\theta))} = \frac{-\sin(-\theta)}{-\cos(-\theta)} = \frac{\sin\theta}{-\cos\theta} = -\tan\theta.$$

The second to last equality occurs because $\sin x$ is an odd function and $\cos x$ is an even function.

52. $\tan 2x = \dfrac{2\tan x}{1-\tan^2 x}$

SOLUTION Using the definition of the tangent function and the double angle formulas for sine and cosine, we find

$$\tan 2x = \frac{\sin 2x}{\cos 2x} = \frac{2\sin x\cos x}{\cos^2 x - \sin^2 x}\cdot\frac{1/\cos^2 x}{1/\cos^2 x} = \frac{2\tan x}{1-\tan^2 x}.$$

53. $\tan x = \dfrac{\sin 2x}{1+\cos 2x}$

SOLUTION Using the addition formula for the sine function, we find

$$\sin 2x = \sin(x+x) = \sin x\cos x + \cos x\sin x = 2\sin x\cos x.$$

By Exercise 45, we know that $\cos 2x = 2\cos^2 x - 1$. Therefore,

$$\frac{\sin 2x}{1+\cos 2x} = \frac{2\sin x\cos x}{1+2\cos^2 x - 1} = \frac{2\sin x\cos x}{2\cos^2 x} = \frac{\sin x}{\cos x} = \tan x.$$

54. $\sin^2 x\cos^2 x = \dfrac{1-\cos 4x}{8}$

SOLUTION Using the double angle formulas for sine and cosine, we find

$$\begin{aligned}\sin^2 x\cos^2 x &= \frac{1}{2}(1-\cos 2x)\cdot\frac{1}{2}(1+\cos 2x) = \frac{1}{4}(1-\cos^2 2x)\\ &= \frac{1}{4}\left(1 - \frac{1}{2} - \frac{1}{2}\cos 4x\right) = \frac{1}{8}(1-\cos 4x).\end{aligned}$$

55. Use Exercises 48 and 49 to show that $\tan\theta$ and $\cot\theta$ are periodic with period π.

SOLUTION By Exercises 48 and 49,

$$\tan(\theta+\pi) = \frac{\sin(\theta+\pi)}{\cos(\theta+\pi)} = \frac{-\sin\theta}{-\cos\theta} = \tan\theta,$$

and

$$\cot(\theta+\pi) = \frac{\cos(\theta+\pi)}{\sin(\theta+\pi)} = \frac{-\cos\theta}{-\sin\theta} = \cot\theta.$$

Thus, both $\tan\theta$ and $\cot\theta$ are periodic with period π.

56. Use the identity of Exercise 45 to show that $\cos\frac{\pi}{8}$ is equal to $\sqrt{\frac{1}{2}+\frac{\sqrt{2}}{4}}$.

SOLUTION Upon substituting $\theta = \frac{\pi}{8}$ into the identity

$$\cos 2\theta = 2\cos^2\theta - 1$$

we have

$$\frac{\sqrt{2}}{2} = \cos\frac{\pi}{4} = 2\cos^2\frac{\pi}{8} - 1.$$

Thus,

$$2\cos^2\frac{\pi}{8} = 1 + \frac{\sqrt{2}}{2} \quad \text{or} \quad \cos^2\frac{\pi}{8} = \frac{1}{2} + \frac{\sqrt{2}}{4}.$$

Taking the square root of both sides of this last expression and recognizing that $\cos\frac{\pi}{8} > 0$ because $0 < \frac{\pi}{8} < \frac{\pi}{2}$, it follows that

$$\cos\frac{\pi}{8} = \sqrt{\frac{1}{2}+\frac{\sqrt{2}}{4}}.$$

57. Use the Law of Cosines to find the distance from P to Q in Figure 26.

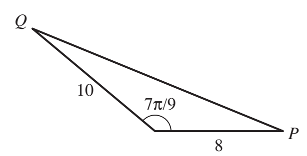


FIGURE 26

SOLUTION By the Law of Cosines, the distance from P to Q is

$$\sqrt{10^2 + 8^2 - 2(10)(8)\cos\frac{7\pi}{9}} = 16.928.$$

Further Insights and Challenges

58. Use Figure 27 to derive the Law of Cosines from the Pythagorean Theorem.

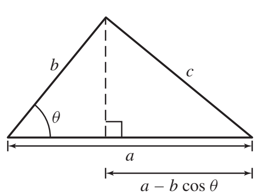

FIGURE 27

SOLUTION First note that the length of the altitude in Figure 27 is $b\sin\theta$. Applying the Pythagorean Theorem to the right triangle on the right in the figure, it then follows that

$$\begin{aligned} c^2 &= (a - b\cos\theta)^2 + b^2\sin^2\theta \\ &= a^2 - 2ab\cos\theta + b^2\cos^2\theta + b^2\sin^2\theta \\ &= a^2 + b^2 - 2ab\cos\theta. \end{aligned}$$

59. Use the addition formula to prove

$$\cos 3\theta = 4\cos^3\theta - 3\cos\theta$$

SOLUTION

$$\begin{aligned}\cos 3\theta &= \cos(2\theta+\theta) = \cos 2\theta\cos\theta - \sin 2\theta\sin\theta = (2\cos^2\theta - 1)\cos\theta - (2\sin\theta\cos\theta)\sin\theta \\ &= \cos\theta(2\cos^2\theta - 1 - 2\sin^2\theta) = \cos\theta(2\cos^2\theta - 1 - 2(1-\cos^2\theta)) \\ &= \cos\theta(2\cos^2\theta - 1 - 2 + 2\cos^2\theta) = 4\cos^3\theta - 3\cos\theta\end{aligned}$$

60. Use the addition formulas for sine and cosine to prove

$$\tan(a+b) = \frac{\tan a + \tan b}{1 - \tan a\tan b}$$

$$\cot(a-b) = \frac{\cot a\cot b + 1}{\cot b - \cot a}$$

SOLUTION

$$\tan(a+b) = \frac{\sin(a+b)}{\cos(a+b)} = \frac{\sin a\cos b + \cos a\sin b}{\cos a\cos b - \sin a\sin b} = \frac{\frac{\sin a\cos b}{\cos a\cos b} + \frac{\cos a\sin b}{\cos a\cos b}}{\frac{\cos a\cos b}{\cos a\cos b} - \frac{\sin a\sin b}{\cos a\cos b}} = \frac{\tan a + \tan b}{1 - \tan a\tan b}$$

$$\cot(a-b) = \frac{\cos(a-b)}{\sin(a-b)} = \frac{\cos a\cos b + \sin a\sin b}{\sin a\cos b - \cos a\sin b} = \frac{\frac{\cos a\cos b}{\sin a\sin b} + \frac{\sin a\sin b}{\sin a\sin b}}{\frac{\sin a\cos b}{\sin a\sin b} - \frac{\cos a\sin b}{\sin a\sin b}} = \frac{\cot a\cot b + 1}{\cot b - \cot a}$$

61. Let θ be the angle between the line $y = mx + b$ and the x-axis [Figure 28(A)]. Prove that $m = \tan\theta$.

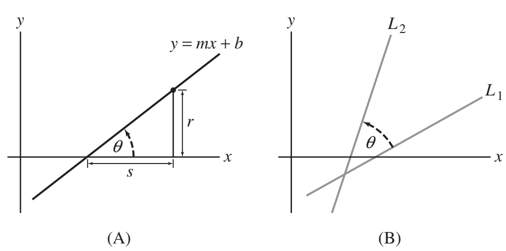

FIGURE 28

SOLUTION Using the distances labeled in Figure 28(A), we see that the slope of the line is given by the ratio r/s. The tangent of the angle θ is given by the same ratio. Therefore, $m = \tan\theta$.

62. Let L_1 and L_2 be the lines of slope m_1 and m_2 [Figure 28(B)]. Show that the angle θ between L_1 and L_2 satisfies $\cot\theta = \dfrac{m_2 m_1 + 1}{m_2 - m_1}$.

SOLUTION Measured from the positive x-axis, let α and β satisfy $\tan\alpha = m_1$ and $\tan\beta = m_2$. Without loss of generality, let $\beta \ge \alpha$. Then the angle between the two lines will be $\theta = \beta - \alpha$. Then from Exercise 60,

$$\cot\theta = \cot(\beta - \alpha) = \frac{\cot\beta\cot\alpha + 1}{\cot\alpha - \cot\beta} = \frac{(\frac{1}{m_1})(\frac{1}{m_2}) + 1}{\frac{1}{m_1} - \frac{1}{m_2}} = \frac{1 + m_1 m_2}{m_2 - m_1}$$

63. Perpendicular Lines Use Exercise 62 to prove that two lines with nonzero slopes m_1 and m_2 are perpendicular if and only if $m_2 = -1/m_1$.

SOLUTION If lines are perpendicular, then the angle between them is $\theta = \pi/2 \Rightarrow$

$$\cot(\pi/2) = \frac{1 + m_1 m_2}{m_1 - m_2}$$

$$0 = \frac{1 + m_1 m_2}{m_1 - m_2}$$

$$\Rightarrow m_1 m_2 = -1 \Rightarrow m_1 = -\frac{1}{m_2}$$

64. Apply the double-angle formula to prove:

(a) $\cos\frac{\pi}{8} = \frac{1}{2}\sqrt{2+\sqrt{2}}$

(b) $\cos\frac{\pi}{16} = \frac{1}{2}\sqrt{2+\sqrt{2+\sqrt{2}}}$

Guess the values of $\cos\frac{\pi}{32}$ and of $\cos\frac{\pi}{2^n}$ for all n.

SOLUTION

(a) $\cos\frac{\pi}{8} = \cos\frac{\pi/4}{2} = \sqrt{\frac{1+\cos\frac{\pi}{4}}{2}} = \sqrt{\frac{1+\frac{\sqrt{2}}{2}}{2}} = \frac{1}{2}\sqrt{2+\sqrt{2}}.$

(b) $\cos\frac{\pi}{16} = \sqrt{\frac{1+\cos\frac{\pi}{8}}{2}} = \sqrt{\frac{1+\frac{1}{2}\sqrt{2+\sqrt{2}}}{2}} = \frac{1}{2}\sqrt{2+\sqrt{2+\sqrt{2}}}.$

(c) Observe that $8 = 2^3$ and $\cos\frac{\pi}{8}$ involves two nested square roots of 2; further, $16 = 2^4$ and $\cos\frac{\pi}{16}$ involves three nested square roots of 2. Since $32 = 2^5$, it seems plausible that

$$\cos\frac{\pi}{32} = \frac{1}{2}\sqrt{2+\sqrt{2+\sqrt{2+\sqrt{2}}}},$$

and that $\cos\frac{\pi}{2^n}$ involves $n-1$ nested square roots of 2. Note that the general case can be proven by induction.

1.5 Inverse Functions

Preliminary Questions

1. Which of the following satisfy $f^{-1}(x) = f(x)$?

(a) $f(x) = x$

(b) $f(x) = 1 - x$

(c) $f(x) = 1$

(d) $f(x) = \sqrt{x}$

(e) $f(x) = |x|$

(f) $f(x) = x^{-1}$

SOLUTION The functions **(a)** $f(x) = x$, **(b)** $f(x) = 1 - x$ and **(f)** $f(x) = x^{-1}$ satisfy $f^{-1}(x) = f(x)$.

2. The graph of a function looks like the track of a roller coaster. Is the function one-to-one?

SOLUTION Because the graph looks like the track of a roller coaster, there will be several locations at which the graph has the same height. The graph will therefore fail the horizontal line test, meaning that the function is *not* one-to-one.

3. The function f maps teenagers in the United States to their last names. Explain why the inverse function f^{-1} does not exist.

SOLUTION Many different teenagers will have the same last name, so this function will not be one-to-one. Consequently, the function does not have an inverse.

4. The following fragment of a train schedule for the New Jersey Transit System defines a function f from towns to times. Is f one-to-one? What is $f^{-1}(6{:}27)$?

Trenton	6:21
Hamilton Township	6:27
Princeton Junction	6:34
New Brunswick	6:38

SOLUTION This function is one-to-one, and $f^{-1}(6{:}27) =$ Hamilton Township.

5. A homework problem asks for a sketch of the graph of the *inverse* of $f(x) = x + \cos x$. Frank, after trying but failing to find a formula for $f^{-1}(x)$, says it's impossible to graph the inverse. Bianca hands in an accurate sketch without solving for f^{-1}. How did Bianca complete the problem?

SOLUTION The graph of the inverse function is the reflection of the graph of $y = f(x)$ through the line $y = x$.

6. Which of the following quantities is undefined?

(a) $\sin^{-1}\left(-\frac{1}{2}\right)$

(b) $\cos^{-1}(2)$

(c) $\csc^{-1}\left(\frac{1}{2}\right)$

(d) $\csc^{-1}(2)$

SOLUTION **(b)** and **(c)** are undefined. $\sin^{-1}\left(-\frac{1}{2}\right) = -\frac{\pi}{6}$ and $\csc^{-1}(2) = \frac{\pi}{6}$.

7. Give an example of an angle θ such that $\cos^{-1}(\cos\theta) \neq \theta$. Does this contradict the definition of inverse function?

SOLUTION Any angle $\theta < 0$ or $\theta > \pi$ will work. No, this does not contradict the definition of inverse function.

Exercises

1. Show that $f(x) = 7x - 4$ is invertible and find its inverse.

SOLUTION Solving $y = 7x - 4$ for x yields $x = \frac{y+4}{7}$. Thus, $f^{-1}(x) = \frac{x+4}{7}$.

2. Is $f(x) = x^2 + 2$ one-to-one? If not, describe a domain on which it is one-to-one.

SOLUTION f is not one-to-one because $f(-1) = f(1) = 3$. However, if the domain is restricted to $x \geq 0$ or $x \leq 0$, then f is one-to-one.

3. What is the largest interval containing zero on which $f(x) = \sin x$ is one-to-one?

SOLUTION Looking at the graph of $\sin x$, the function is one-to-one on the interval $[-\pi/2, \pi/2]$.

4. Show that $f(x) = \frac{x-2}{x+3}$ is invertible and find its inverse.

(a) What is the domain of $f(x)$? The range of $f^{-1}(x)$?
(b) What is the domain of $f^{-1}(x)$? The range of $f(x)$?

SOLUTION We solve $y = f(x)$ for x as follows:

$$\begin{aligned} y &= \frac{x-2}{x+3} \\ yx + 3y &= x - 2 \\ yx - x &= -3y - 2 \\ x &= \frac{-3y-2}{y-1} = \frac{3y+2}{1-y}. \end{aligned}$$

Therefore,

$$f^{-1}(x) = \frac{3x+2}{1-x}.$$

(a) Domain of $f(x) = \{x | x \neq -3\} =$ Range of $f^{-1}(x)$.
(b) Domain of $f^{-1}(x) = \{x | x \neq 1\} =$ Range of $f(x)$.

5. Verify that $f(x) = x^3 + 3$ and $g(x) = (x-3)^{1/3}$ are inverses by showing that $f(g(x)) = x$ and $g(f(x)) = x$.

SOLUTION

- $f(g(x)) = \left((x-3)^{1/3}\right)^3 + 3 = x - 3 + 3 = x.$
- $g(f(x)) = \left(x^3 + 3 - 3\right)^{1/3} = \left(x^3\right)^{1/3} = x.$

6. Repeat Exercise 5 for $f(t) = \frac{t+1}{t-1}$ and $g(t) = \frac{t+1}{t-1}$.

SOLUTION

$$f(g(t)) = \frac{\frac{t+1}{t-1} + 1}{\frac{t+1}{t-1} - 1} = \frac{t+1+t-1}{t+1-(t-1)} = t.$$

The calculations for $g(f(t))$ are identical.

7. The escape velocity from a planet of radius R is $v(R) = \sqrt{\frac{2GM}{R}}$, where G is the universal gravitational constant and M is the mass. Find the inverse of $v(R)$ expressing R in terms of v.

SOLUTION To find the inverse, we solve

$$y = \sqrt{\frac{2GM}{R}}$$

for R. This yields

$$R = \frac{2GM}{y^2}.$$

Therefore,

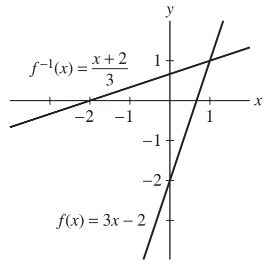
$$v^{-1}(R) = \frac{2GM}{R^2}.$$

In Exercises 8–15, find a domain on which f is one-to-one and a formula for the inverse of f restricted to this domain. Sketch the graphs of f and f^{-1}.

8. $f(x) = 3x - 2$

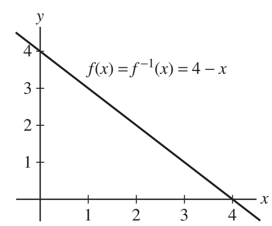
SOLUTION The linear function $f(x) = 3x - 2$ is one-to-one for all real numbers. Solving $y = 3x - 2$ for x gives $x = (y + 2)/3$. Thus,

$$f^{-1}(x) = \frac{x + 2}{3}.$$



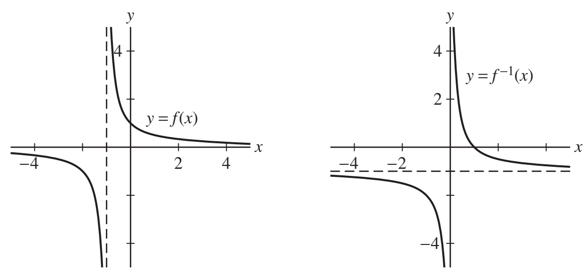
9. $f(x) = 4 - x$

SOLUTION The linear function $f(x) = 4 - x$ is one-to-one for all real numbers. Solving $y = x - 4$ for x gives $x = 4 - y$. Thus, $f^{-1}(x) = 4 - x$.



10. $f(x) = \dfrac{1}{x + 1}$

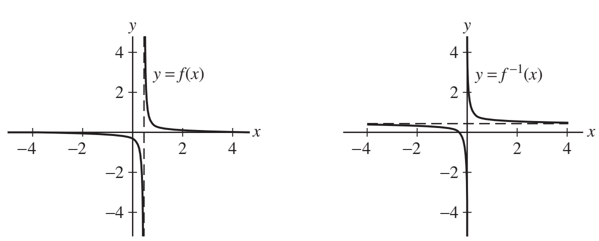
SOLUTION The graph of $f(x) = 1/(x + 1)$ given below shows that f passes the horizontal line test, and is therefore one-to-one, on its entire domain $\{x : x \neq -1\}$. Solving $y = \dfrac{1}{x+1}$ for x gives $x = \dfrac{1}{y} - 1$. Thus, $f^{-1}(x) = \dfrac{1}{x} - 1$.



11. $f(x) = \dfrac{1}{7x - 3}$

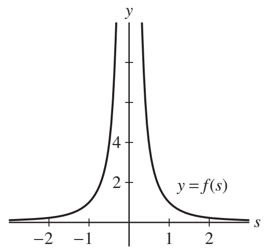
SOLUTION The graph of $f(x) = 1/(7x - 3)$ given below shows that f passes the horizontal line test, and is therefore one-to-one, on its entire domain $\{x : x \neq \frac{3}{7}\}$. Solving $y = 1/(7x - 3)$ for x gives

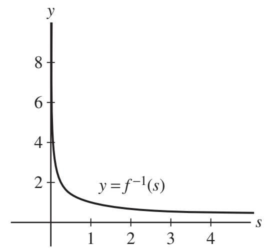
$$x = \frac{1}{7y} + \frac{3}{7}; \quad \text{thus,} \quad f^{-1}(x) = \frac{1}{7x} + \frac{3}{7}.$$



12. $f(s) = \dfrac{1}{s^2}$

SOLUTION To make $f(s) = s^{-2}$ one-to-one, we must restrict the domain to either $\{s : s > 0\}$ or $\{s : s < 0\}$. If we choose the domain $\{s : s > 0\}$, then solving $y = \dfrac{1}{s^2}$ for s yields $s = \dfrac{1}{\sqrt{y}}$. Hence, $f^{-1}(s) = \dfrac{1}{\sqrt{s}}$. Had we chosen the domain $\{s : s < 0\}$, the inverse would have been $f^{-1}(s) = -\dfrac{1}{\sqrt{s}}$.





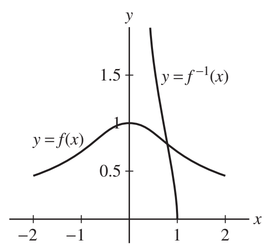
13. $f(x) = \dfrac{1}{\sqrt{x^2+1}}$

SOLUTION To make the function $f(x) = \dfrac{1}{\sqrt{x^2+1}}$ one-to-one, we must restrict the domain to either $\{x : x \geq 0\}$ or $\{x : x \leq 0\}$. If we choose the domain $\{x : x \geq 0\}$, then solving $y = \dfrac{1}{\sqrt{x^2+1}}$ for x yields

$$x = \frac{\sqrt{1-y^2}}{y}; \quad \text{hence,} \quad f^{-1}(x) = \frac{\sqrt{1-x^2}}{x}.$$

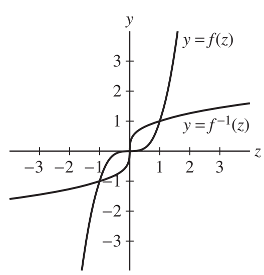
Had we chosen the domain $\{x : x \leq 0\}$, the inverse would have been

$$f^{-1}(x) = -\frac{\sqrt{1-x^2}}{x}.$$



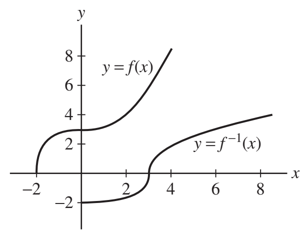
14. $f(z) = z^3$

SOLUTION The function $f(z) = z^3$ is one-to-one over its entire domain (see the graph below). Solving $y = z^3$ for z yields $y^{1/3} = z$. Thus, $f^{-1}(z) = z^{1/3}$.



15. $f(x) = \sqrt{x^3+9}$

SOLUTION The graph of $f(x) = \sqrt{x^3+9}$ given below shows that f passes the horizontal line test, and therefore is one-to-one, on its entire domain $\{x : x \geq -9^{1/3}\}$. Solving $y = \sqrt{x^3+9}$ for x yields $x = (y^2-9)^{1/3}$. Thus, $f^{-1}(x) = (x^2-9)^{1/3}$.



16. For each function shown in Figure 19, sketch the graph of the inverse (restrict the function's domain if necessary).

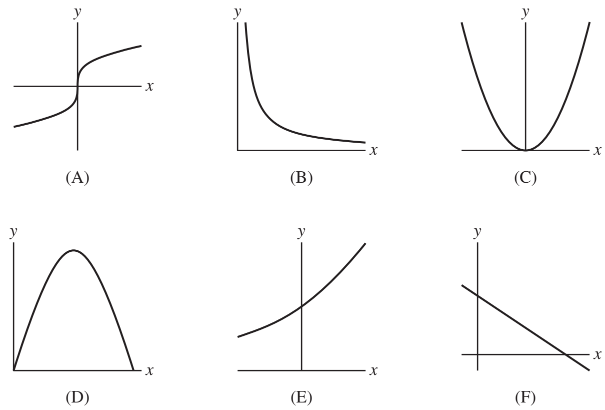


FIGURE 19

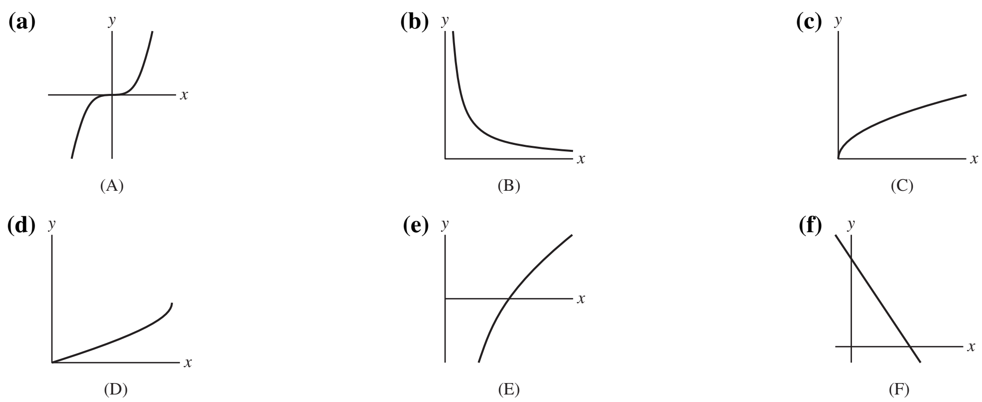
SOLUTION Here, we apply the rule that the graph of f^{-1} is obtained by reflecting the graph of f across the line $y = x$. For (C) and (D), we must restrict the domain of f to make f one-to-one.



17. Which of the graphs in Figure 20 is the graph of a function satisfying $f^{-1} = f$?

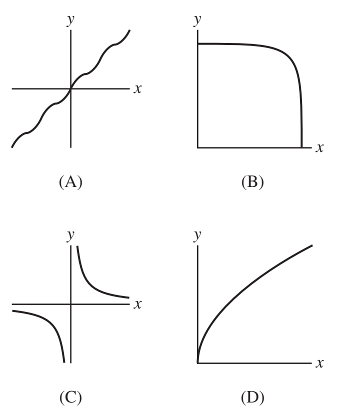


FIGURE 20

SOLUTION Figures (B) and (C) would not change when reflected around the line $y = x$. Therefore, these two satisfy $f^{-1} = f$.

18. Let n be a nonzero integer. Find a domain on which $f(x) = (1 - x^n)^{1/n}$ coincides with its inverse. *Hint:* The answer depends on whether n is even or odd.

SOLUTION First note

$$f(f(x)) = \left(1 - \left((1 - x^n)^{1/n}\right)^n\right)^{1/n} = \left(1 - (1 - x^n)\right)^{1/n} = (x^n)^{1/n} = x,$$

so $f(x)$ coincides with its inverse. For the domain and range of f, let's first consider the case when $n > 0$. If n is even, then $f(x)$ is defined only when $1 - x^n \geq 0$. Hence, the domain is $-1 \leq x \leq 1$. The range is $0 \leq y \leq 1$. If n is odd, then $f(x)$ is defined for all real numbers, and the range is also all real numbers. Now, suppose $n < 0$. Then $-n > 0$, and

$$f(x) = \left(1 - \frac{1}{x^{-n}}\right)^{-1/-n} = \left(\frac{x^{-n}}{x^{-n} - 1}\right)^{1/-n}.$$

If n is even, then $f(x)$ is defined only when $x^{-n} - 1 > 0$. Hence, the domain is $|x| > 1$. The range is $y > 1$. If n is odd, then $f(x)$ is defined for all real numbers except $x = 1$. The range is all real numbers except $y = 1$.

19. Let $f(x) = x^7 + x + 1$.

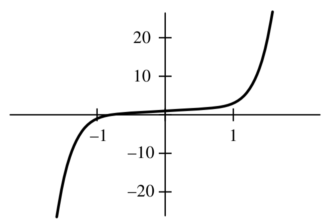
(a) Show that f^{-1} exists (but do not attempt to find it). *Hint:* Show that f is increasing.

(b) What is the domain of f^{-1}?

(c) Find $f^{-1}(3)$.

SOLUTION

(a) The graph of $f(x) = x^7 + x + 1$ is shown below. From this graph, we see that $f(x)$ is a strictly increasing function; by Example 3, it is therefore one-to-one. Because f is one-to-one, by Theorem 3, f^{-1} exists.

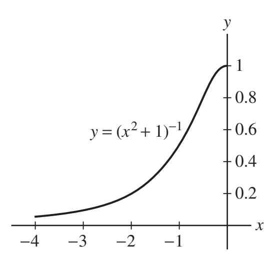


(b) The domain of $f^{-1}(x)$ is the range of $f(x) : (-\infty, \infty)$.

(c) Note that $f(1) = 1^7 + 1 + 1 = 3$; therefore, $f^{-1}(3) = 1$.

20. Show that $f(x) = (x^2 + 1)^{-1}$ is one-to-one on $(-\infty, 0]$, and find a formula for f^{-1} for this domain of f.

SOLUTION



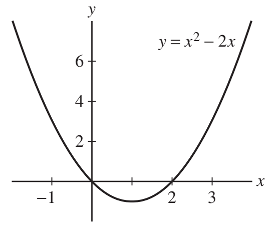
Notice that the graph of $f(x) = (x^2 + 1)^{-1}$ over the interval $(-\infty, 0]$ (shown above) passes the horizontal line test. Thus, $f(x)$ is one-to-one on $(-\infty, 0]$. To find a formula for f^{-1}, we solve $y = (x^2 + 1)^{-1}$ for x, which yields $x = \pm\sqrt{\frac{1}{y} - 1}$. Because the domain of f was restricted to $x \leq 0$, we choose the negative sign in front of the radical. Therefore, $f^{-1}(x) = -\sqrt{\frac{1}{x} - 1}$.

21. Let $f(x) = x^2 - 2x$. Determine a domain on which f^{-1} exists, and find a formula for f^{-1} for this domain of f.

SOLUTION From the graph of $y = x^2 - 2x$ shown below, we see that if the domain of f is restricted to either $x \leq 1$ or $x \geq 1$, then f is one-to-one and f^{-1} exists. To find a formula for f^{-1}, we solve $y = x^2 - 2x$ for x as follows:

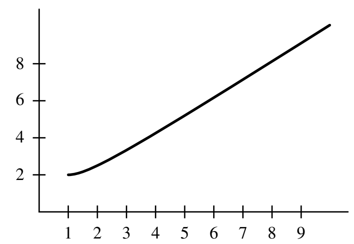
$$\begin{aligned} y + 1 &= x^2 - 2x + 1 = (x - 1)^2 \\ x - 1 &= \pm\sqrt{y + 1} \\ x &= 1 \pm \sqrt{y + 1} \end{aligned}$$

If the domain of f is restricted to $x \leq 1$, then we choose the negative sign in front of the radical and $f^{-1}(x) = 1 - \sqrt{x + 1}$. If the domain of f is restricted to $x \geq 1$, we choose the positive sign in front of the radical and $f^{-1}(x) = 1 + \sqrt{x + 1}$.



22. Show that $f(x) = x + x^{-1}$ is one-to-one on $[1, \infty)$, and find the corresponding inverse f^{-1}. What is the domain of f^{-1}?

SOLUTION The graph of $f(x) = x + x^{-1}$ on $[1, \infty)$ is shown below. From this graph, we see that for $x > 1$ the function is increasing, which implies that the function is one-to-one. Also, note that since f is increasing for $x > 1$, $f(x) \geq f(1) = 2$ for $x > 1$.



To find a formula for f^{-1}, let $y = x + x^{-1}$. Then $xy = x^2 + 1$ or $x^2 - xy + 1 = 0$. Using the quadratic formula, we find

$$x = \frac{y \pm \sqrt{y^2 - 4}}{2}.$$

To have $x \geq 1$ for $y \geq 2$, we must choose the positive sign in front of the radical. Thus,

$$f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2}$$

for $x \geq 2$.

In Exercises 23–28, evaluate without using a calculator.

23. $\cos^{-1} 1$

SOLUTION $\cos^{-1} 1 = 0$.

24. $\sin^{-1} \dfrac{1}{2}$

SOLUTION $\sin^{-1} \frac{1}{2} = \frac{\pi}{6}$.

25. $\cot^{-1} 1$

SOLUTION $\cot^{-1} 1 = \frac{\pi}{4}$.

26. $\sec^{-1} \dfrac{2}{\sqrt{3}}$

SOLUTION $\sec^{-1} \frac{2}{\sqrt{3}} = \frac{\pi}{6}$.

27. $\tan^{-1} \sqrt{3}$

SOLUTION $\tan^{-1} \sqrt{3} = \tan^{-1}\left(\frac{\sqrt{3}/2}{1/2}\right) = \frac{\pi}{3}$.

28. $\sin^{-1}(-1)$

SOLUTION $\sin^{-1}(-1) = -\frac{\pi}{2}$.

In Exercises 29–38, compute without using a calculator.

29. $\sin^{-1}\left(\sin \dfrac{\pi}{3}\right)$

SOLUTION $\sin^{-1}(\sin \frac{\pi}{3}) = \frac{\pi}{3}$.

30. $\sin^{-1}\left(\sin\dfrac{4\pi}{3}\right)$

SOLUTION $\sin^{-1}(\sin\frac{4\pi}{3}) = \sin^{-1}(-\frac{\sqrt{3}}{2}) = -\frac{\pi}{3}$. The answer is not $\frac{4\pi}{3}$ because $\frac{4\pi}{3}$ is not in the range of the inverse sine function.

31. $\cos^{-1}\left(\cos\dfrac{3\pi}{2}\right)$

SOLUTION $\cos^{-1}(\cos\frac{3\pi}{2}) = \cos^{-1}(0) = \frac{\pi}{2}$. The answer is not $\frac{3\pi}{2}$ because $\frac{3\pi}{2}$ is not in the range of the inverse cosine function.

32. $\sin^{-1}\left(\sin\left(-\dfrac{5\pi}{6}\right)\right)$

SOLUTION $\sin^{-1}(\sin(-\frac{5\pi}{6})) = \sin^{-1}(-\frac{1}{2}) = -\frac{\pi}{6}$. The answer is not $-\frac{5\pi}{6}$ because $-\frac{5\pi}{6}$ is not in the range of the inverse sine function.

33. $\tan^{-1}\left(\tan\dfrac{3\pi}{4}\right)$

SOLUTION $\tan^{-1}(\tan\frac{3\pi}{4}) = \tan^{-1}(-1) = -\frac{\pi}{4}$. The answer is not $\frac{3\pi}{4}$ because $\frac{3\pi}{4}$ is not in the range of the inverse tangent function.

34. $\tan^{-1}(\tan\pi)$

SOLUTION $\tan^{-1}(\tan\pi) = \tan^{-1}(0) = 0$. The answer is not π because π is not in the range of the inverse tangent function.

35. $\sec^{-1}(\sec 3\pi)$

SOLUTION $\sec^{-1}(\sec 3\pi) = \sec^{-1}(-1) = \pi$. The answer is not 3π because 3π is not in the range of the inverse secant function.

36. $\sec^{-1}\left(\sec\dfrac{3\pi}{2}\right)$

SOLUTION No inverse since $\sec\frac{3\pi}{2} = \frac{1}{\cos\frac{3\pi}{2}} = \frac{1}{0} \longrightarrow \infty$.

37. $\csc^{-1}\big(\csc(-\pi)\big)$

SOLUTION No inverse since $\csc(-\pi) = \frac{1}{\sin(-\pi)} = \frac{1}{0} \longrightarrow \infty$.

38. $\cot^{-1}\left(\cot\left(-\dfrac{\pi}{4}\right)\right)$

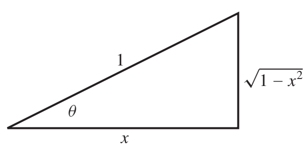
SOLUTION $\cot^{-1}\big(\cot(-\frac{\pi}{4})\big) = \cot^{-1}(-1) = \frac{3\pi}{4}$. The answer is not $-\frac{\pi}{4}$ because $-\frac{\pi}{4}$ is not in the range of the inverse cotangent function.

In Exercises 39–42, simplify by referring to the appropriate triangle or trigonometric identity.

39. $\tan(\cos^{-1} x)$

SOLUTION Let $\theta = \cos^{-1} x$. Then $\cos\theta = x$ and we generate the triangle shown below. From the triangle,

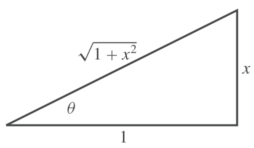
$$\tan(\cos^{-1} x) = \tan\theta = \frac{\sqrt{1-x^2}}{x}.$$



40. $\cos(\tan^{-1} x)$

SOLUTION Let $\theta = \tan^{-1} x$. Then $\tan\theta = x$ and we generate the triangle shown below. From the triangle,

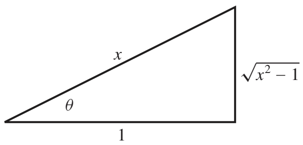
$$\cos(\tan^{-1} x) = \cos\theta = \frac{1}{\sqrt{x^2+1}}.$$



41. $\cot(\sec^{-1} x)$

SOLUTION Let $\theta = \sec^{-1} x$. Then $\sec\theta = x$ and we generate the triangle shown below. From the triangle,

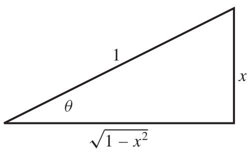
$$\cot(\sec^{-1} x) = \cot\theta = \frac{1}{\sqrt{x^2 - 1}}.$$



42. $\cot(\sin^{-1} x)$

SOLUTION Let $\theta = \sin^{-1} x$. Then $\sin\theta = x$ and we generate the triangle shown below. From the triangle,

$$\cot(\sin^{-1} x) = \cot\theta = \frac{\sqrt{1 - x^2}}{x}.$$

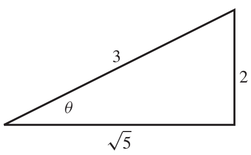


In Exercises 43–50, refer to the appropriate triangle or trigonometric identity to compute the given value.

43. $\cos\left(\sin^{-1} \frac{2}{3}\right)$

SOLUTION Let $\theta = \sin^{-1} \frac{2}{3}$. Then $\sin\theta = \frac{2}{3}$ and we generate the triangle shown below. From the triangle,

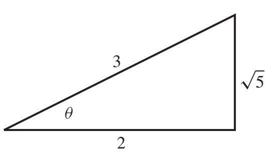
$$\cos\left(\sin^{-1} \frac{2}{3}\right) = \cos\theta = \frac{\sqrt{5}}{3}.$$



44. $\tan\left(\cos^{-1} \frac{2}{3}\right)$

SOLUTION Let $\theta = \cos^{-1} \frac{2}{3}$. Then $\cos\theta = \frac{2}{3}$ and we generate the triangle shown below. From the triangle,

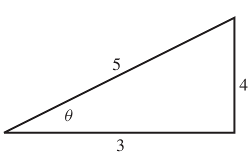
$$\tan\left(\cos^{-1} \frac{2}{3}\right) = \tan\theta = \frac{\sqrt{5}}{2}.$$



45. $\tan\left(\sin^{-1} 0.8\right)$

SOLUTION Let $\theta = \sin^{-1} 0.8$. Then $\sin\theta = 0.8 = \frac{4}{5}$ and we generate the triangle shown below. From the triangle,

$$\tan(\sin^{-1} 0.8) = \tan\theta = \frac{4}{3}.$$



46. $\cos\left(\cot^{-1} 1\right)$

SOLUTION $\cot^{-1} 1 = \frac{\pi}{4}$. Hence, $\cos(\cot^{-1} 1) = \cos\frac{\pi}{4} = \frac{\sqrt{2}}{2}$.

47. $\cot\left(\csc^{-1} 2\right)$

SOLUTION $\csc^{-1} 2 = \frac{\pi}{6}$. Hence, $\cot(\csc^{-1} 2) = \cot\frac{\pi}{6} = \sqrt{3}$.

48. $\tan\left(\sec^{-1}(-2)\right)$

SOLUTION $\sec^{-1}(-2) = \frac{2\pi}{3}$. Hence $\tan(\sec^{-1}(-2)) = \tan\frac{2\pi}{3} = -\sqrt{3}$.

49. $\cot\left(\tan^{-1} 20\right)$

SOLUTION Let $\theta = \tan^{-1} 20$. Then $\tan\theta = 20$, so $\cot(\tan^{-1} 20) = \cot\theta = \frac{1}{\tan\theta} = \frac{1}{20}$.

50. $\sin\left(\csc^{-1} 20\right)$

SOLUTION Let $\theta = \csc^{-1} 20$. Then $\csc\theta = 20$, so $\sin(\csc^{-1} 20) = \sin\theta = \frac{1}{\csc\theta} = \frac{1}{20}$.

Further Insights and Challenges

51. Show that if $f(x)$ is odd and $f^{-1}(x)$ exists, then $f^{-1}(x)$ is odd. Show, on the other hand, that an even function does not have an inverse.

SOLUTION Suppose $f(x)$ is odd and $f^{-1}(x)$ exists. Because $f(x)$ is odd, $f(-x) = -f(x)$. Let $y = f^{-1}(x)$, then $f(y) = x$. Since $f(x)$ is odd, $f(-y) = -f(y) = -x$. Thus $f^{-1}(-x) = -y = -f^{-1}(x)$. Hence, f^{-1} is odd.

On the other hand, if $f(x)$ is even, then $f(-x) = f(x)$. Hence, f is not one-to-one and f^{-1} does not exist.

52. A cylindrical tank of radius R and length L lying horizontally as in Figure 21 is filled with oil to height h. Show that the volume $V(h)$ of oil in the tank as a function of height h is

$$V(h) = L\left(R^2\cos^{-1}\left(1 - \frac{h}{R}\right) - (R-h)\sqrt{2hR - h^2}\right)$$

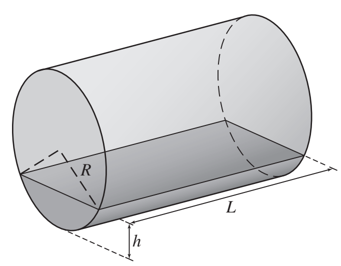


FIGURE 21 Oil in the tank has level h.

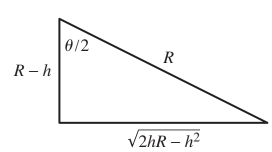
SOLUTION From Figure 21, we see that the volume of oil in the tank, $V(h)$, is equal to L times $A(h)$, the area of that portion of the circular cross section occupied by the oil. Now,

$$A(h) = \text{area of sector} - \text{area of triangle} = \frac{R^2\theta}{2} - \frac{R^2\sin\theta}{2},$$

where θ is the central angle of the sector. Referring to the diagram below,

$$\cos\frac{\theta}{2} = \frac{R-h}{R} \quad \text{and} \quad \sin\frac{\theta}{2} = \frac{\sqrt{2hR - h^2}}{R}.$$



Thus,

$$\theta = 2\cos^{-1}\left(1 - \frac{h}{R}\right),$$

$$\sin\theta = 2\sin\frac{\theta}{2}\cos\frac{\theta}{2} = 2\frac{(R-h)\sqrt{2hR - h^2}}{R^2},$$

and

$$V(h) = L\left(R^2\cos^{-1}\left(1 - \frac{h}{R}\right) - (R-h)\sqrt{2hR - h^2}\right).$$

1.6 Exponential and Logarithmic Functions

Preliminary Questions

1. Which of the following equations is incorrect?

(a) $3^2 \cdot 3^5 = 3^7$

(b) $(\sqrt{5})^{4/3} = 5^{2/3}$

(c) $3^2 \cdot 2^3 = 1$

(d) $(2^{-2})^{-2} = 16$

SOLUTION

(a) This equation is correct: $3^2 \cdot 3^5 = 3^{2+5} = 3^7$.

(b) This equation is correct: $(\sqrt{5})^{4/3} = (5^{1/2})^{4/3} = 5^{(1/2)\cdot(4/3)} = 5^{2/3}$.

(c) This equation is incorrect: $3^2 \cdot 2^3 = 9 \cdot 8 = 72 \neq 1$.

(d) this equation is correct: $(2^{-2})^{-2} = 2^{(-2)\cdot(-2)} = 2^4 = 16$.

2. Compute $\log_{b^2}(b^4)$.

SOLUTION Because $b^4 = (b^2)^2$, $\log_{b^2}(b^4) = 2$.

3. When is $\ln x$ negative?

SOLUTION $\ln x$ is negative for $0 < x < 1$.

4. What is $\ln(-3)$? Explain.

SOLUTION $\ln(-3)$ is not defined.

5. Explain the phrase "The logarithm converts multiplication into addition."

SOLUTION This phrase is a verbal description of the general property of logarithms that states

$$\log(ab) = \log a + \log b.$$

6. What are the domain and range of $\ln x$?

SOLUTION The domain of $\ln x$ is $x > 0$ and the range is all real numbers.

7. Which hyperbolic functions take on only positive values?

SOLUTION $\cosh x$ and $\operatorname{sech} x$ take on only positive values.

8. Which hyperbolic functions are increasing on their domains?

SOLUTION $\sinh x$ and $\tanh x$ are increasing on their domains.

9. Describe three properties of hyperbolic functions that have trigonometric analogs.

SOLUTION Hyperbolic functions have the following analogs with trigonometric functions: parity, identities and derivative formulas.

Exercises

1. Rewrite as a whole number (without using a calculator):

(a) 7^0

(b) $10^2(2^{-2} + 5^{-2})$

(c) $\dfrac{(4^3)^5}{(4^5)^3}$

(d) $27^{4/3}$

(e) $8^{-1/3} \cdot 8^{5/3}$

(f) $3 \cdot 4^{1/4} - 12 \cdot 2^{-3/2}$

SOLUTION

(a) $7^0 = 1$.
(b) $10^2(2^{-2} + 5^{-2}) = 100(1/4 + 1/25) = 25 + 4 = 29$.
(c) $(4^3)^5/(4^5)^3 = 4^{15}/4^{15} = 1$.
(d) $(27)^{4/3} = (27^{1/3})^4 = 3^4 = 81$.
(e) $8^{-1/3} \cdot 8^{5/3} = (8^{1/3})^5/8^{1/3} = 2^5/2 = 2^4 = 16$.
(f) $3 \cdot 4^{1/4} - 12 \cdot 2^{-3/2} = 3 \cdot 2^{1/2} - 3 \cdot 2^2 \cdot 2^{-3/2} = 0$.

In Exercises 2–10, solve for the unknown variable.

2. $9^{2x} = 9^8$

SOLUTION If $9^{2x} = 9^8$, then $2x = 8$, and $x = 4$.

3. $e^{2x} = e^{x+1}$

SOLUTION If $e^{2x} = e^{x+1}$ then $2x = x + 1$, and $x = 1$.

4. $e^{t^2} = e^{4t-3}$

SOLUTION If $e^{t^2} = e^{4t-3}$, then $t^2 = 4t - 3$ or $t^2 - 4t + 3 = (t - 3)(t - 1) = 0$. Thus, $t = 1$ or $t = 3$.

5. $3^x = \left(\frac{1}{3}\right)^{x+1}$

SOLUTION Rewrite $(\frac{1}{3})^{x+1}$ as $(3^{-1})^{x+1} = 3^{-x-1}$. Then $3^x = 3^{-x-1}$, which requires $x = -x - 1$. Thus, $x = -1/2$.

6. $(\sqrt{5})^x = 125$

SOLUTION Rewrite $(\sqrt{5})^x$ as $(5^{1/2})^x = 5^{x/2}$ and 125 as 5^3. Then $5^{x/2} = 5^3$, so $x/2 = 3$ and $x = 6$.

7. $4^{-x} = 2^{x+1}$

SOLUTION Rewrite 4^{-x} as $(2^2)^{-x} = 2^{-2x}$. Then $2^{-2x} = 2^{x+1}$, which requires $-2x = x + 1$. Solving for x gives $x = -1/3$.

8. $b^4 = 10^{12}$

SOLUTION $b^4 = 10^{12}$ is equivalent to $b^4 = (10^3)^4$ so $b = 10^3$. Alternately, raise both sides of the equation to the one-fourth power. This gives $b = (10^{12})^{1/4} = 10^3$.

9. $k^{3/2} = 27$

SOLUTION Raise both sides of the equation to the two-thirds power. This gives $k = (27)^{2/3} = (27^{1/3})^2 = 3^2 = 9$.

10. $\left(b^2\right)^{x+1} = b^{-6}$

SOLUTION Rewrite $(b^2)^{x+1}$ as $b^{2(x+1)}$. Then $2(x + 1) = -6$, and $x = -4$.

In Exercises 11–26, calculate without using a calculator.

11. $\log_3 27$

SOLUTION $\log_3 27 = \log_3 3^3 = 3 \log_3 3 = 3$.

12. $\log_5 \frac{1}{25}$

SOLUTION $\log_5 \dfrac{1}{25} = \log_5 5^{-2} = -2 \log_5 5 = -2$.

13. $\ln 1$

SOLUTION $\ln 1 = 0$.

14. $\log_5(5^4)$

SOLUTION $\log_5(5^4) = 4 \log_5 5 = 4$.

15. $\log_2(2^{5/3})$

SOLUTION $\log_2 2^{5/3} = \dfrac{5}{3} \log_2 2 = \dfrac{5}{3}$.

16. $\log_2(8^{5/3})$

SOLUTION $\log_2(8^{5/3}) = \dfrac{5}{3} \log_2 2^3 = 5 \log_2 2 = 5$.

17. $\log_{64} 4$

SOLUTION $\log_{64} 4 = \log_{64} 64^{1/3} = \frac{1}{3}\log_{64} 64 = \frac{1}{3}$.

18. $\log_7(49^2)$

SOLUTION $\log_7 49^2 = 2\log_7 7^2 = 2 \cdot 2 \cdot \log_7 7 = 4$.

19. $\log_8 2 + \log_4 2$

SOLUTION $\log_8 2 + \log_4 2 = \log_8 8^{1/3} + \log_4 4^{1/2} = \frac{1}{3} + \frac{1}{2} = \frac{5}{6}$.

20. $\log_{25} 30 + \log_{25} \frac{5}{6}$

SOLUTION $\log_{25} 30 + \log_{25} \frac{5}{6} = \log_{25}\left(30 \cdot \frac{5}{6}\right) = \log_{25} 25 = 1$.

21. $\log_4 48 - \log_4 12$

SOLUTION $\log_4 48 - \log_4 12 = \log_4 \frac{48}{12} = \log_4 4 = 1$.

22. $\ln(\sqrt{e} \cdot e^{7/5})$

SOLUTION $\ln(\sqrt{e} \cdot e^{7/5}) = \ln(e^{1/2} \cdot e^{7/5}) = \ln(e^{1/2+7/5}) = \ln(e^{19/10}) = \frac{19}{10}$.

23. $\ln(e^3) + \ln(e^4)$

SOLUTION $\ln(e^3) + \ln(e^4) = 3 + 4 = 7$.

24. $\log_2 \frac{4}{3} + \log_2 24$

SOLUTION $\log_2 \frac{4}{3} + \log_2 24 = \log_2\left(\frac{4}{3} \cdot 24\right) = \log_2 32 = \log_2 2^5 = 5\log_2 2 = 5$.

25. $7^{\log_7(29)}$

SOLUTION $7^{\log_7(29)} = 29$.

26. $8^{3\log_8(2)}$

SOLUTION $8^{3\log_8(2)} = 8^{\log_8(2^3)} = 8^{\log_8(8)} = 8^1 = 8$.

27. Write as the natural log of a single expression:

(a) $2\ln 5 + 3\ln 4$

(b) $5\ln(x^{1/2}) + \ln(9x)$

SOLUTION

(a) $2\ln 5 + 3\ln 4 = \ln 5^2 + \ln 4^3 = \ln 25 + \ln 64 = \ln(25 \cdot 64) = \ln 1600$.

(b) $5\ln x^{1/2} + \ln 9x = \ln x^{5/2} + \ln 9x = \ln(x^{5/2} \cdot 9x) = \ln(9x^{7/2})$.

28. Solve for x: $\ln(x^2 + 1) - 3\ln x = \ln(2)$.

SOLUTION Combining terms on the left-hand side gives

$$\ln(x^2 + 1) - 3\ln x = \ln(x^2 + 1) - \ln x^3 = \ln \frac{x^2 + 1}{x^3}.$$

Therefore, $\frac{x^2+1}{x^3} = 2$ or $2x^3 - x^2 - 1 = 0$; $x = 1$ is the only real root to this equation. Substituting $x = 1$ into the original equation, we find

$$\ln 2 - 3\ln 1 = \ln 2 - 0 = \ln 2$$

as needed. Hence, $x = 1$ is the only solution.

In Exercises 29–34, solve for the unknown.

29. $7e^{5t} = 100$

SOLUTION Divide the equation by 7 and then take the natural logarithm of both sides. This gives

$$5t = \ln\left(\frac{100}{7}\right) \quad \text{or} \quad t = \frac{1}{5}\ln\left(\frac{100}{7}\right).$$

30. $6e^{-4t} = 2$

SOLUTION Divide the equation by 6 and then take the natural logarithm of both sides. This gives

$$-4t = \ln\left(\frac{1}{3}\right) \quad \text{or} \quad t = \frac{\ln 3}{4}.$$

31. $2^{x^2-2x} = 8$

SOLUTION Since $8 = 2^3$, we have $x^2 - 2x - 3 = 0$ or $(x-3)(x+1) = 0$. Thus, $x = -1$ or $x = 3$.

32. $e^{2t+1} = 9e^{1-t}$

SOLUTION Taking the natural logarithm of both sides of the equation gives

$$2t + 1 = \ln\left(9e^{1-t}\right) = \ln 9 + \ln e^{1-t} = \ln 9 + (1-t).$$

Thus, $3t = \ln 9$ or $t = \frac{1}{3}\ln 9$.

33. $\ln(x^4) - \ln(x^2) = 2$

SOLUTION $\ln(x^4) - \ln(x^2) = \ln\left(\dfrac{x^4}{x^2}\right) = \ln(x^2) = 2\ln x$. Thus, $2\ln x = 2$ or $\ln x = 1$. Hence, $x = e$.

34. $\log_3 y + 3\log_3(y^2) = 14$

SOLUTION $14 = \log_3 y + 3\log_3(y^2) = \log_3 y + \log_3 y^6 = \log_3 y^7$. Thus, $y^7 = 3^{14}$ or $y = 3^2 = 9$.

35. Use a calculator to compute $\sinh x$ and $\cosh x$ for $x = -3, 0, 5$.

SOLUTION

x	-3	0	5
$\sinh x = \dfrac{e^x - e^{-x}}{2}$	$\dfrac{e^{-3} - e^3}{2} = -10.0179$	$\dfrac{e^0 - e^0}{2} = 0$	$\dfrac{e^5 - e^{-5}}{2} = 74.203$
$\cosh x = \dfrac{e^x + e^{-x}}{2}$	$\dfrac{e^{-3} + e^3}{2} = 10.0677$	$\dfrac{e^0 + e^0}{2} = 1$	$\dfrac{e^5 + e^{-5}}{2} = 74.210$

36. Compute $\sinh(\ln 5)$ and $\tanh(3\ln 5)$ without using a calculator.

SOLUTION

$$\sinh(\ln 5) = \frac{e^{\ln 5} - e^{-\ln 5}}{2} = \frac{5 - 1/5}{2} = \frac{24/5}{2} = 12/5;$$

$$\tanh(3\ln 5) = \frac{\sinh(3\ln 5)}{\cosh(3\ln 5)} = \frac{\frac{e^{3\ln 5} - e^{-3\ln 5}}{2}}{\frac{e^{3\ln 5} + e^{-3\ln 5}}{2}} = \frac{5^3 - 1/5^3}{5^3 + 1/5^3} = \frac{5^6 - 1}{5^6 + 1}.$$

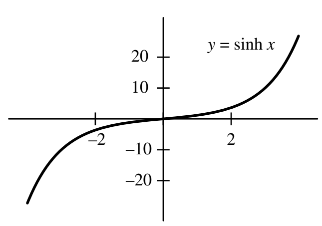
37. Show, by producing a counterexample, that $\ln(ab)$ is not equal to $(\ln a)(\ln b)$.

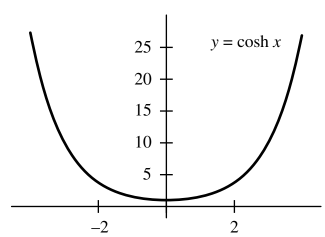
SOLUTION Let $a = e^2$ and $b = e^3$. Then $ab = e^5$ and $\ln(ab) = \ln(e^5) = 5$; however,

$$(\ln a)(\ln b) = (\ln e^2)(\ln e^3) = 2(3) = 6.$$

38. For which values of x are $y = \sinh x$ and $y = \cosh x$ increasing and decreasing?

SOLUTION The graph of $y = \sinh x$ is shown below on the left. From this graph, we see that $\sinh x$ is increasing for all x. On the other hand, from the graph of $y = \cosh x$ shown below on the right, we see that $\cosh x$ is decreasing for $x < 0$ and is increasing for $x > 0$.





39. Show that $y = \tanh x$ is an odd function.

SOLUTION $\tanh(-x) = \dfrac{e^{-x} - e^{-(-x)}}{e^{-x} + e^{-(-x)}} = \dfrac{e^{-x} - e^{x}}{e^{-x} + e^{x}} = -\dfrac{e^{x} - e^{-x}}{e^{x} + e^{-x}} = -\tanh x.$

40. The population of a city (in millions) at time t (years) is $P(t) = 2.4e^{0.06t}$, where $t = 0$ is the year 2000. When will the population double from its size at $t = 0$?

SOLUTION Population doubles when $4.8 = 2.4e^{0.06t}$. Thus, $0.06t = \ln 2$ or $t = \dfrac{\ln 2}{0.06} \approx 11.55$ years.

41. The **Gutenberg–Richter Law** states that the number N of earthquakes per year worldwide of Richter magnitude at least M satisfies an approximate relation $\log_{10} N = a - M$ for some constant a. Find a, assuming that there is one earthquake of magnitude $M \geq 8$ per year. How many earthquakes of magnitude $M \geq 5$ occur per year?

SOLUTION Substituting $N = 1$ and $M = 8$ into the Gutenberg–Richter law and solving for a yields

$$a = 8 + \log_{10} 1 = 8.$$

The number N of earthquakes of Richter magnitude $M \geq 5$ then satisfies

$$\log_{10} N = 8 - 5 = 3.$$

Finally, $N = 10^3 = 1000$ earthquakes.

42. The energy E (in joules) radiated as seismic waves from an earthquake of Richter magnitude M is given by the formula $\log_{10} E = 4.8 + 1.5M$.

(a) Express E as a function of M.

(b) Show that when M increases by 1, the energy increases by a factor of approximately 31.6.

SOLUTION

(a) Solving $\log_{10} E = 4.8 + 1.5M$ for E yields

$$E = 10^{4.8+1.5M}.$$

(b) Using the formula from part (a), we find

$$\frac{E(M+1)}{E(M)} = \frac{10^{4.8+1.5(M+1)}}{10^{4.8+1.5M}} = \frac{10^{6.3+1.5M}}{10^{4.8+1.5M}} = 10^{1.5} \approx 31.6228.$$

43. Refer to the graphs to explain why the equation $\sinh x = t$ has a unique solution for every t and why $\cosh x = t$ has two solutions for every $t > 1$.

SOLUTION From its graph we see that $\sinh x$ is a one-to-one function with $\lim_{x\to-\infty} \sinh x = -\infty$ and $\lim_{x\to\infty} \sinh x = \infty$. Thus, for every real number t, the equation $\sinh x = t$ has a unique solution. On the other hand, from its graph, we see that $\cosh x$ is not one-to-one. Rather, it is an even function with a minimum value of $\cosh 0 = 1$. Thus, for every $t > 1$, the equation $\cosh x = t$ has two solutions: one positive, the other negative.

44. Compute $\cosh x$ and $\tanh x$, assuming that $\sinh x = 0.8$.

SOLUTION Using the identity $\cosh^2 x - \sinh^2 x = 1$, it follows that $\cosh^2 x - (\frac{4}{5})^2 = 1$, so that $\cosh^2 x = \frac{41}{25}$ and

$$\cosh x = \frac{\sqrt{41}}{5}.$$

Then, by definition,

$$\tanh x = \frac{\sinh x}{\cosh x} = \frac{\frac{4}{5}}{\frac{\sqrt{41}}{5}} = \frac{4}{\sqrt{41}}.$$

45. Prove the addition formula for $\cosh x$.

SOLUTION

$$\begin{aligned}
\cosh(x+y) &= \frac{e^{x+y} + e^{-(x+y)}}{2} = \frac{2e^{x+y} + 2e^{-(x+y)}}{4} \\
&= \frac{e^{x+y} + e^{-x+y} + e^{x-y} + e^{-(x+y)}}{4} + \frac{e^{x+y} - e^{-x+y} - e^{x-y} + e^{-(x+y)}}{4} \\
&= \left(\frac{e^x + e^{-x}}{2}\right)\left(\frac{e^y + e^{-y}}{2}\right) + \left(\frac{e^x - e^{-x}}{2}\right)\left(\frac{e^y - e^{-y}}{2}\right) \\
&= \cosh x \cosh y + \sinh x \sinh y.
\end{aligned}$$

46. Use the addition formulas to prove

$$\sinh(2x) = 2\cosh x \sinh x$$

$$\cosh(2x) = \cosh^2 x + \sinh^2 x$$

SOLUTION $\sinh(2x) = \sinh(x + x) = \sinh x \cosh x + \cosh x \sinh x = 2\cosh x \sinh x$ and $\cosh(2x) = \cosh(x + x) = \cosh x \cosh x + \sinh x \sinh x = \cosh^2 x + \sinh^2 x$.

47. An (imaginary) train moves along a track at velocity v. Bionica walks down the aisle of the train with velocity u in the direction of the train's motion. Compute the velocity w of Bionica relative to the ground using the laws of both Galileo and Einstein in the following cases.

(a) $v = 500$ m/s and $u = 10$ m/s. Is your calculator accurate enough to detect the difference between the two laws?

(b) $v = 10^7$ m/s and $u = 10^6$ m/s.

SOLUTION Recall that the speed of light is $c \approx 3 \times 10^8$ m/s.

(a) By Galileo's law, $w = 500 + 10 = 510$ m/s. Using Einstein's law and a calculator,

$$\tanh^{-1}\frac{w}{c} = \tanh^{-1}\frac{500}{c} + \tanh^{-1}\frac{10}{c} = 1.7 \times 10^{-6};$$

so $w = c \cdot \tanh(1.7 \times 10^{-6}) \approx 510$ m/s. No, the calculator was not accurate enough to detect the difference between the two laws.

(b) By Galileo's law, $u + v = 10^7 + 10^6 = 1.1 \times 10^7$ m/s. By Einstein's law,

$$\tanh^{-1}\frac{w}{c} = \tanh^{-1}\frac{10^7}{3 \times 10^8} + \tanh^{-1}\frac{10^6}{3 \times 10^8} \approx 0.036679,$$

so $w \approx c \cdot \tanh(0.036679) \approx 1.09988 \times 10^7$ m/s.

Further Insights and Challenges

48. Show that $\log_a b \log_b a = 1$.

SOLUTION $\log_a b = \dfrac{\ln b}{\ln a}$ and $\log_b a = \dfrac{\ln a}{\ln b}$. Thus $\log_a b \cdot \log_b a = \dfrac{\ln b}{\ln a} \cdot \dfrac{\ln a}{\ln b} = 1$.

49. Verify the formula $\log_b x = \dfrac{\log_a x}{\log_a b}$ for $a, b > 0$.

SOLUTION Let $y = \log_b x$. Then $x = b^y$ and $\log_a x = \log_a b^y = y \log_a b$. Thus, $y = \dfrac{\log_a x}{\log_a b}$.

50. **(a)** Use the addition formulas for $\sinh x$ and $\cosh x$ to prove

$$\tanh(u + v) = \frac{\tanh u + \tanh v}{1 + \tanh u \tanh v}$$

(b) Use (a) to show that Einstein's Law of Velocity Addition [Eq. (3)] is equivalent to

$$w = \frac{u + v}{1 + \frac{uv}{c^2}}$$

SOLUTION

(a)

$$\tanh(u + v) = \frac{\sinh(u + v)}{\cosh(u + v)} = \frac{\sinh u \cosh v + \cosh u \sinh v}{\cosh u \cosh v + \sinh u \sinh v}$$

$$= \frac{\sinh u \cosh v + \cosh u \sinh v}{\cosh u \cosh v + \sinh u \sinh v} \cdot \frac{1/(\cosh u \cosh v)}{1/(\cosh u \cosh v)} = \frac{\tanh u + \tanh v}{1 + \tanh u \tanh v}$$

(b) Einstein's law states: $\tanh^{-1}(w/c) = \tanh^{-1}(u/c) + \tanh^{-1}(v/c)$. Thus

$$\frac{w}{c} = \tanh\left(\tanh^{-1}(u/c) + \tanh^{-1}(v/c)\right) = \frac{\tanh(\tanh^{-1}(v/c)) + \tanh(\tanh^{-1}(u/c))}{1 + \tanh(\tanh^{-1}(v/c))\tanh(\tanh^{-1}(u/c))}$$

$$= \frac{\frac{v}{c} + \frac{u}{c}}{1 + \frac{v}{c}\frac{u}{c}} = \frac{(1/c)(u + v)}{1 + \frac{uv}{c^2}}.$$

Hence,

$$w = \frac{u + v}{1 + \frac{uv}{c^2}}.$$

51. Prove that every function $f(x)$ can be written as a sum $f(x) = f_+(x) + f_-(x)$ of an even function $f_+(x)$ and an odd function $f_-(x)$. Express $f(x) = 5e^x + 8e^{-x}$ in terms of $\cosh x$ and $\sinh x$.

SOLUTION Let $f_+(x) = \frac{f(x)+f(-x)}{2}$ and $f_-(x) = \frac{f(x)-f(-x)}{2}$. Then $f_+ + f_- = \frac{2f(x)}{2} = f(x)$. Moreover,

$$f_+(-x) = \frac{f(-x) + f(-(-x))}{2} = \frac{f(-x) + f(x)}{2} = f_+(x),$$

so $f_+(x)$ is an even function, while

$$\begin{aligned} f_-(-x) &= \frac{f(-x) - f(-(-x))}{2} \\ &= \frac{f(-x) - f(x)}{2} = -\frac{(f(x) - f(-x))}{2} = -f_-(x), \end{aligned}$$

so $f_-(x)$ is an odd function.

For $f(x) = 5e^x + 8e^{-x}$, we have

$$f_+(x) = \frac{5e^x + 8e^{-x} + 5e^{-x} + 8e^x}{2} = 8\cosh x + 5\cosh x = 13\cosh x$$

and

$$f_-(x) = \frac{5e^x + 8e^{-x} - 5e^{-x} - 8e^x}{2} = 5\sinh x - 8\sinh x = -3\sinh x.$$

Therefore, $f(x) = f_+(x) + f_-(x) = 13\cosh x - 3\sinh x$.

1.7 Technology: Calculators and Computers

Preliminary Questions

1. Is there a definite way of choosing the optimal viewing rectangle, or is it best to experiment until you find a viewing rectangle appropriate to the problem at hand?

SOLUTION It is best to experiment with the window size until one is found that is appropriate for the problem at hand.

2. Describe the calculator screen produced when the function $y = 3 + x^2$ is plotted with viewing rectangle:

(a) $[-1, 1] \times [0, 2]$ **(b)** $[0, 1] \times [0, 4]$

SOLUTION

(a) Using the viewing rectangle $[-1, 1]$ by $[0, 2]$, the screen will display nothing as the minimum value of $y = 3 + x^2$ is $y = 3$.

(b) Using the viewing rectangle $[0, 1]$ by $[0, 4]$, the screen will display the portion of the parabola between the points $(0, 3)$ and $(1, 4)$.

3. According to the evidence in Example 4, it appears that $f(n) = (1 + 1/n)^n$ never takes on a value greater than 3 for $n > 0$. Does this evidence *prove* that $f(n) \le 3$ for $n > 0$?

SOLUTION No, this evidence does not constitute a proof that $f(n) \le 3$ for $n \ge 0$.

4. How can a graphing calculator be used to find the minimum value of a function?

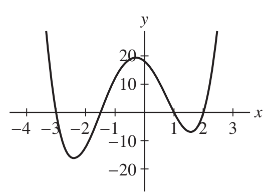
SOLUTION Experiment with the viewing window to zoom in on the lowest point on the graph of the function. The y-coordinate of the lowest point on the graph is the minimum value of the function.

Exercises

The exercises in this section should be done using a graphing calculator or computer algebra system.

1. Plot $f(x) = 2x^4 + 3x^3 - 14x^2 - 9x + 18$ in the appropriate viewing rectangles and determine its roots.

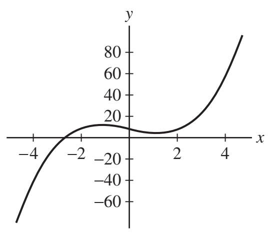
SOLUTION Using a viewing rectangle of $[-4, 3]$ by $[-20, 20]$, we obtain the plot below.



Now, the roots of $f(x)$ are the x-intercepts of the graph of $y = f(x)$. From the plot, we can identify the x-intercepts as -3, -1.5, 1, and 2. The roots of $f(x)$ are therefore $x = -3$, $x = -1.5$, $x = 1$, and $x = 2$.

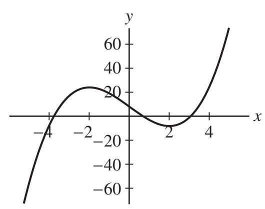
2. How many solutions does $x^3 - 4x + 8 = 0$ have?

SOLUTION Solutions to the equation $x^3 - 4x + 8 = 0$ are the x-intercepts of the graph of $y = x^3 - 4x + 8$. From the figure below, we see that the graph has one x-intercept (between $x = -4$ and $x = -2$), so the equation has one solution.



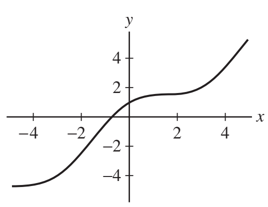
3. How many *positive* solutions does $x^3 - 12x + 8 = 0$ have?

SOLUTION The graph of $y = x^3 - 12x + 8$ shown below has two x-intercepts to the right of the origin; therefore the equation $x^3 - 12x + 8 = 0$ has two positive solutions.



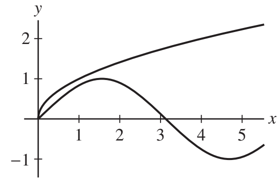
4. Does $\cos x + x = 0$ have a solution? A positive solution?

SOLUTION The graph of $y = \cos x + x$ shown below has one x-intercept; therefore, the equation $\cos x + x = 0$ has one solution. The lone x-intercept is to the left of the origin, so the equation has no positive solutions.



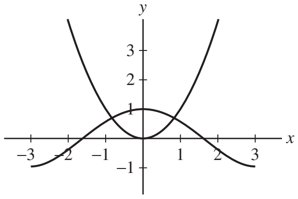
5. Find all the solutions of $\sin x = \sqrt{x}$ for $x > 0$.

SOLUTION Solutions to the equation $\sin x = \sqrt{x}$ correspond to points of intersection between the graphs of $y = \sin x$ and $y = \sqrt{x}$. The two graphs are shown below; the only point of intersection is at $x = 0$. Therefore, there are no solutions of $\sin x = \sqrt{x}$ for $x > 0$.



6. How many solutions does $\cos x = x^2$ have?

SOLUTION Solutions to the equation $\cos x = x^2$ correspond to points of intersection between the graphs of $y = \cos x$ and $y = x^2$. The two graphs are shown below; there are two points of intersection. Thus, the equation $\cos x = x^2$ has two solutions.

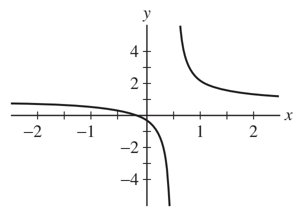


7. Let $f(x) = (x - 100)^2 + 1000$. What will the display show if you graph $f(x)$ in the viewing rectangle $[-10, 10]$ by $[-10, 10]$? Find an appropriate viewing rectangle.

SOLUTION Because $(x - 100)^2 \geq 0$ for all x, it follows that $f(x) = (x - 100)^2 + 1000 \geq 1000$ for all x. Thus, using a viewing rectangle of $[-10, 10]$ by $[-10, 10]$ will display nothing. The minimum value of the function occurs when $x = 100$, so an appropriate viewing rectangle would be $[50, 150]$ by $[1000, 2000]$.

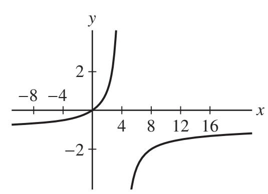
8. Plot $f(x) = \dfrac{8x + 1}{8x - 4}$ in an appropriate viewing rectangle. What are the vertical and horizontal asymptotes?

SOLUTION From the graph of $y = \dfrac{8x + 1}{8x - 4}$ shown below, we see that the vertical asymptote is $x = \frac{1}{2}$ and the horizontal asymptote is $y = 1$.



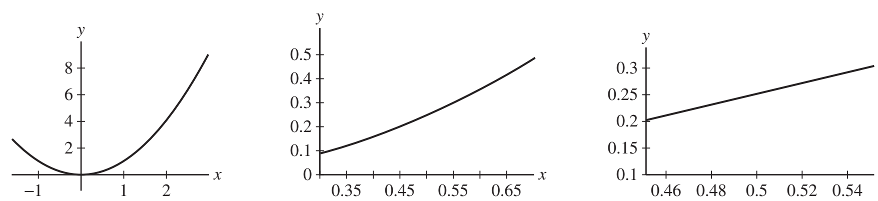
9. Plot the graph of $f(x) = x/(4 - x)$ in a viewing rectangle that clearly displays the vertical and horizontal asymptotes.

SOLUTION From the graph of $y = \dfrac{x}{4 - x}$ shown below, we see that the vertical asymptote is $x = 4$ and the horizontal asymptote is $y = -1$.



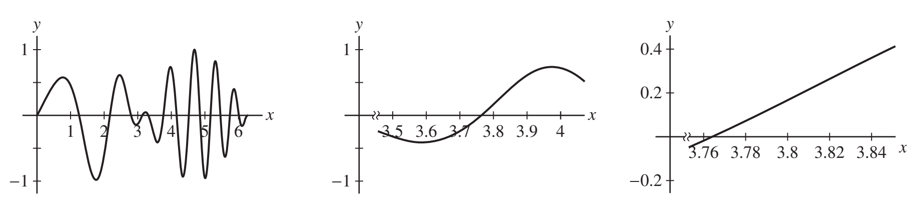
10. Illustrate local linearity for $f(x) = x^2$ by zooming in on the graph at $x = 0.5$ (see Example 6).

SOLUTION The following three graphs display $f(x) = x^2$ over the intervals $[-1, 3]$, $[0.3, 0.7]$ and $[0.45, 0.55]$. The final graph looks like a straight line.



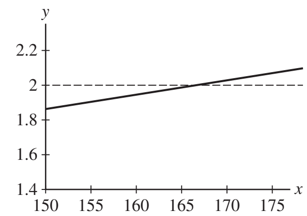
11. Plot $f(x) = \cos(x^2)\sin x$ for $0 \leq x \leq 2\pi$. Then illustrate local linearity at $x = 3.8$ by choosing appropriate viewing rectangles.

SOLUTION The following three graphs display $f(x) = \cos(x^2)\sin x$ over the intervals $[0, 2\pi]$, $[3.5, 4.1]$ and $[3.75, 3.85]$. The final graph looks like a straight line.



12. If P_0 dollars are deposited in a bank account paying 5% interest compounded monthly, then the account has value $P_0\left(1 + \frac{0.05}{12}\right)^N$ after N months. Find, to the nearest integer N, the number of months after which the account value doubles.

SOLUTION $P(N) = P_0(1 + \frac{0.05}{12})^N$. This doubles when $P(N) = 2P_0$, or when $2 = (1 + \frac{0.05}{12})^N$. The graphs of $y = 2$ and $y = (1 + \frac{0.05}{12})^N$ are shown below; they appear to intersect at $N = 167$. Thus, it will take approximately 167 months for money earning $r = 5\%$ interest compounded monthly to double in value.

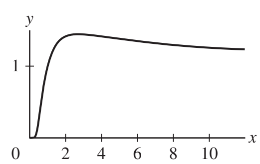


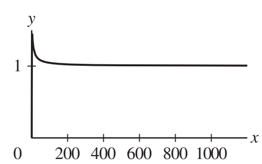
In Exercises 13–18, investigate the behavior of the function as n or x grows large by making a table of function values and plotting a graph (see Example 4). Describe the behavior in words.

13. $f(n) = n^{1/n}$

SOLUTION The table and graphs below suggest that as n gets large, $n^{1/n}$ approaches 1.

n	$n^{1/n}$
10	1.258925412
10^2	1.047128548
10^3	1.006931669
10^4	1.000921458
10^5	1.000115136
10^6	1.000013816

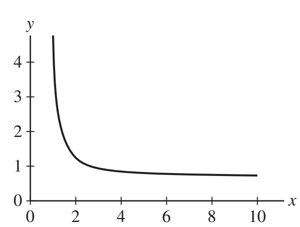


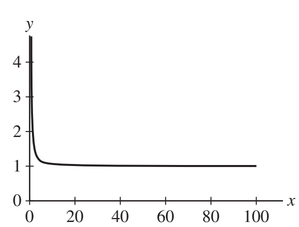


14. $f(n) = \dfrac{4n+1}{6n-5}$

SOLUTION The table and graphs below suggest that as n gets large, $\dfrac{4n+1}{6n-5}$ approaches $\dfrac{2}{3}$.

n	$\dfrac{4n+1}{6n-5}$
10	0.7454545455
10^2	0.6739495798
10^3	0.6673894912
10^4	0.6667388949
10^5	0.6666738889
10^6	0.6666673889

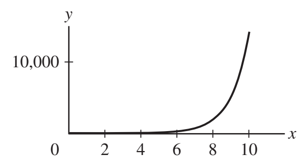


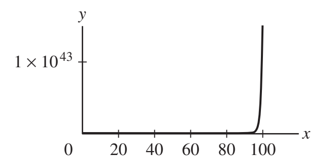


15. $f(n) = \left(1 + \dfrac{1}{n}\right)^{n^2}$

SOLUTION The table and graphs below suggest that as n gets large, $f(n)$ tends toward ∞.

n	$\left(1 + \dfrac{1}{n}\right)^{n^2}$
10	13780.61234
10^2	$1.635828711 \times 10^{43}$
10^3	$1.195306603 \times 10^{434}$
10^4	$5.341783312 \times 10^{4342}$
10^5	$1.702333054 \times 10^{43429}$
10^6	$1.839738749 \times 10^{434294}$

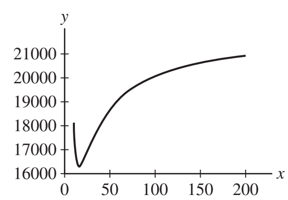


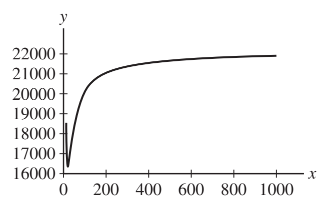


16. $f(x) = \left(\dfrac{x+6}{x-4}\right)^{x}$

SOLUTION The table and graphs below suggest that as x gets large, $f(x)$ roughly tends toward 22026.

x	$\left(\dfrac{x+6}{x-4}\right)^{x}$
10	18183.91210
10^2	20112.36934
10^3	21809.33633
10^4	22004.43568
10^5	22024.26311
10^6	22025.36451
10^7	22026.35566

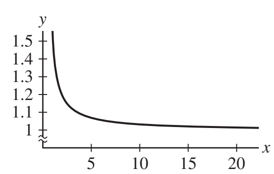


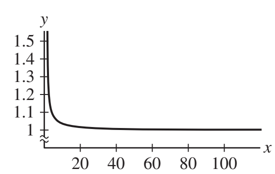


17. $f(x) = \left(x \tan \dfrac{1}{x}\right)^{x}$

SOLUTION The table and graphs below suggest that as x gets large, $f(x)$ approaches 1.

x	$\left(x \tan \dfrac{1}{x}\right)^{x}$
10	1.033975759
10^2	1.003338973
10^3	1.000333389
10^4	1.000033334
10^5	1.000003333
10^6	1.000000333

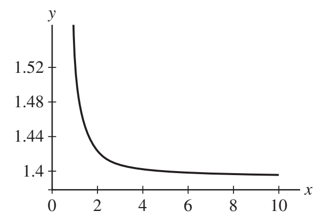


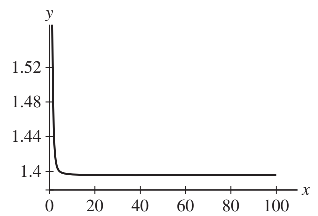


18. $f(x) = \left(x \tan \frac{1}{x}\right)^{x^2}$

SOLUTION The table and graphs below suggest that as x gets large, $f(x)$ approaches 1.39561.

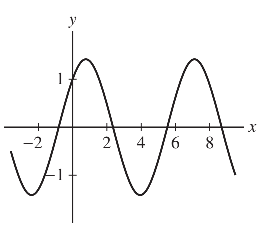
x	$\left(x \tan \frac{1}{x}\right)^{x^2}$
10	1.396701388
10^2	1.395623280
10^3	1.395612534
10^4	1.395612426
10^5	1.395612425
10^6	1.395612425



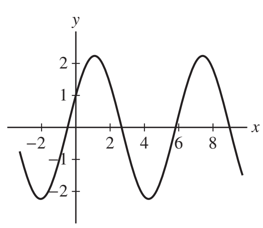


19. The graph of $f(\theta) = A\cos\theta + B\sin\theta$ is a sinusoidal wave for any constants A and B. Confirm this for $(A, B) = (1, 1)$, $(1, 2)$, and $(3, 4)$ by plotting $f(\theta)$.

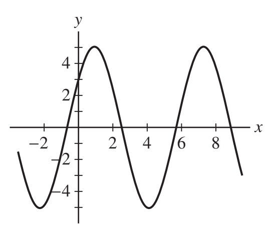
SOLUTION The graphs of $f(\theta) = \cos\theta + \sin\theta$, $f(\theta) = \cos\theta + 2\sin\theta$ and $f(\theta) = 3\cos\theta + 4\sin\theta$ are shown below.



$(A, B) = (1, 1)$



$(A, B) = (1, 2)$



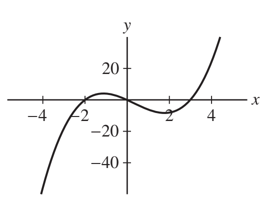
$(A, B) = (3, 4)$

20. Find the maximum value of $f(\theta)$ for the graphs produced in Exercise 19. Can you guess the formula for the maximum value in terms of A and B?

SOLUTION For $A = 1$ and $B = 1$, max $\approx 1.4 \approx \sqrt{2}$
For $A = 1$ and $B = 2$, max $\approx 2.25 \approx \sqrt{5}$
For $A = 3$ and $B = 4$, max $\approx 5 = \sqrt{3^2 + 4^2}$
Max $= \sqrt{A^2 + B^2}$

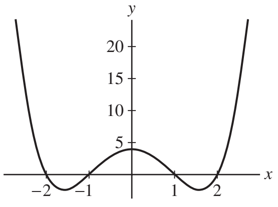
21. Find the intervals on which $f(x) = x(x + 2)(x - 3)$ is positive by plotting a graph.

SOLUTION The function $f(x) = x(x + 2)(x - 3)$ is positive when the graph of $y = x(x + 2)(x - 3)$ lies above the x-axis. The graph of $y = x(x + 2)(x - 3)$ is shown below. Clearly, the graph lies above the x-axis and the function is positive for $x \in (-2, 0) \cup (3, \infty)$.



22. Find the set of solutions to the inequality $(x^2-4)(x^2-1) < 0$ by plotting a graph.

SOLUTION To solve the inequality $(x^2-4)(x^2-1) < 0$, we can plot the graph of $y = (x^2-4)(x^2-1)$ and identify when the graph lies below the x-axis. The graph of $y = (x^2-4)(x^2-1)$ is shown below. The solution set for the inequality $(x^2-4)(x^2-1) < 0$ is clearly $x \in (-2,-1) \cup (1,2)$.



Further Insights and Challenges

23. CAS Let $f_1(x) = x$ and define a sequence of functions by $f_{n+1}(x) = \frac{1}{2}(f_n(x) + x/f_n(x))$. For example, $f_2(x) = \frac{1}{2}(x+1)$. Use a computer algebra system to compute $f_n(x)$ for $n = 3, 4, 5$ and plot $f_n(x)$ together with $\sqrt{x}$ for $x \geq 0$. What do you notice?

SOLUTION With $f_1(x) = x$ and $f_2(x) = \frac{1}{2}(x+1)$, we calculate

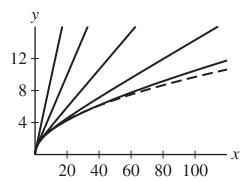
$$f_3(x) = \frac{1}{2}\left(\frac{1}{2}(x+1) + \frac{x}{\frac{1}{2}(x+1)}\right) = \frac{x^2+6x+1}{4(x+1)}$$

$$f_4(x) = \frac{1}{2}\left(\frac{x^2+6x+1}{4(x+1)} + \frac{x}{\frac{x^2+6x+1}{4(x+1)}}\right) = \frac{x^4+28x^3+70x^2+28x+1}{8(1+x)(1+6x+x^2)}$$

and

$$f_5(x) = \frac{1+120x+1820x^2+8008x^3+12870x^4+8008x^5+1820x^6+120x^7+x^8}{16(1+x)(1+6x+x^2)(1+28x+70x^2+28x^3+x^4)}.$$

A plot of $f_1(x)$, $f_2(x)$, $f_3(x)$, $f_4(x)$, $f_5(x)$ and $\sqrt{x}$ is shown below, with the graph of $\sqrt{x}$ shown as a dashed curve. It seems as if the f_n are asymptotic to $\sqrt{x}$.



24. Set $P_0(x) = 1$ and $P_1(x) = x$. The **Chebyshev polynomials** (useful in approximation theory) are defined inductively by the formula $P_{n+1}(x) = 2xP_n(x) - P_{n-1}(x)$.

(a) Show that $P_2(x) = 2x^2 - 1$.

(b) Compute $P_n(x)$ for $3 \leq n \leq 6$ using a computer algebra system or by hand, and plot $P_n(x)$ over $[-1,1]$.

(c) Check that your plots confirm two interesting properties: (a) $P_n(x)$ has n real roots in $[-1,1]$ and (b) for $x \in [-1,1]$, $P_n(x)$ lies between -1 and 1.

SOLUTION

(a) With $P_0(x) = 1$ and $P_1(x) = x$, we calculate

$$P_2(x) = 2x(P_1(x)) - P_0(x) = 2x(x) - 1 = 2x^2 - 1.$$

(b) Using the formula $P_{n+1}(x) = 2xP_n(x) - P_{n-1}(x)$ with $n = 2, 3, 4$ and 5, we find

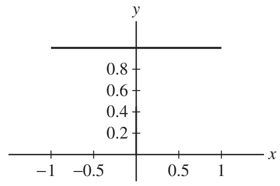
$$P_3(x) = 2x(2x^2-1) - x = 4x^3 - 3x$$

$$P_4(x) = 2x(4x^3-3x) - (2x^2-1) = 8x^4 - 8x^2 + 1$$

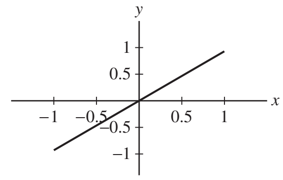
$$P_5(x) = 16x^5 - 20x^3 + 5x$$

$$P_6(x) = 32x^6 - 48x^4 + 18x^2 - 1$$

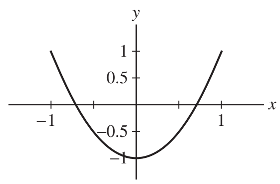
The graphs of the functions $P_n(x)$ for $0 \leq n \leq 6$ are shown below.



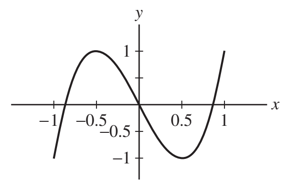
$P_0(x)$



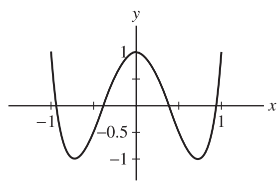
$P_1(x)$



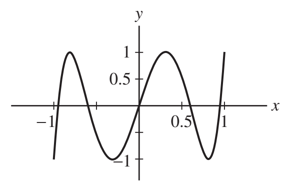
$P_2(x)$



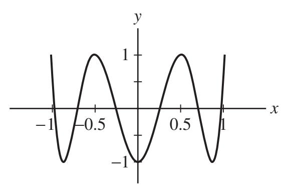
$P_3(x)$



$P_4(x)$



$P_5(x)$



$P_6(x)$

(c) From the graphs shown above, it is clear that for each n, the polynomial $P_n(x)$ has precisely n roots on the interval $[-1, 1]$ and that $-1 \le P_n(x) \le 1$ for $x \in [-1, 1]$.

CHAPTER REVIEW EXERCISES

1. Express $(4, 10)$ as a set $\{x : |x - a| < c\}$ for suitable a and c.

SOLUTION The center of the interval $(4, 10)$ is $\frac{4+10}{2} = 7$ and the radius is $\frac{10-4}{2} = 3$. Therefore, the interval $(4, 10)$ is equivalent to the set $\{x : |x - 7| < 3\}$.

2. Express as an interval:

(a) $\{x : |x - 5| < 4\}$ **(b)** $\{x : |5x + 3| \le 2\}$

SOLUTION

(a) Upon dropping the absolute value, the inequality $|x - 5| < 4$ becomes $-4 < x - 5 < 4$ or $1 < x < 9$. The set $\{x : |x - 5| < 4\}$ can therefore be expressed as the interval $(1, 9)$.

(b) Upon dropping the absolute value, the inequality $|5x + 3| \le 2$ becomes $-2 \le 5x + 3 \le 2$ or $-1 \le x \le -\frac{1}{5}$. The set $\{x : |5x + 3| \le 2\}$ can therefore be expressed as the interval $[-1, -\frac{1}{5}]$.

3. Express $\{x : 2 \le |x - 1| \le 6\}$ as a union of two intervals.

SOLUTION The set $\{x : 2 \le |x - 1| \le 6\}$ consists of those numbers that are at least 2 but at most 6 units from 1. The numbers larger than 1 that satisfy these conditions are $3 \le x \le 7$, while the numbers smaller than 1 that satisfy these conditions are $-5 \le x \le -1$. Therefore $\{x : 2 \le |x - 1| \le 6\} = [-5, -1] \cup [3, 7]$.

4. Give an example of numbers x, y such that $|x| + |y| = x - y$.

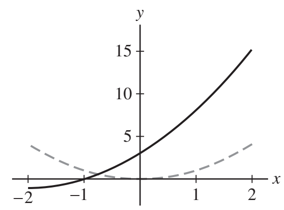
SOLUTION Let $x = 3$ and $y = -1$. Then $|x| + |y| = 3 + 1 = 4$ and $x - y = 3 - (-1) = 4$.

5. Describe the pairs of numbers x, y such that $|x + y| = x - y$.

SOLUTION First consider the case when $x + y \ge 0$. Then $|x + y| = x + y$ and we obtain the equation $x + y = x - y$. The solution of this equation is $y = 0$. Thus, the pairs $(x, 0)$ with $x \ge 0$ satisfy $|x + y| = x - y$. Next, consider the case when $x + y < 0$. Then $|x + y| = -(x + y) = -x - y$ and we obtain the equation $-x - y = x - y$. The solution of this equation is $x = 0$. Thus, the pairs $(0, y)$ with $y < 0$ also satisfy $|x + y| = x - y$.

6. Sketch the graph of $y = f(x+2) - 1$, where $f(x) = x^2$ for $-2 \le x \le 2$.

SOLUTION The graph of $y = f(x+2) - 1$ is obtained by shifting the graph of $y = f(x)$ two units to the left and one unit down. In the figure below, the graph of $y = f(x)$ is shown as the dashed curve, and the graph of $y = f(x+2) - 1$ is shown as the solid curve.



In Exercises 7–10, let $f(x)$ be the function shown in Figure 1.

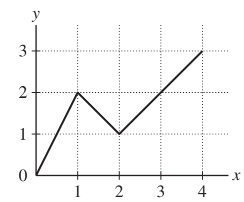


FIGURE 1

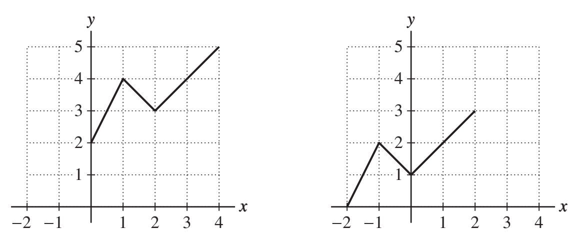
7. Sketch the graphs of $y = f(x) + 2$ and $y = f(x+2)$.

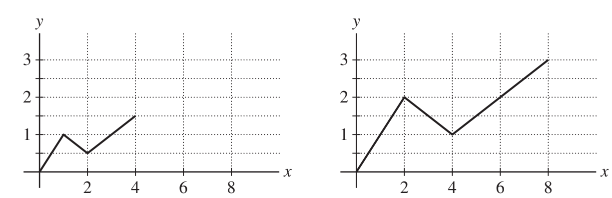
SOLUTION The graph of $y = f(x) + 2$ is obtained by shifting the graph of $y = f(x)$ up 2 units (see the graph below at the left). The graph of $y = f(x+2)$ is obtained by shifting the graph of $y = f(x)$ to the left 2 units (see the graph below at the right).



$f(x) + 2$ $\qquad$ $f(x + 2)$

8. Sketch the graphs of $y = \frac{1}{2} f(x)$ and $y = f\left(\frac{1}{2}x\right)$.

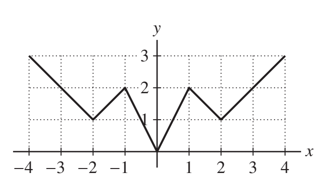
SOLUTION The graph of $y = \frac{1}{2} f(x)$ is obtained by compressing the graph of $y = f(x)$ vertically by a factor of 2 (see the graph below at the left). The graph of $y = f(\frac{1}{2}x)$ is obtained by stretching the graph of $y = f(x)$ horizontally be a factor of 2 (see the graph below at the right).



$f(x)/2$ $\qquad$ $f(x/2)$

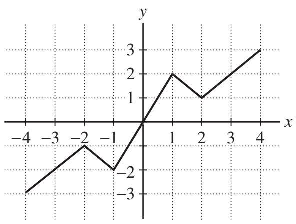
9. Continue the graph of $f(x)$ to the interval $[-4, 4]$ as an even function.

SOLUTION To continue the graph of $f(x)$ to the interval $[-4, 4]$ as an even function, reflect the graph of $f(x)$ across the y-axis (see the graph below).



10. Continue the graph of $f(x)$ to the interval $[-4, 4]$ as an odd function.

SOLUTION To continue the graph of $f(x)$ to the interval $[-4, 4]$ as an odd function, reflect the graph of $f(x)$ through the origin (see the graph below).



In Exercises 11–14, find the domain and range of the function.

11. $f(x) = \sqrt{x+1}$

SOLUTION The domain of the function $f(x) = \sqrt{x+1}$ is $\{x : x \geq -1\}$ and the range is $\{y : y \geq 0\}$.

12. $f(x) = \dfrac{4}{x^4+1}$

SOLUTION The domain of the function $f(x) = \dfrac{4}{x^4+1}$ is the set of all real numbers and the range is $\{y : 0 < y \leq 4\}$.

13. $f(x) = \dfrac{2}{3-x}$

SOLUTION The domain of the function $f(x) = \dfrac{2}{3-x}$ is $\{x : x \neq 3\}$ and the range is $\{y : y \neq 0\}$.

14. $f(x) = \sqrt{x^2 - x + 5}$

SOLUTION Because

$$x^2 - x + 5 = \left(x^2 - x + \frac{1}{4}\right) + 5 - \frac{1}{4} = \left(x - \frac{1}{2}\right)^2 + \frac{19}{4},$$

$x^2 - x + 5 \geq \frac{19}{4}$ for all x. It follows that the domain of the function $f(x) = \sqrt{x^2 - x + 5}$ is all real numbers and the range is $\{y : y \geq \sqrt{19}/2\}$.

15. Determine whether the function is increasing, decreasing, or neither:

(a) $f(x) = 3^{-x}$

(b) $f(x) = \dfrac{1}{x^2+1}$

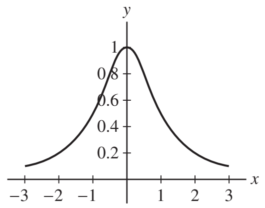
(c) $g(t) = t^2 + t$

(d) $g(t) = t^3 + t$

SOLUTION

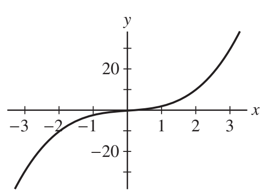
(a) The function $f(x) = 3^{-x}$ can be rewritten as $f(x) = (\frac{1}{3})^x$. This is an exponential function with a base less than 1; therefore, this is a decreasing function.

(b) From the graph of $y = 1/(x^2+1)$ shown below, we see that this function is neither increasing nor decreasing for all x (though it is increasing for $x < 0$ and decreasing for $x > 0$).



(c) The graph of $y = t^2 + t$ is an upward opening parabola; therefore, this function is neither increasing nor decreasing for all t. By completing the square we find $y = (t + \frac{1}{2})^2 - \frac{1}{4}$. The vertex of this parabola is then at $t = -\frac{1}{2}$, so the function is decreasing for $t < -\frac{1}{2}$ and increasing for $t > -\frac{1}{2}$.

(d) From the graph of $y = t^3 + t$ shown below, we see that this is an increasing function.



16. Determine whether the function is even, odd, or neither:

(a) $f(x) = x^4 - 3x^2$

(b) $g(x) = \sin(x+1)$

(c) $f(x) = 2^{-x^2}$

SOLUTION

(a) $f(-x) = (-x)^4 - 3(-x)^2 = x^4 - 3x^2 = f(x)$, so this function is even.

(b) $g(-x) = \sin(-x+1)$, which is neither equal to $g(x)$ nor to $-g(x)$, so this function is neither even nor odd.

(c) $f(-x) = 2^{-(-x)^2} = 2^{-x^2} = f(x)$, so this function is even.

In Exercises 17–22, find the equation of the line.

17. Line passing through $(-1, 4)$ and $(2, 6)$

SOLUTION The slope of the line passing through $(-1, 4)$ and $(2, 6)$ is

$$m = \frac{6-4}{2-(-1)} = \frac{2}{3}.$$

The equation of the line passing through $(-1, 4)$ and $(2, 6)$ is therefore $y - 4 = \frac{2}{3}(x+1)$ or $2x - 3y = -14$.

18. Line passing through $(-1, 4)$ and $(-1, 6)$

SOLUTION The line passing through $(-1, 4)$ and $(-1, 6)$ is vertical with an x-coordinate of -1. Therefore, the equation of the line is $x = -1$.

19. Line of slope 6 through $(9, 1)$

SOLUTION Using the point-slope form for the equation of a line, the equation of the line of slope 6 and passing through $(9, 1)$ is $y - 1 = 6(x - 9)$ or $6x - y = 53$.

20. Line of slope $-\frac{3}{2}$ through $(4, -12)$

SOLUTION Using the point-slope form for the equation of a line, the equation of the line of slope $-\frac{3}{2}$ and passing through $(4, -12)$ is $y + 12 = -\frac{3}{2}(x - 4)$ or $3x + 2y = -12$.

21. Line through $(2, 3)$ parallel to $y = 4 - x$

SOLUTION The equation $y = 4 - x$ is in slope-intercept form; it follows that the slope of this line is -1. Any line parallel to $y = 4 - x$ will have the same slope, so we are looking for the equation of the line of slope -1 and passing through $(2, 3)$. The equation of this line is $y - 3 = -(x - 2)$ or $x + y = 5$.

22. Horizontal line through $(-3, 5)$

SOLUTION A horizontal line has a slope of 0; the equation of the specified line is therefore $y - 5 = 0(x + 3)$ or $y = 5$.

23. Does the following table of market data suggest a linear relationship between price and number of homes sold during a one-year period? Explain.

Price (thousands of \$)	180	195	220	240
No. of homes sold	127	118	103	91

SOLUTION Examine the slope between consecutive data points. The first pair of data points yields a slope of

$$\frac{118-127}{195-180} = -\frac{9}{15} = -\frac{3}{5},$$

while the second pair of data points yields a slope of

$$\frac{103-118}{220-195} = -\frac{15}{25} = -\frac{3}{5}$$

and the last pair of data points yields a slope of

$$\frac{91-103}{240-220} = -\frac{12}{20} = -\frac{3}{5}.$$

Because all three slopes are equal, the data does suggest a linear relationship between price and the number of homes sold.

24. Does the following table of revenue data for a computer manufacturer suggest a linear relation between revenue and time? Explain.

Year	2001	2005	2007	2010
Revenue (billions of \$)	13	18	15	11

SOLUTION Examine the slope between consecutive data points. The first pair of data points yields a slope of

$$\frac{18-13}{2005-2001}=\frac{5}{4},$$

while the second pair of data points yields a slope of

$$\frac{15-18}{2007-2005}=-\frac{3}{2}$$

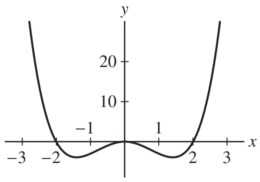
and the last pair of data points yields a slope of

$$\frac{11-15}{2010-2007}=-\frac{4}{3}.$$

Because the three slopes are not equal, the data does not suggest a linear relationship between revenue and time.

25. Find the roots of $f(x)=x^4-4x^2$ and sketch its graph. On which intervals is $f(x)$ decreasing?

SOLUTION The roots of $f(x)=x^4-4x^2$ are obtained by solving the equation $x^4-4x^2=x^2(x-2)(x+2)=0$, which yields $x=-2$, $x=0$ and $x=2$. The graph of $y=f(x)$ is shown below. From this graph we see that $f(x)$ is decreasing for x less than approximately -1.4 and for x between 0 and approximately 1.4.



26. Let $h(z)=2z^2+12z+3$. Complete the square and find the minimum value of $h(z)$.

SOLUTION Let $h(z)=2z^2+12z+3$. Completing the square yields

$$h(z)=2(z^2+6z)+3=2(z^2+6z+9)+3-18=2(z+3)^2-15.$$

Because $(z+3)^2\geq 0$ for all z, it follows that $h(z)=2(z+3)^2-15\geq -15$ for all z. Thus, the minimum value of $h(z)$ is -15.

27. Let $f(x)$ be the square of the distance from the point $(2,1)$ to a point $(x,3x+2)$ on the line $y=3x+2$. Show that $f(x)$ is a quadratic function, and find its minimum value by completing the square.

SOLUTION Let $f(x)$ denote the square of the distance from the point $(2,1)$ to a point $(x,3x+2)$ on the line $y=3x+2$. Then

$$f(x)=(x-2)^2+(3x+2-1)^2=x^2-4x+4+9x^2+6x+1=10x^2+2x+5,$$

which is a quadratic function. Completing the square, we find

$$f(x)=10\left(x^2+\frac{1}{5}x+\frac{1}{100}\right)+5-\frac{1}{10}=10\left(x+\frac{1}{10}\right)^2+\frac{49}{10}.$$

Because $(x+\frac{1}{10})^2\geq 0$ for all x, it follows that $f(x)\geq\frac{49}{10}$ for all x. Hence, the minimum value of $f(x)$ is $\frac{49}{10}$.

28. Prove that $x^2+3x+3\geq 0$ for all x.

SOLUTION Observe that

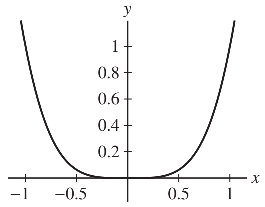
$$x^2+3x+3=\left(x^2+3x+\frac{9}{4}\right)+3-\frac{9}{4}=\left(x+\frac{3}{2}\right)^2+\frac{3}{4}.$$

Thus, $x^2+3x+3\geq\frac{3}{4}>0$ for all x.

In Exercises 29–34, sketch the graph by hand.

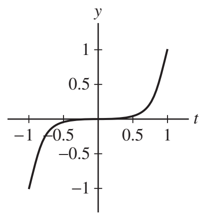
29. $y = t^4$

SOLUTION



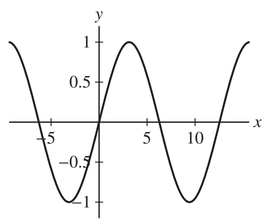
30. $y = t^5$

SOLUTION



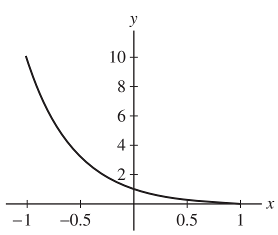
31. $y = \sin \dfrac{\theta}{2}$

SOLUTION



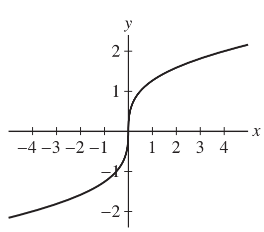
32. $y = 10^{-x}$

SOLUTION



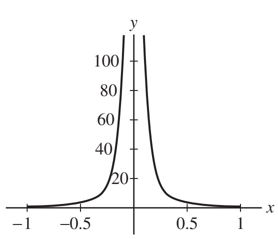
33. $y = x^{1/3}$

SOLUTION



34. $y = \dfrac{1}{x^2}$

SOLUTION



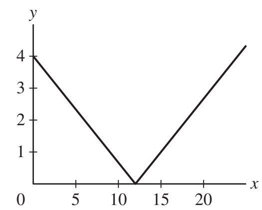
35. Show that the graph of $y = f\left(\frac{1}{3}x - b\right)$ is obtained by shifting the graph of $y = f\left(\frac{1}{3}x\right)$ to the right $3b$ units. Use this observation to sketch the graph of $y = \left|\frac{1}{3}x - 4\right|$.

SOLUTION Let $g(x) = f(\frac{1}{3}x)$. Then

$$g(x - 3b) = f\left(\frac{1}{3}(x - 3b)\right) = f\left(\frac{1}{3}x - b\right).$$

Thus, the graph of $y = f(\frac{1}{3}x - b)$ is obtained by shifting the graph of $y = f(\frac{1}{3}x)$ to the right $3b$ units.

The graph of $y = |\frac{1}{3}x - 4|$ is the graph of $y = |\frac{1}{3}x|$ shifted right 12 units (see the graph below).



36. Let $h(x) = \cos x$ and $g(x) = x^{-1}$. Compute the composite functions $h(g(x))$ and $g(h(x))$, and find their domains.

SOLUTION Let $h(x) = \cos x$ and $g(x) = x^{-1}$. Then

$$h(g(x)) = h(x^{-1}) = \cos x^{-1}.$$

The domain of this function is $x \neq 0$. On the other hand,

$$g(h(x)) = g(\cos x) = \frac{1}{\cos x} = \sec x.$$

The domain of this function is

$$x \neq \frac{(2n+1)\pi}{2} \text{ for any integer } n.$$

37. Find functions f and g such that the function

$$f(g(t)) = (12t + 9)^4$$

SOLUTION One possible choice is $f(t) = t^4$ and $g(t) = 12t + 9$. Then

$$f(g(t)) = f(12t + 9) = (12t + 9)^4$$

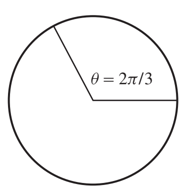
as desired.

38. Sketch the points on the unit circle corresponding to the following three angles, and find the values of the six standard trigonometric functions at each angle:

(a) $\frac{2\pi}{3}$ **(b)** $\frac{7\pi}{4}$ **(c)** $\frac{7\pi}{6}$

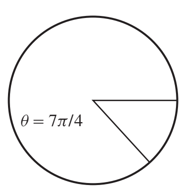
SOLUTION

(a)



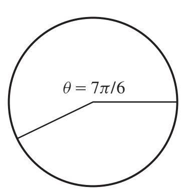
$$\sin\frac{2\pi}{3} = \frac{\sqrt{3}}{2} \qquad \cos\frac{2\pi}{3} = -\frac{1}{2}$$
$$\tan\frac{2\pi}{3} = -\sqrt{3} \qquad \cot\frac{2\pi}{3} = -\frac{\sqrt{3}}{3}$$
$$\sec\frac{2\pi}{3} = -2 \qquad \csc\frac{2\pi}{3} = \frac{2\sqrt{3}}{3}$$

(b)



$$\sin\frac{7\pi}{4} = -\frac{\sqrt{2}}{2} \qquad \cos\frac{7\pi}{4} = \frac{\sqrt{2}}{2}$$
$$\tan\frac{7\pi}{4} = -1 \qquad \cot\frac{7\pi}{4} = -1$$
$$\sec\frac{7\pi}{4} = \sqrt{2} \qquad \csc\frac{7\pi}{4} = -\sqrt{2}$$

(c)



$$\sin\frac{7\pi}{6} = -\frac{1}{2} \qquad \cos\frac{7\pi}{6} = -\frac{\sqrt{3}}{2}$$
$$\tan\frac{7\pi}{6} = \frac{\sqrt{3}}{3} \qquad \cot\frac{7\pi}{6} = \sqrt{3}$$
$$\sec\frac{7\pi}{6} = -\frac{2\sqrt{3}}{2} \qquad \csc\frac{7\pi}{6} = -2$$

39. What is the period of the function $g(\theta) = \sin 2\theta + \sin \frac{\theta}{2}$?

SOLUTION The function $\sin 2\theta$ has a period of π, and the function $\sin(\theta/2)$ has a period of 4π. Because 4π is a multiple of π, the period of the function $g(\theta) = \sin 2\theta + \sin \theta/2$ is 4π.

40. Assume that $\sin\theta = \frac{4}{5}$, where $\pi/2 < \theta < \pi$. Find:

(a) $\tan\theta$ **(b)** $\sin 2\theta$ **(c)** $\csc\dfrac{\theta}{2}$

SOLUTION If $\sin\theta = 4/5$, then by the fundamental trigonometric identity,

$$\cos^2\theta = 1 - \sin^2\theta = 1 - \left(\frac{4}{5}\right)^2 = \frac{9}{25}.$$

Because $\pi/2 < \theta < \pi$, it follows that $\cos\theta$ must be negative. Hence, $\cos\theta = -3/5$.

(a) $\tan\theta = \dfrac{\sin\theta}{\cos\theta} = \dfrac{4/5}{-3/5} = -\dfrac{4}{3}$.

(b) $\sin(2\theta) = 2\sin\theta\cos\theta = 2\cdot\dfrac{4}{5}\cdot -\dfrac{3}{5} = -\dfrac{24}{25}$.

(c) We first note that

$$\sin\left(\frac{\theta}{2}\right) = \sqrt{\frac{1-\cos\theta}{2}} = \sqrt{\frac{1-(-3/5)}{2}} = 2\frac{\sqrt{5}}{5}.$$

Thus,

$$\csc\left(\frac{\theta}{2}\right) = \frac{\sqrt{5}}{2}.$$

41. Give an example of values a, b such that

(a) $\cos(a+b) \neq \cos a + \cos b$ **(b)** $\cos\dfrac{a}{2} \neq \dfrac{\cos a}{2}$

SOLUTION

(a) Take $a = b = \pi/2$. Then $\cos(a+b) = \cos\pi = -1$ but

$$\cos a + \cos b = \cos\frac{\pi}{2} + \cos\frac{\pi}{2} = 0 + 0 = 0.$$

(b) Take $a = \pi$. Then

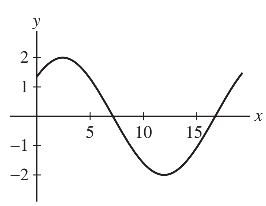
$$\cos\left(\frac{a}{2}\right) = \cos\left(\frac{\pi}{2}\right) = 0$$

but

$$\frac{\cos a}{2} = \frac{\cos\pi}{2} = \frac{-1}{2} = -\frac{1}{2}.$$

42. Let $f(x) = \cos x$. Sketch the graph of $y = 2f\left(\frac{1}{3}x - \frac{\pi}{4}\right)$ for $0 \le x \le 6\pi$.

SOLUTION



43. Solve $\sin 2x + \cos x = 0$ for $0 \le x < 2\pi$.

SOLUTION Using the double angle formula for the sine function, we rewrite the equation as $2\sin x\cos x + \cos x = \cos x(2\sin x + 1) = 0$. Thus, either $\cos x = 0$ or $\sin x = -1/2$. From here we see that the solutions are $x = \pi/2$, $x = 7\pi/6$, $x = 3\pi/2$ and $x = 11\pi/6$.

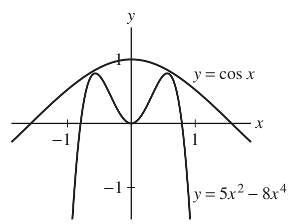
44. How does $h(n) = n^2/2^n$ behave for large whole-number values of n? Does $h(n)$ tend to infinity?

SOLUTION The table below suggests that for large whole number values of n, $h(n) = \dfrac{n^2}{2^n}$ tends toward 0.

n	$h(n) = n^2/2^n$
10	0.09765625000
10^2	$7.888609052 \times 10^{-27}$
10^3	$9.332636185 \times 10^{-296}$
10^4	$5.012372749 \times 10^{-3003}$
10^5	$1.000998904 \times 10^{-30093}$
10^6	$1.010034059 \times 10^{-301018}$

45. GU Use a graphing calculator to determine whether the equation $\cos x = 5x^2 - 8x^4$ has any solutions.

SOLUTION The graphs of $y = \cos x$ and $y = 5x^2 - 8x^4$ are shown below. Because the graphs do not intersect, there are no solutions to the equation $\cos x = 5x^2 - 8x^4$.

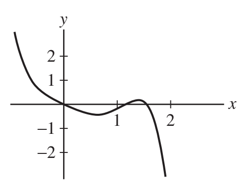


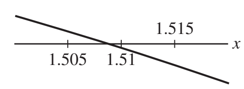
46. GU Using a graphing calculator, find the number of real roots and estimate the largest root to two decimal places:

(a) $f(x) = 1.8x^4 - x^5 - x$
(b) $g(x) = 1.7x^4 - x^5 - x$

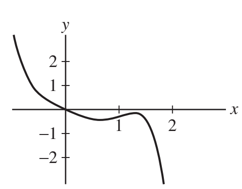
SOLUTION

(a) The graph of $y = 1.8x^4 - x^5 - x$ is shown below at the left. Because the graph has three x-intercepts, the function $f(x) = 1.8x^4 - x^5 - x$ has three real roots. From the graph shown below at the right, we see that the largest root of $f(x) = 1.8x^4 - x^5 - x$ is approximately $x = 1.51$.





(b) The graph of $y = 1.7x^4 - x^5 - x$ is shown below. Because the graph has only one x-intercept, the function $f(x) = 1.7x^4 - x^5 - x$ has only one real root. From the graph, we see that the largest root of $f(x) = 1.7x^4 - x^5 - x$ is approximately $x = 0$.



47. Match each quantity (a)–(d) with (i), (ii), or (iii) if possible, or state that no match exists.

(a) $2^a 3^b$
(b) $\dfrac{2^a}{3^b}$
(c) $(2^a)^b$
(d) $2^{a-b} 3^{b-a}$

(i) 2^{ab}
(ii) 6^{a+b}
(iii) $\left(\frac{2}{3}\right)^{a-b}$

SOLUTION

(a) No match.
(b) No match.
(c) **(i)**: $(2^a)^b = 2^{ab}$.
(d) **(iii)**: $2^{a-b}3^{b-a} = 2^{a-b}\left(\dfrac{1}{3}\right)^{a-b} = \left(\dfrac{2}{3}\right)^{a-b}$.

48. Match each quantity (a)–(d) with (i), (ii), or (iii) if possible, or state that no match exists.

(a) $\ln\left(\frac{a}{b}\right)$ **(b)** $\frac{\ln a}{\ln b}$

(c) $e^{\ln a - \ln b}$ **(d)** $(\ln a)(\ln b)$

(i) $\ln a + \ln b$ **(ii)** $\ln a - \ln b$ **(iii)** $\frac{a}{b}$

SOLUTION

(a) **(ii)**: $\ln\left(\frac{a}{b}\right) = \ln a - \ln b$.

(b) No match.

(c) **(iii)**: $e^{\ln a - \ln b} = e^{\ln a}\frac{1}{e^{\ln b}} = \frac{a}{b}$.

(d) No match.

49. Find the inverse of $f(x) = \sqrt{x^3 - 8}$ and determine its domain and range.

SOLUTION To find the inverse of $f(x) = \sqrt{x^3 - 8}$, we solve $y = \sqrt{x^3 - 8}$ for x as follows:

$$y^2 = x^3 - 8$$
$$x^3 = y^2 + 8$$
$$x = \sqrt[3]{y^2 + 8}.$$

Therefore, $f^{-1}(x) = \sqrt[3]{x^2 + 8}$. The domain of f^{-1} is the range of f, namely $\{x : x \geq 0\}$; the range of f^{-1} is the domain of f, namely $\{y : y \geq 2\}$.

50. Find the inverse of $f(x) = \frac{x-2}{x-1}$ and determine its domain and range.

SOLUTION To find the inverse of $f(x) = \frac{x-2}{x-1}$, we solve $y = \frac{x-2}{x-1}$ for x as follows:

$$x - 2 = y(x-1) = yx - y$$
$$x - yx = 2 - y$$
$$x = \frac{2-y}{1-y}.$$

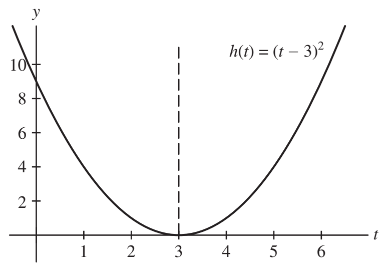
Therefore,

$$f^{-1}(x) = \frac{2-x}{1-x} = \frac{x-2}{x-1}.$$

The domain of f^{-1} is the range of f, namely $\{x : x \neq 1\}$; the range of f^{-1} is the domain of f, namely $\{y : y \neq 1\}$.

51. Find a domain on which $h(t) = (t-3)^2$ is one-to-one and determine the inverse on this domain.

SOLUTION From the graph of $h(t) = (t-3)^2$ shown below, we see that h is one-to-one on each of the intervals $t \geq 3$ and $t \leq 3$.



We find the inverse of $h(t) = (t-3)^2$ on the domain $\{t : t \leq 3\}$ by solving $y = (t-3)^2$ for t. First, we find

$$\sqrt{y} = \sqrt{(t-3)^2} = |t-3|.$$

Having restricted the domain to $\{t : t \leq 3\}$, $|t-3| = -(t-3) = 3-t$. Thus,

$$\sqrt{y} = 3 - t$$
$$t = 3 - \sqrt{y}.$$

The inverse function is $h^{-1}(t) = 3 - \sqrt{t}$. For $t \geq 3$, $h^{-1}(t) = 3 + \sqrt{t}$.

52. Show that $g(x) = \dfrac{x}{x-1}$ is equal to its inverse on the domain $\{x : x \neq 1\}$.

SOLUTION To show that $g(x) = \frac{x}{x-1}$ is equal to its inverse, we need to show that for $x \neq 1$,

$$g\left(g(x)\right) = x.$$

First, we notice that for $x \neq 1$, $g(x) \neq 1$. Therefore,

$$g\left(g(x)\right) = g\left(\frac{x}{x-1}\right) = \frac{\frac{x}{x-1}}{\frac{x}{x-1} - 1} = \frac{x}{x-(x-1)} = \frac{x}{1} = x.$$

53. Suppose that $g(x)$ is the inverse of $f(x)$. Match the functions (a)–(d) with their inverses (i)–(iv).

(a) $f(x) + 1$ **(b)** $f(x+1)$ **(c)** $4f(x)$ **(d)** $f(4x)$

(i) $g(x)/4$ **(ii)** $g(x/4)$ **(iii)** $g(x-1)$ **(iv)** $g(x) - 1$

SOLUTION

(a) **(iii)**: $f(x) + 1$ and $g(x-1)$ are inverse functions:

$$f(g(x-1)) + 1 = (x-1) + 1 = x;$$
$$g(f(x) + 1 - 1) = g(f(x)) = x.$$

(b) **(iv)**: $f(x+1)$ and $g(x) - 1$ are inverse functions:

$$f(g(x) - 1 + 1) = f(g(x)) = x;$$
$$g(f(x+1)) - 1 = (x+1) - 1 = x.$$

(c) **(ii)**: $4f(x)$ and $g(x/4)$ are inverse functions:

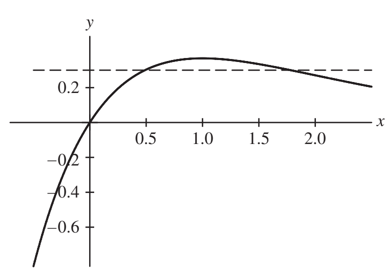
$$4f(g(x/4)) = 4(x/4) = x;$$
$$g(4f(x)/4) = g(f(x)) = x.$$

(d) **(i)**: $f(4x)$ and $g(x)/4$ are inverse functions:

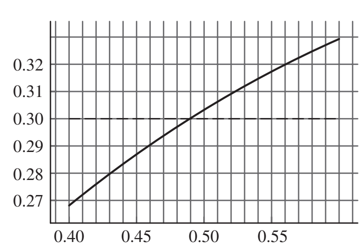
$$f(4 \cdot g(x)/4) = f(g(x)) = x;$$
$$\frac{1}{4}g(f(4x)) = \frac{1}{4}(4x) = x.$$

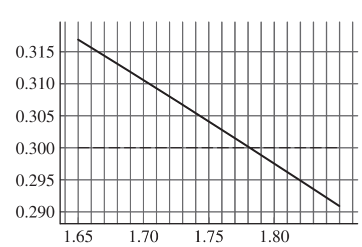
54. $\boxed{\text{GU}}$ Plot $f(x) = xe^{-x}$ and use the zoom feature to find two solutions of $f(x) = 0.3$.

SOLUTION The graph of $f(x) = xe^{-x}$ is shown below. Based on this graph, we should zoom in near $x = 0.5$ and near $x = 1.75$ to find solutions of $f(x) = 0.3$.



From the figure below at the left, we see that one solution of $f(x) = 0.3$ is approximately $x = 0.49$; from the figure below at the right, we see that a second solution of $f(x) = 0.3$ is approximately $x = 1.78$.





2 LIMITS

2.1 Limits, Rates of Change, and Tangent Lines

Preliminary Questions

1. Average velocity is equal to the slope of a secant line through two points on a graph. Which graph?

SOLUTION Average velocity is the slope of a secant line through two points on the graph of position as a function of time.

2. Can instantaneous velocity be defined as a ratio? If not, how is instantaneous velocity computed?

SOLUTION Instantaneous velocity cannot be defined as a ratio. It is defined as the limit of average velocity as time elapsed shrinks to zero.

3. What is the graphical interpretation of instantaneous velocity at a moment $t = t_0$?

SOLUTION Instantaneous velocity at time $t = t_0$ is the slope of the line tangent to the graph of position as a function of time at $t = t_0$.

4. What is the graphical interpretation of the following statement? The average rate of change approaches the instantaneous rate of change as the interval $[x_0, x_1]$ shrinks to x_0.

SOLUTION The slope of the secant line over the interval $[x_0, x_1]$ approaches the slope of the tangent line at $x = x_0$.

5. The rate of change of atmospheric temperature with respect to altitude is equal to the slope of the tangent line to a graph. Which graph? What are possible units for this rate?

SOLUTION The rate of change of atmospheric temperature with respect to altitude is the slope of the line tangent to the graph of atmospheric temperature as a function of altitude. Possible units for this rate of change are °F/ft or °C/m.

Exercises

1. A ball dropped from a state of rest at time $t = 0$ travels a distance $s(t) = 4.9t^2$ m in t seconds.

(a) How far does the ball travel during the time interval [2, 2.5]?

(b) Compute the average velocity over [2, 2.5].

(c) Compute the average velocity for the time intervals in the table and estimate the ball's instantaneous velocity at $t = 2$.

Interval	[2, 2.01]	[2, 2.005]	[2, 2.001]	[2, 2.00001]
Average velocity				

SOLUTION

(a) During the time interval [2, 2.5], the ball travels $\Delta s = s(2.5) - s(2) = 4.9(2.5)^2 - 4.9(2)^2 = 11.025$ m.

(b) The average velocity over [2, 2.5] is

$$\frac{\Delta s}{\Delta t} = \frac{s(2.5) - s(2)}{2.5 - 2} = \frac{11.025}{0.5} = 22.05 \text{ m/s}.$$

(c)

time interval	[2, 2.01]	[2, 2.005]	[2, 2.001]	[2, 2.00001]
average velocity	19.649	19.6245	19.6049	19.600049

The instantaneous velocity at $t = 2$ is 19.6 m/s.

2. A wrench released from a state of rest at time $t = 0$ travels a distance $s(t) = 4.9t^2$ m in t seconds. Estimate the instantaneous velocity at $t = 3$.

SOLUTION To find the instantaneous velocity, we compute the average velocities:

time interval	[3, 3.01]	[3, 3.005]	[3, 3.001]	[3, 3.00001]
average velocity	29.449	29.4245	29.4049	29.400049

The instantaneous velocity is approximately 29.4 m/s.

3. Let $v = 20\sqrt{T}$ as in Example 2. Estimate the instantaneous rate of change of v with respect to T when $T = 300\,\mathrm{K}$.

SOLUTION

T interval	[300, 300.01]	[300, 300.005]
average rate of change	0.577345	0.577348
T interval	[300, 300.001]	[300, 300.00001]
average rate of change	0.57735	0.57735

The instantaneous rate of change is approximately $0.57735\ \mathrm{m/(s \cdot K)}$.

4. Compute $\Delta y/\Delta x$ for the interval [2, 5], where $y = 4x - 9$. What is the instantaneous rate of change of y with respect to x at $x = 2$?

SOLUTION $\Delta y/\Delta x = ((4(5) - 9) - (4(2) - 9))/(5 - 2) = 4$. Because the graph of $y = 4x - 9$ is a line with slope 4, the average rate of change of y calculated over any interval will be equal to 4; hence, the instantaneous rate of change at any x will also be equal to 4.

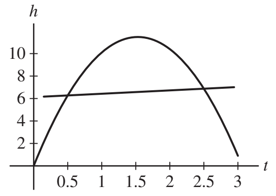
In Exercises 5 and 6, a stone is tossed vertically into the air from ground level with an initial velocity of 15 m/s. *Its height at time t is* $h(t) = 15t - 4.9t^2$ m.

5. Compute the stone's average velocity over the time interval [0.5, 2.5] and indicate the corresponding secant line on a sketch of the graph of $h(t)$.

SOLUTION The average velocity is equal to

$$\frac{h(2.5) - h(0.5)}{2} = 0.3.$$

The secant line is plotted with $h(t)$ below.



6. Compute the stone's average velocity over the time intervals [1, 1.01], [1, 1.001], [1, 1.0001] and [0.99, 1], [0.999, 1], [0.9999, 1], and then estimate the instantaneous velocity at $t = 1$.

SOLUTION With $h(t) = 15t - 4.9t^2$, the average velocity over the time interval $[t_1, t_2]$ is given by

$$\frac{\Delta h}{\Delta t} = \frac{h(t_2) - h(t_1)}{t_2 - t_1}.$$

time interval	[1, 1.01]	[1, 1.001]	[1, 1.0001]	[0.99, 1]	[0.999, 1]	[0.9999, 1]
average velocity	5.151	5.1951	5.1995	5.249	5.2049	5.2005

The instantaneous velocity at $t = 1$ second is 5.2 m/s.

7. With an initial deposit of \$100, the balance in a bank account after t years is $f(t) = 100(1.08)^t$ dollars.

(a) What are the units of the rate of change of $f(t)$?

(b) Find the average rate of change over [0, 0.5] and [0, 1].

(c) Estimate the instantaneous rate of change at $t = 0.5$ by computing the average rate of change over intervals to the left and right of $t = 0.5$.

SOLUTION

(a) The units of the rate of change of $f(t)$ are dollars/year or \$/yr.

(b) The average rate of change of $f(t) = 100(1.08)^t$ over the time interval $[t_1, t_2]$ is given by

$$\frac{\Delta f}{\Delta t} = \frac{f(t_2) - f(t_1)}{t_2 - t_1}.$$

time interval	[0, .5]	[0, 1]
average rate of change	7.8461	8

(c)

time interval	[0.5, 0.51]	[0.5, 0.501]	[0.5, 0.5001]
average rate of change	8.0011	7.9983	7.9981
time interval	[0.49, 0.5]	[0.499, 0.5]	[0.4999, 0.5]
average rate of change	7.9949	7.9977	7.998

The rate of change at $t = 0.5$ is approximately \$8/yr.

8. The position of a particle at time t is $s(t) = t^3 + t$. Compute the average velocity over the time interval [1, 4] and estimate the instantaneous velocity at $t = 1$.

SOLUTION The average velocity over the time interval [1, 4] is

$$\frac{s(4) - s(1)}{4 - 1} = \frac{68 - 2}{3} = 22.$$

To estimate the instantaneous velocity at $t = 1$, we examine the following table.

time interval	[1, 1.01]	[1, 1.001]	[1, 1.0001]	[0.99, 1]	[0.999, 1]	[0.9999, 1]
average rate of change	4.0301	4.0030	4.0003	3.9701	3.9970	3.9997

The rate of change at $t = 1$ is approximately 4.

9. Figure 8 shows the estimated number N of Internet users in Chile, based on data from the United Nations Statistics Division.

(a) Estimate the rate of change of N at $t = 2003.5$.

(b) Does the rate of change increase or decrease as t increases? Explain graphically.

(c) Let R be the average rate of change over [2001, 2005]. Compute R.

(d) Is the rate of change at $t = 2002$ greater than or less than the average rate R? Explain graphically.

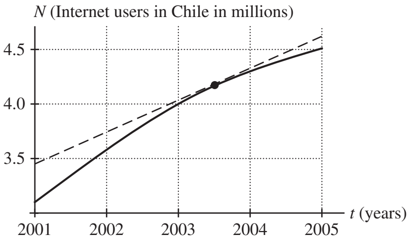


FIGURE 8

SOLUTION

(a) The tangent line shown in Figure 8 appears to pass through the points (2002, 3.75) and (2005, 4.6). Thus, the rate of change of N at $t = 2003.5$ is approximately

$$\frac{4.6 - 3.75}{2005 - 2002} = 0.283$$

million Internet users per year.

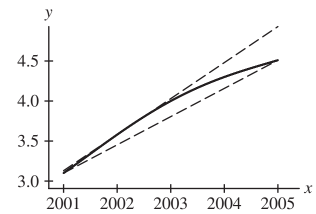
(b) As t increases, we move from left to right along the graph in Figure 8. Moreover, as we move from left to right along the graph, the slope of the tangent line decreases. Thus, the rate of change decreases as t increases.

(c) The graph of $N(t)$ appear to pass through the points (2001, 3.1) and (2005, 4.5). Thus, the average rate of change over [2001, 2005] is approximately

$$R = \frac{4.5 - 3.1}{2005 - 2001} = 0.35$$

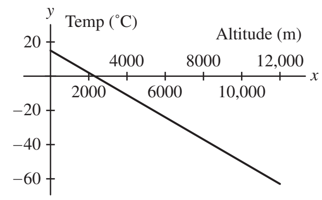
million Internet users per year.

(d) For the figure below, we see that the slope of the tangent line at $t = 2002$ is larger than the slope of the secant line through the endpoints of the graph of $N(t)$. Thus, the rate of change at $t = 2002$ is greater than the average rate of change R.



10. The **atmospheric temperature** T (in °C) at altitude h meters above a certain point on earth is $T = 15 - 0.0065h$ for $h \le 12{,}000$ m. What are the average and instantaneous rates of change of T with respect to h? Why are they the same? Sketch the graph of T for $h \le 12{,}000$.

SOLUTION The average and instantaneous rates of change of T with respect to h are both -0.0065°C/m. The rates of change are the same because T is a linear function of h with slope -0.0065.



In Exercises 11–18, estimate the instantaneous rate of change at the point indicated.

11. $P(x) = 3x^2 - 5; \quad x = 2$

SOLUTION

x interval	[2, 2.01]	[2, 2.001]	[2, 2.0001]	[1.99, 2]	[1.999, 2]	[1.9999, 2]
average rate of change	12.03	12.003	12.0003	11.97	11.997	11.9997

The rate of change at $x = 2$ is approximately 12.

12. $f(t) = 12t - 7; \quad t = -4$

SOLUTION

t interval	[−4, −3.99]	[−4, −3.999]	[−4, −3.9999]
average rate of change	12	12	12
t interval	[−4.01, −4]	[−4.001, −4]	[−4.0001, −4]
average rate of change	12	12	12

The rate of change at $t = -4$ is 12, as the graph of $y = f(t)$ is a line with slope 12.

13. $y(x) = \dfrac{1}{x+2}; \quad x = 2$

SOLUTION

x interval	[2, 2.01]	[2, 2.001]	[2, 2.0001]	[1.99, 2]	[1.999, 2]	[1.9999, 2]
average rate of change	−0.0623	−0.0625	−0.0625	−0.0627	−0.0625	−0.0625

The rate of change at $x = 2$ is approximately -0.06.

14. $y(t) = \sqrt{3t+1}; \quad t = 1$

SOLUTION

t interval	[1, 1.01]	[1, 1.001]	[1, 1.0001]	[0.99, 1]	[0.999, 1]	[0.9999, 1]
average rate of change	0.7486	0.7499	0.7500	0.7514	0.7501	0.7500

The rate of change at $t = 1$ is approximately 0.75.

15. $f(x) = e^x; \quad x = 0$

SOLUTION

x interval	$[-0.01, 0]$	$[-0.001, 0]$	$[-0.0001, 0]$	$[0, 0.01]$	$[0, 0.001]$	$[0, 0.0001]$
average rate of change	0.9950	0.9995	0.99995	1.0050	1.0005	1.00005

The rate of change at $x = 0$ is approximately 1.00.

16. $f(x) = e^x; \quad x = e$

SOLUTION

x interval	$[e - 0.01, e]$	$[e - 0.001, e]$	$[e - 0.0001, e]$	$[e, e + 0.01]$	$[e, e + 0.001]$	$[e, e + 0.0001]$
average rate of change	15.0787	15.1467	15.1535	15.2303	15.1618	15.1550

The rate of change at $x = e$ is approximately 15.15.

17. $f(x) = \ln x; \quad x = 3$

SOLUTION

x interval	$[2.99, 3]$	$[2.999, 3]$	$[2.9999, 3]$	$[3, 3.01]$	$[3, 3.001]$	$[3, 3.0001]$
average rate of change	0.33389	0.33339	0.33334	0.33278	0.33328	0.33333

The rate of change at $x = 3$ is approximately 0.333.

18. $f(x) = \tan^{-1} x; \quad x = \frac{\pi}{4}$

SOLUTION

x interval	$\left[\frac{\pi}{4} - 0.01, \frac{\pi}{4}\right]$	$\left[\frac{\pi}{4} - 0.001, \frac{\pi}{4}\right]$	$\left[\frac{\pi}{4} - 0.0001, \frac{\pi}{4}\right]$	$\left[\frac{\pi}{4}, \frac{\pi}{4} + 0.01\right]$	$\left[\frac{\pi}{4}, \frac{\pi}{4} + 0.001\right]$	$\left[\frac{\pi}{4}, \frac{\pi}{4} + 0.0001\right]$
average rate of change	0.6215	0.6188	0.6185	0.6155	0.6182	0.6185

The rate of change at $x = \frac{\pi}{4}$ is approximately 0.619.

19. The height (in centimeters) at time t (in seconds) of a small mass oscillating at the end of a spring is $h(t) = 8\cos(12\pi t)$.

(a) Calculate the mass's average velocity over the time intervals $[0, 0.1]$ and $[3, 3.5]$.

(b) Estimate its instantaneous velocity at $t = 3$.

SOLUTION

(a) The average velocity over the time interval $[t_1, t_2]$ is given by $\dfrac{\Delta h}{\Delta t} = \dfrac{h(t_2) - h(t_1)}{t_2 - t_1}$.

time interval	$[0, 0.1]$	$[3, 3.5]$
average velocity	-144.721 cm/s	0 cm/s

(b)

time interval	$[3, 3.0001]$	$[3, 3.00001]$	$[3, 3.000001]$	$[2.9999, 3]$	$[2.99999, 3]$	$[2.999999, 3]$
average velocity	-0.5685	-0.05685	-0.005685	0.5685	0.05685	0.005685

The instantaneous velocity at $t = 3$ seconds is approximately 0 cm/s.

20. The number $P(t)$ of *E. coli* cells at time t (hours) in a petri dish is plotted in Figure 9.

(a) Calculate the average rate of change of $P(t)$ over the time interval $[1, 3]$ and draw the corresponding secant line.

(b) Estimate the slope m of the line in Figure 9. What does m represent?

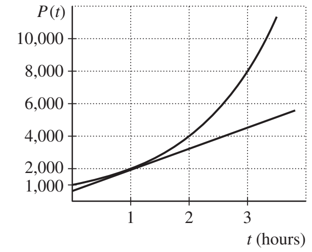


FIGURE 9 Number of *E. coli* cells at time t.

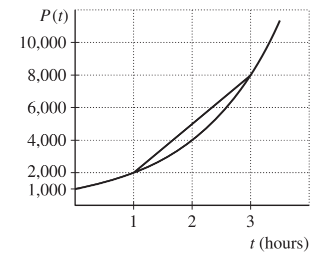
SOLUTION

(a) Looking at the graph, we can estimate $P(1) = 2000$ and $P(3) = 8000$. Assuming these values of $P(t)$, the average rate of change is

$$\frac{P(3) - P(1)}{3 - 1} = \frac{6000}{2} = 3000 \text{ cells/hour.}$$

The secant line is here:



(b) The line in Figure 9 goes through two points with approximate coordinates (1, 2000) and (2.5, 4000). This line has approximate slope

$$m = \frac{4000 - 2000}{2.5 - 1} = \frac{4000}{3} \text{ cells/hour.}$$

m is close to the slope of the line tangent to the graph of $P(t)$ at $t = 1$, and so m represents the instantaneous rate of change of $P(t)$ at $t = 1$ hour.

21. Assume that the period T (in seconds) of a pendulum (the time required for a complete back-and-forth cycle) is $T = \frac{3}{2}\sqrt{L}$, where L is the pendulum's length (in meters).

(a) What are the units for the rate of change of T with respect to L? Explain what this rate measures.

(b) Which quantities are represented by the slopes of lines A and B in Figure 10?

(c) Estimate the instantaneous rate of change of T with respect to L when $L = 3$ m.

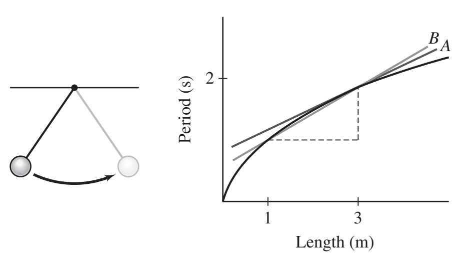


FIGURE 10 The period T is the time required for a pendulum to swing back and forth.

SOLUTION

(a) The units for the rate of change of T with respect to L are seconds per meter. This rate measures the sensitivity of the period of the pendulum to a change in the length of the pendulum.

(b) The slope of the line B represents the average rate of change in T from $L = 1$ m to $L = 3$ m. The slope of the line A represents the instantaneous rate of change of T at $L = 3$ m.

(c)

time interval	[3, 3.01]	[3, 3.001]	[3, 3.0001]	[2.99, 3]	[2.999, 3]	[2.9999, 3]
average velocity	0.4327	0.4330	0.4330	0.4334	0.4330	0.4330

The instantaneous rate of change at $L = 1$ m is approximately 0.4330 s/m.

22. The graphs in Figure 11 represent the positions of moving particles as functions of time.

(a) Do the instantaneous velocities at times t_1, t_2, t_3 in (A) form an increasing or a decreasing sequence?

(b) Is the particle speeding up or slowing down in (A)?

(c) Is the particle speeding up or slowing down in (B)?

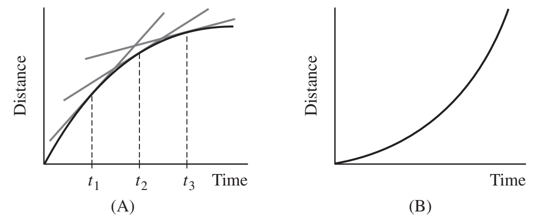

FIGURE 11

SOLUTION

(a) As the value of the independent variable increases, we note that the slope of the tangent lines decreases. Since Figure 11(A) displays position as a function of time, the slope of each tangent line is equal to the velocity of the particle; consequently, the velocities at t_1, t_2, t_3 form a decreasing sequence.

(b) Based on the solution to part (a), the velocity of the particle is decreasing; hence, the particle is slowing down.

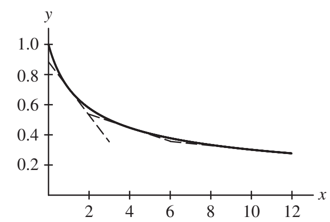
(c) If we were to draw several lines tangent to the graph in Figure 11(B), we would find that the slopes would be increasing. Accordingly, the velocity of the particle associated with Figure 11(B) is increasing, and the particle is speeding up.

23. GU An advertising campaign boosted sales of Crunchy Crust frozen pizza to a peak level of S_0 dollars per month. A marketing study showed that after t months, monthly sales declined to

$$S(t) = S_0 g(t), \quad \text{where } g(t) = \frac{1}{\sqrt{1+t}}.$$

Do sales decline more slowly or more rapidly as time increases? Answer by referring to a sketch the graph of $g(t)$ together with several tangent lines.

SOLUTION We notice from the figure below that, as time increases, the slopes of the tangent lines to the graph of $g(t)$ become less negative. Thus, sales decline more slowly as time increases.



24. The fraction of a city's population infected by a flu virus is plotted as a function of time (in weeks) in Figure 12.

(a) Which quantities are represented by the slopes of lines A and B? Estimate these slopes.

(b) Is the flu spreading more rapidly at $t = 1$, 2, or 3?

(c) Is the flu spreading more rapidly at $t = 4$, 5, or 6?

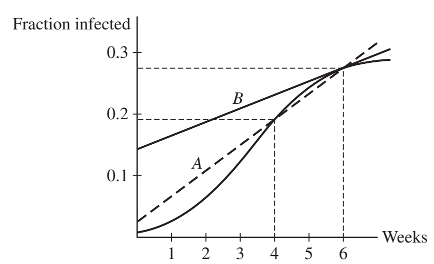


FIGURE 12

SOLUTION

(a) The slope of line A is the average rate of change over the interval $[4, 6]$, whereas the slope of the line B is the instantaneous rate of change at $t = 6$. Thus, the slope of the line $A \approx (0.28 - 0.19)/2 = 0.045$/week, whereas the slope of the line $B \approx (0.28 - 0.15)/6 = 0.0217$/week.

(b) Among times $t = 1, 2, 3$, the flu is spreading most rapidly at $t = 3$ since the slope is greatest at that instant; hence, the rate of change is greatest at that instant.

(c) Among times $t = 4, 5, 6$, the flu is spreading most rapidly at $t = 4$ since the slope is greatest at that instant; hence, the rate of change is greatest at that instant.

25. The graphs in Figure 13 represent the positions s of moving particles as functions of time t. Match each graph with a description:

(a) Speeding up

(b) Speeding up and then slowing down

(c) Slowing down

(d) Slowing down and then speeding up

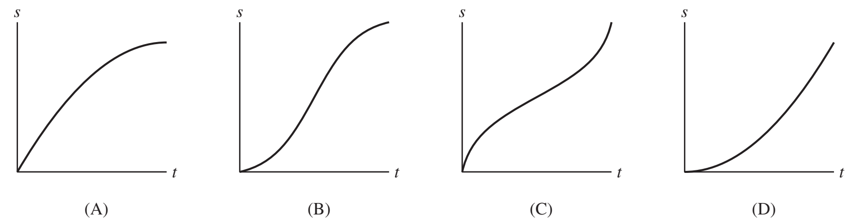

FIGURE 13

SOLUTION When a particle is speeding up over a time interval, its graph is bent upward over that interval. When a particle is slowing down, its graph is bent downward over that interval. Accordingly,

- In graph (A), the particle is (c) slowing down.
- In graph (B), the particle is (b) speeding up and then slowing down.
- In graph (C), the particle is (d) slowing down and then speeding up.
- In graph (D), the particle is (a) speeding up.

26. An epidemiologist finds that the percentage $N(t)$ of susceptible children who were infected on day t during the first three weeks of a measles outbreak is given, to a reasonable approximation, by the formula (Figure 14)

$$N(t) = \frac{100t^2}{t^3 + 5t^2 - 100t + 380}$$

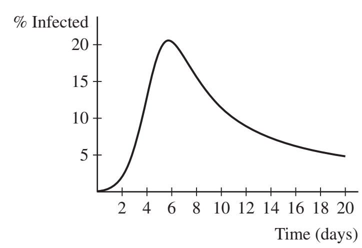

FIGURE 14 Graph of $N(t)$.

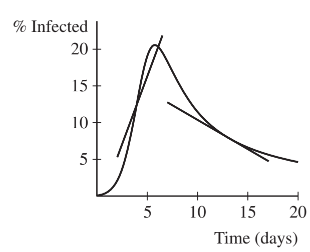
(a) Draw the secant line whose slope is the average rate of change in infected children over the intervals [4, 6] and [12, 14]. Then compute these average rates (in units of percent per day).

(b) Is the rate of decline greater at $t = 8$ or $t = 16$?

(c) Estimate the rate of change of $N(t)$ on day 12.

SOLUTION

(a)



The average rate of change of $N(t)$ over the interval between day 4 and day 6 is given by

$$\frac{\Delta N}{\Delta t} = \frac{N(6) - N(4)}{6 - 4} = 3.776\%/\text{day}.$$

Similarly, we calculate the average rate of change of $N(t)$ over the interval between day 12 and day 14 as

$$\frac{\Delta N}{\Delta t} = \frac{N(14) - N(12)}{14 - 12} = -0.7983\%/\text{day}.$$

(b) The slope of the tangent line at $t = 8$ would be more negative than the slope of the tangent line at $t = 16$. Thus, the rate of decline is greater at $t = 8$ than at $t = 16$.

(c)

time interval	[12, 12.5]	[12, 12.2]	[12, 12.01]	[12, 12.001]
average rate of change	-0.9288	-0.9598	-0.9805	-0.9815

time interval	[11.5, 12]	[11.8, 12]	[11.99, 12]	[11.999, 12]
average rate of change	-1.0402	-1.0043	-0.9827	-0.9817

The instantaneous rate of change of $N(t)$ on day 12 is $-0.9816\%/\text{day}$.

27. The fungus *Fusarium exosporium* infects a field of flax plants through the roots and causes the plants to wilt. Eventually, the entire field is infected. The percentage $f(t)$ of infected plants as a function of time t (in days) since planting is shown in Figure 15.

(a) What are the units of the rate of change of $f(t)$ with respect to t? What does this rate measure?

(b) Use the graph to rank (from smallest to largest) the average infection rates over the intervals [0, 12], [20, 32], and [40, 52].

(c) Use the following table to compute the average rates of infection over the intervals [30, 40], [40, 50], [30, 50].

Days	0	10	20	30	40	50	60
Percent infected	0	18	56	82	91	96	98

(d) Draw the tangent line at $t = 40$ and estimate its slope.

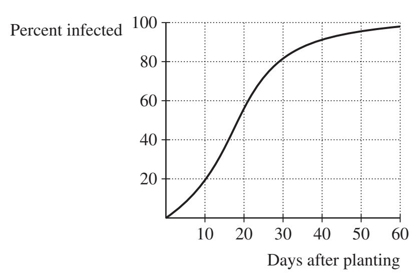


FIGURE 15

SOLUTION

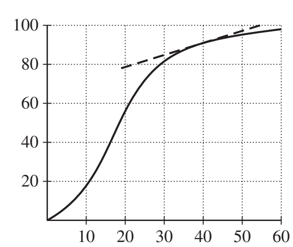
(a) The units of the rate of change of $f(t)$ with respect to t are percent /day or %/d. This rate measures how quickly the population of flax plants is becoming infected.

(b) From smallest to largest, the average rates of infection are those over the intervals [40, 52], [0, 12], [20, 32]. This is because the slopes of the secant lines over these intervals are arranged from smallest to largest.

(c) The average rates of infection over the intervals [30, 40], [40, 50], [30, 50] are 0.9, 0.5, 0.7 %/d, respectively.

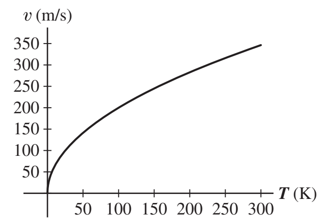
(d) The tangent line sketched in the graph below appears to pass through the points (20, 80) and (40, 91). The estimate of the instantaneous rate of infection at $t = 40$ days is therefore

$$\frac{91 - 80}{40 - 20} = \frac{11}{20} = 0.55\%/\text{d}.$$



28. Let $v = 20\sqrt{T}$ as in Example 2. Is the rate of change of v with respect to T greater at low temperatures or high temperatures? Explain in terms of the graph.

SOLUTION



As the graph progresses to the right, the graph bends progressively downward, meaning that the slope of the tangent lines becomes smaller. This means that the rate of change of v with respect to T is lower at high temperatures.

29. If an object in linear motion (but with changing velocity) covers Δs meters in Δt seconds, then its average velocity is $v_0 = \Delta s/\Delta t$ m/s. Show that it would cover the same distance if it traveled at constant velocity v_0 over the same time interval. This justifies our calling $\Delta s/\Delta t$ the *average velocity*.

SOLUTION At constant velocity, the distance traveled is equal to velocity times time, so an object moving at constant velocity v_0 for Δt seconds travels $v_0 \delta t$ meters. Since $v_0 = \Delta s/\Delta t$, we find

$$\text{distance traveled} = v_0 \delta t = \left(\frac{\Delta s}{\Delta t}\right) \Delta t = \Delta s$$

So the object covers the same distance Δs by traveling at constant velocity v_0.

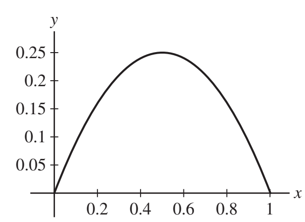
30. Sketch the graph of $f(x) = x(1-x)$ over [0, 1]. Refer to the graph and, without making any computations, find:

(a) The average rate of change over [0, 1]

(b) The (instantaneous) rate of change at $x = \frac{1}{2}$

(c) The values of x at which the rate of change is positive

SOLUTION



(a) $f(0) = f(1)$, so there is no change between $x = 0$ and $x = 1$. The average rate of change is zero.

(b) The tangent line to the graph of $f(x)$ is horizontal at $x = \frac{1}{2}$; the instantaneous rate of change is zero at this point.

(c) The rate of change is positive at all points where the graph is rising, because the slope of the tangent line is positive at these points. This is so for all x between $x = 0$ and $x = 0.5$.

31. Which graph in Figure 16 has the following property: For all x, the average rate of change over $[0, x]$ is greater than the instantaneous rate of change at x. Explain.

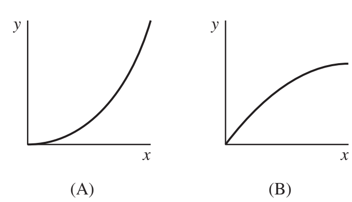


FIGURE 16

SOLUTION

(a) The average rate of change over $[0, x]$ is greater than the instantaneous rate of change at x: (B).

(b) The average rate of change over $[0, x]$ is less than the instantaneous rate of change at x: (A)

The graph in (B) bends downward, so the slope of the secant line through $(0, 0)$ and $(x, f(x))$ is larger than the slope of the tangent line at $(x, f(x))$. On the other hand, the graph in (A) bends upward, so the slope of the tangent line at $(x, f(x))$ is larger than the slope of the secant line through $(0, 0)$ and $(x, f(x))$.

Further Insights and Challenges

32. The height of a projectile fired in the air vertically with initial velocity 25 m/s is

$$h(t) = 25t - 4.9t^2 \text{ m}.$$

(a) Compute $h(1)$. Show that $h(t) - h(1)$ can be factored with $(t - 1)$ as a factor.

(b) Using part (a), show that the average velocity over the interval $[1, t]$ is $20.1 - 4.9t$.

(c) Use this formula to find the average velocity over several intervals $[1, t]$ with t close to 1. Then estimate the instantaneous velocity at time $t = 1$.

SOLUTION

(a) With $h(t) = 25t - 4.9t^2$, we have $h(1) = 20.1$ m, so

$$h(t) - h(1) = -4.9t^2 + 25t - 20.1.$$

Factoring the quadratic, we obtain

$$h(t) - h(1) = (t - 1)(-4.9t + 20.1).$$

(b) The average velocity over the interval $[1, t]$ is

$$\frac{h(t) - h(1)}{t - 1} = \frac{(t - 1)(-4.9t + 20.1)}{t - 1} = 20.1 - 4.9t.$$

(c)

t	1.01	1.001	1.0001	1.00001
average velocity over $[1, t]$	15.151	15.1951	15.19951	15.199951

The instantaneous velocity is approximately 15.2 m/s. Plugging $t = 1$ second into the formula in (b) yields $20.1 - 4.9(1) = 15.2$ m/s exactly.

33. Let $Q(t) = t^2$. As in the previous exercise, find a formula for the average rate of change of Q over the interval $[1, t]$ and use it to estimate the instantaneous rate of change at $t = 1$. Repeat for the interval $[2, t]$ and estimate the rate of change at $t = 2$.

SOLUTION The average rate of change is

$$\frac{Q(t) - Q(1)}{t - 1} = \frac{t^2 - 1}{t - 1}.$$

Applying the difference of squares formula gives that the average rate of change is $((t + 1)(t - 1))/(t - 1) = (t + 1)$ for $t \neq 1$. As t gets closer to 1, this gets closer to $1 + 1 = 2$. The instantaneous rate of change is 2.

For $t_0 = 2$, the average rate of change is

$$\frac{Q(t) - Q(2)}{t - 2} = \frac{t^2 - 4}{t - 2},$$

which simplifies to $t + 2$ for $t \neq 2$. As t approaches 2, the average rate of change approaches 4. The instantaneous rate of change is therefore 4.

34. Show that the average rate of change of $f(x) = x^3$ over $[1, x]$ is equal to

$$x^2 + x + 1.$$

Use this to estimate the instantaneous rate of change of $f(x)$ at $x = 1$.

SOLUTION The average rate of change is

$$\frac{f(x) - f(1)}{x - 1} = \frac{x^3 - 1}{x - 1}.$$

Factoring the numerator as the difference of cubes means the average rate of change is

$$\frac{(x - 1)(x^2 + x + 1)}{x - 1} = x^2 + x + 1$$

(for all $x \neq 1$). The closer x gets to 1, the closer the average rate of change gets to $1^2 + 1 + 1 = 3$. The instantaneous rate of change is 3.

35. Find a formula for the average rate of change of $f(x) = x^3$ over $[2, x]$ and use it to estimate the instantaneous rate of change at $x = 2$.

SOLUTION The average rate of change is

$$\frac{f(x) - f(2)}{x - 2} = \frac{x^3 - 8}{x - 2}.$$

Applying the difference of cubes formula to the numerator, we find that the average rate of change is

$$\frac{(x^2 + 2x + 4)(x - 2)}{x - 2} = x^2 + 2x + 4$$

for $x \neq 2$. The closer x gets to 2, the closer the average rate of change gets to $2^2 + 2(2) + 4 = 12$.

36. Let $T = \frac{3}{2}\sqrt{L}$ as in Exercise 21. The numbers in the second column of Table 1 are increasing, and those in the last column are decreasing. Explain why in terms of the graph of T as a function of L. Also, explain graphically why the instantaneous rate of change at $L = 3$ lies between 0.4329 and 0.4331.

TABLE 1 **Average Rates of Change of T with Respect to L**

Interval	Average rate of change	Interval	Average rate of change
[3, 3.2]	0.42603	[2.8, 3]	0.44048
[3, 3.1]	0.42946	[2.9, 3]	0.43668
[3, 3.001]	0.43298	[2.999, 3]	0.43305
[3, 3.0005]	0.43299	[2.9995, 3]	0.43303

SOLUTION Since the average rate of change is increasing on the intervals $[3, L]$ as L get close to 3, we know that the slopes of the secant lines between points on the graph over these intervals are increasing. The more rows we add with smaller intervals, the greater the average rate of change. This means that the instantaneous rate of change is probably greater than all of the numbers in this column.

Likewise, since the average rate of change is *decreasing* on the intervals $[L, 3]$ as L gets closer to 3, we know that the slopes of the secant lines between points over these intervals are decreasing. This means that the instantaneous rate of change is probably less than all the numbers in this column.

The tangent slope is somewhere between the greatest value in the first column and the least value in the second column. Hence, it is between 0.43299 and 0.43303. The first column underestimates the instantaneous rate of change by secant slopes; this estimate improves as L decreases toward $L = 3$. The second column overestimates the instantaneous rate of change by secant slopes; this estimate improves as L increases toward $L = 3$.

2.2 Limits: A Numerical and Graphical Approach

Preliminary Questions

1. What is the limit of $f(x) = 1$ as $x \to \pi$?

SOLUTION $\lim_{x\to\pi} 1 = 1$.

2. What is the limit of $g(t) = t$ as $t \to \pi$?

SOLUTION $\lim_{t\to\pi} t = \pi$.

3. Is $\lim\limits_{x\to 10} 20$ equal to 10 or 20?

SOLUTION $\lim_{x\to 10} 20 = 20$.

4. Can $f(x)$ approach a limit as $x \to c$ if $f(c)$ is undefined? If so, give an example.

SOLUTION Yes. The limit of a function f as $x \to c$ does not depend on what happens *at* $x = c$, only on the behavior of f as $x \to c$. As an example, consider the function

$$f(x) = \frac{x^2 - 1}{x - 1}.$$

The function is clearly not defined at $x = 1$ but

$$\lim_{x\to 1} f(x) = \lim_{x\to 1} \frac{x^2-1}{x-1} = \lim_{x\to 1}(x+1) = 2.$$

5. What does the following table suggest about $\lim_{x\to 1-} f(x)$ and $\lim_{x\to 1+} f(x)$?

x	0.9	0.99	0.999	1.1	1.01	1.001
$f(x)$	7	25	4317	3.0126	3.0047	3.00011

SOLUTION The values in the table suggest that $\lim_{x\to 1-} f(x) = \infty$ and $\lim_{x\to 1+} f(x) = 3$.

6. Can you tell whether $\lim_{x\to 5} f(x)$ exists from a plot of $f(x)$ for $x > 5$? Explain.

SOLUTION No. By examining values of $f(x)$ for x close to but greater than 5, we can determine whether the one-sided limit $\lim_{x\to 5+} f(x)$ exists. To determine whether $\lim_{x\to 5} f(x)$ exists, we must examine value of $f(x)$ on both sides of $x = 5$.

7. If you know in advance that $\lim_{x\to 5} f(x)$ exists, can you determine its value from a plot of $f(x)$ for all $x > 5$?

SOLUTION Yes. If $\lim_{x\to 5} f(x)$ exists, then both one-sided limits must exist and be equal.

Exercises

In Exercises 1–4, fill in the tables and guess the value of the limit.

1. $\lim_{x\to 1} f(x)$, where $f(x) = \dfrac{x^3-1}{x^2-1}$.

x	$f(x)$	x	$f(x)$
1.002		0.998	
1.001		0.999	
1.0005		0.9995	
1.00001		0.99999	

SOLUTION

x	0.998	0.999	0.9995	0.99999	1.00001	1.0005	1.001	1.002
$f(x)$	1.498501	1.499250	1.499625	1.499993	1.500008	1.500375	1.500750	1.501500

The limit as $x \to 1$ is $\frac{3}{2}$.

2. $\lim_{t\to 0} h(t)$, where $h(t) = \dfrac{\cos t - 1}{t^2}$. Note that $h(t)$ is even; that is, $h(t) = h(-t)$.

t	± 0.002	± 0.0001	± 0.00005	± 0.00001
$h(t)$				

SOLUTION

t	± 0.002	± 0.0001
$h(t)$	-0.499999833333	-0.499999999583
t	± 0.00005	± 0.00001
$h(t)$	-0.499999999896	-0.500000000000

The limit as $t \to 0$ is $-\frac{1}{2}$.

3. $\lim_{y \to 2} f(y)$, where $f(y) = \dfrac{y^2 - y - 2}{y^2 + y - 6}$.

y	$f(y)$	y	$f(y)$
2.002		1.998	
2.001		1.999	
2.0001		1.9999	

SOLUTION

y	1.998	1.999	1.9999	2.0001	2.001	2.02
$f(y)$	0.59984	0.59992	0.599992	0.600008	0.60008	0.601594

The limit as $y \to 2$ is $\frac{3}{5}$.

4. $\lim_{x \to 0+} f(x)$, where $f(x) = x \ln x$.

x	1	0.5	0.1	0.05	0.01	0.005	0.001
$f(x)$							

SOLUTION

x	1.0	0.5	0.1	0.05	0.01	0.005	0.001
$f(x)$	0	-0.34657	-0.23026	-0.14979	-0.04605	-0.02649	-0.00691

The limit as $x \to 0+$ is 0.

5. Determine $\lim_{x \to 0.5} f(x)$ for $f(x)$ as in Figure 9.

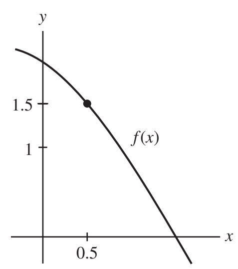

FIGURE 9

SOLUTION The graph suggests that $f(x) \to 1.5$ as $x \to 0.5$.

6. Determine $\lim_{x \to 0.5} g(x)$ for $g(x)$ as in Figure 10.

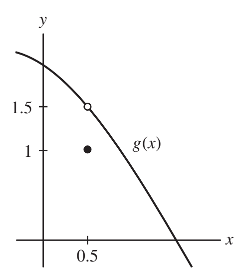

FIGURE 10

SOLUTION The graph suggests that $g(x) \to 1.5$ as $x \to 0.5$. The value $g(0.5)$, which happens to be 1, does not affect the limit.

In Exercises 7 and 8, evaluate the limit.

7. $\lim_{x \to 21} x$

SOLUTION As $x \to 21$, $f(x) = x \to 21$. You can see this, for example, on the graph of $f(x) = x$.

8. $\lim_{x \to 4.2} \sqrt{3}$

SOLUTION The graph of $f(x) = \sqrt{3}$ is a horizontal line. $f(x) = \sqrt{3}$ for all values of x, so the limit is also equal to $\sqrt{3}$.

In Exercises 9–16, verify each limit using the limit definition. For example, in Exercise 9, show that $|3x - 12|$ can be made as small as desired by taking x close to 4.

9. $\lim_{x \to 4} 3x = 12$

SOLUTION $|3x - 12| = 3|x - 4|$. $|3x - 12|$ can be made arbitrarily small by making x close enough to 4, thus making $|x - 4|$ small.

10. $\lim_{x \to 5} 3 = 3$

SOLUTION $|f(x) - 3| = |3 - 3| = 0$ for all values of x so $f(x) - 3$ is already smaller than any positive number as $x \to 5$.

11. $\lim_{x \to 3} (5x + 2) = 17$

SOLUTION $|(5x + 2) - 17| = |5x - 15| = 5|x - 3|$. Therefore, if you make $|x - 3|$ small enough, you can make $|(5x + 2) - 17|$ as small as desired.

12. $\lim_{x \to 2} (7x - 4) = 10$

SOLUTION As $x \to 2$, note that $|(7x - 4) - 10| = |7x - 14| = 7\,|x - 2|$. If you make $|x - 2|$ small enough, you can make $|(7x - 4) - 10|$ as small as desired.

13. $\lim_{x \to 0} x^2 = 0$

SOLUTION As $x \to 0$, we have $|x^2 - 0| = |x + 0||x - 0|$. To simplify things, suppose that $|x| < 1$, so that $|x + 0||x - 0| = |x||x| < |x|$. By making $|x|$ sufficiently small, so that $|x + 0||x - 0| = x^2$ is even smaller, you can make $|x^2 - 0|$ as small as desired.

14. $\lim_{x \to 0} (3x^2 - 9) = -9$

SOLUTION $|3x^2 - 9 - (-9)| = |3x^2| = 3|x^2|$. If you make $|x| < 1$, $|x^2| < |x|$, so that making $|x - 0|$ small enough can make $|3x^2 - 9 - (-9)|$ as small as desired.

15. $\lim_{x \to 0} (4x^2 + 2x + 5) = 5$

SOLUTION As $x \to 0$, we have $|4x^2 + 2x + 5 - 5| = |4x^2 + 2x| = |x||4x + 2|$. If $|x| < 1$, $|4x + 2|$ can be no bigger than 6, so $|x||4x + 2| < 6|x|$. Therefore, by making $|x - 0| = |x|$ sufficiently small, you can make $|4x^2 + 2x + 5 - 5| = |x||4x + 2|$ as small as desired.

16. $\lim_{x \to 0} (x^3 + 12) = 12$

SOLUTION $|(x^3 + 12) - 12| = |x^3|$. If we make $|x| < 1$, then $|x^3| < |x|$. Therefore, by making $|x - 0| = |x|$ sufficiently small, we can make $|(x^3 + 12) - 12|$ as small as desired.

In Exercises 17–36, estimate the limit numerically or state that the limit does not exist. If infinite, state whether the one-sided limits are ∞ or $-\infty$.

17. $\lim_{x \to 1} \dfrac{\sqrt{x} - 1}{x - 1}$

SOLUTION

x	0.9995	0.99999	1.00001	1.0005
$f(x)$	0.500063	0.500001	0.49999	0.499938

The limit as $x \to 1$ is $\frac{1}{2}$.

18. $\lim_{x \to -4} \dfrac{2x^2 - 32}{x + 4}$

SOLUTION

x	-4.001	-4.0001	-3.9999	-3.999
$f(x)$	-16.002	-16.0002	-15.9998	-15.998

The limit as $x \to -4$ is -16.

19. $\lim_{x\to 2} \frac{x^2+x-6}{x^2-x-2}$

SOLUTION

x	1.999	1.99999	2.00001	2.001
$f(x)$	1.666889	1.666669	1.666664	1.666445

The limit as $x \to 2$ is $\frac{5}{3}$.

20. $\lim_{x\to 3} \frac{x^3-2x^2-9}{x^2-2x-3}$

SOLUTION

x	2.99	2.995	3.005	3.01
$f(x)$	3.741880	3.745939	3.754064	3.758130

The limit as $x \to 3$ is 3.75.

21. $\lim_{x\to 0} \frac{\sin 2x}{x}$

SOLUTION

x	-0.01	-0.005	0.005	0.01
$f(x)$	1.999867	1.999967	1.999967	1.999867

The limit as $x \to 0$ is 2.

22. $\lim_{x\to 0} \frac{\sin 5x}{x}$

SOLUTION

x	-0.01	-0.005	0.005	0.01
$f(x)$	4.997917	4.999479	4.999479	4.997917

The limit as $x \to 0$ is 5.

23. $\lim_{\theta\to 0} \frac{\cos\theta - 1}{\theta}$

SOLUTION

x	-0.05	-0.001	0.001	0.05
$f(x)$	0.0249948	0.0005	-0.0005	-0.0249948

The limit as $x \to 0$ is 0.

24. $\lim_{x\to 0} \frac{\sin x}{x^2}$

SOLUTION

x	-0.01	-0.001	-0.0001	0.0001	0.001	0.01
$f(x)$	-99.9983	-999.9998	-10000.0	10000.0	999.9998	99.9983

The limit does not exist. As $x \to 0-$, $f(x) \to -\infty$; similarly, as $x \to 0+$, $f(x) \to \infty$.

25. $\lim_{x\to 4} \frac{1}{(x-4)^3}$

SOLUTION

x	3.99	3.999	3.9999	4.0001	4.001	4.01
$f(x)$	-10^6	-10^9	-10^{12}	10^{12}	10^9	10^6

The limit does not exist. As $x \to 4-$, $f(x) \to -\infty$; similarly, as $x \to 4+$, $f(x) \to \infty$.

26. $\lim_{x \to 1-} \frac{3-x}{x-1}$

SOLUTION

x	0.99	0.999	0.9999	0.99999
$f(x)$	-201	-2001	-20001	-200001

As $x \to 1-$, $f(x) \to -\infty$.

27. $\lim_{x \to 3+} \frac{x-4}{x^2-9}$

SOLUTION

x	3.01	3.001	3.0001	3.00001
$f(x)$	-16.473	-166.473	-1666.473	-16666.473

As $x \to 3+$, $f(x) \to -\infty$.

28. $\lim_{h \to 0} \frac{3^h - 1}{h}$

SOLUTION

h	-0.05	-0.001	-0.0001	0.0001	0.001	0.05
$f(h)$	1.06898	1.09801	1.09855	1.09867	1.09922	1.12935

The limit as $x \to 0$ is approximately 1.099. (The exact answer is $\ln 3$.)

29. $\lim_{h \to 0} \sin h \cos \frac{1}{h}$

SOLUTION

h	-0.01	-0.001	-0.0001	0.0001	0.001	0.01
$f(h)$	-0.008623	-0.000562	0.000095	-0.000095	0.000562	0.008623

The limit as $x \to 0$ is 0.

30. $\lim_{h \to 0} \cos \frac{1}{h}$

SOLUTION

h	± 0.1	± 0.01	± 0.001	± 0.0001
$f(h)$	-0.839072	0.862319	0.562379	-0.952155

The limit does not exist since $\cos(1/h)$ oscillates infinitely often as $h \to 0$.

31. $\lim_{x \to 0} |x|^x$

SOLUTION

x	-0.05	-0.001	-0.00001	0.00001	0.001	0.05
$f(x)$	1.161586	1.006932	1.000115	0.999885	0.993116	0.860892

The limit as $x \to 0$ is 1.

32. $\lim_{x \to 1+} \frac{\sec^{-1} x}{\sqrt{x-1}}$

SOLUTION

x	1.05	1.01	1.005	1.001
$f(x)$	1.3857	1.4084	1.4113	1.4136

The limit as $x \to 1+$ is approximately 1.414. (The exact answer is $\sqrt{2}$.)

33. $\lim_{t\to e} \dfrac{t-e}{\ln t - 1}$

SOLUTION

r	$e-0.01$	$e-0.001$	$e-0.0001$	$e+0.0001$	$e+0.001$	$e+0.01$
$f(t)$	2.713279	2.717782	2.718232	2.718332	2.718782	2.723279

The limit as $t \to 0$ is approximately 2.718. (The exact answer is e.)

34. $\lim_{r\to 0} (1+r)^{1/r}$

SOLUTION

r	-0.01	-0.001	-0.0001	0.0001	0.001	0.01
$f(r)$	2.731999	2.719642	2.718418	2.718146	2.716924	2.704814

The limit as $r \to 0$ is approximately 2.718. (The exact answer is e.)

35. $\lim_{x\to 1-} \dfrac{\tan^{-1} x}{\cos^{-1} x}$

SOLUTION

x	0.999	0.9999	0.99999	0.999999	0.9999999
$f(x)$	17.549	55.532	175.619	555.360	1756.204

The limit as $x \to 1-$ does not exist.

36. $\lim_{x\to 0} \dfrac{\tan^{-1} x - x}{\sin^{-1} x - x}$

SOLUTION

x	-0.01	-0.001	0.001	0.01
$f(x)$	-1.999791	-2.000066	-2.000066	-1.999791

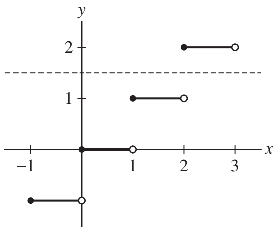
The limit as $x \to 0$ is approximately -2.00. (The exact answer is -2.)

37. The **greatest integer function** is defined by $[x] = n$, where n is the unique integer such that $n \le x < n+1$. Sketch the graph of $y = [x]$. Calculate, for c an integer:

(a) $\lim_{x\to c-} [x]$

(b) $\lim_{x\to c+} [x]$

SOLUTION Here is a graph of the greatest integer function:



(a) From the graph, we see that, for c an integer,

$$\lim_{x\to c-} [x] = c - 1.$$

(b) From the graph, we see that, for c an integer,

$$\lim_{x\to c+} [x] = c.$$

38. Determine the one-sided limits at $c = 1, 2,$ and 4 of the function $g(x)$ shown in Figure 11, and state whether the limit exists at these points.

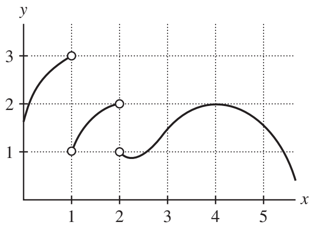


FIGURE 11

SOLUTION

- At $c = 1$, the left-hand limit is $\lim_{x\to 1-} g(x) = 3$, whereas the right-hand limit is $\lim_{x\to 1+} g(x) = 1$. Accordingly, the two-sided limit does not exist at $c = 1$.
- At $c = 2$, the left-hand limit is $\lim_{x\to 2-} g(x) = 2$, whereas the right-hand limit is $\lim_{x\to 2+} g(x) = 1$. Accordingly, the two-sided limit does not exist at $c = 2$.
- At $c = 4$, the left-hand limit is $\lim_{x\to 4-} g(x) = 2$, whereas the right-hand limit is $\lim_{x\to 4+} g(x) = 2$. Accordingly, the two-sided limit exists at $c = 4$ and equals 2.

In Exercises 39–46, determine the one-sided limits numerically or graphically. If infinite, state whether the one-sided limits are ∞ or $-\infty$, and describe the corresponding vertical asymptote. In Exercise 46, $[x]$ is the greatest integer function defined in Exercise 37.

39. $\lim_{x\to 0\pm} \dfrac{\sin x}{|x|}$

SOLUTION

x	-0.2	-0.02	0.02	0.2
$f(x)$	-0.993347	-0.999933	0.999933	0.993347

The left-hand limit is $\lim_{x\to 0-} f(x) = -1$, whereas the right-hand limit is $\lim_{x\to 0+} f(x) = 1$.

40. $\lim_{x\to 0\pm} |x|^{1/x}$

SOLUTION

x	-0.2	-0.1	0.15	0.2
$f(x)$	3125.0	10^{10}	0.000003	0.000320

The left-hand limit is $\lim_{x\to 0-} f(x) = \infty$, whereas the right-hand limit is $\lim_{x\to 0+} f(x) = 0$. Thus, the line $x = 0$ is a vertical asymptote from the left for the graph of $y = |x|^{1/x}$.

41. $\lim_{x\to 0\pm} \dfrac{x - \sin|x|}{x^3}$

SOLUTION

x	-0.1	-0.01	0.01	0.1
$f(x)$	199.853	19999.8	0.166666	0.166583

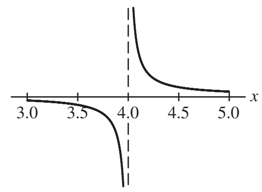
The left-hand limit is $\lim_{x\to 0-} f(x) = \infty$, whereas the right-hand limit is $\lim_{x\to 0+} f(x) = \dfrac{1}{6}$. Thus, the line $x = 0$ is a vertical asymptote from the left for the graph of $y = \frac{x-\sin|x|}{x^3}$.

42. $\lim_{x\to 4\pm} \dfrac{x+1}{x-4}$

SOLUTION The graph of $y = \frac{x+1}{x-4}$ for x near 4 is shown below. From this graph, we see that

$$\lim_{x\to 4-} \frac{x+1}{x-4} = -\infty \quad \text{while} \quad \lim_{x\to 4+} \frac{x+1}{x-4} = \infty.$$

Thus, the line $x = 4$ is a vertical asymptote for the graph of $y = \frac{x+1}{x-4}$.

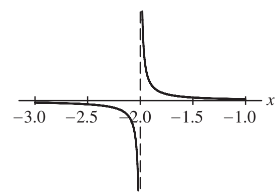


43. $\lim\limits_{x\to -2\pm} \dfrac{4x^2+7}{x^3+8}$

SOLUTION The graph of $y = \frac{4x^2+7}{x^3+8}$ for x near -2 is shown below. From this graph, we see that

$$\lim_{x\to -2-} \frac{4x^2+7}{x^3+8} = -\infty \quad \text{while} \quad \lim_{x\to -2+} \frac{4x^2+7}{x^3+8} = \infty.$$

Thus, the line $x = -2$ is a vertical asymptote for the graph of $y = \frac{4x^2+7}{x^3+8}$.

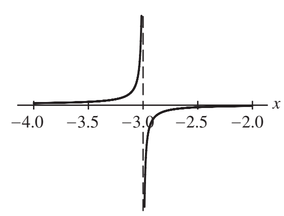


44. $\lim\limits_{x\to -3\pm} \dfrac{x^2}{x^2-9}$

SOLUTION The graph of $y = \frac{x^2}{x^2-9}$ for x near -3 is shown below. From this graph, we see that

$$\lim_{x\to -3-} \frac{x^2}{x^2-9} = \infty \quad \text{while} \quad \lim_{x\to -3+} \frac{x^2}{x^2-9} = -\infty.$$

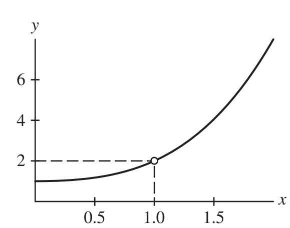
Thus, the line $x = -3$ is a vertical asymptote for the graph of $y = \frac{x^2}{x^2-9}$.



45. $\lim\limits_{x\to 1\pm} \dfrac{x^5+x-2}{x^2+x-2}$

SOLUTION The graph of $y = \frac{x^5+x-2}{x^2+x-2}$ for x near 1 is shown below. From this graph, we see that

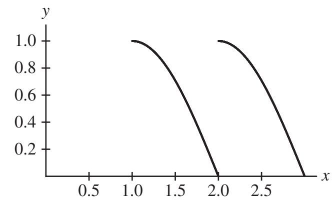
$$\lim_{x\to 1\pm} \frac{x^5+x-2}{x^2+x-2} = 2.$$



46. $\lim\limits_{x\to 2\pm} \cos\left(\dfrac{\pi}{2}(x - [x])\right)$

SOLUTION The graph of $y = \cos\left(\frac{\pi}{2}(x - [x])\right)$ for x near 2 is shown below. From this graph, we see that

$$\lim_{x\to 2-} \cos\left(\frac{\pi}{2}(x - [x])\right) = 0 \quad \text{while} \quad \lim_{x\to 2+} \cos\left(\frac{\pi}{2}(x - [x])\right) = 1.$$



47. Determine the one-sided limits at $c = 2, 4$ of the function $f(x)$ in Figure 12. What are the vertical asymptotes of $f(x)$?

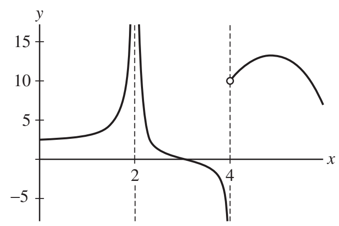


FIGURE 12

SOLUTION

- For $c = 2$, we have $\lim_{x \to 2-} f(x) = \infty$ and $\lim_{x \to 2+} f(x) = \infty$.
- For $c = 4$, we have $\lim_{x \to 4-} f(x) = -\infty$ and $\lim_{x \to 4+} f(x) = 10$.

The vertical asymptotes are the vertical lines $x = 2$ and $x = 4$.

48. Determine the infinite one- and two-sided limits in Figure 13.

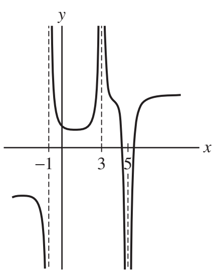

FIGURE 13

SOLUTION

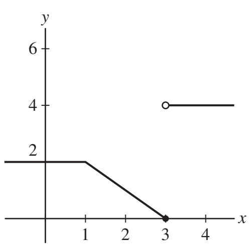
- $\lim_{x \to -1-} f(x) = -\infty$
- $\lim_{x \to -1+} f(x) = \infty$
- $\lim_{x \to 3} f(x) = \infty$
- $\lim_{x \to 5} f(x) = -\infty$

The vertical asymptotes are the vertical lines $x = 1$, $x = 3$, and $x = 5$.

In Exercises 49–52, sketch the graph of a function with the given limits.

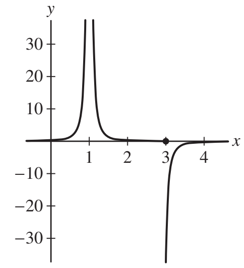
49. $\lim_{x \to 1} f(x) = 2, \quad \lim_{x \to 3-} f(x) = 0, \quad \lim_{x \to 3+} f(x) = 4$

SOLUTION



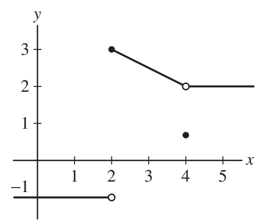
50. $\lim_{x\to 1} f(x) = \infty, \quad \lim_{x\to 3-} f(x) = 0, \quad \lim_{x\to 3+} f(x) = -\infty$

SOLUTION



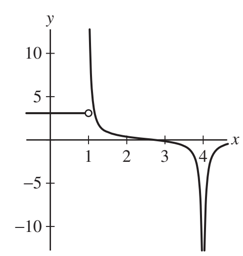
51. $\lim_{x\to 2+} f(x) = f(2) = 3, \quad \lim_{x\to 2-} f(x) = -1, \; \lim_{x\to 4} f(x) = 2 \neq f(4)$

SOLUTION



52. $\lim_{x\to 1+} f(x) = \infty, \quad \lim_{x\to 1-} f(x) = 3, \quad \lim_{x\to 4} f(x) = -\infty$

SOLUTION



53. Determine the one-sided limits of the function $f(x)$ in Figure 14, at the points $c = 1, 3, 5, 6$.

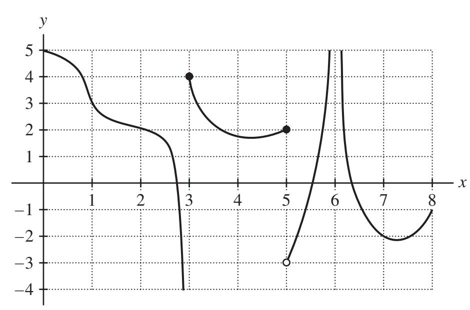


FIGURE 14 Graph of $f(x)$

SOLUTION

- $\lim_{x\to 1-} f(x) = \lim_{x\to 1+} f(x) = 3$
- $\lim_{x\to 3-} f(x) = -\infty$
- $\lim_{x\to 3+} f(x) = 4$
- $\lim_{x\to 5-} f(x) = 2$
- $\lim_{x\to 5+} f(x) = -3$
- $\lim_{x\to 6-} f(x) = \lim_{x\to 6+} f(x) = \infty$

54. Does either of the two oscillating functions in Figure 15 appear to approach a limit as $x \to 0$?

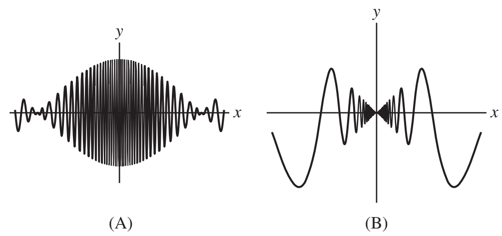

FIGURE 15

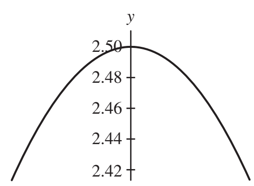
SOLUTION (A) does not appear to approach a limit as $x \to 0$; the values of the function oscillate wildly as $x \to 0$. The values of the function graphed in (B) seem to settle to 0 as $x \to 0$, so the limit seems to exist.

GU *In Exercises 55–60, plot the function and use the graph to estimate the value of the limit.*

55. $\displaystyle\lim_{\theta \to 0} \frac{\sin 5\theta}{\sin 2\theta}$

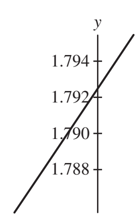
SOLUTION



From the graph of $y = \dfrac{\sin 5\theta}{\sin 2\theta}$ shown above, we see that the limit as $\theta \to 0$ is $\frac{5}{2}$.

56. $\displaystyle\lim_{x \to 0} \frac{12^x - 1}{4^x - 1}$

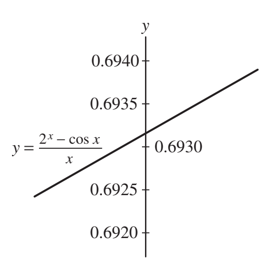
SOLUTION



From the graph of $y = \dfrac{12^x - 1}{4^x - 1}$ shown above, we see that the limit as $x \to 0$ is approximately 1.7925. (The exact answer is $\ln 12/\ln 4$.)

57. $\displaystyle\lim_{x \to 0} \frac{2^x - \cos x}{x}$

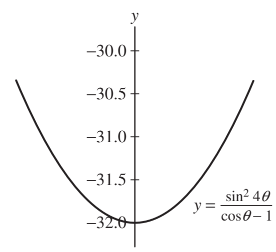
SOLUTION



The limit as $x \to 0$ is approximately 0.693. (The exact answer is $\ln 2$.)

58. $\lim_{\theta \to 0} \frac{\sin^2 4\theta}{\cos\theta - 1}$

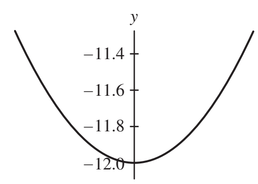
SOLUTION



The limit as $\theta \to 0$ is -32.

59. $\lim_{\theta \to 0} \frac{\cos 7\theta - \cos 5\theta}{\theta^2}$

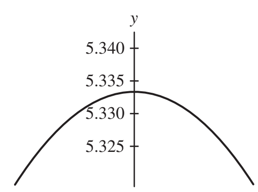
SOLUTION



From the graph of $y = \frac{\cos 7\theta - \cos 5\theta}{\theta^2}$ shown above, we see that the limit as $\theta \to 0$ is -12.

60. $\lim_{\theta \to 0} \frac{\sin^2 2\theta - \theta \sin 4\theta}{\theta^4}$

SOLUTION



From the graph of $y = \frac{\sin^2 2\theta - \theta \sin 4\theta}{\theta^4}$ shown above, we see that the limit as $\theta \to 0$ is approximately 5.333. (The exact answer is $\frac{16}{3}$.)

61. Let n be a positive integer. For which n are the two infinite one-sided limits $\lim_{x \to 0\pm} 1/x^n$ equal?

SOLUTION First, suppose that n is even. Then $x^n \ge 0$ for all x, and $\frac{1}{x^n} > 0$ for all $x \neq 0$. Hence,

$$\lim_{x \to 0-} \frac{1}{x^n} = \lim_{x \to 0+} \frac{1}{x^n} = \infty.$$

Next, suppose that n is odd. Then $\frac{1}{x^n} > 0$ for all $x > 0$ but $\frac{1}{x^n} < 0$ for all $x < 0$. Thus,

$$\lim_{x \to 0-} \frac{1}{x^n} = -\infty \quad \text{but} \quad \lim_{x \to 0+} \frac{1}{x^n} = \infty.$$

Finally, the two infinite one-sided limits are equal whenever n is even.

62. Let $L(n) = \lim_{x \to 1} \left(\frac{n}{1 - x^n} - \frac{1}{1 - x} \right)$ for n a positive integer. Investigate $L(n)$ numerically for several values of n, and then guess the value of of $L(n)$ in general.

SOLUTION

- We first notice that for $n = 1$,

$$\frac{1}{1 - x} - \frac{1}{1 - x} = 0,$$

so $L(1) = 0$.

- Next, let's try $n = 3$. From the table below, it appears that $L(3) = 1$.

x	0.99	0.999	1.001	1.01
$f(x)$	1.006700	1.000667	0.999334	0.993367

- For $n = 6$, we find

x	0.99	0.999	0.9999	1.0001	1.001	1.01
$f(x)$	2.529312	2.502919	2.500392	2.499375	2.497082	2.470980

Thus, $L(6) = 2.5 = \frac{5}{2}$

From these values, we conjecture that $L(n) = \frac{n-1}{2}$.

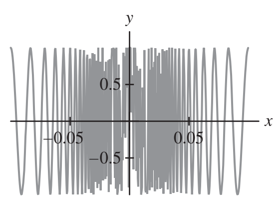
63. GU In some cases, numerical investigations can be misleading. Plot $f(x) = \cos \frac{\pi}{x}$.

(a) Does $\lim_{x\to 0} f(x)$ exist?

(b) Show, by evaluating $f(x)$ at $x = \frac{1}{2}, \frac{1}{4}, \frac{1}{6}, \ldots$, that you might be able to trick your friends into believing that the limit exists and is equal to $L = 1$.

(c) Which sequence of evaluations might trick them into believing that the limit is $L = -1$.

SOLUTION Here is the graph of $f(x)$.



(a) From the graph of $f(x)$, which shows that the value of $f(x)$ oscillates more and more rapidly as $x \to 0$, it follows that $\lim_{x\to 0} f(x)$ does not exist.

(b) Notice that

$$f\left(\frac{1}{2}\right) = \cos\frac{\pi}{1/2} = \cos 2\pi = 1;$$

$$f\left(\frac{1}{4}\right) = \cos\frac{\pi}{1/4} = \cos 4\pi = 1;$$

$$f\left(\frac{1}{6}\right) = \cos\frac{\pi}{1/6} = \cos 6\pi = 1;$$

and, in general, $f(\frac{1}{2n}) = 1$ for all integers n.

(c) At $x = 1, \frac{1}{3}, \frac{1}{5}, \ldots$, the value of $f(x)$ is always -1.

Further Insights and Challenges

64. Light waves of frequency λ passing through a slit of width a produce a **Fraunhofer diffraction pattern** of light and dark fringes (Figure 16). The intensity as a function of the angle θ is

$$I(\theta) = I_m\left(\frac{\sin(R\sin\theta)}{R\sin\theta}\right)^2$$

where $R = \pi a/\lambda$ and I_m is a constant. Show that the intensity function is not defined at $\theta = 0$. Then choose any two values for R and check numerically that $I(\theta)$ approaches I_m as $\theta \to 0$.

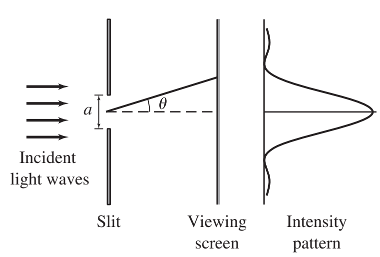


FIGURE 16 Fraunhofer diffraction pattern.

SOLUTION If you plug in $\theta = 0$, you get a division by zero in the expression

$$\frac{\sin\left(R\sin\theta\right)}{R\sin\theta};$$

thus, $I(0)$ is undefined. If $R = 2$, a table of values as $\theta \to 0$ follows:

θ	-0.01	-0.005	0.005	0.01
$I(\theta)$	$0.998667\ I_m$	$0.9999667\ I_m$	$0.9999667\ I_m$	$0.9998667\ I_m$

The limit as $\theta \to 0$ is $1 \cdot I_m = I_m$.

If $R = 3$, the table becomes:

θ	-0.01	-0.005	0.005	0.01
$I(\theta)$	$0.999700\ I_m$	$0.999925\ I_m$	$0.999925\ I_m$	$0.999700\ I_m$

Again, the limit as $\theta \to 0$ is $1I_m = I_m$.

65. Investigate $\lim_{\theta\to 0} \frac{\sin n\theta}{\theta}$ numerically for several values of n. Then guess the value in general.

SOLUTION

- For $n = 3$, we have

θ	-0.1	-0.01	-0.001	0.001	0.01	0.1
$\frac{\sin n\theta}{\theta}$	2.955202	2.999550	2.999996	2.999996	2.999550	2.955202

  The limit as $\theta \to 0$ is 3.

- For $n = -5$, we have

θ	-0.1	-0.01	-0.001	0.001	0.01	0.1
$\frac{\sin n\theta}{\theta}$	-4.794255	-4.997917	-4.999979	-4.999979	-4.997917	-4.794255

  The limit as $\theta \to 0$ is -5.

- We surmise that, in general, $\lim_{\theta\to 0} \frac{\sin n\theta}{\theta} = n$.

66. Show numerically that $\lim_{x\to 0} \frac{b^x - 1}{x}$ for $b = 3, 5$ appears to equal $\ln 3, \ln 5$, where $\ln x$ is the natural logarithm. Then make a conjecture (guess) for the value in general and test your conjecture for two additional values of b.

SOLUTION

-

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$\frac{5^x - 1}{x}$	1.486601	1.596556	1.608144	1.610734	1.622459	1.746189

  We have $\ln 5 \approx 1.6094$.

•

x	−0.1	−0.01	−0.001	0.001	0.01	0.1
$\dfrac{3^x - 1}{x}$	1.040415	1.092600	1.098009	1.099216	1.104669	1.161232

We have $\ln 3 \approx 1.0986$.

• We conjecture that $\lim_{x \to 0} \dfrac{b^x - 1}{x} = \ln b$ for any positive number b. Here are two additional test cases.

x	−0.1	−0.01	−0.001	0.001	0.01	0.1
$\dfrac{\left(\frac{1}{2}\right)^x - 1}{x}$	−0.717735	−0.695555	−0.693387	−0.692907	−0.690750	−0.669670

We have $\ln \frac{1}{2} \approx -0.69315$.

x	−0.1	−0.01	−0.001	0.001	0.01	0.1
$\dfrac{7^x - 1}{x}$	1.768287	1.927100	1.944018	1.947805	1.964966	2.148140

We have $\ln 7 \approx 1.9459$.

67. Investigate $\lim_{x \to 1} \dfrac{x^n - 1}{x^m - 1}$ for (m, n) equal to (2, 1), (1, 2), (2, 3), and (3, 2). Then guess the value of the limit in general and check your guess for two additional pairs.

SOLUTION

•

x	0.99	0.9999	1.0001	1.01
$\dfrac{x - 1}{x^2 - 1}$	0.502513	0.500025	0.499975	0.497512

The limit as $x \to 1$ is $\frac{1}{2}$.

x	0.99	0.9999	1.0001	1.01
$\dfrac{x^2 - 1}{x - 1}$	1.99	1.9999	2.0001	2.01

The limit as $x \to 1$ is 2.

x	0.99	0.9999	1.0001	1.01
$\dfrac{x^2 - 1}{x^3 - 1}$	0.670011	0.666700	0.666633	0.663344

The limit as $x \to 1$ is $\frac{2}{3}$.

x	0.99	0.9999	1.0001	1.01
$\dfrac{x^3 - 1}{x^2 - 1}$	1.492513	1.499925	1.500075	1.507512

The limit as $x \to 1$ is $\frac{3}{2}$.

- For general m and n, we have $\lim_{x\to 1} \frac{x^n - 1}{x^m - 1} = \frac{n}{m}$.
-

x	0.99	0.9999	1.0001	1.01
$\frac{x-1}{x^3-1}$	0.336689	0.333367	0.333300	0.330022

The limit as $x \to 1$ is $\frac{1}{3}$.

x	0.99	0.9999	1.0001	1.01
$\frac{x^3-1}{x-1}$	2.9701	2.9997	3.0003	3.0301

The limit as $x \to 1$ is 3.

x	0.99	0.9999	1.0001	1.01
$\frac{x^3-1}{x^7-1}$	0.437200	0.428657	0.428486	0.420058

The limit as $x \to 1$ is $\frac{3}{7} \approx 0.428571$.

68. Find by numerical experimentation the positive integers k such that $\lim_{x\to 0} \frac{\sin(\sin^2 x)}{x^k}$ exists.

SOLUTION

- For $k = 1$, we have $\lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{\sin(\sin^2 x)}{x} = 0$.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	-0.01	-0.0001	0.0001	0.01

- For $k = 2$, we have $\lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{\sin(\sin^2 x)}{x^2} = 1$.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	0.999967	1.000000	1.000000	0.999967

- For $k = 3$, the limit does not exist.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	-10^2	-10^4	10^4	10^2

Indeed, as $x \to 0-$, $f(x) = \frac{\sin(\sin^2 x)}{x^3} \to -\infty$, whereas as $x \to 0+$, $f(x) = \frac{\sin(\sin^2 x)}{x^3} \to \infty$.

- For $k = 4$, we have $\lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{\sin(\sin^2 x)}{x^4} = \infty$.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	10^4	10^8	10^8	10^4

- For $k = 5$, the limit does not exist.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	-10^6	-10^{12}	10^{12}	10^6

Indeed, as $x \to 0-$, $f(x) = \frac{\sin(\sin^2 x)}{x^5} \to -\infty$, whereas as $x \to 0+$, $f(x) = \frac{\sin(\sin^2 x)}{x^5} \to \infty$.

- For $k = 6$, we have $\lim_{x \to 0} f(x) = \lim_{x \to 0} \frac{\sin(\sin^2 x)}{x^6} = \infty$.

x	-0.01	-0.0001	0.0001	0.01
$f(x)$	10^8	10^{16}	10^{16}	10^8

- SUMMARY
  - For $k = 1$, the limit is 0.
  - For $k = 2$, the limit is 1.
  - For odd $k > 2$, the limit does not exist.
  - For even $k > 2$, the limit is ∞.

69. GU Plot the graph of $f(x) = \frac{2^x - 8}{x - 3}$.

(a) Zoom in on the graph to estimate $L = \lim_{x \to 3} f(x)$.

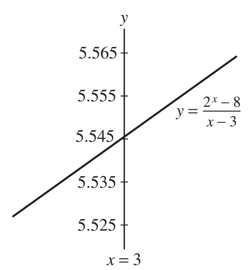
(b) Explain why

$$f(2.99999) \le L \le f(3.00001)$$

Use this to determine L to three decimal places.

SOLUTION

(a)



(b) It is clear that the graph of f rises as we move to the right. Mathematically, we may express this observation as: whenever $u < v$, $f(u) < f(v)$. Because

$$2.99999 < 3 = \lim_{x \to 3} f(x) < 3.00001,$$

it follows that

$$f(2.99999) < L = \lim_{x \to 3} f(x) < f(3.00001).$$

With $f(2.99999) \approx 5.54516$ and $f(3.00001) \approx 5.545195$, the above inequality becomes $5.54516 < L < 5.545195$; hence, to three decimal places, $L = 5.545$.

70. GU The function $f(x) = \frac{2^{1/x} - 2^{-1/x}}{2^{1/x} + 2^{-1/x}}$ is defined for $x \neq 0$.

(a) Investigate $\lim_{x \to 0+} f(x)$ and $\lim_{x \to 0-} f(x)$ numerically.

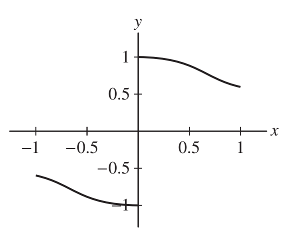
(b) Plot the graph of f and describe its behavior near $x = 0$.

SOLUTION

(a)

x	-0.3	-0.2	-0.1	0.1	0.2	0.3
$f(x)$	-0.980506	-0.998049	-0.999998	0.999998	0.998049	0.980506

(b) As $x \to 0-$, $f(x) \to -1$, whereas as $x \to 0+$, $f(x) \to 1$.



2.3 Basic Limit Laws

Preliminary Questions

1. State the Sum Law and Quotient Law.

SOLUTION Suppose $\lim_{x\to c} f(x)$ and $\lim_{x\to c} g(x)$ both exist. The Sum Law states that

$$\lim_{x\to c}(f(x)+g(x)) = \lim_{x\to c} f(x) + \lim_{x\to c} g(x).$$

Provided $\lim_{x\to c} g(x) \neq 0$, the Quotient Law states that

$$\lim_{x\to c} \frac{f(x)}{g(x)} = \frac{\lim_{x\to c} f(x)}{\lim_{x\to c} g(x)}.$$

2. Which of the following is a verbal version of the Product Law (assuming the limits exist)?

(a) The product of two functions has a limit.

(b) The limit of the product is the product of the limits.

(c) The product of a limit is a product of functions.

(d) A limit produces a product of functions.

SOLUTION The verbal version of the Product Law is **(b)**: The limit of the product is the product of the limits.

3. Which statement is correct? The Quotient Law does not hold if:

(a) The limit of the denominator is zero.

(b) The limit of the numerator is zero.

SOLUTION Statements **(a)** is correct. The Quotient Law does not hold if the limit of the denominator is zero.

Exercises

In Exercises 1–24, evaluate the limit using the Basic Limit Laws and the limits $\lim_{x\to c} x^{p/q} = c^{p/q}$ *and* $\lim_{x\to c} k = k$.

1. $\lim_{x\to 9} x$

SOLUTION $\lim_{x\to 9} x = 9.$

2. $\lim_{x\to -3} 14$

SOLUTION $\lim_{x\to -3} 14 = 14.$

3. $\lim_{x\to \frac{1}{2}} x^4$

SOLUTION $\lim_{x\to \frac{1}{2}} x^4 = \left(\frac{1}{2}\right)^4 = \frac{1}{16}.$

4. $\lim_{z\to 27} z^{2/3}$

SOLUTION $\lim_{z\to 27} z^{2/3} = 27^{2/3} = 9.$

5. $\lim_{t\to 2} t^{-1}$

SOLUTION $\lim_{t\to 2} t^{-1} = 2^{-1} = \frac{1}{2}.$

6. $\lim_{x\to 5} x^{-2}$

SOLUTION $\lim_{x\to 5} x^{-2} = 5^{-2} = \frac{1}{25}.$

7. $\lim_{x\to 0.2} (3x+4)$

SOLUTION Using the Sum Law and the Constant Multiple Law:

$$\begin{aligned}\lim_{x\to 0.2}(3x+4) &= \lim_{x\to 0.2} 3x + \lim_{x\to 0.2} 4\\ &= 3\lim_{x\to 0.2} x + \lim_{x\to 0.2} 4 = 3(0.2)+4 = 4.6.\end{aligned}$$

8. $\lim\limits_{x\to\frac{1}{3}}(3x^3+2x^2)$

SOLUTION Using the Sum Law, the Constant Multiple Law and the Powers Law:

$$\begin{aligned}\lim_{x\to\frac{1}{3}}(3x^3+2x^2) &= \lim_{x\to\frac{1}{3}} 3x^3 + \lim_{x\to\frac{1}{3}} 2x^2\\ &= 3\lim_{x\to\frac{1}{3}} x^3 + 2\lim_{x\to\frac{1}{3}} x^2\\ &= 3\left(\frac{1}{3}\right)^3 + 2\left(\frac{1}{3}\right)^2 = \frac{1}{3}.\end{aligned}$$

9. $\lim\limits_{x\to-1}(3x^4-2x^3+4x)$

SOLUTION Using the Sum Law, the Constant Multiple Law and the Powers Law:

$$\begin{aligned}\lim_{x\to-1}(3x^4-2x^3+4x) &= \lim_{x\to-1} 3x^4 - \lim_{x\to-1} 2x^3 + \lim_{x\to-1} 4x\\ &= 3\lim_{x\to-1} x^4 - 2\lim_{x\to-1} x^3 + 4\lim_{x\to-1} x\\ &= 3(-1)^4 - 2(-1)^3 + 4(-1) = 3+2-4 = 1.\end{aligned}$$

10. $\lim\limits_{x\to 8}(3x^{2/3}-16x^{-1})$

SOLUTION Using the Sum Law, the Constant Multiple Law and the Powers Law:

$$\begin{aligned}\lim_{x\to 8}(3x^{2/3}-16x^{-1}) &= \lim_{x\to 8} 3x^{2/3} - \lim_{x\to 8} 16x^{-1}\\ &= 3\lim_{x\to 8} x^{2/3} - 16\lim_{x\to 8} x^{-1}\\ &= 3(8)^{2/3} - 16(8)^{-1} = 3(4) - 2 = 10.\end{aligned}$$

11. $\lim\limits_{x\to 2}(x+1)(3x^2-9)$

SOLUTION Using the Product Law, the Sum Law and the Constant Multiple Law:

$$\begin{aligned}\lim_{x\to 2}(x+1)\left(3x^2-9\right) &= \left(\lim_{x\to 2} x + \lim_{x\to 2} 1\right)\left(\lim_{x\to 2} 3x^2 - \lim_{x\to 2} 9\right)\\ &= (2+1)\left(3\lim_{x\to 2} x^2 - 9\right)\\ &= 3(3(2)^2-9) = 9.\end{aligned}$$

12. $\lim\limits_{x\to\frac{1}{2}}(4x+1)(6x-1)$

SOLUTION Using the Product Law, the Sum Law and the Constant Multiple Law:

$$\begin{aligned}\lim_{x\to 1/2}(4x+1)(6x-1) &= \left(\lim_{x\to 1/2}(4x+1)\right)\left(\lim_{x\to 1/2}(6x-1)\right)\\ &= \left(\lim_{x\to 1/2} 4x + \lim_{x\to 1/2} 1\right)\left(\lim_{x\to 1/2} 6x - \lim_{x\to 1/2} 1\right)\\ &= \left(4\lim_{x\to 1/2} x + \lim_{x\to 1/2} 1\right)\left(6\lim_{x\to 1/2} x - \lim_{x\to 1/2} 1\right)\\ &= \left(4\cdot\frac{1}{2}+1\right)\left(6\cdot\frac{1}{2}-1\right) = 3(2) = 6.\end{aligned}$$

13. $\lim\limits_{t\to 4}\dfrac{3t-14}{t+1}$

SOLUTION Using the Quotient Law, the Sum Law and the Constant Multiple Law:

$$\lim_{t\to 4}\frac{3t-14}{t+1} = \frac{\lim_{t\to 4}(3t-14)}{\lim_{t\to 4}(t+1)} = \frac{3\lim_{t\to 4} t - \lim_{t\to 4} 14}{\lim_{t\to 4} t + \lim_{t\to 4} 1} = \frac{3\cdot 4 - 14}{4+1} = -\frac{2}{5}.$$

14. $\lim_{z\to 9} \frac{\sqrt{z}}{z-2}$

SOLUTION Using the Quotient Law, the Powers Law and the Sum Law:

$$\lim_{z\to 9} \frac{\sqrt{z}}{z-2} = \frac{\lim_{z\to 9}\sqrt{z}}{\lim_{z\to 9}(z-2)} = \frac{\lim_{z\to 9}\sqrt{z}}{\lim_{z\to 9} z - \lim_{z\to 9} 2} = \frac{3}{7}.$$

15. $\lim_{y\to \frac{1}{4}} (16y+1)(2y^{1/2}+1)$

SOLUTION Using the Product Law, the Sum Law, the Constant Multiple Law and the Powers Law:

$$\begin{aligned}\lim_{y\to \frac{1}{4}} (16y+1)(2y^{1/2}+1) &= \left(\lim_{y\to \frac{1}{4}} (16y+1)\right)\left(\lim_{y\to \frac{1}{4}} (2y^{1/2}+1)\right)\\ &= \left(16 \lim_{y\to \frac{1}{4}} y + \lim_{y\to \frac{1}{4}} 1\right)\left(2 \lim_{y\to \frac{1}{4}} y^{1/2} + \lim_{y\to \frac{1}{4}} 1\right)\\ &= \left(16\left(\frac{1}{4}\right)+1\right)\left(2\left(\frac{1}{2}\right)+1\right) = 10.\end{aligned}$$

16. $\lim_{x\to 2} x(x+1)(x+2)$

SOLUTION Using the Product Law and Sum Law:

$$\begin{aligned}\lim_{x\to 2} x(x+1)(x+2) &= \left(\lim_{x\to 2} x\right)\left(\lim_{x\to 2} (x+1)\right)\left(\lim_{x\to 2} (x+2)\right)\\ &= 2\left(\lim_{x\to 2} x + \lim_{x\to 2} 1\right)\left(\lim_{x\to 2} x + \lim_{x\to 2} 2\right)\\ &= 2(2+1)(2+2) = 24\end{aligned}$$

17. $\lim_{y\to 4} \frac{1}{\sqrt{6y+1}}$

SOLUTION Using the Quotient Law, the Powers Law, the Sum Law and the Constant Multiple Law:

$$\begin{aligned}\lim_{y\to 4} \frac{1}{\sqrt{6y+1}} &= \frac{1}{\lim_{y\to 4}\sqrt{6y+1}} = \frac{1}{\sqrt{6\lim_{y\to 4} y + 1}}\\ &= \frac{1}{\sqrt{6(4)+1}} = \frac{1}{5}.\end{aligned}$$

18. $\lim_{w\to 7} \frac{\sqrt{w+2}+1}{\sqrt{w-3}-1}$

SOLUTION Using the Quotient Law, the Sum Law and the Powers Law:

$$\begin{aligned}\lim_{w\to 7} \frac{\sqrt{w+2}+1}{\sqrt{w-3}-1} &= \frac{\lim_{w\to 7}(\sqrt{w+2}+1)}{\lim_{w\to 7}(\sqrt{w-3}-1)}\\ &= \frac{\sqrt{\lim_{w\to 7}(w+2)}+1}{\sqrt{\lim_{w\to 7}(w-3)}-1}\\ &= \frac{\sqrt{9}+1}{\sqrt{4}-1} = 4.\end{aligned}$$

19. $\lim_{x\to -1} \frac{x}{x^3+4x}$

SOLUTION Using the Quotient Law, the Sum Law, the Powers Law and the Constant Multiple Law:

$$\lim_{x\to -1} \frac{x}{x^3+4x} = \frac{\lim_{x\to -1} x}{\lim_{x\to -1} x^3 + 4 \lim_{x\to -1} x} = \frac{-1}{(-1)^3+4(-1)} = \frac{1}{5}.$$

20. $\lim_{t\to -1} \dfrac{t^2+1}{(t^3+2)(t^4+1)}$

SOLUTION Using the Quotient Law, the Product Law, the Sum Law and the Powers Law:

$$\lim_{x\to -1} \frac{t^2+1}{(t^3+2)(t^4+1)} = \frac{\lim_{x\to -1} t^2 + \lim_{x\to -1} 1}{\left(\lim_{x\to -1} t^3 + \lim_{x\to -1} 2\right)\left(\lim_{x\to -1} t^4 + \lim_{x\to -1} 1\right)}$$
$$= \frac{(-1)^2+1}{((-1)^3+2)((-1)^4+1)} = \frac{2}{(1)(2)} = 1.$$

21. $\lim_{t\to 25} \dfrac{3\sqrt{t} - \frac{1}{5}t}{(t-20)^2}$

SOLUTION Using the Quotient Law, the Sum Law, the Constant Multiple Law and the Powers Law:

$$\lim_{t\to 25} \frac{3\sqrt{t} - \frac{1}{5}t}{(t-20)^2} = \frac{3\sqrt{\lim_{t\to 25} t} - \frac{1}{5}\lim_{t\to 25} t}{\left(\lim_{t\to 25} t - 20\right)^2} = \frac{3(5) - \frac{1}{5}(25)}{5^2} = \frac{2}{5}.$$

22. $\lim_{y\to \frac{1}{3}} (18y^2-4)^4$

SOLUTION Using the Powers Law, the Sum Law and the Constant Multiple Law:

$$\lim_{y\to \frac{1}{3}} (18y^2-4)^4 = \left(18 \lim_{y\to \frac{1}{3}} y^2 - 4\right)^4 = (2-4)^4 = 16.$$

23. $\lim_{t\to \frac{3}{2}} (4t^2+8t-5)^{3/2}$

SOLUTION Using the Powers Law, the Sum Law and the Constant Multiple Law:

$$\lim_{t\to \frac{3}{2}} (4t^2+8t-5)^{3/2} = \left(4 \lim_{t\to \frac{3}{2}} t^2 + 8 \lim_{t\to \frac{3}{2}} t - 5\right)^{3/2} = (9+12-5)^{3/2} = 64.$$

24. $\lim_{t\to 7} \dfrac{(t+2)^{1/2}}{(t+1)^{2/3}}$

SOLUTION Using the Quotient Law, the Powers Law and the Sum Law:

$$\lim_{t\to 7} \frac{(t+2)^{1/2}}{(t+1)^{2/3}} = \frac{\left(\lim_{t\to 7} t + 2\right)^{1/2}}{\left(\lim_{t\to 7} t + 1\right)^{2/3}} = \frac{9^{1/2}}{8^{2/3}} = \frac{3}{4}.$$

25. Use the Quotient Law to prove that if $\lim_{x\to c} f(x)$ exists and is nonzero, then

$$\lim_{x\to c} \frac{1}{f(x)} = \frac{1}{\lim_{x\to c} f(x)}$$

SOLUTION Since $\lim_{x\to c} f(x)$ is nonzero, we can apply the Quotient Law:

$$\lim_{x\to c} \left(\frac{1}{f(x)}\right) = \frac{\left(\lim_{x\to c} 1\right)}{\left(\lim_{x\to c} f(x)\right)} = \frac{1}{\lim_{x\to c} f(x)}.$$

26. Assuming that $\lim_{x\to 6} f(x) = 4$, compute:

(a) $\lim_{x\to 6} f(x)^2$ **(b)** $\lim_{x\to 6} \dfrac{1}{f(x)}$ **(c)** $\lim_{x\to 6} x\sqrt{f(x)}$

SOLUTION

(a) Using the Powers Law:

$$\lim_{x\to 6} f(x)^2 = \left(\lim_{x\to 6} f(x)\right)^2 = 4^2 = 16.$$

(b) Since $\lim_{x\to 6} f(x) \neq 0$, we may apply the Quotient Law:

$$\lim_{x\to 6} \frac{1}{f(x)} = \frac{1}{\lim_{x\to 6} f(x)} = \frac{1}{4}.$$

(c) Using the Product Law and Powers Law:

$$\lim_{x\to 6} x\sqrt{f(x)} = \left(\lim_{x\to 6} x\right)\left(\lim_{x\to 6} f(x)\right)^{1/2} = 6(4)^{1/2} = 12.$$

In Exercises 27–30, evaluate the limit assuming that $\lim_{x\to -4} f(x) = 3$ *and* $\lim_{x\to -4} g(x) = 1$.

27. $\lim_{x\to -4} f(x)g(x)$

SOLUTION $\lim_{x\to -4} f(x)g(x) = \lim_{x\to -4} f(x) \lim_{x\to -4} g(x) = 3 \cdot 1 = 3.$

28. $\lim_{x\to -4} (2f(x) + 3g(x))$

SOLUTION

$$\begin{aligned}\lim_{x\to -4} (2f(x) + 3g(x)) &= 2 \lim_{x\to -4} f(x) + 3 \lim_{x\to -4} g(x) \\ &= 2 \cdot 3 + 3 \cdot 1 = 6 + 3 = 9.\end{aligned}$$

29. $\lim_{x\to -4} \frac{g(x)}{x^2}$

SOLUTION Since $\lim_{x\to -4} x^2 \neq 0$, we may apply the Quotient Law, then applying the Powers Law:

$$\lim_{x\to -4} \frac{g(x)}{x^2} = \frac{\lim_{x\to -4} g(x)}{\lim_{x\to -4} x^2} = \frac{1}{\left(\lim_{x\to -4} x\right)^2} = \frac{1}{16}.$$

30. $\lim_{x\to -4} \frac{f(x)+1}{3g(x)-9}$

SOLUTION

$$\lim_{x\to -4} \frac{f(x)+1}{3g(x)-9} = \frac{\lim_{x\to -4} f(x) + \lim_{x\to -4} 1}{3\lim_{x\to -4} g(x) - \lim_{x\to -4} 9} = \frac{3+1}{3\cdot 1 - 9} = \frac{4}{-6} = -\frac{2}{3}.$$

31. Can the Quotient Law be applied to evaluate $\lim_{x\to 0} \frac{\sin x}{x}$? Explain.

SOLUTION The limit Quotient Law *cannot* be applied to evaluate $\lim_{x\to 0} \frac{\sin x}{x}$ since $\lim_{x\to 0} x = 0$. This violates a condition of the Quotient Law. Accordingly, the rule *cannot* be employed.

32. Show that the Product Law cannot be used to evaluate the limit $\lim_{x\to \pi/2} \left(x - \frac{\pi}{2}\right) \tan x$.

SOLUTION The limit Product Law *cannot* be applied to evaluate $\lim_{x\to \pi/2} (x - \pi/2) \tan x$ since $\lim_{x\to \pi/2} \tan x$ does not exist (for example, as $x \to \pi/2-$, $\tan x \to \infty$). This violates a hypothesis of the Product Law. Accordingly, the rule *cannot* be employed.

33. Give an example where $\lim_{x\to 0} (f(x) + g(x))$ exists but neither $\lim_{x\to 0} f(x)$ nor $\lim_{x\to 0} g(x)$ exists.

SOLUTION Let $f(x) = 1/x$ and $g(x) = -1/x$. Then $\lim_{x\to 0} (f(x) + g(x)) = \lim_{x\to 0} 0 = 0$ However, $\lim_{x\to 0} f(x) = \lim_{x\to 0} 1/x$ and $\lim_{x\to 0} g(x) = \lim_{x\to 0} -1/x$ do not exist.

Further Insights and Challenges

34. Show that if both $\lim_{x\to c} f(x)\,g(x)$ and $\lim_{x\to c} g(x)$ exist and $\lim_{x\to c} g(x) \neq 0$, then $\lim_{x\to c} f(x)$ exists. *Hint:* Write $f(x) = \dfrac{f(x)\,g(x)}{g(x)}$.

SOLUTION Given that $\lim_{x\to c} f(x)g(x) = L$ and $\lim_{x\to c} g(x) = M \neq 0$ both exist, observe that

$$\lim_{x\to c} f(x) = \lim_{x\to c} \frac{f(x)g(x)}{g(x)} = \frac{\lim_{x\to c} f(x)g(x)}{\lim_{x\to c} g(x)} = \frac{L}{M}$$

also exists.

35. Suppose that $\lim_{t\to 3} tg(t) = 12$. Show that $\lim_{t\to 3} g(t)$ exists and equals 4.

SOLUTION We are given that $\lim_{t\to 3} tg(t) = 12$. Since $\lim_{t\to 3} t = 3 \neq 0$, we may apply the Quotient Law:

$$\lim_{t\to 3} g(t) = \lim_{t\to 3} \frac{tg(t)}{t} = \frac{\lim_{t\to 3} tg(t)}{\lim_{t\to 3} t} = \frac{12}{3} = 4.$$

36. Prove that if $\lim_{t\to 3} \frac{h(t)}{t} = 5$, then $\lim_{t\to 3} h(t) = 15$.

SOLUTION Given that $\lim_{t\to 3} \dfrac{h(t)}{t} = 5$, observe that $\lim_{t\to 3} t = 3$. Now use the Product Law:

$$\lim_{t\to 3} h(t) = \lim_{t\to 3} t\,\frac{h(t)}{t} = \left(\lim_{t\to 3} t\right)\left(\lim_{t\to 3} \frac{h(t)}{t}\right) = 3 \cdot 5 = 15.$$

37. Assuming that $\lim_{x\to 0} \frac{f(x)}{x} = 1$, which of the following statements is necessarily true? Why?

(a) $f(0) = 0$

(b) $\lim_{x\to 0} f(x) = 0$

SOLUTION

(a) Given that $\lim_{x\to 0} \dfrac{f(x)}{x} = 1$, it is not necessarily true that $f(0) = 0$. A counterexample is provided by $f(x) = \begin{cases} x, & x \neq 0 \\ 5, & x = 0 \end{cases}$.

(b) Given that $\lim_{x\to 0} \dfrac{f(x)}{x} = 1$, it is necessarily true that $\lim_{x\to 0} f(x) = 0$. For note that $\lim_{x\to 0} x = 0$, whence

$$\lim_{x\to 0} f(x) = \lim_{x\to 0} x\,\frac{f(x)}{x} = \left(\lim_{x\to 0} x\right)\left(\lim_{x\to 0} \frac{f(x)}{x}\right) = 0 \cdot 1 = 0.$$

38. Prove that if $\lim_{x\to c} f(x) = L \neq 0$ and $\lim_{x\to c} g(x) = 0$, then the limit $\lim_{x\to c} \frac{f(x)}{g(x)}$ does not exist.

SOLUTION Suppose that $\lim_{x\to c} \dfrac{f(x)}{g(x)}$ exists. Then

$$L = \lim_{x\to c} f(x) = \lim_{x\to c} g(x) \cdot \frac{f(x)}{g(x)} = \lim_{x\to c} g(x) \cdot \lim_{x\to c} \frac{f(x)}{g(x)} = 0 \cdot \lim_{x\to c} \frac{f(x)}{g(x)} = 0.$$

But, we were given that $L \neq 0$, so we have arrived at a contradiction. Thus, $\lim_{x\to c} \dfrac{f(x)}{g(x)}$ does not exist.

39. Suppose that $\lim_{h\to 0} g(h) = L$.

(a) Explain why $\lim_{h\to 0} g(ah) = L$ for any constant $a \neq 0$.

(b) If we assume instead that $\lim_{h\to 1} g(h) = L$, is it still necessarily true that $\lim_{h\to 1} g(ah) = L$?

(c) Illustrate (a) and (b) with the function $f(x) = x^2$.

SOLUTION

(a) As $h \to 0$, $ah \to 0$ as well; hence, if we make the change of variable $w = ah$, then

$$\lim_{h\to 0} g(ah) = \lim_{w\to 0} g(w) = L.$$

(b) No. As $h \to 1$, $ah \to a$, so we should not expect $\lim_{h\to 1} g(ah) = \lim_{h\to 1} g(h)$.

(c) Let $g(x) = x^2$. Then

$$\lim_{h\to 0} g(h) = 0 \quad \text{and} \quad \lim_{h\to 0} g(ah) = \lim_{h\to 0} (ah)^2 = 0.$$

On the other hand,

$$\lim_{h\to 1} g(h) = 1 \quad \text{while} \quad \lim_{h\to 1} g(ah) = \lim_{h\to 1} (ah)^2 = a^2,$$

which is equal to the previous limit if and only if $a = \pm 1$.

40. Assume that $L(a) = \lim_{x\to 0} \frac{a^x - 1}{x}$ exists for all $a > 0$. Assume also that $\lim_{x\to 0} a^x = 1$.

(a) Prove that $L(ab) = L(a) + L(b)$ for $a, b > 0$. *Hint:* $(ab)^x - 1 = a^x(b^x - 1) + (a^x - 1)$. This shows that $L(a)$ "behaves" like a logarithm. We will see that $L(a) = \ln a$ in Section 3.10.

(b) Verify numerically that $L(12) = L(3) + L(4)$.

SOLUTION

(a) Let $a, b > 0$. Then

$$\begin{aligned} L(ab) = \lim_{x\to 0} \frac{(ab)^x - 1}{x} &= \lim_{x\to 0} \frac{a^x(b^x - 1) + (a^x - 1)}{x} \\ &= \lim_{x\to 0} a^x \cdot \lim_{x\to 0} \frac{b^x - 1}{x} + \lim_{x\to 0} \frac{a^x - 1}{x} \\ &= 1 \cdot L(b) + L(a) = L(a) + L(b). \end{aligned}$$

(b) From the table below, we estimate that, to three decimal places, $L(3) = 1.099$, $L(4) = 1.386$ and $L(12) = 2.485$. Thus,

$$L(12) = 2.485 = 1.099 + 1.386 = L(3) + L(4).$$

x	-0.01	-0.001	-0.0001	0.0001	0.001	0.01
$(3^x - 1)/x$	1.092600	1.098009	1.098552	1.098673	1.099216	1.104669
$(4^x - 1)/x$	1.376730	1.385334	1.386198	1.386390	1.387256	1.395948
$(12^x - 1)/x$	2.454287	2.481822	2.484600	2.485215	2.488000	2.516038

2.4 Limits and Continuity

Preliminary Questions

1. Which property of $f(x) = x^3$ allows us to conclude that $\lim_{x\to 2} x^3 = 8$?

SOLUTION We can conclude that $\lim_{x\to 2} x^3 = 8$ because the function x^3 is continuous at $x = 2$.

2. What can be said about $f(3)$ if f is continuous and $\lim_{x\to 3} f(x) = \frac{1}{2}$?

SOLUTION If f is continuous and $\lim_{x\to 3} f(x) = \frac{1}{2}$, then $f(3) = \frac{1}{2}$.

3. Suppose that $f(x) < 0$ if x is positive and $f(x) > 1$ if x is negative. Can f be continuous at $x = 0$?

SOLUTION Since $f(x) < 0$ when x is positive and $f(x) > 1$ when x is negative, it follows that

$$\lim_{x\to 0+} f(x) \le 0 \quad \text{and} \quad \lim_{x\to 0-} f(x) \ge 1.$$

Thus, $\lim_{x\to 0} f(x)$ does not exist, so f cannot be continuous at $x = 0$.

4. Is it possible to determine $f(7)$ if $f(x) = 3$ for all $x < 7$ and f is right-continuous at $x = 7$? What if f is left-continuous?

SOLUTION No. To determine $f(7)$, we need to combine either knowledge of the values of $f(x)$ for $x < 7$ with *left*-continuity or knowledge of the values of $f(x)$ for $x > 7$ with right-continuity.

5. Are the following true or false? If false, state a correct version.

(a) $f(x)$ is continuous at $x = a$ if the left- and right-hand limits of $f(x)$ as $x \to a$ exist and are equal.

(b) $f(x)$ is continuous at $x = a$ if the left- and right-hand limits of $f(x)$ as $x \to a$ exist and equal $f(a)$.

(c) If the left- and right-hand limits of $f(x)$ as $x \to a$ exist, then f has a removable discontinuity at $x = a$.

(d) If $f(x)$ and $g(x)$ are continuous at $x = a$, then $f(x) + g(x)$ is continuous at $x = a$.

(e) If $f(x)$ and $g(x)$ are continuous at $x = a$, then $f(x)/g(x)$ is continuous at $x = a$.

SOLUTION

(a) False. The correct statement is "$f(x)$ is continuous at $x = a$ if the left- and right-hand limits of $f(x)$ as $x \to a$ exist and equal $f(a)$."

(b) True.

(c) False. The correct statement is "If the left- and right-hand limits of $f(x)$ as $x \to a$ are equal but not equal to $f(a)$, then f has a removable discontinuity at $x = a$."

(d) True.

(e) False. The correct statement is "If $f(x)$ and $g(x)$ are continuous at $x = a$ and $g(a) \neq 0$, then $f(x)/g(x)$ is continuous at $x = a$."

Exercises

1. Referring to Figure 14, state whether $f(x)$ is left- or right-continuous (or neither) at each point of discontinuity. Does $f(x)$ have any removable discontinuities?

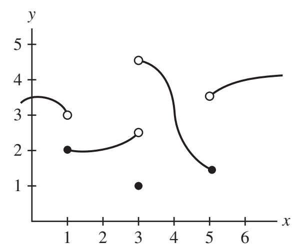


FIGURE 14 Graph of $y = f(x)$

SOLUTION

- The function f is discontinuous at $x = 1$; it is right-continuous there.
- The function f is discontinuous at $x = 3$; it is neither left-continuous nor right-continuous there.
- The function f is discontinuous at $x = 5$; it is left-continuous there.

However, these discontinuities are not removable.

Exercises 2–4 refer to the function $g(x)$ in Figure 15.

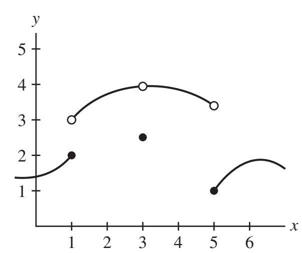

FIGURE 15 Graph of $y = g(x)$

2. State whether $g(x)$ is left- or right-continuous (or neither) at each of its points of discontinuity.

SOLUTION

- The function g is discontinuous at $x = 1$; it is left-continuous there.
- The function g is discontinuous at $x = 3$; it is neither left-continuous nor right-continuous there.
- The function g is discontinuous at $x = 5$; it is right-continuous there.

3. At which point c does $g(x)$ have a removable discontinuity? How should $g(c)$ be redefined to make g continuous at $x = c$?

SOLUTION Because $\lim_{x\to 3} g(x)$ exists, the function g has a removable discontinuity at $x = 3$. Assigning $g(3) = 4$ makes g continuous at $x = 3$.

4. Find the point c_1 at which $g(x)$ has a jump discontinuity but is left-continuous. How should $g(c_1)$ be redefined to make g right-continuous at $x = c_1$?

SOLUTION The function g has a jump discontinuity at $x = 1$, but is left-continuous there. Assigning $g(1) = 3$ makes g right-continuous at $x = 1$ (but no longer left-continuous).

5. In Figure 16, determine the one-sided limits at the points of discontinuity. Which discontinuity is removable and how should f be redefined to make it continuous at this point?

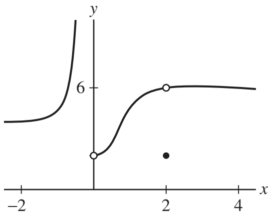

FIGURE 16

SOLUTION The function f is discontinuous at $x = 0$, at which $\lim_{x\to 0-} f(x) = \infty$ and $\lim_{x\to 0+} f(x) = 2$. The function f is also discontinuous at $x = 2$, at which $\lim_{x\to 2-} f(x) = 6$ and $\lim_{x\to 2+} f(x) = 6$. Because the two one-sided limits exist and are equal at $x = 2$, the discontinuity at $x = 2$ is removable. Assigning $f(2) = 6$ makes f continuous at $x = 2$.

6. Suppose that $f(x) = 2$ for $x < 3$ and $f(x) = -4$ for $x > 3$.

(a) What is $f(3)$ if f is left-continuous at $x = 3$?

(b) What is $f(3)$ if f is right-continuous at $x = 3$?

SOLUTION $f(x) = 2$ for $x < 3$ and $f(x) = -4$ for $x > 3$.

- If f is left-continuous at $x = 3$, then $f(3) = \lim_{x\to 3-} f(x) = 2$.
- If f is right-continuous at $x = 3$, then $f(3) = \lim_{x\to 0+} f(x) = -4$.

In Exercises 7–16, use the Laws of Continuity and Theorems 2 and 3 to show that the function is continuous.

7. $f(x) = x + \sin x$

SOLUTION Since x and $\sin x$ are continuous, so is $x + \sin x$ by Continuity Law (i).

8. $f(x) = x \sin x$

SOLUTION Since x and $\sin x$ are continuous, so is $x \sin x$ by Continuity Law (iii).

9. $f(x) = 3x + 4 \sin x$

SOLUTION Since x and $\sin x$ are continuous, so are $3x$ and $4 \sin x$ by Continuity Law (ii). Thus $3x + 4 \sin x$ is continuous by Continuity Law (i).

10. $f(x) = 3x^3 + 8x^2 - 20x$

SOLUTION

- Since x is continuous, so are x^3 and x^2 by repeated applications of Continuity Law (iii).
- Hence $3x^3$, $8x^2$, and $-20x$ are continuous by Continuity Law (ii).
- Finally, $3x^3 + 8x^2 - 20x$ is continuous by Continuity Law (i).

11. $f(x) = \dfrac{1}{x^2 + 1}$

SOLUTION

- Since x is continuous, so is x^2 by Continuity Law (iii).
- Recall that constant functions, such as 1, are continuous. Thus $x^2 + 1$ is continuous.
- Finally, $\dfrac{1}{x^2 + 1}$ is continuous by Continuity Law (iv) because $x^2 + 1$ is never 0.

12. $f(x) = \dfrac{x^2 - \cos x}{3 + \cos x}$

SOLUTION

- Since x is continuous, so is x^2 by Continuity Law (iii).
- Since $\cos x$ is continuous, so is $-\cos x$ by Continuity Law (ii).

- Accordingly, $x^2 - \cos x$ is continuous by Continuity Law (i).
- Since 3 (a constant function) and $\cos x$ are continuous, so is $3 + \cos x$ by Continuity Law (i).
- Finally, $\dfrac{x^2 - \cos x}{3 + \cos x}$ is continuous by Continuity Law (iv) because $3 + \cos x$ is never 0.

13. $f(x) = \cos(x^2)$

SOLUTION The function $f(x)$ is a composite of two continuous functions: $\cos x$ and x^2, so $f(x)$ is continuous by Theorem 5, which states that a composite of continuous functions is continuous.

14. $f(x) = \tan^{-1}(4^x)$

SOLUTION The function $f(x)$ is a composite of two continuous functions: $\tan^{-1} x$ and 4^x, so $f(x)$ is continuous by Theorem 5, which states that a composite of continuous functions is continuous.

15. $f(x) = e^x \cos 3x$

SOLUTION e^x and $\cos 3x$ are continuous, so $e^x \cos 3x$ is continuous by Continuity Law (iii).

16. $f(x) = \ln(x^4 + 1)$

SOLUTION

- Since x is continuous, so is x^4 by repeated application of Continuity Law (iii).
- Since 1 (a constant function) and x^4 are continuous, so is $x^4 + 1$ by Continuity Law (i).
- Finally, because $x^4 + 1 > 0$ for all x and $\ln x$ is continuous for $x > 0$, the composite function $\ln(x^4 + 1)$ is continuous.

In Exercises 17–34, determine the points of discontinuity. State the type of discontinuity (removable, jump, infinite, or none of these) and whether the function is left- or right-continuous.

17. $f(x) = \dfrac{1}{x}$

SOLUTION The function $1/x$ is discontinuous at $x = 0$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $x = 0$.

18. $f(x) = |x|$

SOLUTION The function $f(x) = |x|$ is continuous everywhere.

19. $f(x) = \dfrac{x - 2}{|x - 1|}$

SOLUTION The function $\dfrac{x - 2}{|x - 1|}$ is discontinuous at $x = 1$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $x = 1$.

20. $f(x) = [x]$

SOLUTION This function has a jump discontinuity at $x = n$ for every integer n. It is continuous at all other values of x. For every integer n,

$$\lim_{x \to n+} [x] = n$$

since $[x] = n$ for all x between n and $n + 1$. This shows that $[x]$ is *right-continuous* at $x = n$. On the other hand,

$$\lim_{x \to n-} [x] = n - 1$$

since $[x] = n - 1$ for all x between $n - 1$ and n. Thus $[x]$ is not left-continuous.

21. $f(x) = \left[\dfrac{1}{2}x\right]$

SOLUTION The function $\left[\frac{1}{2}x\right]$ is discontinuous at even integers, at which there are jump discontinuities. Because

$$\lim_{x \to 2n+} \left[\frac{1}{2}x\right] = n$$

but

$$\lim_{x \to 2n-} \left[\frac{1}{2}x\right] = n - 1,$$

it follows that this function is right-continuous at the even integers but not left-continuous.

22. $g(t) = \dfrac{1}{t^2 - 1}$

SOLUTION The function $f(t) = \dfrac{1}{t^2-1} = \dfrac{1}{(t-1)(t+1)}$ is discontinuous at $t = -1$ and $t = 1$, at which there are infinite discontinuities. The function is neither left- nor right- continuous at either point of discontinuity.

23. $f(x) = \dfrac{x+1}{4x-2}$

SOLUTION The function $f(x) = \dfrac{x+1}{4x-2}$ is discontinuous at $x = \frac{1}{2}$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $x = \frac{1}{2}$.

24. $h(z) = \dfrac{1-2z}{z^2 - z - 6}$

SOLUTION The function $f(z) = \dfrac{1-2z}{z^2-z-6} = \dfrac{1-2z}{(z+2)(z-3)}$ is discontinuous at $z = -2$ and $z = 3$, at which there are infinite discontinuities. The function is neither left- nor right- continuous at either point of discontinuity.

25. $f(x) = 3x^{2/3} - 9x^3$

SOLUTION The function $f(x) = 3x^{2/3} - 9x^3$ is defined and continuous for all x.

26. $g(t) = 3t^{-2/3} - 9t^3$

SOLUTION The function $g(t) = 3t^{-2/3} - 9t^3$ is discontinuous at $t = 0$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $t = 0$.

27. $f(x) = \begin{cases} \dfrac{x-2}{|x-2|} & x \neq 2 \\ -1 & x = 2 \end{cases}$

SOLUTION For $x > 2$, $f(x) = \dfrac{x-2}{(x-2)} = 1$. For $x < 2$, $f(x) = \dfrac{(x-2)}{(2-x)} = -1$. The function has a jump discontinuity at $x = 2$. Because

$$\lim_{x \to 2-} f(x) = -1 = f(2)$$

but

$$\lim_{x \to 2+} f(x) = 1 \neq f(2),$$

it follows that this function is left-continuous at $x = 2$ but not right-continuous.

28. $f(x) = \begin{cases} \cos \dfrac{1}{x} & x \neq 0 \\ 1 & x = 0 \end{cases}$

SOLUTION The function $\cos\left(\frac{1}{x}\right)$ is discontinuous at $x = 0$, at which there is an oscillatory discontinuity. Because neither

$$\lim_{x \to 0-} f(x) \quad \text{nor} \quad \lim_{x \to 0+} f(x)$$

exist, the function is neither left- nor right-continuous at $x = 0$.

29. $g(t) = \tan 2t$

SOLUTION The function $g(t) = \tan 2t = \dfrac{\sin 2t}{\cos 2t}$ is discontinuous whenever $\cos 2t = 0$; i.e., whenever

$$2t = \frac{(2n+1)\pi}{2} \qquad \text{or} \qquad t = \frac{(2n+1)\pi}{4},$$

where n is an integer. At every such value of t there is an infinite discontinuity. The function is neither left- nor right-continuous at any of these points of discontinuity.

30. $f(x) = \csc(x^2)$

SOLUTION The function $f(x) = \csc(x^2) = \dfrac{1}{\sin(x^2)}$ is discontinuous whenever $\sin(x^2) = 0$; i.e., whenever $x^2 = n\pi$ or $x = \pm\sqrt{n\pi}$, where n is a positive integer. At every such value of x there is an infinite discontinuity. The function is neither left- nor right-continuous at any of these points of discontinuity.

31. $f(x) = \tan(\sin x)$

SOLUTION The function $f(x) = \tan(\sin x)$ is continuous everywhere. Reason: $\sin x$ is continuous everywhere and $\tan u$ is continuous on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$—and in particular on $-1 \le u = \sin x \le 1$. Continuity of $\tan(\sin x)$ follows by the continuity of composite functions.

32. $f(x) = \cos(\pi[x])$

SOLUTION The function $f(x) = \cos(\pi[x])$ has a jump discontinuity at $x = n$ for every integer n. The function is right-continuous but not left-continuous at each of these points of discontinuity.

33. $f(x) = \dfrac{1}{e^x - e^{-x}}$

SOLUTION The function $f(x) = \dfrac{1}{e^x - e^{-x}}$ is discontinuous at $x = 0$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $x = 0$.

34. $f(x) = \ln|x - 4|$

SOLUTION The function $f(x) = \ln|x - 4|$ is discontinuous at $x = 4$, at which there is an infinite discontinuity. The function is neither left- nor right-continuous at $x = 4$.

In Exercises 35–48, determine the domain of the function and prove that it is continuous on its domain using the Laws of Continuity and the facts quoted in this section.

35. $f(x) = 2\sin x + 3\cos x$

SOLUTION The domain of $2\sin x + 3\cos x$ is all real numbers. Both $\sin x$ and $\cos x$ are continuous on this domain, so $2\sin x + 3\cos x$ is continuous by Continuity Laws (i) and (ii).

36. $f(x) = \sqrt{x^2 + 9}$

SOLUTION The domain of $\sqrt{x^2 + 9}$ is all real numbers, as $x^2 + 9 > 0$ for all x. Since $\sqrt{x}$ and the polynomial $x^2 + 9$ are both continuous, so is the composite function $\sqrt{x^2 + 9}$.

37. $f(x) = \sqrt{x}\sin x$

SOLUTION This function is defined as long as $x \ge 0$. Since $\sqrt{x}$ and $\sin x$ are continuous, so is $\sqrt{x}\sin x$ by Continuity Law (iii).

38. $f(x) = \dfrac{x^2}{x + x^{1/4}}$

SOLUTION This function is defined as long as $x \ge 0$ and $x + x^{1/4} \ne 0$, and so the domain is all $x > 0$. Since x is continuous, so are x^2 and $x + x^{1/4}$ by Continuity Laws (iii) and (i); hence, by Continuity Law (iv), so is $\dfrac{x^2}{x + x^{1/4}}$.

39. $f(x) = x^{2/3}2^x$

SOLUTION The domain of $x^{2/3}2^x$ is all real numbers as the denominator of the rational exponent is odd. Both $x^{2/3}$ and 2^x are continuous on this domain, so $x^{2/3}2^x$ is continuous by Continuity Law (iii).

40. $f(x) = x^{1/3} + x^{3/4}$

SOLUTION The domain of $x^{1/3} + x^{3/4}$ is $x \ge 0$. On this domain, both $x^{1/3}$ and $x^{3/4}$ are continuous, so $x^{1/3} + x^{3/4}$ is continuous by Continuity Law (i).

41. $f(x) = x^{-4/3}$

SOLUTION This function is defined for all $x \ne 0$. Because the function $x^{4/3}$ is continuous and not equal to zero for $x \ne 0$, it follows that

$$x^{-4/3} = \frac{1}{x^{4/3}}$$

is continuous for $x \ne 0$ by Continuity Law (iv).

42. $f(x) = \ln(9 - x^2)$

SOLUTION The domain of $\ln(9 - x^2)$ is all x such that $9 - x^2 > 0$, or $|x| < 3$. The polynomial $9 - x^2$ is continuous for all real numbers and $\ln x$ is continuous for $x > 0$; therefore, the composite function $\ln(9 - x^2)$ is continuous for $|x| < 3$.

43. $f(x) = \tan^2 x$

SOLUTION The domain of $\tan^2 x$ is all $x \ne \pm(2n - 1)\pi/2$ where n is a positive integer. Because $\tan x$ is continuous on this domain, it follows from Continuity Law (iii) that $\tan^2 x$ is also continuous on this domain.

44. $f(x) = \cos(2^x)$

SOLUTION The domain of $\cos(2^x)$ is all real numbers. Because the functions $\cos x$ and 2^x are continuous on this domain, so is the composite function $\cos(2^x)$.

45. $f(x) = (x^4 + 1)^{3/2}$

SOLUTION The domain of $(x^4 + 1)^{3/2}$ is all real numbers as $x^4 + 1 > 0$ for all x. Because $x^{3/2}$ and the polynomial $x^4 + 1$ are both continuous, so is the composite function $(x^4 + 1)^{3/2}$.

46. $f(x) = e^{-x^2}$

SOLUTION The domain of e^{-x^2} is all real numbers. Because e^x and the polynomial $-x^2$ are both continuous for all real numbers, so is the composite function e^{-x^2}.

47. $f(x) = \dfrac{\cos(x^2)}{x^2 - 1}$

SOLUTION The domain for this function is all $x \neq \pm 1$. Because the functions $\cos x$ and x^2 are continuous on this domain, so is the composite function $\cos(x^2)$. Finally, because the polynomial $x^2 - 1$ is continuous and not equal to zero for $x \neq \pm 1$, the function $\dfrac{\cos(x^2)}{x^2 - 1}$ is continuous by Continuity Law (iv).

48. $f(x) = 9^{\tan x}$

SOLUTION The domain of $9^{\tan x}$ is all $x \neq \pm(2n - 1)\pi/2$ where n is a positive integer. Because $\tan x$ and 9^x are continuous on this domain, it follows that the composite function $9^{\tan x}$ is also continuous on this domain.

49. Show that the function

$$f(x) = \begin{cases} x^2 + 3 & \text{for } x < 1 \\ 10 - x & \text{for } 1 \le x \le 2 \\ 6x - x^2 & \text{for } x > 2 \end{cases}$$

is continuous for $x \neq 1, 2$. Then compute the right- and left-hand limits at $x = 1, 2$, and determine whether $f(x)$ is left-continuous, right-continuous, or continuous at these points (Figure 17).

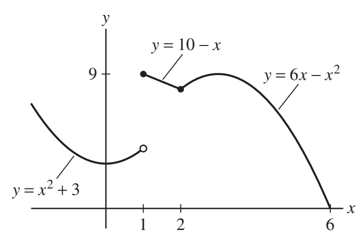

FIGURE 17

SOLUTION Let's start with $x \neq 1, 2$.

- Because x is continuous, so is x^2 by Continuity Law (iii). The constant function 3 is also continuous, so $x^2 + 3$ is continuous by Continuity Law (i). Therefore, $f(x)$ is continuous for $x < 1$.
- Because x and the constant function 10 are continuous, the function $10 - x$ is continuous by Continuity Law (i). Therefore, $f(x)$ is continuous for $1 < x < 2$.
- Because x is continuous, x^2 is continuous by Continuity Law (iii) and $6x$ is continuous by Continuity Law (ii). Therefore, $6x - x^2$ is continuous by Continuity Law (i), so $f(x)$ is continuous for $x > 2$.

At $x = 1$, $f(x)$ has a jump discontinuity because the one-sided limits exist but are not equal:

$$\lim_{x \to 1-} f(x) = \lim_{x \to 1-} (x^2 + 3) = 4, \qquad \lim_{x \to 1+} f(x) = \lim_{x \to 1+} (10 - x) = 9.$$

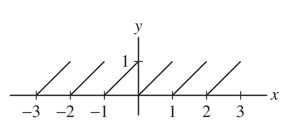
Furthermore, the right-hand limit equals the function value $f(1) = 9$, so $f(x)$ is right-continuous at $x = 1$. At $x = 2$,

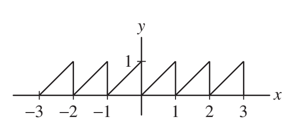
$$\lim_{x \to 2-} f(x) = \lim_{x \to 2-} (10 - x) = 8, \qquad \lim_{x \to 2+} f(x) = \lim_{x \to 2+} (6x - x^2) = 8.$$

The left- and right-hand limits exist and are equal to $f(2)$, so $f(x)$ is continuous at $x = 2$.

50. Sawtooth Function Draw the graph of $f(x) = x - [x]$. At which points is f discontinuous? Is it left- or right-continuous at those points?

SOLUTION Two views of the sawtooth function $f(x) = x - [x]$ appear below. The first is the actual graph. In the second, the jumps are "connected" so as to better illustrate its "sawtooth" nature. The function is right-continuous at integer values of x.

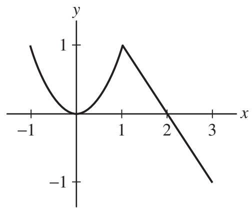




In Exercises 51–54, sketch the graph of $f(x)$. At each point of discontinuity, state whether f is left- or right-continuous.

51. $f(x) = \begin{cases} x^2 & \text{for } x \le 1 \\ 2 - x & \text{for } x > 1 \end{cases}$

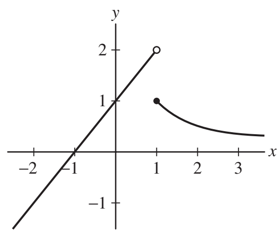
SOLUTION



The function f is continuous everywhere.

52. $f(x) = \begin{cases} x + 1 & \text{for } x < 1 \\ \dfrac{1}{x} & \text{for } x \ge 1 \end{cases}$

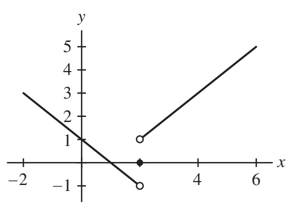
SOLUTION



The function f is right-continuous at $x = 1$.

53. $f(x) = \begin{cases} \dfrac{x^2 - 3x + 2}{|x - 2|} & x \ne 2 \\ 0 & x = 2 \end{cases}$

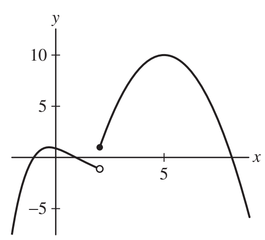
SOLUTION



The function f is neither left- nor right-continuous at $x = 2$.

54. $f(x) = \begin{cases} x^3 + 1 & \text{for } -\infty < x \le 0 \\ -x + 1 & \text{for } 0 < x < 2 \\ -x^2 + 10x - 15 & \text{for } x \ge 2 \end{cases}$

SOLUTION



The function f is right-continuous at $x = 2$.

55. Show that the function

$$f(x) = \begin{cases} \dfrac{x^2 - 16}{x - 4} & x \neq 4 \\ 10 & x = 4 \end{cases}$$

has a removable discontinuity at $x = 4$.

SOLUTION To show that $f(x)$ has a removable discontinuity at $x = 4$, we must establish that

$$\lim_{x \to 4} f(x)$$

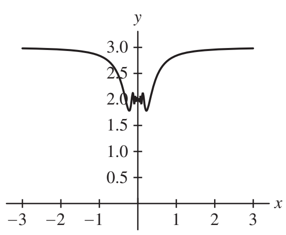
exists but does not equal $f(4)$. Now,

$$\lim_{x \to 4} \frac{x^2 - 16}{x - 4} = \lim_{x \to 4} (x + 4) = 8 \neq 10 = f(4);$$

thus, $f(x)$ has a removable discontinuity at $x = 4$. To remove the discontinuity, we must redefine $f(4) = 8$.

56. GU Define $f(x) = x \sin \frac{1}{x} + 2$ for $x \neq 0$. Plot $f(x)$. How should $f(0)$ be defined so that f is continuous at $x = 0$?

SOLUTION



From the graph, it appears that $f(0)$ should be defined equal to 2 to make f continuous at $x = 0$.

In Exercises 57–59, find the value of the constant (a, b, or c) that makes the function continuous.

57. $f(x) = \begin{cases} x^2 - c & \text{for } x < 5 \\ 4x + 2c & \text{for } x \geq 5 \end{cases}$

SOLUTION As $x \to 5-$, we have $x^2 - c \to 25 - c = L$. As $x \to 5+$, we have $4x + 2c \to 20 + 2c = R$. Match the limits: $L = R$ or $25 - c = 20 + 2c$ implies $c = \frac{5}{3}$.

58. $f(x) = \begin{cases} 2x + 9x^{-1} & \text{for } x \leq 3 \\ -4x + c & \text{for } x > 3 \end{cases}$

SOLUTION As $x \to 3-$, we have $2x + 9x^{-1} \to 9 = L$. As $x \to 3+$, we have $-4x + c \to c - 12 = R$. Match the limits: $L = R$ or $9 = c - 12$ implies $c = 21$.

59. $f(x) = \begin{cases} x^{-1} & \text{for } x < -1 \\ ax + b & \text{for } -1 \leq x \leq \frac{1}{2} \\ x^{-1} & \text{for } x > \frac{1}{2} \end{cases}$

SOLUTION As $x \to -1-$, $x^{-1} \to -1$ while as $x \to -1+$, $ax + b \to b - a$. For f to be continuous at $x = -1$, we must therefore have $b - a = -1$. Now, as $x \to \frac{1}{2}-$, $ax + b \to \frac{1}{2}a + b$ while as $x \to \frac{1}{2}+$, $x^{-1} \to 2$. For f to be continuous at $x = \frac{1}{2}$, we must therefore have $\frac{1}{2}a + b = 2$. Solving these two equations for a and b yields $a = 2$ and $b = 1$.

60. Define

$$g(x) = \begin{cases} x + 3 & \text{for } x < -1 \\ cx & \text{for } -1 \leq x \leq 2 \\ x + 2 & \text{for } x > 2 \end{cases}$$

Find a value of c such that $g(x)$ is

(a) left-continuous

(b) right-continuous

In each case, sketch the graph of $g(x)$.

SOLUTION

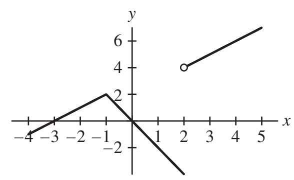
(a) In order for $g(x)$ to be left-continuous, we need

$$\lim_{x\to -1-} g(x) = \lim_{x\to -1-} (x+3) = 2$$

to be equal to

$$\lim_{x\to -1+} g(x) = \lim_{x\to -1+} cx = -c.$$

Therefore, we must have $c = -2$. The graph of $g(x)$ with $c = -2$ is shown below.



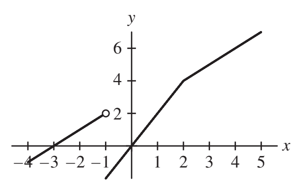
(b) In order for $g(x)$ to be right-continuous, we need

$$\lim_{x\to 2-} g(x) = \lim_{x\to 2-} cx = 2c$$

to be equal to

$$\lim_{x\to 2+} g(x) = \lim_{x\to 2+} (x+2) = 4.$$

Therefore, we must have $c = 2$. The graph of $g(x)$ with $c = 2$ is shown below.



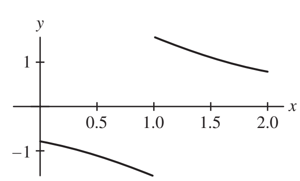
61. Define $g(t) = \tan^{-1}\left(\dfrac{1}{t-1}\right)$ for $t \neq 1$. Answer the following questions, using a plot if necessary.

(a) Can $g(1)$ be defined so that $g(t)$ is continuous at $t = 1$?

(b) How should $g(1)$ be defined so that $g(t)$ is left-continuous at $t = 1$?

SOLUTION

(a) From the graph of $g(t)$ shown below, we see that g has a jump discontinuity at $t = 1$; therefore, $g(a)$ cannot be defined so that g is continuous at $t = 1$.



(b) To make g left-continuous at $t = 1$, we should define

$$g(1) = \lim_{t\to 1-} \tan^{-1}\left(\tfrac{1}{t-1}\right) = -\frac{\pi}{2}.$$

62. Each of the following statements is *false*. For each statement, sketch the graph of a function that provides a counterexample.

(a) If $\lim_{x\to a} f(x)$ exists, then $f(x)$ is continuous at $x = a$.

(b) If $f(x)$ has a jump discontinuity at $x = a$, then $f(a)$ is equal to either $\lim_{x\to a-} f(x)$ or $\lim_{x\to a+} f(x)$.

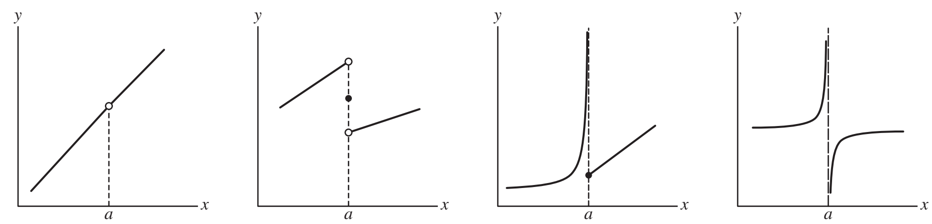
SOLUTION Refer to the four figures shown below.

(a) The figure at the top left shows a function for which $\lim_{x\to a} f(x)$ exists, but the function is not continuous at $x = a$ because the function is not defined at $x = a$.

(b) The figure at the top right shows a function that has a jump discontinuity at $x = a$ but $f(a)$ is not equal to either $\lim_{x \to a-} f(x)$ or $\lim_{x \to a-} f(x)$.

(c) This statement can be false either when the two one-sided limits exist and are equal or when one or both of the one-sided limits does not exist. The figure at the top left shows a function that has a discontinuity at $x = a$ with both one-sided limits being equal; the figure at the bottom left shows a function that has a discontinuity at $x = a$ with a one-sided limit that does not exist.

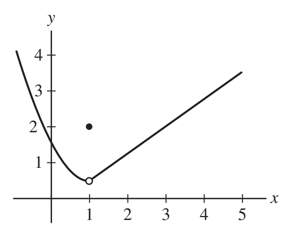
(d) The figure at the bottom left shows a function for which $\lim_{x \to a} f(x)$ does not exist and one of the one-sided limits also does not exist; the figure at the bottom right shows a function for which $\lim_{x \to a} f(x)$ does not exist and neither of the one-sided limits exists.



In Exercises 63–66, draw the graph of a function on [0, 5] *with the given properties.*

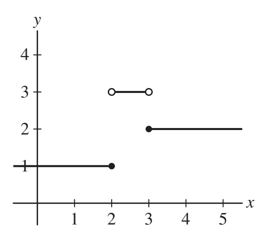
63. $f(x)$ is not continuous at $x = 1$, but $\lim_{x \to 1+} f(x)$ and $\lim_{x \to 1-} f(x)$ exist and are equal.

SOLUTION



64. $f(x)$ is left-continuous but not continuous at $x = 2$ and right-continuous but not continuous at $x = 3$.

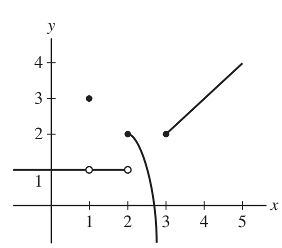
SOLUTION



65. $f(x)$ has a removable discontinuity at $x = 1$, a jump discontinuity at $x = 2$, and

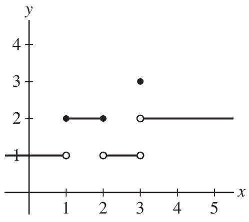
$$\lim_{x \to 3-} f(x) = -\infty, \qquad \lim_{x \to 3+} f(x) = 2$$

SOLUTION



66. $f(x)$ is right- but not left-continuous at $x = 1$, left- but not right-continuous at $x = 2$, and neither left- nor right-continuous at $x = 3$.

SOLUTION



In Exercises 67–80, evaluate using substitution.

67. $\lim_{x\to -1}(2x^3 - 4)$

SOLUTION $\lim_{x\to -1}(2x^3 - 4) = 2(-1)^3 - 4 = -6.$

68. $\lim_{x\to 2}(5x - 12x^{-2})$

SOLUTION $\lim_{x\to 2}(5x - 12x^{-2}) = 5(2) - 12(2^{-2}) = 10 - 12(\frac{1}{4}) = 7.$

69. $\lim_{x\to 3} \dfrac{x+2}{x^2+2x}$

SOLUTION $\lim_{x\to 3} \dfrac{x+2}{x^2+2x} = \dfrac{3+2}{3^2+2\cdot 3} = \dfrac{5}{15} = \dfrac{1}{3}$

70. $\lim_{x\to \pi} \sin\left(\dfrac{x}{2} - \pi\right)$

SOLUTION $\lim_{x\to \pi} \sin(\frac{x}{2} - \pi) = \sin(-\frac{\pi}{2}) = -1.$

71. $\lim_{x\to \frac{\pi}{4}} \tan(3x)$

SOLUTION $\lim_{x\to \frac{\pi}{4}} \tan(3x) = \tan(3\cdot\frac{\pi}{4}) = \tan(\frac{3\pi}{4}) = -1$

72. $\lim_{x\to \pi} \dfrac{1}{\cos x}$

SOLUTION $\lim_{x\to \pi} \dfrac{1}{\cos x} = \dfrac{1}{\cos \pi} = \dfrac{1}{-1} = -1.$

73. $\lim_{x\to 4} x^{-5/2}$

SOLUTION $\lim_{x\to 4} x^{-5/2} = 4^{-5/2} = \dfrac{1}{32}.$

74. $\lim_{x\to 2} \sqrt{x^3 + 4x}$

SOLUTION $\lim_{x\to 2} \sqrt{x^3 + 4x} = \sqrt{2^3 + 4(2)} = 4.$

75. $\lim_{x\to -1}(1 - 8x^3)^{3/2}$

SOLUTION $\lim_{x\to -1}(1 - 8x^3)^{3/2} = (1 - 8(-1)^3)^{3/2} = 27.$

76. $\lim_{x\to 2} \left(\dfrac{7x+2}{4-x}\right)^{2/3}$

SOLUTION $\lim_{x\to 2} \left(\dfrac{7x+2}{4-x}\right)^{2/3} = \left(\dfrac{7(2)+2}{4-2}\right)^{2/3} = 4.$

77. $\lim_{x\to 3} 10^{x^2-2x}$

SOLUTION $\lim_{x\to 3} 10^{x^2-2x} = 10^{3^2-2(3)} = 1000.$

78. $\lim_{x \to -\frac{\pi}{2}} 3^{\sin x}$

SOLUTION $\lim_{x \to -\frac{\pi}{2}} 3^{-\sin x} = 3^{-\sin(\pi/2)} = \frac{1}{3}$.

79. $\lim_{x \to 4} \sin^{-1}\left(\frac{x}{4}\right)$

SOLUTION $\lim_{x \to 4} \sin^{-1}\left(\frac{x}{4}\right) = \sin^{-1}\left(\lim_{x \to 4} \frac{x}{4}\right) = \sin^{-1}\left(\frac{4}{4}\right) = \frac{\pi}{2}$

80. $\lim_{x \to 0} \tan^{-1}(e^x)$

SOLUTION $\lim_{x \to 0} \tan^{-1}(e^x) = \tan^{-1}\left(\lim_{x \to 0} e^x\right) = \tan^{-1}(e^0) = \tan^{-1} 1 = \frac{\pi}{4}$

81. Suppose that $f(x)$ and $g(x)$ are discontinuous at $x = c$. Does it follow that $f(x) + g(x)$ is discontinuous at $x = c$? If not, give a counterexample. Does this contradict Theorem 1 (i)?

SOLUTION Even if $f(x)$ and $g(x)$ are discontinuous at $x = c$, it is *not* necessarily true that $f(x) + g(x)$ is discontinuous at $x = c$. For example, suppose $f(x) = -x^{-1}$ and $g(x) = x^{-1}$. Both $f(x)$ and $g(x)$ are discontinuous at $x = 0$; however, the function $f(x) + g(x) = 0$, which is continuous everywhere, including $x = 0$. This does not contradict Theorem 1 (i), which deals only with continuous functions.

82. Prove that $f(x) = |x|$ is continuous for all x. *Hint:* To prove continuity at $x = 0$, consider the one-sided limits.

SOLUTION Let $c < 0$. Then

$$\lim_{x \to c} |x| = \lim_{x \to c} -x = -c = |c|.$$

Next, let $c > 0$. Then

$$\lim_{x \to c} |x| = \lim_{x \to c} x = c = |c|.$$

Finally,

$$\lim_{x \to 0-} |x| = \lim_{x \to 0-} -x = 0,$$

$$\lim_{x \to 0+} |x| = \lim_{x \to 0+} x = 0$$

and we recall that $|0| = 0$. Thus, $|x|$ is continuous for all x.

83. Use the result of Exercise 82 to prove that if $g(x)$ is continuous, then $f(x) = |g(x)|$ is also continuous.

SOLUTION Recall that the composition of two continuous functions is continuous. Now, $f(x) = |g(x)|$ is a composition of the continuous functions $g(x)$ and $|x|$, so is also continuous.

84. Which of the following quantities would be represented by continuous functions of time and which would have one or more discontinuities?

(a) Velocity of an airplane during a flight

(b) Temperature in a room under ordinary conditions

(c) Value of a bank account with interest paid yearly

(d) The salary of a teacher

(e) The population of the world

SOLUTION

(a) The velocity of an airplane during a flight from Boston to Chicago is a continuous function of time.

(b) The temperature of a room under ordinary conditions is a continuous function of time.

(c) The value of a bank account with interest paid yearly is *not* a continuous function of time. It has discontinuities when deposits or withdrawals are made and when interest is paid.

(d) The salary of a teacher is *not* a continuous function of time. It has discontinuities whenever the teacher gets a raise (or whenever his or her salary is lowered).

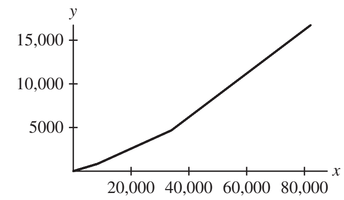
(e) The population of the world is *not* a continuous function of time since it changes by a discrete amount with each birth or death. Since it takes on such large numbers (many billions), it is often treated as a continuous function for the purposes of mathematical modeling.

85. In 2009, the federal income tax $T(x)$ on income of x dollars (up to \$82,250) was determined by the formula

$$T(x) = \begin{cases} 0.10x & \text{for } 0 \le x < 8350 \\ 0.15x - 417.50 & \text{for } 8350 \le x < 33{,}950 \\ 0.25x - 3812.50 & \text{for } 33{,}950 \le x < 82{,}250 \end{cases}$$

Sketch the graph of $T(x)$. Does $T(x)$ have any discontinuities? Explain why, if $T(x)$ had a jump discontinuity, it might be advantageous in some situations to earn *less* money.

SOLUTION $T(x)$, the amount of federal income tax owed on an income of x dollars in 2009, might be a discontinuous function depending upon how the tax tables are constructed (as determined by that year's regulations). Here is a graph of $T(x)$ for that particular year.



If $T(x)$ had a jump discontinuity (say at $x = c$), it might be advantageous to earn slightly less income than c (say $c - \epsilon$) and be taxed at a lower rate than to earn c or more and be taxed at a higher rate. Your net earnings may actually be more in the former case than in the latter one.

Further Insights and Challenges

86. If $f(x)$ has a removable discontinuity at $x = c$, then it is possible to redefine $f(c)$ so that $f(x)$ is continuous at $x = c$. Can this be done in more than one way?

SOLUTION In order for $f(x)$ to have a removable discontinuity at $x = c$, $\lim_{x\to c} f(x) = L$ must exist. To remove the discontinuity, we define $f(c) = L$. Then f is continuous at $x = c$ since $\lim_{x\to c} f(x) = L = f(c)$. Now *assume* that we may define $f(c) = M \neq L$ and still have f continuous at $x = c$. Then $\lim_{x\to c} f(x) = f(c) = M$. Therefore $M = L$, a contradiction. Roughly speaking, there's only one way to fill in the hole in the graph of f!

87. Give an example of functions $f(x)$ and $g(x)$ such that $f(g(x))$ is continuous but $g(x)$ has at least one discontinuity.

SOLUTION Answers may vary. The simplest examples are the functions $f(g(x))$ where $f(x) = C$ is a constant function, and $g(x)$ is defined for all x. In these cases, $f(g(x)) = C$. For example, if $f(x) = 3$ and $g(x) = [x]$, g is discontinuous at all integer values $x = n$, but $f(g(x)) = 3$ is continuous.

88. Continuous at Only One Point Show that the following function is continuous only at $x = 0$:

$$f(x) = \begin{cases} x & \text{for } x \text{ rational} \\ -x & \text{for } x \text{ irrational} \end{cases}$$

SOLUTION Let $f(x) = x$ for x rational and $f(x) = -x$ for x irrational.

- Now $f(0) = 0$ since 0 is rational. Moreover, as $x \to 0$, we have $|f(x) - f(0)| = |f(x) - 0| = |x| \to 0$. Thus $\lim_{x\to 0} f(x) = f(0)$ and f is continuous at $x = 0$.
- Let $c \neq 0$ be any nonzero rational number. Let $\{x_1, x_2, \dots\}$ be a sequence of irrational points that approach c; i.e., as $n \to \infty$, the x_n get arbitrarily close to c. Notice that as $n \to \infty$, we have $|f(x_n) - f(c)| = |-x_n - c| = |x_n + c| \to |2c| \neq 0$. Therefore, it is *not* true that $\lim_{x\to c} f(x) = f(c)$. Accordingly, f is *not* continuous at $x = c$. Since c was arbitrary, f is discontinuous at all rational numbers.
- Let $c \neq 0$ be any nonzero irrational number. Let $\{x_1, x_2, \dots\}$ be a sequence of rational points that approach c; i.e., as $n \to \infty$, the x_n get arbitrarily close to c. Notice that as $n \to \infty$, we have $|f(x_n) - f(c)| = |x_n - (-c)| = |x_n + c| \to |2c| \neq 0$. Therefore, it is *not* true that $\lim_{x\to c} f(x) = f(c)$. Accordingly, f is *not* continuous at $x = c$. Since c was arbitrary, f is discontinuous at all irrational numbers.
- CONCLUSION: f is continuous at $x = 0$ and is discontinuous at all points $x \neq 0$.

89. Show that $f(x)$ is a discontinuous function for all x where $f(x)$ is defined as follows:

$$f(x) = \begin{cases} 1 & \text{for } x \text{ rational} \\ -1 & \text{for } x \text{ irrational} \end{cases}$$

Show that $f(x)^2$ is continuous for all x.

SOLUTION $\lim_{x\to c} f(x)$ does not exist for any c. If c is irrational, then there is always a rational number r arbitrarily close to c so that $|f(c) - f(r)| = 2$. If, on the other hand, c is rational, there is always an *irrational* number z arbitrarily close to c so that $|f(c) - f(z)| = 2$.

On the other hand, $f(x)^2$ is a constant function that always has value 1, which is obviously continuous.

2.5 Evaluating Limits Algebraically

Preliminary Questions

1. Which of the following is indeterminate at $x = 1$?

$$\frac{x^2+1}{x-1}, \qquad \frac{x^2-1}{x+2}, \qquad \frac{x^2-1}{\sqrt{x+3}-2}, \qquad \frac{x^2+1}{\sqrt{x+3}-2}$$

SOLUTION At $x = 1$, $\frac{x^2-1}{\sqrt{x+3}-2}$ is of the form $\frac{0}{0}$; hence, this function is indeterminate. None of the remaining functions is indeterminate at $x = 1$: $\frac{x^2+1}{x-1}$ and $\frac{x^2+1}{\sqrt{x+3}-2}$ are undefined because the denominator is zero but the numerator is not, while $\frac{x^2-1}{x+2}$ is equal to 0.

2. Give counterexamples to show that these statements are false:

(a) If $f(c)$ is indeterminate, then the right- and left-hand limits as $x \to c$ are not equal.

(b) If $\lim_{x\to c} f(x)$ exists, then $f(c)$ is not indeterminate.

(c) If $f(x)$ is undefined at $x = c$, then $f(x)$ has an indeterminate form at $x = c$.

SOLUTION

(a) Let $f(x) = \frac{x^2-1}{x-1}$. At $x = 1$, f is indeterminate of the form $\frac{0}{0}$ but

$$\lim_{x\to 1-} \frac{x^2-1}{x-1} = \lim_{x\to 1-} (x+1) = 2 = \lim_{x\to 1+} (x+1) = \lim_{x\to 1+} \frac{x^2-1}{x-1}.$$

(b) Again, let $f(x) = \frac{x^2-1}{x-1}$. Then

$$\lim_{x\to 1} f(x) = \lim_{x\to 1} \frac{x^2-1}{x-1} = \lim_{x\to 1} (x+1) = 2$$

but $f(1)$ is indeterminate of the form $\frac{0}{0}$.

(c) Let $f(x) = \frac{1}{x}$. Then f is undefined at $x = 0$ but does not have an indeterminate form at $x = 0$.

3. The method for evaluating limits discussed in this section is sometimes called "simplify and plug in." Explain how it actually relies on the property of continuity.

SOLUTION If f is continuous at $x = c$, then, by definition, $\lim_{x\to c} f(x) = f(c)$; in other words, the limit of a continuous function at $x = c$ is the value of the function at $x = c$. The "simplify and plug-in" strategy is based on simplifying a function which is indeterminate to a continuous function. Once the simplification has been made, the limit of the remaining continuous function is obtained by evaluation.

Exercises

In Exercises 1–4, show that the limit leads to an indeterminate form. Then carry out the two-step procedure: Transform the function algebraically and evaluate using continuity.

1. $\lim_{x\to 6} \frac{x^2-36}{x-6}$

SOLUTION When we substitute $x = 6$ into $\frac{x^2-36}{x-6}$, we obtain the indeterminate form $\frac{0}{0}$. Upon factoring the numerator and simplifying, we find

$$\lim_{x\to 6} \frac{x^2-36}{x-6} = \lim_{x\to 6} \frac{(x-6)(x+6)}{x-6} = \lim_{x\to 6} (x+6) = 12.$$

2. $\lim_{h\to 3} \frac{9-h^2}{h-3}$

SOLUTION When we substitute $h = 3$ into $\frac{9-h^2}{h-3}$, we obtain the indeterminate form $\frac{0}{0}$. Upon factoring the denominator and simplifying, we find

$$\lim_{h\to 3} \frac{9-h^2}{h-3} = \lim_{h\to 3} \frac{(3-h)(3+h)}{h-3} = \lim_{h\to 3} -(3+h) = -6.$$

3. $\lim_{x\to -1} \frac{x^2+2x+1}{x+1}$

SOLUTION When we substitute $x = -1$ into $\frac{x^2+2x+1}{x+1}$, we obtain the indeterminate form $\frac{0}{0}$. Upon factoring the numerator and simplifying, we find

$$\lim_{x\to -1} \frac{x^2+2x+1}{x+1} = \lim_{x\to -1} \frac{(x+1)^2}{x+1} = \lim_{x\to -1} (x+1) = 0.$$

4. $\lim_{t\to 9} \frac{2t-18}{5t-45}$

SOLUTION When we substitute $t = 9$ into $\frac{2t-18}{5t-45}$, we obtain the indeterminate form $\frac{0}{0}$. Upon dividing out the common factor of $t - 9$ from both the numerator and denominator, we find

$$\lim_{t\to 9} \frac{2t-18}{5t-45} = \lim_{t\to 9} \frac{2(t-9)}{5(t-9)} = \lim_{t\to 9} \frac{2}{5} = \frac{2}{5}.$$

In Exercises 5–34, evaluate the limit, if it exists. If not, determine whether the one-sided limits exist (finite or infinite).

5. $\lim_{x\to 7} \frac{x-7}{x^2-49}$

SOLUTION $\lim_{x\to 7} \frac{x-7}{x^2-49} = \lim_{x\to 7} \frac{x-7}{(x-7)(x+7)} = \lim_{x\to 7} \frac{1}{x+7} = \frac{1}{14}.$

6. $\lim_{x\to 8} \frac{x^2-64}{x-9}$

SOLUTION $\lim_{x\to 8} \frac{x^2-64}{x-9} = \frac{0}{-1} = 0$

7. $\lim_{x\to -2} \frac{x^2+3x+2}{x+2}$

SOLUTION $\lim_{x\to -2} \frac{x^2+3x+2}{x+2} = \lim_{x\to -2} \frac{(x+1)(x+2)}{x+2} = \lim_{x\to -2} (x+1) = -1.$

8. $\lim_{x\to 8} \frac{x^3-64x}{x-8}$

SOLUTION $\lim_{x\to 8} \frac{x^3-64x}{x-8} = \lim_{x\to 8} \frac{x(x-8)(x+8)}{x-8} = \lim_{x\to 8} x(x+8) = 8(16) = 128.$

9. $\lim_{x\to 5} \frac{2x^2-9x-5}{x^2-25}$

SOLUTION $\lim_{x\to 5} \frac{2x^2-9x-5}{x^2-25} = \lim_{x\to 5} \frac{(x-5)(2x+1)}{(x-5)(x+5)} = \lim_{x\to 5} \frac{2x+1}{x+5} = \frac{11}{10}.$

10. $\displaystyle\lim_{h\to 0}\frac{(1+h)^3-1}{h}$

SOLUTION

$$\lim_{h\to 0}\frac{(1+h)^3-1}{h}=\lim_{h\to 0}\frac{1+3h+3h^2+h^3-1}{h}=\lim_{h\to 0}\frac{3h+3h^2+h^3}{h}$$
$$=\lim_{h\to 0}(3+3h+h^2)=3+3(0)+0^2=3.$$

11. $\displaystyle\lim_{x\to -\frac{1}{2}}\frac{2x+1}{2x^2+3x+1}$

SOLUTION $\displaystyle\lim_{x\to -\frac{1}{2}}\frac{2x+1}{2x^2+3x+1}=\lim_{x\to -\frac{1}{2}}\frac{2x+1}{(2x+1)(x+1)}=\lim_{x\to -\frac{1}{2}}\frac{1}{x+1}=2.$

12. $\displaystyle\lim_{x\to 3}\frac{x^2-x}{x^2-9}$

SOLUTION As $x\to 3$, the numerator $x^2-x\to 6$ while the denominator $x^2-9\to 0$; thus, this limit does not exist. Checking the one-sided limits, we find

$$\lim_{x\to 3-}\frac{x^2-x}{x^2-9}=\lim_{x\to 3-}\frac{x(x-1)}{(x-3)(x+3)}=-\infty$$

while

$$\lim_{x\to 3+}\frac{x^2-x}{x^2-9}=\lim_{x\to 3+}\frac{x(x-1)}{(x-3)(x+3)}=\infty.$$

13. $\displaystyle\lim_{x\to 2}\frac{3x^2-4x-4}{2x^2-8}$

SOLUTION $\displaystyle\lim_{x\to 2}\frac{3x^2-4x-4}{2x^2-8}=\lim_{x\to 2}\frac{(3x+2)(x-2)}{2(x-2)(x+2)}=\lim_{x\to 2}\frac{3x+2}{2(x+2)}=\frac{8}{8}=1.$

14. $\displaystyle\lim_{h\to 0}\frac{(3+h)^3-27}{h}$

SOLUTION

$$\lim_{h\to 0}\frac{(3+h)^3-27}{h}=\lim_{h\to 0}\frac{27+27h+9h^2+h^3-27}{h}=\lim_{h\to 0}\frac{27h+9h^2+h^3}{h}$$
$$=\lim_{h\to 0}(27+9h+h^2)=27+9(0)+0^2=27.$$

15. $\displaystyle\lim_{t\to 0}\frac{4^{2t}-1}{4^t-1}$

SOLUTION $\displaystyle\lim_{t\ to 0}\frac{4^{2t}-1}{4^t-1}=\lim_{t\ to 0}\frac{(4^t-1)(4^t+1)}{4^t-1}=\lim_{t\to 0}(4^t+1)=2.$

16. $\displaystyle\lim_{h\to 4}\frac{(h+2)^2-9h}{h-4}$

SOLUTION $\displaystyle\lim_{h\to 4}\frac{(h+2)^2-9h}{h-4}=\lim_{h\to 4}\frac{h^2-5h+4}{h-4}=\lim_{h\to 4}\frac{(h-1)(h-4)}{h-4}=\lim_{h\to 4}(h-1)=3.$

17. $\displaystyle\lim_{x\to 16}\frac{\sqrt{x}-4}{x-16}$

SOLUTION $\displaystyle\lim_{x\to 16}\frac{\sqrt{x}-4}{x-16}=\lim_{x\to 16}\frac{\sqrt{x}-4}{\left(\sqrt{x}+4\right)\left(\sqrt{x}-4\right)}=\lim_{x\to 16}\frac{1}{\sqrt{x}+4}=\frac{1}{8}.$

18. $\displaystyle\lim_{t\to -2}\frac{2t+4}{12-3t^2}$

SOLUTION $\displaystyle\lim_{t\to -2}\frac{2t+4}{12-3t^2}=\lim_{t\to -2}\frac{2(t+2)}{-3(t-2)(t+2)}=\lim_{t\to -2}\frac{2}{-3(t-2)}=\frac{1}{6}.$

19. $\displaystyle\lim_{y\to 3}\frac{y^2+y-12}{y^3-10y+3}$

SOLUTION $\displaystyle\lim_{y\to 3}\frac{y^2+y-12}{y^3-10y+3}=\lim_{y\to 3}\frac{(y-3)(y+4)}{(y-3)(y^2+3y-1)}=\lim_{y\to 3}\frac{(y+4)}{(y^2+3y-1)}=\frac{7}{17}.$

20. $\displaystyle\lim_{h\to 0}\frac{\frac{1}{(h+2)^2}-\frac{1}{4}}{h}$

SOLUTION

$$\lim_{h\to 0}\frac{\frac{1}{(h+2)^2}-\frac{1}{4}}{h}=\lim_{h\to 0}\frac{\frac{4-(h+2)^2}{4(h+2)^2}}{h}=\lim_{h\to 0}\frac{\frac{4-(h^2+4h+4)}{4(h+2)^2}}{h}=\lim_{h\to 0}\frac{\frac{-h^2-4h}{4(h+2)^2}}{h}$$
$$=\lim_{h\to 0}\frac{h\frac{-h-4}{4(h+2)^2}}{h}=\lim_{h\to 0}\frac{-h-4}{4(h+2)^2}=\frac{-4}{16}=-\frac{1}{4}.$$

21. $\displaystyle\lim_{h\to 0}\frac{\sqrt{2+h}-2}{h}$

SOLUTION $\displaystyle\lim_{h\to 0}\frac{\sqrt{h+2}-2}{h}$ does not exist.

- As $h\to 0+$, we have $\displaystyle\frac{\sqrt{h+2}-2}{h}=\frac{\left(\sqrt{h+2}-2\right)\left(\sqrt{h+2}+2\right)}{h(\sqrt{h+2}+2)}=\frac{h-2}{h(\sqrt{h+2}+2)}\to-\infty.$
- As $h\to 0-$, we have $\displaystyle\frac{\sqrt{h+2}-2}{h}=\frac{\left(\sqrt{h+2}-2\right)\left(\sqrt{h+2}+2\right)}{h(\sqrt{h+2}+2)}=\frac{h-2}{h(\sqrt{h+2}+2)}\to\infty.$

22. $\displaystyle\lim_{x\to 8}\frac{\sqrt{x-4}-2}{x-8}$

SOLUTION

$$\lim_{x\to 8}\frac{\sqrt{x-4}-2}{x-8}=\lim_{x\to 8}\frac{(\sqrt{x-4}-2)(\sqrt{x-4}+2)}{(x-8)(\sqrt{x-4}+2)}=\lim_{x\to 8}\frac{x-4-4}{(x-8)(\sqrt{x-4}+2)}$$
$$=\lim_{x\to 8}\frac{1}{\sqrt{x-4}+2}=\frac{1}{\sqrt{4}+2}=\frac{1}{4}.$$

23. $\displaystyle\lim_{x\to 4}\frac{x-4}{\sqrt{x}-\sqrt{8-x}}$

SOLUTION

$$\lim_{x\to 4}\frac{x-4}{\sqrt{x}-\sqrt{8-x}}=\lim_{x\to 4}\frac{(x-4)(\sqrt{x}+\sqrt{8-x})}{(\sqrt{x}-\sqrt{8-x})(\sqrt{x}+\sqrt{8-x})}=\lim_{x\to 4}\frac{(x-4)(\sqrt{x}+\sqrt{8-x})}{x-(8-x)}$$
$$=\lim_{x\to 4}\frac{(x-4)(\sqrt{x}+\sqrt{8-x})}{2x-8}=\lim_{x\to 4}\frac{(x-4)(\sqrt{x}+\sqrt{8-x})}{2(x-4)}$$
$$=\lim_{x\to 4}\frac{(\sqrt{x}+\sqrt{8-x})}{2}=\frac{\sqrt{4}+\sqrt{4}}{2}=2.$$

24. $\displaystyle\lim_{x\to 4}\frac{\sqrt{5-x}-1}{2-\sqrt{x}}$

SOLUTION

$$\lim_{x\to 4}\frac{\sqrt{5-x}-1}{2-\sqrt{x}}=\lim_{x\to 4}\left(\frac{\sqrt{5-x}-1}{2-\sqrt{x}}\cdot\frac{\sqrt{5-x}+1}{\sqrt{5-x}+1}\right)=\lim_{x\to 4}\frac{4-x}{(2-\sqrt{x})(\sqrt{5-x}+1)}$$
$$=\lim_{x\to 4}\frac{(2-\sqrt{x})(2+\sqrt{x})}{(2-\sqrt{x})(\sqrt{5-x}+1)}=\lim_{x\to 4}\frac{2+\sqrt{x}}{\sqrt{5-x}+1}=2.$$

25. $\lim_{x\to 4}\left(\frac{1}{\sqrt{x}-2}-\frac{4}{x-4}\right)$

SOLUTION $\lim_{x\to 4}\left(\frac{1}{\sqrt{x}-2}-\frac{4}{x-4}\right)=\lim_{x\to 4}\frac{\sqrt{x}+2-4}{\left(\sqrt{x}-2\right)\left(\sqrt{x}+2\right)}=\lim_{x\to 4}\frac{\sqrt{x}-2}{\left(\sqrt{x}-2\right)\left(\sqrt{x}+2\right)}=\frac{1}{4}.$

26. $\lim_{x\to 0+}\left(\frac{1}{\sqrt{x}}-\frac{1}{\sqrt{x^2+x}}\right)$

SOLUTION

$$\lim_{x\to 0+}\left(\frac{1}{\sqrt{x}}-\frac{1}{\sqrt{x^2+x}}\right)=\lim_{x\to 0+}\frac{\sqrt{x+1}-1}{\sqrt{x}\sqrt{x+1}}=\lim_{x\to 0+}\frac{\left(\sqrt{x+1}-1\right)\left(\sqrt{x+1}+1\right)}{\sqrt{x}\sqrt{x+1}\left(\sqrt{x+1}+1\right)}$$
$$=\lim_{x\to 0+}\frac{x}{\sqrt{x}\sqrt{x+1}\left(\sqrt{x+1}+1\right)}=\lim_{x\to 0+}\frac{\sqrt{x}}{\sqrt{x+1}\left(\sqrt{x+1}+1\right)}=0.$$

27. $\lim_{x\to 0}\frac{\cot x}{\csc x}$

SOLUTION $\lim_{x\to 0}\frac{\cot x}{\csc x}=\lim_{x\to 0}\frac{\cos x}{\sin x}\cdot\sin x=\cos 0=1.$

28. $\lim_{\theta\to\frac{\pi}{2}}\frac{\cot\theta}{\csc\theta}$

SOLUTION $\lim_{\theta\to\frac{\pi}{2}}\frac{\cot\theta}{\csc\theta}=\lim_{\theta\to\frac{\pi}{2}}\frac{\cos\theta}{\sin\theta}\cdot\sin\theta=\cos\frac{\pi}{2}=0.$

29. $\lim_{t\to 2}\frac{2^{2t}+2^t-20}{2^t-4}$

SOLUTION $\lim_{t\to 2}\frac{2^{2t}+2^t-20}{2^t-4}=\lim_{t\to 2}\frac{(2^t+5)(2^t-4)}{2^t-4}=\lim_{t\to 2}(2^t+5)=9.$

30. $\lim_{x\to 1}\left(\frac{1}{1-x}-\frac{2}{1-x^2}\right)$

SOLUTION $\lim_{x\to 1}\left(\frac{1}{1-x}-\frac{2}{1-x^2}\right)=\lim_{x\to 1}\frac{(1+x)-2}{(1-x)(1+x)}=\lim_{x\to 1}\frac{-1}{1+x}=-\frac{1}{2}.$

31. $\lim_{x\to\frac{\pi}{4}}\frac{\sin x-\cos x}{\tan x-1}$

SOLUTION $\lim_{x\to\frac{\pi}{4}}\frac{\sin x-\cos x}{\tan x-1}\cdot\frac{\cos x}{\cos x}=\lim_{x\to\frac{\pi}{4}}\frac{(\sin x-\cos x)\cos x}{\sin x-\cos x}=\cos\frac{\pi}{4}=\frac{\sqrt{2}}{2}.$

32. $\lim_{\theta\to\frac{\pi}{2}}\left(\sec\theta-\tan\theta\right)$

SOLUTION

$$\lim_{\theta\to\frac{\pi}{2}}\left(\sec\theta-\tan\theta\right)=\lim_{\theta\to\frac{\pi}{2}}\frac{1-\sin\theta}{\cos\theta}\cdot\frac{1+\sin\theta}{1+\sin\theta}=\lim_{\theta\to\frac{\pi}{2}}\frac{1-\sin^2\theta}{\cos\theta\,(1+\sin\theta)}=\lim_{\theta\to\frac{\pi}{2}}\frac{\cos\theta}{1+\sin\theta}=\frac{0}{2}=0.$$

33. $\lim_{\theta\to\frac{\pi}{4}}\left(\frac{1}{\tan\theta-1}-\frac{2}{\tan^2\theta-1}\right)$

SOLUTION $\lim_{\theta\to\frac{\pi}{4}}\left(\frac{1}{\tan\theta-1}-\frac{2}{\tan^2\theta-1}\right)=\lim_{\theta\to\frac{\pi}{4}}\frac{(\tan\theta+1)-2}{(\tan\theta+1)(\tan\theta-1)}=\lim_{\theta\to\frac{\pi}{4}}\frac{1}{\tan\theta+1}=\frac{1}{2}.$

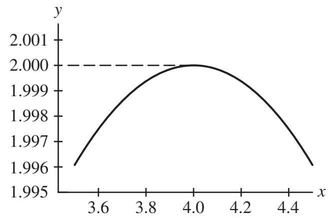
34. $\lim_{x\to\frac{\pi}{3}}\frac{2\cos^2 x+3\cos x-2}{2\cos x-1}$

SOLUTION

$$\lim_{x\to\frac{\pi}{3}}\frac{2\cos^2 x+3\cos x-2}{2\cos x-1}=\lim_{x\to\frac{\pi}{3}}\frac{(2\cos x-1)\,(\cos x+2)}{2\cos x-1}=\lim_{x\to\frac{\pi}{3}}\cos x+2=\cos\frac{\pi}{3}+2=\frac{5}{2}.$$

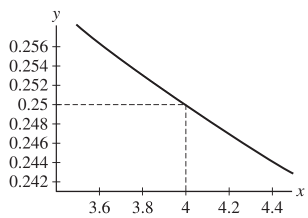
35. GU Use a plot of $f(x) = \dfrac{x-4}{\sqrt{x}-\sqrt{8-x}}$ to estimate $\lim_{x\to 4} f(x)$ to two decimal places. Compare with the answer obtained algebraically in Exercise 23.

SOLUTION Let $f(x) = \frac{x-4}{\sqrt{x}-\sqrt{8-x}}$. From the plot of $f(x)$ shown below, we estimate $\lim_{x\to 4} f(x) \approx 2.00$; to two decimal places, this matches the value of 2 obtained in Exercise 23.



36. GU Use a plot of $f(x) = \dfrac{1}{\sqrt{x}-2} - \dfrac{4}{x-4}$ to estimate $\lim_{x\to 4} f(x)$ numerically. Compare with the answer obtained algebraically in Exercise 25.

SOLUTION Let $f(x) = \frac{1}{\sqrt{x}-2} - \frac{4}{x-4}$. From the plot of $f(x)$ shown below, we estimate $\lim_{x\to 4} f(x) \approx 0.25$; to two decimal places, this matches the value of $\frac{1}{4}$ obtained in Exercise 25.



In Exercises 37–42, evaluate using the identity

$$a^3 - b^3 = (a-b)(a^2+ab+b^2)$$

37. $\lim_{x\to 2} \dfrac{x^3-8}{x-2}$

SOLUTION $\lim_{x\to 2} \dfrac{x^3-8}{x-2} = \lim_{x\to 2} \dfrac{(x-2)\left(x^2+2x+4\right)}{x-2} = \lim_{x\to 2} \left(x^2+2x+4\right) = 12.$

38. $\lim_{x\to 3} \dfrac{x^3-27}{x^2-9}$

SOLUTION $\lim_{x\to 3} \dfrac{x^3-27}{x^2-9} = \lim_{x\to 3} \dfrac{(x-3)\left(x^2+3x+9\right)}{(x-3)(x+3)} = \lim_{x\to 3} \dfrac{\left(x^2+3x+9\right)}{x+3} = \dfrac{27}{6} = \dfrac{9}{2}.$

39. $\lim_{x\to 1} \dfrac{x^2-5x+4}{x^3-1}$

SOLUTION $\lim_{x\to 1} \dfrac{x^2-5x+4}{x^3-1} = \lim_{x\to 1} \dfrac{(x-1)(x-4)}{(x-1)\left(x^2+x+1\right)} = \lim_{x\to 1} \dfrac{x-4}{x^2+x+1} = -1.$

40. $\lim_{x\to -2} \dfrac{x^3+8}{x^2+6x+8}$

SOLUTION $\lim_{x\to -2} \dfrac{x^3+8}{x^2+6x+8} = \lim_{x\to -2} \dfrac{(x+2)(x^2-2x+4)}{(x+2)(x+4)} = \lim_{x\to -2} \dfrac{(x^2-2x+4)}{x+4} = \dfrac{12}{2} = 6.$

41. $\lim_{x\to 1} \dfrac{x^4-1}{x^3-1}$

SOLUTION

$$\lim_{x\to 1} \frac{x^4-1}{x^3-1} = \lim_{x\to 1} \frac{(x^2-1)(x^2+1)}{(x-1)(x^2+x+1)} = \lim_{x\to 1} \frac{(x-1)(x+1)(x^2+1)}{(x-1)(x^2+x+1)} = \lim_{x\to 1} \frac{(x+1)(x^2+1)}{(x^2+x+1)} = \frac{4}{3}.$$

42. $\lim_{x\to 27} \frac{x-27}{x^{1/3}-3}$

SOLUTION $\lim_{x\to 27} \frac{x-27}{x^{1/3}-3} = \lim_{x\to 27} \frac{(x^{1/3}-3)(x^{2/3}+3x^{1/3}+9)}{x^{1/3}-3} = \lim_{x\to 27}(x^{2/3}+3x^{1/3}+9) = 27$

43. Evaluate $\lim_{h\to 0} \frac{\sqrt[4]{1+h}-1}{h}$. *Hint:* Set $x = \sqrt[4]{1+h}$ and rewrite as a limit as $x \to 1$.

SOLUTION Let $x = \sqrt[4]{1+h}$. Then $h = x^4 - 1 = (x-1)(x+1)(x^2+1)$, $x \to 1$ as $h \to 0$ and

$$\lim_{h\to 0} \frac{\sqrt[4]{1+h}-1}{h} = \lim_{x\to 1} \frac{x-1}{(x-1)(x+1)(x^2+1)} = \lim_{x\to 1} \frac{1}{(x+1)(x^2+1)} = \frac{1}{4}.$$

44. Evaluate $\lim_{h\to 0} \frac{\sqrt[3]{1+h}-1}{\sqrt[2]{1+h}-1}$. *Hint:* Set $x = \sqrt[6]{1+h}$ and rewrite as a limit as $x \to 1$.

SOLUTION Let $x = \sqrt[6]{1+h}$. Then $\sqrt[3]{1+h} - 1 = x^2 - 1 = (x-1)(x+1)$, $\sqrt{1+h} - 1 = x^3 - 1 = (x-1)(x^2 + x + 1)$, $x \to 1$ as $h \to 0$ and

$$\lim_{h\to 0} \frac{\sqrt[3]{1+h}-1}{\sqrt[2]{1+h}-1} = \lim_{x\to 1} \frac{(x-1)(x+1)}{(x-1)(x^2+x+1)} = \lim_{x\to 1} \frac{x+1}{x^2+x+1} = \frac{2}{3}.$$

In Exercises 45–54, evaluate in terms of the constant a.

45. $\lim_{x\to 0}(2a+x)$

SOLUTION $\lim_{x\to 0}(2a+x) = 2a$.

46. $\lim_{h\to -2}(4ah+7a)$

SOLUTION $\lim_{h\to -2}(4ah+7a) = -a$.

47. $\lim_{t\to -1}(4t-2at+3a)$

SOLUTION $\lim_{t\to -1}(4t-2at+3a) = -4+5a$.

48. $\lim_{h\to 0} \frac{(3a+h)^2-9a^2}{h}$

SOLUTION $\lim_{h\to 0} \frac{(3a+h)^2-9a^2}{h} = \lim_{h\to 0} \frac{6ah+h^2}{h} = \lim_{h\to 0}(6a+h) = 6a$.

49. $\lim_{h\to 0} \frac{2(a+h)^2-2a^2}{h}$

SOLUTION $\lim_{h\to 0} \frac{2(a+h)^2-2a^2}{h} = \lim_{h\to 0} \frac{4ha+2h^2}{h} = \lim_{h\to 0}(4a+2h) = 4a$.

50. $\lim_{x\to a} \frac{(x+a)^2-4x^2}{x-a}$

SOLUTION

$$\lim_{x\to a} \frac{(x+a)^2-4x^2}{x-a} = \lim_{x\to a} \frac{(x^2+2ax+a^2)-4x^2}{x-a} = \lim_{x\to a} \frac{-3x^2+2ax+a^2}{x-a}$$
$$= \lim_{x\to a} \frac{(a-x)(a+3x)}{x-a} = \lim_{x\to a}(-(a+3x)) = -4a.$$

51. $\lim_{x\to a} \frac{\sqrt{x}-\sqrt{a}}{x-a}$

SOLUTION $\lim_{x\to a} \frac{\sqrt{x}-\sqrt{a}}{x-a} = \lim_{x\to a} \frac{\sqrt{x}-\sqrt{a}}{\left(\sqrt{x}-\sqrt{a}\right)\left(\sqrt{x}+\sqrt{a}\right)} = \lim_{x\to a} \frac{1}{\sqrt{x}+\sqrt{a}} = \frac{1}{2\sqrt{a}}$.

52. $\displaystyle\lim_{h\to 0}\frac{\sqrt{a+2h}-\sqrt{a}}{h}$

SOLUTION

$$\lim_{h\to 0}\frac{\sqrt{a+2h}-\sqrt{a}}{h}=\lim_{h\to 0}\frac{\left(\sqrt{a+2h}-\sqrt{a}\right)\left(\sqrt{a+2h}+\sqrt{a}\right)}{h\left(\sqrt{a+2h}+\sqrt{a}\right)}$$
$$=\lim_{h\to 0}\frac{2h}{h\left(\sqrt{a+2h}+\sqrt{a}\right)}=\lim_{h\to 0}\frac{2}{\sqrt{a+2h}+\sqrt{a}}=\frac{1}{\sqrt{a}}.$$

53. $\displaystyle\lim_{x\to 0}\frac{(x+a)^3-a^3}{x}$

SOLUTION $\displaystyle\lim_{x\to 0}\frac{(x+a)^3-a^3}{x}=\lim_{x\to 0}\frac{x^3+3x^2a+3xa^2+a^3-a^3}{x}=\lim_{x\to 0}(x^2+3xa+3a^2)=3a^2.$

54. $\displaystyle\lim_{h\to a}\frac{\frac{1}{h}-\frac{1}{a}}{h-a}$

SOLUTION $\displaystyle\lim_{h\to a}\frac{\frac{1}{h}-\frac{1}{a}}{h-a}=\lim_{h\to a}\frac{\frac{a-h}{ah}}{h-a}=\lim_{h\to a}\frac{a-h}{ah}\frac{1}{h-a}=\lim_{h\to a}\frac{-1}{ah}=-\frac{1}{a^2}$

Further Insights and Challenges

In Exercises 55–58, find all values of c such that the limit exists.

55. $\displaystyle\lim_{x\to c}\frac{x^2-5x-6}{x-c}$

SOLUTION $\displaystyle\lim_{x\to c}\frac{x^2-5x-6}{x-c}$ will exist provided that $x-c$ is a factor of the numerator. (Otherwise there will be an infinite discontinuity at $x=c$.) Since $x^2-5x-6=(x+1)(x-6)$, this occurs for $c=-1$ and $c=6$.

56. $\displaystyle\lim_{x\to 1}\frac{x^2+3x+c}{x-1}$

SOLUTION $\displaystyle\lim_{x\to 1}\frac{x^2+3x+c}{x-1}$ exists as long as $(x-1)$ is a factor of x^2+3x+c. If $x^2+3x+c=(x-1)(x+q)$, then $q-1=3$ and $-q=c$. Hence $q=4$ and $c=-4$.

57. $\displaystyle\lim_{x\to 1}\left(\frac{1}{x-1}-\frac{c}{x^3-1}\right)$

SOLUTION Simplifying, we find

$$\frac{1}{x-1}-\frac{c}{x^3-1}=\frac{x^2+x+1-c}{(x-1)(x^2+x+1)}.$$

In order for the limit to exist as $x\to 1$, the numerator must evaluate to 0 at $x=1$. Thus, we must have $3-c=0$, which implies $c=3$.

58. $\displaystyle\lim_{x\to 0}\frac{1+cx^2-\sqrt{1+x^2}}{x^4}$

SOLUTION Rationalizing the numerator, we find

$$\frac{1+cx^2-\sqrt{1+x^2}}{x^4}=\frac{(1+cx^2-\sqrt{1+x^2})(1+cx^2+\sqrt{1+x^2})}{x^4(1+cx^2+\sqrt{1+x^2})}=\frac{(1+cx^2)^2-(1+x^2)}{x^4(1+cx^2+\sqrt{1+x^2})}$$
$$=\frac{(2c-1)x^2+c^2x^4}{x^4(1+cx^2+\sqrt{1+x^2})}.$$

In order for the limit to exist as $x\to 0$, the coefficient of x^2 in the numerator must be zero. Thus, we need $2c-1=0$, which implies $c=\frac{1}{2}$.

59. For which sign $\pm$ does the following limit exist?

$$\lim_{x\to 0}\left(\frac{1}{x}\pm\frac{1}{x(x-1)}\right)$$

SOLUTION

- The limit $\lim_{x\to 0}\left(\frac{1}{x}+\frac{1}{x(x-1)}\right) = \lim_{x\to 0}\frac{(x-1)+1}{x(x-1)} = \lim_{x\to 0}\frac{1}{x-1} = -1.$
- The limit $\lim_{x\to 0}\left(\frac{1}{x}-\frac{1}{x(x-1)}\right)$ does not exist.
  - As $x \to 0+$, we have $\frac{1}{x}-\frac{1}{x(x-1)} = \frac{(x-1)-1}{x(x-1)} = \frac{x-2}{x(x-1)} \to \infty.$
  - As $x \to 0-$, we have $\frac{1}{x}-\frac{1}{x(x-1)} = \frac{(x-1)-1}{x(x-1)} = \frac{x-2}{x(x-1)} \to -\infty.$

2.6 Trigonometric Limits

Preliminary Questions

1. Assume that $-x^4 \le f(x) \le x^2$. What is $\lim_{x\to 0} f(x)$? Is there enough information to evaluate $\lim_{x\to \frac{1}{2}} f(x)$? Explain.

SOLUTION Since $\lim_{x\to 0} -x^4 = \lim_{x\to 0} x^2 = 0$, the squeeze theorem guarantees that $\lim_{x\to 0} f(x) = 0$. Since $\lim_{x\to \frac{1}{2}} -x^4 = -\frac{1}{16} \neq \frac{1}{4} = \lim_{x\to \frac{1}{2}} x^2$, we do not have enough information to determine $\lim_{x\to \frac{1}{2}} f(x)$.

2. State the Squeeze Theorem carefully.

SOLUTION Assume that for $x \neq c$ (in some open interval containing c),

$$l(x) \le f(x) \le u(x)$$

and that $\lim_{x\to c} l(x) = \lim_{x\to c} u(x) = L$. Then $\lim_{x\to c} f(x)$ exists and

$$\lim_{x\to c} f(x) = L.$$

3. If you want to evaluate $\lim_{h\to 0}\frac{\sin 5h}{3h}$, it is a good idea to rewrite the limit in terms of the variable (choose one):

(a) $\theta = 5h$ **(b)** $\theta = 3h$ **(c)** $\theta = \frac{5h}{3}$

SOLUTION To match the given limit to the pattern of

$$\lim_{\theta\to 0}\frac{\sin\theta}{\theta},$$

it is best to substitute for the argument of the sine function; thus, rewrite the limit in terms of **(a):** $\theta = 5h$**.**

Exercises

1. State precisely the hypothesis and conclusions of the Squeeze Theorem for the situation in Figure 6.

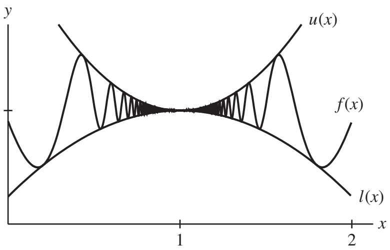


FIGURE 6

SOLUTION For all $x \neq 1$ on the open interval $(0, 2)$ containing $x = 1$, $\ell(x) \le f(x) \le u(x)$. Moreover,

$$\lim_{x\to 1}\ell(x) = \lim_{x\to 1} u(x) = 2.$$

Therefore, by the Squeeze Theorem,

$$\lim_{x\to 1} f(x) = 2.$$

2. In Figure 7, is $f(x)$ squeezed by $u(x)$ and $l(x)$ at $x = 3$? At $x = 2$?

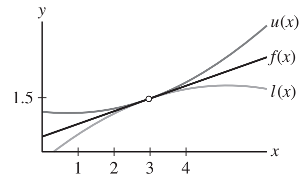

FIGURE 7

SOLUTION Because there is an open interval containing $x = 3$ on which $l(x) \le f(x) \le u(x)$ and $\lim_{x\to 3} l(x) = \lim_{x\to 3} u(x)$, $f(x)$ is *squeezed* by $u(x)$ and $l(x)$ at $x = 3$. Because there is an open interval containing $x = 2$ on which $l(x) \le f(x) \le u(x)$ but $\lim_{x\to 2} l(x) \ne \lim_{x\to 2} u(x)$, $f(x)$ is *trapped* by $u(x)$ and $l(x)$ at $x = 2$ but not *squeezed*.

3. What does the Squeeze Theorem say about $\lim_{x\to 7} f(x)$ if $\lim_{x\to 7} l(x) = \lim_{x\to 7} u(x) = 6$ and $f(x)$, $u(x)$, and $l(x)$ are related as in Figure 8? The inequality $f(x) \le u(x)$ is not satisfied for all x. Does this affect the validity of your conclusion?

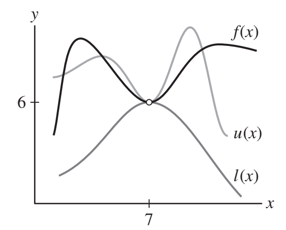

FIGURE 8

SOLUTION The Squeeze Theorem does not require that the inequalities $l(x) \le f(x) \le u(x)$ hold for all x, only that the inequalities hold on some open interval containing $x = c$. In Figure 8, it is clear that $l(x) \le f(x) \le u(x)$ on some open interval containing $x = 7$. Because $\lim_{x\to 7} u(x) = \lim_{x\to 7} l(x) = 6$, the Squeeze Theorem guarantees that $\lim_{x\to 7} f(x) = 6$.

4. Determine $\lim_{x\to 0} f(x)$ assuming that $\cos x \le f(x) \le 1$.

SOLUTION Because $\lim_{x\to 0} \cos x = \lim_{x\to 0} 1 = 1$, it follows that $\lim_{x\to 0} f(x) = 1$ by the Squeeze Theorem.

5. State whether the inequality provides sufficient information to determine $\lim_{x\to 1} f(x)$, and if so, find the limit.

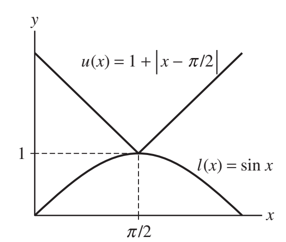
(a) $4x - 5 \le f(x) \le x^2$
(b) $2x - 1 \le f(x) \le x^2$
(c) $4x - x^2 \le f(x) \le x^2 + 2$

SOLUTION

(a) Because $\lim_{x\to 1} (4x - 5) = -1 \ne 1 = \lim_{x\to 1} x^2$, the given inequality does *not* provide sufficient information to determine $\lim_{x\to 1} f(x)$.
(b) Because $\lim_{x\to 1} (2x - 1) = 1 = \lim_{x\to 1} x^2$, it follows from the Squeeze Theorem that $\lim_{x\to 1} f(x) = 1$.
(c) Because $\lim_{x\to 1} (4x - x^2) = 3 = \lim_{x\to 1} (x^2 + 2)$, it follows from the Squeeze Theorem that $\lim_{x\to 1} f(x) = 3$.

6. $\boxed{\text{GU}}$ Plot the graphs of $u(x) = 1 + \left|x - \frac{\pi}{2}\right|$ and $l(x) = \sin x$ on the same set of axes. What can you say about $\lim_{x\to \frac{\pi}{2}} f(x)$ if $f(x)$ is squeezed by $l(x)$ and $u(x)$ at $x = \frac{\pi}{2}$?

SOLUTION



$\lim_{x\to \pi/2} u(x) = 1$ and $\lim_{x\to \pi/2} l(x) = 1$, so any function $f(x)$ satisfying $l(x) \le f(x) \le u(x)$ for all x near $\pi/2$ will satisfy $\lim_{x\to \pi/2} f(x) = 1$.

In Exercises 7–16, evaluate using the Squeeze Theorem.

7. $\lim_{x\to 0} x^2 \cos \frac{1}{x}$

SOLUTION Multiplying the inequality $-1 \le \cos \frac{1}{x} \le 1$, which holds for all $x \ne 0$, by x^2 yields $-x^2 \le x^2 \cos \frac{1}{x} \le x^2$. Because

$$\lim_{x\to 0} -x^2 = \lim_{x\to 0} x^2 = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to 0} x^2 \cos \frac{1}{x} = 0.$$

8. $\lim_{x\to 0} x \sin \frac{1}{x^2}$

SOLUTION Multiplying the inequality $\left|\sin \frac{1}{x^2}\right| \le 1$, which holds for $x \ne 0$, by $|x|$ yields $\left|x \sin \frac{1}{x^2}\right| \le |x|$ or $-|x| \le x \sin \frac{1}{x^2} \le |x|$. Because

$$\lim_{x\to 0} -|x| = \lim_{x\to 0} |x| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to 0} x \sin \frac{1}{x^2} = 0.$$

9. $\lim_{x\to 1} (x-1) \sin \frac{\pi}{x-1}$

SOLUTION Multiplying the inequality $\left|\sin \frac{\pi}{x-1}\right| \le 1$, which holds for $x \ne 1$, by $|x-1|$ yields $\left|(x-1)\sin \frac{\pi}{x-1}\right| \le |x-1|$ or $-|x-1| \le (x-1)\sin \frac{\pi}{x-1} \le |x-1|$. Because

$$\lim_{x\to 1} -|x-1| = \lim_{x\to 1} |x-1| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to 1} (x-1) \sin \frac{\pi}{x-1} = 0.$$

10. $\lim_{x\to 3} (x^2-9) \frac{x-3}{|x-3|}$

SOLUTION For $x \ne 3$, $\frac{x-3}{|x-3|} = \pm 1$; thus

$$-|x^2-9| \le (x^2-9)\frac{x-3}{|x-3|} \le |x^2-9|.$$

Because

$$\lim_{x\to 3} -|x^2-9| = \lim_{x\to 3} |x^2-9| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to 3} (x^2-9)\frac{x-3}{|x-3|} = 0.$$

11. $\lim_{t\to 0} (2^t-1) \cos \frac{1}{t}$

SOLUTION Multiplying the inequality $\left|\cos \frac{1}{t}\right| \le 1$, which holds for $t \ne 0$, by $|2^t-1|$ yields $\left|(2^t-1)\cos \frac{1}{t}\right| \le |2^t-1|$ or $-|2^t-1| \le (2^t-1)\cos \frac{1}{t} \le |2^t-1|$. Because

$$\lim_{t\to 0} -|2^t-1| = \lim_{t\to 0} |2^t-1| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{t\to 0} (2^t-1)\cos \frac{1}{t} = 0.$$

12. $\lim_{x\to 0+} \sqrt{x}\, e^{\cos(\pi/x)}$

SOLUTION Since $-1 \le \cos\frac{\pi}{x} \le 1$ and e^x is an increasing function, it follows that

$$\frac{1}{e} \le e^{\cos(\pi/x)} \le e \quad \text{and} \quad \frac{1}{e}\sqrt{x} \le \sqrt{x}e^{\cos(\pi/x)} \le e\sqrt{x}.$$

Because

$$\lim_{x\to 0+} \frac{1}{e}\sqrt{x} = \lim_{x\to 0+} e\sqrt{x} = 0,$$

it follows from the Squeeze Theorem that

$$\lim_{x\to 0+} \sqrt{x}e^{\cos(\pi/x)} = 0.$$

13. $\lim_{t\to 2} (t^2-4)\cos\dfrac{1}{t-2}$

SOLUTION Multiplying the inequality $\left|\cos\frac{1}{t-2}\right| \le 1$, which holds for $t \ne 2$, by $|t^2-4|$ yields $\left|(t^2-4)\cos\frac{1}{t-2}\right| \le |t^2-4|$ or $-|t^2-4| \le (t^2-4)\cos\frac{1}{t-2} \le |t^2-4|$. Because

$$\lim_{t\to 2} -|t^2-4| = \lim_{t\to 2} |t^2-4| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{t\to 2} (t^2-4)\cos\frac{1}{t-2} = 0.$$

14. $\lim_{x\to 0} \tan x \cos\left(\sin\dfrac{1}{x}\right)$

SOLUTION Multiplying the inequality $\left|\cos\left(\sin\frac{1}{x}\right)\right| \le 1$, which holds for $x \ne 0$, by $|\tan x|$ yields $\left|\tan x\cos\left(\sin\frac{1}{x}\right)\right| \le |\tan x|$ or $-|\tan x| \le \tan x \cos\left(\sin\frac{1}{x}\right) \le |\tan x|$. Because

$$\lim_{x\to 0} -|\tan x| = \lim_{x\to 0} |\tan x| = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to 0} \tan x \cos\left(\sin\frac{1}{x}\right) = 0.$$

15. $\lim_{\theta\to\frac{\pi}{2}} \cos\theta\cos(\tan\theta)$

SOLUTION Multiplying the inequality $|\cos(\tan\theta)| \le 1$, which holds for all θ near $\frac{\pi}{2}$ but not equal to $\frac{\pi}{2}$, by $|\cos\theta|$ yields $|\cos\theta\cos(\tan\theta)| \le |\cos\theta|$ or $-|\cos\theta| \le \cos\theta\cos(\tan\theta) \le |\cos\theta|$. Because

$$\lim_{\theta\to\frac{\pi}{2}} -|\cos\theta| = \lim_{\theta\to\frac{\pi}{2}} |\cos\theta| = 0,$$

it follows from the Squeeze Theorem that

$$\lim_{\theta\to\frac{\pi}{2}} \cos\theta\cos(\tan\theta) = 0.$$

16. $\lim_{t\to 0+} \sin t \tan^{-1}(\ln t)$

SOLUTION Multiplying the inequality $|\tan^{-1}(\ln t)| \le \frac{\pi}{2}$, which holds for all $t > 0$, by $|\sin t|$ yields $|\sin t\tan^{-1}(\ln t)| \le \frac{\pi}{2}|\sin t|$ or $-\frac{\pi}{2}|\sin t| \le \sin t\tan^{-1}(\ln t) \le \frac{\pi}{2}|\sin t|$. Because

$$\lim_{t\to 0+} -|\sin t| = \lim_{t\to 0+} |\sin t| = 0,$$

it follows from the Squeeze Theorem that

$$\lim_{t\to 0+} \sin t\tan^{-1}(\ln t) = 0.$$

In Exercises 17–26, evaluate using Theorem 2 as necessary.

17. $\lim_{x\to 0} \frac{\tan x}{x}$

SOLUTION $\lim_{x\to 0} \frac{\tan x}{x} = \lim_{x\to 0} \frac{\sin x}{x} \frac{1}{\cos x} = \lim_{x\to 0} \frac{\sin x}{x} \cdot \lim_{x\to 0} \frac{1}{\cos x} = 1 \cdot 1 = 1.$

18. $\lim_{x\to 0} \frac{\sin x \sec x}{x}$

SOLUTION $\lim_{x\to 0} \frac{\sin x \sec x}{x} = \lim_{x\to 0} \frac{\sin x}{x} \cdot \lim_{x\to 0} \sec x = 1 \cdot 1 = 1.$

19. $\lim_{t\to 0} \frac{\sqrt{t^3+9}\sin t}{t}$

SOLUTION $\lim_{t\to 0} \frac{\sqrt{t^3+9}\sin t}{t} = \lim_{t\to 0} \sqrt{t^3+9} \cdot \lim_{t\to 0} \frac{\sin t}{t} = \sqrt{9} \cdot 1 = 3.$

20. $\lim_{t\to 0} \frac{\sin^2 t}{t}$

SOLUTION $\lim_{t\to 0} \frac{\sin^2 t}{t} = \lim_{t\to 0} \frac{\sin t}{t} \sin t = \lim_{t\to 0} \frac{\sin t}{t} \cdot \lim_{t\to 0} \sin t = 1 \cdot 0 = 0.$

21. $\lim_{x\to 0} \frac{x^2}{\sin^2 x}$

SOLUTION $\lim_{x\to 0} \frac{x^2}{\sin^2 x} = \lim_{x\to 0} \frac{1}{\frac{\sin x}{x} \frac{\sin x}{x}} = \lim_{x\to 0} \frac{1}{\frac{\sin x}{x}} \cdot \lim_{x\to 0} \frac{1}{\frac{\sin x}{x}} = \frac{1}{1} \cdot \frac{1}{1} = 1.$

22. $\lim_{t\to \frac{\pi}{2}} \frac{1-\cos t}{t}$

SOLUTION The function $\frac{1-\cos t}{t}$ is continuous at $\frac{\pi}{2}$; evaluate using substitution:

$$\lim_{t\to \frac{\pi}{2}} \frac{1-\cos t}{t} = \frac{1-0}{\frac{\pi}{2}} = \frac{2}{\pi}.$$

23. $\lim_{\theta\to 0} \frac{\sec\theta - 1}{\theta}$

SOLUTION $\lim_{\theta\to 0} \frac{\sec\theta - 1}{\theta} = \lim_{\theta\to 0} \frac{1-\cos\theta}{\theta\cos\theta} = \lim_{\theta\to 0} \frac{1-\cos\theta}{\theta} \cdot \lim_{\theta\to 0} \frac{1}{\cos\theta} = 0 \cdot 1 = 0.$

24. $\lim_{\theta\to 0} \frac{1-\cos\theta}{\sin\theta}$

SOLUTION

$$\lim_{\theta\to 0} \frac{1-\cos\theta}{\sin\theta} = \lim_{\theta\to 0} \frac{1-\cos\theta}{\theta} \cdot \lim_{\theta\to 0} \frac{\theta}{\sin\theta} = 0 \cdot 1 = 0.$$

25. $\lim_{t\to \frac{\pi}{4}} \frac{\sin t}{t}$

SOLUTION $\frac{\sin t}{t}$ is continuous at $t = \frac{\pi}{4}$. Hence, by substitution

$$\lim_{t\to \frac{\pi}{4}} \frac{\sin t}{t} = \frac{\frac{\sqrt{2}}{2}}{\frac{\pi}{4}} = \frac{2\sqrt{2}}{\pi}.$$

26. $\lim_{t\to 0} \frac{\cos t - \cos^2 t}{t}$

SOLUTION By factoring and applying the Product Law:

$$\lim_{t\to 0} \frac{\cos t - \cos^2 t}{t} = \lim_{t\to 0} \cos t \cdot \lim_{t\to 0} \frac{1-\cos t}{t} = 1(0) = 0.$$

27. Let $L = \lim_{x\to 0} \dfrac{\sin 14x}{x}$.

(a) Show, by letting $\theta = 14x$, that $L = \lim_{\theta\to 0} 14\dfrac{\sin\theta}{\theta}$.

(b) Compute L.

SOLUTION

(a) Let $\theta = 14x$. Then $x = \frac{\theta}{14}$ and $\theta \to 0$ as $x \to 0$, so

$$L = \lim_{x\to 0} \frac{\sin 14x}{x} = \lim_{\theta\to 0} \frac{\sin\theta}{(\theta/14)} = \lim_{\theta\to 0} 14\frac{\sin\theta}{\theta}.$$

(b) Based on part (a),

$$L = 14 \lim_{\theta\to 0} \cdot \frac{\sin\theta}{\theta} = 14.$$

28. Evaluate $\lim_{h\to 0} \dfrac{\sin 9h}{\sin 7h}$. *Hint:* $\dfrac{\sin 9h}{\sin 7h} = \left(\dfrac{9}{7}\right)\left(\dfrac{\sin 9h}{9h}\right)\left(\dfrac{7h}{\sin 7h}\right)$.

SOLUTION

$$\lim_{h\to 0} \frac{\sin 9h}{\sin 7h} = \lim_{h\to 0} \frac{9}{7} \frac{(\sin 9h)\;/\;(9h)}{(\sin 7h)\;/\;(7h)} = \frac{9}{7} \frac{\lim_{h\to 0}(\sin 9h)/(9h)}{\lim_{h\to 0}(\sin 7h)/(7h)} = \frac{9}{7} \cdot \frac{1}{1} = \frac{9}{7}.$$

In Exercises 29–48, evaluate the limit.

29. $\lim_{h\to 0} \dfrac{\sin 9h}{h}$

SOLUTION $\lim_{h\to 0} \dfrac{\sin 9h}{h} = \lim_{h\to 0} 9\,\dfrac{\sin 9h}{9h} = 9.$

30. $\lim_{h\to 0} \dfrac{\sin 4h}{4h}$

SOLUTION Let $x = 4h$. Then $x \to 0$ as $h \to 0$ and

$$\lim_{h\to 0} \frac{\sin 4h}{4h} = \lim x \to 0 \frac{\sin x}{x} = 1.$$

31. $\lim_{h\to 0} \dfrac{\sin h}{5h}$

SOLUTION $\lim_{h\to 0} \dfrac{\sin h}{5h} = \lim_{h\to 0} \dfrac{1}{5}\dfrac{\sin h}{h} = \dfrac{1}{5}.$

32. $\lim_{x\to \frac{\pi}{6}} \dfrac{x}{\sin 3x}$

SOLUTION $\lim_{x\to \frac{\pi}{6}} \dfrac{x}{\sin 3x} = \dfrac{\pi/6}{\sin(\pi/2)} = \dfrac{\pi}{6}.$

33. $\lim_{\theta\to 0} \dfrac{\sin 7\theta}{\sin 3\theta}$

SOLUTION We have

$$\frac{\sin 7\theta}{\sin 3\theta} = \frac{7}{3}\left(\frac{\sin 7\theta}{7\theta}\right)\left(\frac{3\theta}{\sin 3\theta}\right)$$

Therefore,

$$\lim_{\theta\to 0} \frac{\sin 7\theta}{3\theta} = \frac{7}{3}\left(\lim_{\theta\to 0} \frac{\sin 7\theta}{7\theta}\right)\left(\lim_{\theta\to 0} \frac{3\theta}{\sin 3\theta}\right) = \frac{7}{3}(1)(1) = \frac{7}{3}$$

34. $\lim_{x\to 0} \dfrac{\tan 4x}{9x}$

SOLUTION $\lim_{x\to 0} \dfrac{\tan 4x}{9x} = \lim_{x\to 0} \dfrac{1}{9} \cdot \dfrac{\sin 4x}{4x} \cdot \dfrac{4}{\cos 4x} = \dfrac{4}{9}.$

35. $\lim_{x\to 0} x \csc 25x$

SOLUTION Let $h = 25x$. Then

$$\lim_{x\to 0} x \csc 25x = \lim_{h\to 0} \frac{h}{25} \csc h = \frac{1}{25} \lim_{h\to 0} \frac{h}{\sin h} = \frac{1}{25}.$$

36. $\lim_{t\to 0} \frac{\tan 4t}{t \sec t}$

SOLUTION $\lim_{t\to 0} \frac{\tan 4t}{t \sec t} = \lim_{t\to 0} \frac{4 \sin 4t}{4t \cos(4t) \sec(t)} = \lim_{t\to 0} \frac{4 \cos t}{\cos 4t} \cdot \frac{\sin 4t}{4t} = 4.$

37. $\lim_{h\to 0} \frac{\sin 2h \ \sin 3h}{h^2}$

SOLUTION

$$\begin{aligned}\lim_{h\to 0} \frac{\sin 2h \ \sin 3h}{h^2} &= \lim_{h\to 0} \frac{\sin 2h \ \sin 3h}{h \cdot h} = \lim_{h\to 0} \frac{\sin 2h}{h} \frac{\sin 3h}{h} \\ &= \lim_{h\to 0} 2\frac{\sin 2h}{2h} 3\frac{\sin 3h}{3h} = \lim_{h\to 0} 2\frac{\sin 2h}{2h} \lim_{h\to 0} 3\frac{\sin 3h}{3h} = 2 \cdot 3 = 6.\end{aligned}$$

38. $\lim_{z\to 0} \frac{\sin(z/3)}{\sin z}$

SOLUTION $\lim_{z\to 0} \frac{\sin(z/3)}{\sin z} \cdot \frac{z/3}{z/3} = \lim_{z\to 0} \frac{1}{3} \cdot \frac{z}{\sin z} \cdot \frac{\sin(z/3)}{z/3} = \frac{1}{3}.$

39. $\lim_{\theta\to 0} \frac{\sin(-3\theta)}{\sin(4\theta)}$

SOLUTION $\lim_{\theta\to 0} \frac{\sin(-3\theta)}{\sin(4\theta)} = \lim_{\theta\to 0} \frac{-\sin(3\theta)}{3\theta} \cdot \frac{3}{4} \cdot \frac{4\theta}{\sin(4\theta)} = -\frac{3}{4}.$

40. $\lim_{x\to 0} \frac{\tan 4x}{\tan 9x}$

SOLUTION $\lim_{x\to 0} \frac{\tan 4x}{\tan 9x} = \lim_{x\to 0} \frac{\cos 9x}{\cos 4x} \cdot \frac{\sin 4x}{4x} \cdot \frac{4}{9} \cdot \frac{9x}{\sin 9x} = \frac{4}{9}.$

41. $\lim_{t\to 0} \frac{\csc 8t}{\csc 4t}$

SOLUTION $\lim_{t\to 0} \frac{\csc 8t}{\csc 4t} = \lim_{t\to 0} \frac{\sin 4t}{\sin 8t} \cdot \frac{8t}{4t} \cdot \frac{1}{2} = \frac{1}{2}.$

42. $\lim_{x\to 0} \frac{\sin 5x \sin 2x}{\sin 3x \sin 5x}$

SOLUTION $\lim_{x\to 0} \frac{\sin 5x \sin 2x}{\sin 3x \sin 5x} = \lim_{x\to 0} \frac{\sin 2x}{2x} \cdot \frac{2}{3} \cdot \frac{3x}{\sin 3x} = \frac{2}{3}.$

43. $\lim_{x\to 0} \frac{\sin 3x \sin 2x}{x \sin 5x}$

SOLUTION $\lim_{x\to 0} \frac{\sin 3x \sin 2x}{x \sin 5x} = \lim_{x\to 0} \left(3 \frac{\sin 3x}{3x} \cdot \frac{2}{5} \frac{(\sin 2x) \,/\, (2x)}{(\sin 5x) \,/\, (5x)}\right) = \frac{6}{5}.$

44. $\lim_{h\to 0} \frac{1 - \cos 2h}{h}$

SOLUTION $\lim_{h\to 0} \frac{1 - \cos 2h}{h} = \lim_{h\to 0} 2\frac{1 - \cos 2h}{2h} = 2 \lim_{h\to 0} \frac{1 - \cos 2h}{2h} = 2 \cdot 0 = 0.$

45. $\lim_{h\to 0} \frac{\sin(2h)(1 - \cos h)}{h^2}$

SOLUTION $\lim_{h\to 0} \frac{\sin(2h)(1 - \cos h)}{h^2} = \lim_{h\to 0} \frac{\sin(2h)}{h} \lim_{h\to 0} \frac{1 - \cos h}{h} = 1 \cdot 0 = 0.$

46. $\lim_{t\to 0} \dfrac{1-\cos 2t}{\sin^2 3t}$

SOLUTION Using the identity $\cos 2t = 1 - 2\sin^2 t$, we find

$$\frac{1-\cos 2t}{\sin^2 3t} = \frac{2\sin^2 t}{\sin^2 3t} = \frac{2}{9}\left(\frac{\sin t}{t}\right)^2\left(\frac{3t}{\sin 3t}\right)^2.$$

Thus,

$$\lim_{t\to 0}\frac{1-\cos 2t}{\sin^2 3t} = \lim_{t\to 0}\frac{2}{9}\left(\frac{\sin t}{t}\right)^2\left(\frac{3t}{\sin 3t}\right)^2 = \frac{2}{9}.$$

47. $\lim_{\theta\to 0} \dfrac{\cos 2\theta - \cos\theta}{\theta}$

SOLUTION

$$\lim_{\theta\to 0}\frac{\cos 2\theta-\cos\theta}{\theta} = \lim_{\theta\to 0}\frac{(\cos 2\theta - 1)+(1-\cos\theta)}{\theta} = \lim_{\theta\to 0}\frac{\cos 2\theta - 1}{\theta} + \lim_{\theta\to 0}\frac{1-\cos\theta}{\theta}$$

$$= -2\lim_{\theta\to 0}\frac{1-\cos 2\theta}{2\theta} + \lim_{\theta\to 0}\frac{1-\cos\theta}{\theta} = -2\cdot 0 + 0 = 0.$$

48. $\lim_{h\to\frac{\pi}{2}} \dfrac{1-\cos 3h}{h}$

SOLUTION The function is continuous at $\frac{\pi}{2}$, so we may use substitution:

$$\lim_{h\to\frac{\pi}{2}}\frac{1-\cos 3h}{h} = \frac{1-\cos 3\frac{\pi}{2}}{\frac{\pi}{2}} = \frac{1-0}{\frac{\pi}{2}} = \frac{2}{\pi}.$$

49. Calculate $\lim_{x\to 0-}\dfrac{\sin x}{|x|}$.

SOLUTION

$$\lim_{x\to 0-}\frac{\sin x}{|x|} = \lim_{x\to 0-}\frac{\sin x}{-x} = -1$$

50. Use the identity $\sin 3\theta = 3\sin\theta - 4\sin^3\theta$ to evaluate the limit $\lim_{\theta\to 0}\dfrac{\sin 3\theta - 3\sin\theta}{\theta^3}$.

SOLUTION Using the identity $\sin 3\theta = 3\sin\theta - 4\sin^3\theta$, we find

$$\frac{\sin 3\theta - 3\sin\theta}{\theta^3} = -4\left(\frac{\sin\theta}{\theta}\right)^3.$$

Therefore,

$$\lim_{\theta\to 0}\frac{\sin 3\theta - 3\sin\theta}{\theta^3} = -4\lim_{\theta\to 0}\left(\frac{\sin\theta}{\theta}\right)^3 = -4(1)^3 = -4.$$

51. Prove the following result stated in Theorem 2:

$$\lim_{\theta\to 0}\frac{1-\cos\theta}{\theta} = 0$$

7

Hint: $\dfrac{1-\cos\theta}{\theta} = \dfrac{1}{1+\cos\theta}\cdot\dfrac{1-\cos^2\theta}{\theta}$.

SOLUTION

$$\lim_{\theta\to 0}\frac{1-\cos\theta}{\theta} = \lim_{\theta\to 0}\frac{1}{1+\cos\theta}\cdot\frac{1-\cos^2\theta}{\theta} = \lim_{\theta\to 0}\frac{1}{1+\cos\theta}\cdot\frac{\sin^2\theta}{\theta}$$

$$= \lim_{\theta\to 0}\frac{1}{1+\cos\theta}\cdot\lim_{\theta\to 0}\frac{\sin^2\theta}{\theta} = \lim_{\theta\to 0}\frac{1}{1+\cos\theta}\cdot\lim_{\theta\to 0}\sin\theta\,\frac{\sin\theta}{\theta}$$

$$= \lim_{\theta\to 0}\frac{1}{1+\cos\theta}\cdot\lim_{\theta\to 0}\sin\theta\cdot\lim_{\theta\to 0}\frac{\sin\theta}{\theta} = \frac{1}{2}\cdot 0\cdot 1 = 0.$$

52. GU Investigate $\lim_{h\to 0} \dfrac{1-\cos h}{h^2}$ numerically (and graphically if you have a graphing utility). Then prove that the limit is equal to $\frac{1}{2}$. *Hint:* See the hint for Exercise 51.

SOLUTION

h	-0.1	-0.01	0.01	0.1
$\dfrac{1-\cos h}{h^2}$	0.499583	0.499996	0.499996	0.499583

  The limit is $\frac{1}{2}$.

- 
- $\lim_{h\to 0} \dfrac{1-\cos h}{h^2} = \lim_{h\to 0} \dfrac{1-\cos^2 h}{h^2(1+\cos h)} = \lim_{h\to 0} \left(\dfrac{\sin h}{h}\right)^2 \dfrac{1}{1+\cos h} = \dfrac{1}{2}.$

In Exercises 53–55, evaluate using the result of Exercise 52.

53. $\lim_{h\to 0} \dfrac{\cos 3h - 1}{h^2}$

SOLUTION We make the substitution $\theta = 3h$. Then $h = \theta/3$, and

$$\lim_{h\to 0} \frac{\cos 3h - 1}{h^2} = \lim_{\theta\to 0} \frac{\cos\theta - 1}{(\theta/3)^2} = -9 \lim_{\theta\to 0} \frac{1-\cos\theta}{\theta^2} = -\frac{9}{2}.$$

54. $\lim_{h\to 0} \dfrac{\cos 3h - 1}{\cos 2h - 1}$

SOLUTION Write

$$\frac{\cos 3h - 1}{\cos 2h - 1} = \frac{1-\cos 3h}{(3h)^2} \cdot \frac{(2h)^2}{1-\cos 2h} \cdot \frac{9h^2}{4h^2}.$$

Then

$$\lim_{h\to 0} \frac{\cos 3h - 1}{\cos 2h - 1} = \frac{9}{4} \lim_{h\to 0} \frac{1-\cos 3h}{(3h)^2} \cdot \lim_{h\to 0} \frac{(2h)^2}{1-\cos 2h} = \frac{9}{4} \cdot \frac{1}{2} \cdot \frac{1}{1/2} = \frac{9}{4}.$$

55. $\lim_{t\to 0} \dfrac{\sqrt{1-\cos t}}{t}$

SOLUTION $\lim_{t\to 0+} \dfrac{\sqrt{1-\cos t}}{t} = \sqrt{\lim_{t\to 0+} \dfrac{1-\cos t}{t^2}} = \sqrt{\dfrac{1}{2}} = \dfrac{\sqrt{2}}{2}$; on the other hand, $\lim_{t\to 0-} \dfrac{\sqrt{1-\cos t}}{t} = -\sqrt{\lim_{t\to 0-} \dfrac{1-\cos t}{t^2}} = -\sqrt{\dfrac{1}{2}} = -\dfrac{\sqrt{2}}{2}$.

56. Use the Squeeze Theorem to prove that if $\lim_{x\to c} |f(x)| = 0$, then $\lim_{x\to c} f(x) = 0$.

SOLUTION Suppose $\lim_{x\to c} |f(x)| = 0$. Then

$$\lim_{x\to c} -|f(x)| = -\lim_{x\to c} |f(x)| = 0.$$

Now, for all x, the inequalities

$$-|f(x)| \le f(x) \le |f(x)|$$

hold. Because $\lim_{x\to c} |f(x)| = 0$ and $\lim_{x\to c} -|f(x)| = 0$, it follows from the Squeeze Theorem that $\lim_{x\to c} f(x) = 0$.

Further Insights and Challenges

57. Use the result of Exercise 52 to prove that for $m \neq 0$,

$$\lim_{x\to 0} \frac{\cos mx - 1}{x^2} = -\frac{m^2}{2}$$

SOLUTION Substitute $u = mx$ into $\dfrac{\cos mx - 1}{x^2}$. We obtain $x = \frac{u}{m}$. As $x \to 0$, $u \to 0$; therefore,

$$\lim_{x\to 0} \frac{\cos mx - 1}{x^2} = \lim_{u\to 0} \frac{\cos u - 1}{(u/m)^2} = \lim_{u\to 0} m^2 \frac{\cos u - 1}{u^2} = m^2\left(-\frac{1}{2}\right) = -\frac{m^2}{2}.$$

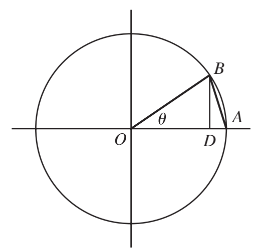
58. Using a diagram of the unit circle and the Pythagorean Theorem, show that

$$\sin^2\theta \le (1-\cos\theta)^2 + \sin^2\theta \le \theta^2$$

Conclude that $\sin^2\theta \le 2(1-\cos\theta) \le \theta^2$ and use this to give an alternative proof of Eq. (7) in Exercise 51. Then give an alternative proof of the result in Exercise 52.

SOLUTION

- Consider the unit circle shown below. The triangle BDA is a right triangle. It has base $1-\cos\theta$, altitude $\sin\theta$, and hypotenuse h. Observe that the hypotenuse h is less than the arc length $AB = \text{radius}\cdot\text{angle} = 1\cdot\theta = \theta$. Apply the Pythagorean Theorem to obtain $(1-\cos\theta)^2 + \sin^2\theta = h^2 \le \theta^2$. The inequality $\sin^2\theta \le (1-\cos\theta)^2 + \sin^2\theta$ follows from the fact that $(1-\cos\theta)^2 \ge 0$.



- Note that

$$(1-\cos\theta)^2 + \sin^2\theta = 1 - 2\cos\theta + \cos^2\theta + \sin^2\theta = 2 - 2\cos\theta = 2(1-\cos\theta).$$

  Therefore,

$$\sin^2\theta \le 2(1-\cos\theta) \le \theta^2.$$

- Divide the previous inequality by 2θ to obtain

$$\frac{\sin^2\theta}{2\theta} \le \frac{1-\cos\theta}{\theta} \le \frac{\theta}{2}.$$

  Because

$$\lim_{\theta\to 0} \frac{\sin^2\theta}{2\theta} = \frac{1}{2}\lim_{\theta\to 0}\frac{\sin\theta}{\theta}\cdot\lim_{\theta\to 0}\sin\theta = \frac{1}{2}(1)(0) = 0,$$

  and $\displaystyle\lim_{h\to 0}\frac{\theta}{2} = 0$, it follows by the Squeeze Theorem that

$$\lim_{\theta\to 0}\frac{1-\cos\theta}{\theta} = 0.$$

- Divide the inequality

$$\sin^2\theta \le 2(1-\cos\theta) \le \theta^2$$

  by $2\theta^2$ to obtain

$$\frac{\sin^2\theta}{2\theta^2} \le \frac{1-\cos\theta}{\theta^2} \le \frac{1}{2}.$$

Because

$$\lim_{\theta\to 0} \frac{\sin^2\theta}{2\theta^2} = \frac{1}{2}\lim_{\theta\to 0}\left(\frac{\sin\theta}{\theta}\right)^2 = \frac{1}{2}(1^2) = \frac{1}{2},$$

and $\lim_{h\to 0} \frac{1}{2} = \frac{1}{2}$, it follows by the Squeeze Theorem that

$$\lim_{\theta\to 0} \frac{1-\cos\theta}{\theta^2} = \frac{1}{2}.$$

59. **(a)** Investigate $\lim_{x\to c} \frac{\sin x - \sin c}{x - c}$ numerically for the five values $c = 0, \frac{\pi}{6}, \frac{\pi}{4}, \frac{\pi}{3}, \frac{\pi}{2}$.
(b) Can you guess the answer for general c?
(c) Check that your answer to (b) works for two other values of c.

SOLUTION

(a)

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.999983	0.99999983	0.99999983	0.999983

Here $c = 0$ and $\cos c = 1$.

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.868511	0.866275	0.865775	0.863511

Here $c = \frac{\pi}{6}$ and $\cos c = \frac{\sqrt{3}}{2} \approx 0.866025$.

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.504322	0.500433	0.499567	0.495662

Here $c = \frac{\pi}{3}$ and $\cos c = \frac{1}{2}$.

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.710631	0.707460	0.706753	0.703559

Here $c = \frac{\pi}{4}$ and $\cos c = \frac{\sqrt{2}}{2} \approx 0.707107$.

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.005000	0.000500	−0.000500	−0.005000

Here $c = \frac{\pi}{2}$ and $\cos c = 0$.

(b) $\lim_{x\to c} \frac{\sin x - \sin c}{x - c} = \cos c$.

(c)

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	−0.411593	−0.415692	−0.416601	−0.420686

Here $c = 2$ and $\cos c = \cos 2 \approx -0.416147$.

x	$c-0.01$	$c-0.001$	$c+0.001$	$c+0.01$
$\frac{\sin x - \sin c}{x-c}$	0.863511	0.865775	0.866275	0.868511

Here $c = -\frac{\pi}{6}$ and $\cos c = \frac{\sqrt{3}}{2} \approx 0.866025$.

2.7 Limits at Infinity

Preliminary Questions

1. Assume that

$$\lim_{x\to\infty} f(x) = L \quad \text{and} \quad \lim_{x\to L} g(x) = \infty$$

Which of the following statements are correct?

(a) $x = L$ is a vertical asymptote of $g(x)$.

(b) $y = L$ is a horizontal asymptote of $g(x)$.

(c) $x = L$ is a vertical asymptote of $f(x)$.

(d) $y = L$ is a horizontal asymptote of $f(x)$.

SOLUTION

(a) Because $\lim_{x\to L} g(x) = \infty$, $x = L$ is a vertical asymptote of $g(x)$. This statement is correct.

(b) This statement is not correct.

(c) This statement is not correct.

(d) Because $\lim_{x\to\infty} f(x) = L$, $y = L$ is a horizontal asymptote of $f(x)$. This statement is correct.

2. What are the following limits?

(a) $\lim_{x\to\infty} x^3$ **(b)** $\lim_{x\to-\infty} x^3$ **(c)** $\lim_{x\to-\infty} x^4$

SOLUTION

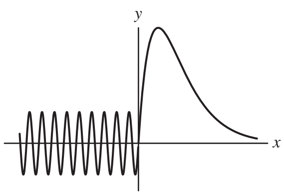
(a) $\lim_{x\to\infty} x^3 = \infty$

(b) $\lim_{x\to-\infty} x^3 = -\infty$

(c) $\lim_{x\to-\infty} x^4 = \infty$

3. Sketch the graph of a function that approaches a limit as $x \to \infty$ but does not approach a limit (either finite or infinite) as $x \to -\infty$.

SOLUTION



4. What is the sign of a if $f(x) = ax^3 + x + 1$ satisfies $\lim_{x\to-\infty} f(x) = \infty$?

SOLUTION Because $\lim_{x\to-\infty} x^3 = -\infty$, a must be negative to have $\lim_{x\to-\infty} f(x) = \infty$.

5. What is the sign of the leading coefficient a_7 if $f(x)$ is a polynomial of degree 7 such that $\lim_{x\to-\infty} f(x) = \infty$?

SOLUTION The behavior of $f(x)$ as $x \to -\infty$ is controlled by the leading term; that is, $\lim_{x\to-\infty} f(x) = \lim_{x\to-\infty} a_7x^7$. Because $x^7 \to -\infty$ as $x \to -\infty$, a_7 must be negative to have $\lim_{x\to-\infty} f(x) = \infty$.

6. Explain why $\lim_{x\to\infty} \sin \frac{1}{x}$ exists but $\lim_{x\to 0} \sin \frac{1}{x}$ does not exist. What is $\lim_{x\to\infty} \sin \frac{1}{x}$?

SOLUTION As $x \to \infty$, $\frac{1}{x} \to 0$, so

$$\lim_{x\to\infty} \sin \frac{1}{x} = \sin 0 = 0.$$

On the other hand, $\frac{1}{x} \to \pm\infty$ as $x \to 0$, and as $\frac{1}{x} \to \pm\infty$, $\sin \frac{1}{x}$ oscillates infinitely often. Thus

$$\lim_{x\to 0} \sin \frac{1}{x}$$

does not exist.

Exercises

1. What are the horizontal asymptotes of the function in Figure 6?

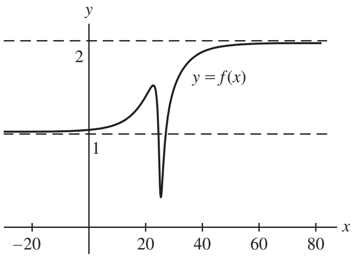


FIGURE 6

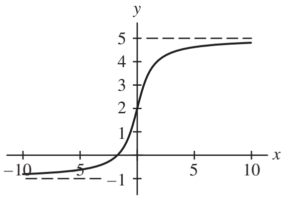
SOLUTION Because

$$\lim_{x\to-\infty} f(x) = 1 \quad \text{and} \quad \lim_{x\to\infty} f(x) = 2,$$

the function $f(x)$ has horizontal asymptotes of $y = 1$ and $y = 2$.

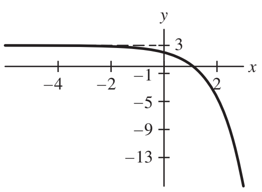
2. Sketch the graph of a function $f(x)$ that has both $y = -1$ and $y = 5$ as horizontal asymptotes.

SOLUTION



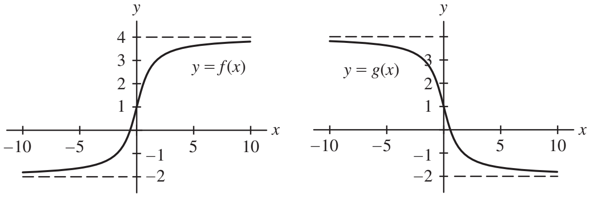
3. Sketch the graph of a function $f(x)$ with a single horizontal asymptote $y = 3$.

SOLUTION



4. Sketch the graphs of two functions $f(x)$ and $g(x)$ that have both $y = -2$ and $y = 4$ as horizontal asymptotes but $\lim_{x\to\infty} f(x) \neq \lim_{x\to\infty} g(x)$.

SOLUTION



5. GU Investigate the asymptotic behavior of $f(x) = \dfrac{x^3}{x^3 + x}$ numerically and graphically:

(a) Make a table of values of $f(x)$ for $x = \pm 50, \pm 100, \pm 500, \pm 1000$.

(b) Plot the graph of $f(x)$.

(c) What are the horizontal asymptotes of $f(x)$?

SOLUTION

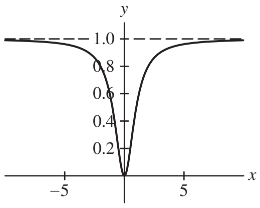
(a) From the table below, it appears that

$$\lim_{x\to\pm\infty} \frac{x^3}{x^3+x} = 1.$$

x	± 50	± 100	± 500	± 1000
$f(x)$	0.999600	0.999900	0.999996	0.999999

(b) From the graph below, it also appears that

$$\lim_{x\to\pm\infty} \frac{x^3}{x^3+x} = 1.$$



(c) The horizontal asymptote of $f(x)$ is $y = 1$.

6. GU Investigate $\lim_{x\to\pm\infty} \frac{12x+1}{\sqrt{4x^2+9}}$ numerically and graphically:

(a) Make a table of values of $f(x) = \frac{12x+1}{\sqrt{4x^2+9}}$ for $x = \pm 100, \pm 500, \pm 1000, \pm 10{,}000$.

(b) Plot the graph of $f(x)$.

(c) What are the horizontal asymptotes of $f(x)$?

SOLUTION

(a) From the tables below, it appears that

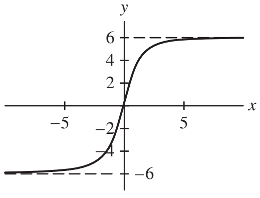
$$\lim_{x\to\infty} \frac{12x+1}{\sqrt{4x^2+9}} = 6 \quad \text{and} \quad \lim_{x\to-\infty} \frac{12x+1}{\sqrt{4x^2+9}} = -6.$$

x	-100	-500	-1000	-10000
$f(x)$	-5.994326	-5.998973	-5.999493	-5.999950

x	100	500	1000	10000
$f(x)$	6.004325	6.000973	6.000493	6.000050

(b) From the graph below, it also appears that

$$\lim_{x\to\infty} \frac{12x+1}{\sqrt{4x^2+9}} = 6 \quad \text{and} \quad \lim_{x\to-\infty} \frac{12x+1}{\sqrt{4x^2+9}} = -6.$$



(c) The horizontal asymptotes of $f(x)$ are $y = -6$ and $y = 6$.

In Exercises 7–16, evaluate the limit.

7. $\lim_{x\to\infty} \frac{x}{x+9}$

SOLUTION

$$\lim_{x\to\infty} \frac{x}{x+9} = \lim_{x\to\infty} \frac{x^{-1}(x)}{x^{-1}(x+9)} = \lim_{x\to\infty} \frac{1}{1+\frac{9}{x}} = \frac{1}{1+0} = 1.$$

8. $\lim_{x\to\infty} \frac{3x^2+20x}{4x^2+9}$

SOLUTION

$$\lim_{x\to\infty} \frac{3x^2+20x}{4x^2+9} = \lim_{x\to\infty} \frac{x^{-2}(3x^2+20x)}{x^{-2}(4x^2+9)} = \lim_{x\to\infty} \frac{3+\frac{20}{x}}{4+\frac{9}{x^2}} = \frac{3+0}{4+0} = \frac{3}{4}.$$

9. $\lim_{x\to\infty} \frac{3x^2+20x}{2x^4+3x^3-29}$

SOLUTION

$$\lim_{x\to\infty} \frac{3x^2+20x}{2x^4+3x^3-29} = \lim_{x\to\infty} \frac{x^{-4}(3x^2+20x)}{x^{-4}(2x^4+3x^3-29)} = \lim_{x\to\infty} \frac{\frac{3}{x^2}+\frac{20}{x^3}}{2+\frac{3}{x}-\frac{29}{x^4}} = \frac{0}{2} = 0.$$

10. $\lim_{x\to\infty} \frac{4}{x+5}$

SOLUTION

$$\lim_{x\to\infty} \frac{4}{x+5} = \lim_{x\to\infty} \frac{x^{-1}(4)}{x^{-1}(x+5)} = \lim_{x\to\infty} \frac{\frac{4}{x}}{1+\frac{5}{x}} = \frac{0}{1} = 0.$$

11. $\lim_{x\to\infty} \frac{7x-9}{4x+3}$

SOLUTION

$$\lim_{x\to\infty} \frac{7x-9}{4x+3} = \lim_{x\to\infty} \frac{x^{-1}(7x-9)}{x^{-1}(4x+3)} = \lim_{x\to\infty} \frac{7-\frac{9}{x}}{4+\frac{3}{x}} = \frac{7}{4}.$$

12. $\lim_{x\to\infty} \frac{9x^2-2}{6-29x}$

SOLUTION

$$\lim_{x\to\infty} \frac{9x^2-2}{6-29x} = \lim_{x\to\infty} \frac{x^{-1}(9x^2-2)}{x^{-1}(6-29x)} = \lim_{x\to\infty} \frac{9x-\frac{2}{x}}{\frac{6}{x}-29} = \frac{\infty}{-29} = -\infty.$$

13. $\lim_{x\to-\infty} \frac{7x^2-9}{4x+3}$

SOLUTION

$$\lim_{x\to-\infty} \frac{7x^2-9}{4x+3} = \lim_{x\to-\infty} \frac{x^{-1}(7x^2-9)}{x^{-1}(4x+3)} = \lim_{x\to-\infty} \frac{7x-\frac{9}{x}}{4+\frac{3}{x}} = -\infty.$$

14. $\lim_{x\to-\infty} \frac{5x-9}{4x^3+2x+7}$

SOLUTION

$$\lim_{x\to-\infty} \frac{5x-9}{4x^3+2x+7} = \lim_{x\to-\infty} \frac{x^{-3}(5x-9)}{x^{-3}(4x^3+2x+7)} = \lim_{x\to-\infty} \frac{\frac{5}{x^2}-\frac{9}{x^3}}{4+\frac{2}{x^2}+\frac{7}{x^3}} = \frac{0}{4} = 0.$$

15. $\lim_{x\to-\infty} \frac{3x^3 - 10}{x + 4}$

SOLUTION

$$\lim_{x\to-\infty} \frac{3x^3 - 10}{x + 4} = \lim_{x\to-\infty} \frac{x^{-1}(3x^3 - 10)}{x^{-1}(x + 4)} = \lim_{x\to-\infty} \frac{3x^2 - \frac{10}{x}}{1 + \frac{4}{x}} = \frac{\infty}{1} = \infty.$$

16. $\lim_{x\to-\infty} \frac{2x^5 + 3x^4 - 31x}{8x^4 - 31x^2 + 12}$

SOLUTION

$$\lim_{x\to-\infty} \frac{2x^5 + 3x^4 - 31x}{8x^4 - 31x^2 + 12} = \lim_{x\to-\infty} \frac{x^{-4}(2x^5 + 3x^4 - 31x)}{x^{-4}(8x^4 - 31x^2 + 12)} = \lim_{x\to-\infty} \frac{2x + 3 - \frac{31}{x^3}}{8 - \frac{31}{x^2} + \frac{12}{x^4}} = \frac{-\infty}{8} = -\infty.$$

In Exercises 17–22, find the horizontal asymptotes.

17. $f(x) = \frac{2x^2 - 3x}{8x^2 + 8}$

SOLUTION First calculate the limits as $x \to \pm\infty$. For $x \to \infty$,

$$\lim_{x\to\infty} \frac{2x^2 - 3x}{8x^2 + 8} = \lim_{x\to\infty} \frac{2 - \frac{3}{x}}{8 + \frac{8}{x^2}} = \frac{2}{8} = \frac{1}{4}.$$

Similarly,

$$\lim_{x\to-\infty} \frac{2x^2 - 3x}{8x^2 + 8} = \lim_{x\to-\infty} \frac{2 - \frac{3}{x}}{8 + \frac{8}{x^2}} = \frac{2}{8} = \frac{1}{4}.$$

Thus, the horizontal asymptote of $f(x)$ is $y = \frac{1}{4}$.

18. $f(x) = \frac{8x^3 - x^2}{7 + 11x - 4x^4}$

SOLUTION First calculate the limits as $x \to \pm\infty$. For $x \to \infty$,

$$\lim_{x\to\infty} \frac{8x^3 - x^2}{7 + 11x - 4x^4} = \lim_{x\to\infty} \frac{\frac{8}{x} - \frac{1}{x^2}}{\frac{7}{x^4} + \frac{11}{x^3} - 4} = 0.$$

Similarly,

$$\lim_{x\to-\infty} \frac{8x^3 - x^2}{7 + 11x - 4x^4} = \lim_{x\to-\infty} \frac{\frac{8}{x} - \frac{1}{x^2}}{\frac{7}{x^4} + \frac{11}{x^3} - 4} = 0.$$

Thus, the horizontal asymptote of $f(x)$ is $y = 0$.

19. $f(x) = \dfrac{\sqrt{36x^2+7}}{9x+4}$

SOLUTION For $x > 0$, $x^{-1} = |x^{-1}| = \sqrt{x^{-2}}$, so

$$\lim_{x\to\infty} \frac{\sqrt{36x^2+7}}{9x+4} = \lim_{x\to\infty} \frac{\sqrt{36+\frac{7}{x^2}}}{9+\frac{4}{x}} = \frac{\sqrt{36}}{9} = \frac{2}{3}.$$

On the other hand, for $x < 0$, $x^{-1} = -|x^{-1}| = -\sqrt{x^{-2}}$, so

$$\lim_{x\to-\infty} \frac{\sqrt{36x^2+7}}{9x+4} = \lim_{x\to-\infty} \frac{-\sqrt{36+\frac{7}{x^2}}}{9+\frac{4}{x}} = \frac{-\sqrt{36}}{9} = -\frac{2}{3}.$$

Thus, the horizontal asymptotes of $f(x)$ are $y = \frac{2}{3}$ and $y = -\frac{2}{3}$.

20. $f(x) = \dfrac{\sqrt{36x^4+7}}{9x^2+4}$

SOLUTION For all $x \neq 0$, $x^{-2} = |x^{-2}| = \sqrt{x^{-4}}$, so

$$\lim_{x\to\infty} \frac{\sqrt{36x^4+7}}{9x^2+4} = \lim_{x\to\infty} \frac{\sqrt{36+\frac{7}{x^4}}}{9+\frac{4}{x^2}} = \frac{\sqrt{36}}{9} = \frac{2}{3}.$$

Similarly,

$$\lim_{x\to-\infty} \frac{\sqrt{36x^4+7}}{9x^2+4} = \lim_{x\to-\infty} \frac{\sqrt{36+\frac{7}{x^4}}}{9+\frac{4}{x^2}} = \frac{\sqrt{36}}{9} = \frac{2}{3}.$$

Thus, the horizontal asymptote of $f(x)$ is $y = \frac{2}{3}$.

21. $f(t) = \dfrac{e^t}{1+e^{-t}}$

SOLUTION With

$$\lim_{t\to\infty} \frac{e^t}{1+e^{-t}} = \frac{\infty}{1} = \infty$$

and

$$\lim_{t\to-\infty} \frac{e^t}{1+e^{-t}} = 0,$$

the function $f(t)$ has one horizontal asymptote, $y = 0$.

22. $f(t) = \dfrac{t^{1/3}}{(64t^2+9)^{1/6}}$

SOLUTION For $t > 0$, $t^{-1/3} = |t^{-1/3}| = (t^{-2})^{1/6}$, so

$$\lim_{t\to\infty} \frac{t^{1/3}}{(64t^2+9)^{1/6}} = \lim_{t\to\infty} \frac{1}{(64+\frac{9}{t^2})^{1/6}} = \frac{1}{2}.$$

On the other hand, for $t < 0$, $t^{-1/3} = -|t^{-1/3}| = -(t^{-2})^{1/6}$, so

$$\lim_{t\to-\infty} \frac{t^{1/3}}{(64t^2+9)^{1/6}} = \lim_{t\to-\infty} \frac{1}{-(64+\frac{9}{t^2})^{1/6}} = -\frac{1}{2}.$$

Thus, the horizontal asymptotes for $f(t)$ are $y = \frac{1}{2}$ and $y = -\frac{1}{2}$.

In Exercises 23–30, evaluate the limit.

23. $\lim_{x\to\infty} \frac{\sqrt{9x^4+3x+2}}{4x^3+1}$

SOLUTION For $x > 0$, $x^{-3} = |x^{-3}| = \sqrt{x^{-6}}$, so

$$\lim_{x\to\infty} \frac{\sqrt{9x^4+3x+2}}{4x^3+1} = \lim_{x\to\infty} \frac{\sqrt{\frac{9}{x^2}+\frac{3}{x^5}+\frac{2}{x^6}}}{4+\frac{1}{x^3}} = 0.$$

24. $\lim_{x\to\infty} \frac{\sqrt{x^3+20x}}{10x-2}$

SOLUTION For $x > 0$, $x^{-1} = |x^{-1}| = \sqrt{x^{-2}}$, so

$$\lim_{x\to\infty} \frac{\sqrt{x^3+20x}}{10x-2} = \lim_{x\to\infty} \frac{\sqrt{x+\frac{20}{x}}}{10-\frac{2}{x}} = \frac{\infty}{10} = \infty.$$

25. $\lim_{x\to-\infty} \frac{8x^2+7x^{1/3}}{\sqrt{16x^4+6}}$

SOLUTION For $x < 0$, $x^{-2} = |x^{-2}| = \sqrt{x^{-4}}$, so

$$\lim_{x\to-\infty} \frac{8x^2+7x^{1/3}}{\sqrt{16x^4+6}} = \lim_{x\to-\infty} \frac{8+\frac{7}{x^{5/3}}}{\sqrt{16+\frac{6}{x^4}}} = \frac{8}{\sqrt{16}} = 2.$$

26. $\lim_{x\to-\infty} \frac{4x-3}{\sqrt{25x^2+4x}}$

SOLUTION For $x < 0$, $x^{-1} = -|x^{-1}| = -\sqrt{x^{-2}}$, so

$$\lim_{x\to-\infty} \frac{4x-3}{\sqrt{25x^2+4x}} = \lim_{x\to-\infty} \frac{4-\frac{3}{x}}{-\sqrt{25+\frac{4}{x}}} = \frac{4}{-\sqrt{25}} = -\frac{4}{5}.$$

27. $\lim_{t\to\infty} \frac{t^{4/3}+t^{1/3}}{(4t^{2/3}+1)^2}$

SOLUTION $\lim_{t\to\infty} \frac{t^{4/3}+t^{1/3}}{(4t^{2/3}+1)^2} = \lim_{t\to\infty} \frac{1+\frac{1}{t}}{(4+\frac{1}{t^{2/3}})^2} = \frac{1}{16}.$

28. $\lim_{t\to\infty} \frac{t^{4/3}-9t^{1/3}}{(8t^4+2)^{1/3}}$

SOLUTION $\lim_{t\to\infty} \frac{t^{4/3}-9t^{1/3}}{(8t^4+2)^{1/3}} = \lim_{t\to\infty} \frac{1-\frac{9}{t}}{(8+\frac{2}{t^4})^{1/3}} = \frac{1}{2}.$

29. $\lim_{x\to-\infty} \frac{|x|+x}{x+1}$

SOLUTION For $x < 0$, $|x| = -x$. Therefore, for all $x < 0$,

$$\frac{|x|+x}{x+1} = \frac{-x+x}{x+1} = 0;$$

consequently,

$$\lim_{x\to-\infty} \frac{|x|+x}{x+1} = 0.$$

30. $\displaystyle\lim_{t\to-\infty} \frac{4+6e^{2t}}{5-9e^{3t}}$

SOLUTION Because

$$\lim_{t\to-\infty} e^{2t} = \lim_{t\to-\infty} e^{3t} = 0,$$

it follows that

$$\lim_{t\to-\infty} \frac{4+6e^{2t}}{5-9e^{3t}} = \frac{4+0}{5-0} = \frac{4}{5}.$$

31. Determine $\displaystyle\lim_{x\to\infty} \tan^{-1} x$. Explain geometrically.

SOLUTION As an angle θ increases from 0 to $\frac{\pi}{2}$, its tangent $x = \tan\theta$ approaches ∞. Therefore,

$$\lim_{x\to\infty} \tan^{-1} x = \frac{\pi}{2}.$$

Geometrically, this means that the graph of $y = \tan^{-1} x$ has a horizontal asymptote at $y = \frac{\pi}{2}$.

32. Show that $\displaystyle\lim_{x\to\infty} (\sqrt{x^2+1} - x) = 0$. *Hint:* Observe that

$$\sqrt{x^2+1} - x = \frac{1}{\sqrt{x^2+1}+x}$$

SOLUTION Rationalizing the "numerator," we find

$$\begin{aligned}\sqrt{x^2+1} - x &= (\sqrt{x^2+1} - x)\frac{\sqrt{x^2+1}+x}{\sqrt{x^2+1}+x}\\ &= \frac{(x^2+1)-x^2}{\sqrt{x^2+1}+x} = \frac{1}{\sqrt{x^2+1}+x}.\end{aligned}$$

Thus,

$$\lim_{x\to\infty} (\sqrt{x^2+1} - x) = \lim_{x\to\infty} \frac{1}{\sqrt{x^2+1}+x} = 0.$$

33. According to the **Michaelis–Menten equation** (Figure 7), when an enzyme is combined with a substrate of concentration s (in millimolars), the reaction rate (in micromolars/min) is

$$R(s) = \frac{As}{K+s} \qquad (A,\ K \text{ constants})$$

(a) Show, by computing $\displaystyle\lim_{s\to\infty} R(s)$, that A is the limiting reaction rate as the concentration s approaches ∞.

(b) Show that the reaction rate $R(s)$ attains one-half of the limiting value A when $s = K$.

(c) For a certain reaction, $K = 1.25$ mM and $A = 0.1$. For which concentration s is $R(s)$ equal to 75% of its limiting value?

Leonor Michaelis 1875–1949 Maud Menten 1879–1960

FIGURE 7 Canadian-born biochemist Maud Menten is best known for her fundamental work on enzyme kinetics with German scientist Leonor Michaelis. She was also an accomplished painter, clarinetist, mountain climber, and master of numerous languages.

SOLUTION

(a) $\lim_{s\to\infty} R(s) = \lim_{s\to\infty} \frac{As}{K+s} = \lim_{s\to\infty} \frac{A}{1+\frac{K}{s}} = A.$

(b) Observe that

$$R(K) = \frac{AK}{K+K} = \frac{AK}{2K} = \frac{A}{2},$$

have of the limiting value.

(c) By part (a), the limiting value is 0.1, so we need to determine the value of s that satisfies

$$R(s) = \frac{0.1s}{1.25+s} = 0.075.$$

Solving this equation for s yields

$$s = \frac{(1.25)(0.075)}{0.025} = 3.75 \text{ mM}.$$

34. Suppose that the average temperature of the earth is $T(t) = 283 + 3(1 - e^{-0.03t})$ kelvins, where t is the number of years since 2000.

(a) Calculate the long-term average $L = \lim_{t\to\infty} T(t)$.

(b) At what time is $T(t)$ within one-half a degree of its limiting value?

SOLUTION

(a) $L = \lim_{t\to\infty} T(t) = \lim_{t\to\infty}(283 + 3(1 - e^{-0.03t})) = 286$ kelvins.

(b) We need to solve the equation

$$T(t) = 283 + 3(1 - e^{-0.03t}) = 285.5.$$

This yields

$$t = \frac{1}{0.03}\ln 6 \approx 59.73.$$

The average temperature of the earth will be within one-half a degree of its limiting value in roughly 2060.

In Exercises 35–42, calculate the limit.

35. $\lim_{x\to\infty}\left(\sqrt{4x^4+9x} - 2x^2\right)$

SOLUTION Write

$$\begin{aligned}\sqrt{4x^4+9x} - 2x^2 &= \left(\sqrt{4x^4+9x} - 2x^2\right)\frac{\sqrt{4x^4+9x}+2x^2}{\sqrt{4x^4+9x}+2x^2}\\ &= \frac{(4x^4+9x)-4x^4}{\sqrt{4x^4+9x}+2x^2} = \frac{9x}{\sqrt{4x^4+9x}+2x^2}.\end{aligned}$$

Thus,

$$\lim_{x\to\infty}(\sqrt{4x^4+9x} - 2x^2) = \lim_{x\to\infty}\frac{9x}{\sqrt{4x^4+9x}+2x^2} = 0.$$

36. $\lim_{x\to\infty}(\sqrt{9x^3+x} - x^{3/2})$

SOLUTION Write

$$\begin{aligned}\sqrt{9x^3+x} - x^{3/2} &= \left(\sqrt{9x^3+x} - x^{3/2}\right)\frac{\sqrt{9x^3+x}+x^{3/2}}{\sqrt{9x^3+x}+x^{3/2}}\\ &= \frac{(9x^3+x)-x^3}{\sqrt{9x^3+x}+x^{3/2}} = \frac{8x^3+x}{\sqrt{9x^3+x}+x^{3/2}}.\end{aligned}$$

Thus,

$$\lim_{x\to\infty}(\sqrt{9x^3+x} - x^{3/2}) = \lim_{t\to\infty}\frac{8x^3+x}{\sqrt{9x^3+x}+x^{3/2}} = \infty.$$

37. $\lim_{x\to\infty}\left(2\sqrt{x}-\sqrt{x+2}\right)$

SOLUTION Write

$$\begin{aligned}2\sqrt{x}-\sqrt{x+2} &= \left(2\sqrt{x}-\sqrt{x+2}\right)\frac{2\sqrt{x}+\sqrt{x+2}}{2\sqrt{x}+\sqrt{x+2}}\\ &= \frac{4x-(x+2)}{2\sqrt{x}+\sqrt{x+2}}=\frac{3x-2}{2\sqrt{x}+\sqrt{x+2}}.\end{aligned}$$

Thus,

$$\lim_{x\to\infty}(2\sqrt{x}-\sqrt{x+2})=\lim_{x\to\infty}\frac{3x-2}{2\sqrt{x}+\sqrt{x+2}}=\infty.$$

38. $\lim_{x\to\infty}\left(\frac{1}{x}-\frac{1}{x+2}\right)$

SOLUTION $\lim_{x\to\infty}\left(\frac{1}{x}-\frac{1}{x+2}\right)=\lim_{x\to\infty}\frac{2}{x(x+2)}=0.$

39. $\lim_{x\to\infty}(\ln(3x+1)-\ln(2x+1))$

SOLUTION Because

$$\ln(3x+1)-\ln(2x+1)=\ln\frac{3x+1}{2x+1}$$

and

$$\lim_{x\to\infty}\frac{3x+1}{2x+1}=\frac{3}{2},$$

it follows that

$$\lim_{x\to\infty}(\ln(3x+1)-\ln(2x+1))=\ln\frac{3}{2}.$$

40. $\lim_{x\to\infty}\left(\ln(\sqrt{5x^2+2})-\ln x\right)$

SOLUTION Because

$$\ln(\sqrt{5x^2+2})-\ln x=\ln\frac{\sqrt{5x^2+2}}{x}$$

and

$$\lim_{x\to\infty}\frac{\sqrt{5x^2+2}}{x}=\lim_{x\to\infty}\frac{\sqrt{5+\frac{2}{x^2}}}{1}=\sqrt{5},$$

it follows that

$$\lim_{x\to\infty}\left(\ln(\sqrt{5x^2+2})-\ln x\right)=\ln\sqrt{5}=\frac{1}{2}\ln 5.$$

41. $\lim_{x\to\infty}\tan^{-1}\left(\frac{x^2+9}{9-x}\right)$

SOLUTION Because

$$\lim_{x\to\infty}\frac{x^2+9}{9-x}=\lim_{x\to\infty}\frac{x+\frac{9}{x}}{\frac{9}{x}-1}=\frac{\infty}{-1}=-\infty,$$

it follows that

$$\lim_{x\to\infty}\tan^{-1}\left(\frac{x^2+9}{9-x}\right)=-\frac{\pi}{2}.$$

42. $\lim_{x \to \infty} \tan^{-1}\left(\frac{1+x}{1-x}\right)$

SOLUTION Because

$$\lim_{x \to \infty} \frac{1+x}{1-x} = -1,$$

it follows that

$$\lim_{x \to \infty} \tan^{-1}\left(\frac{1+x}{1-x}\right) = \tan^{-1}(-1) = -\frac{\pi}{4}.$$

43. Let $P(n)$ be the perimeter of an n-gon inscribed in a unit circle (Figure 8).

(a) Explain, intuitively, why $P(n)$ approaches 2π as $n \to \infty$.

(b) Show that $P(n) = 2n \sin\left(\frac{\pi}{n}\right)$.

(c) Combine (a) and (b) to conclude that $\lim_{n \to \infty} \frac{n}{\pi} \sin\left(\frac{\pi}{n}\right) = 1$.

(d) Use this to give another argument that $\lim_{\theta \to 0} \frac{\sin\theta}{\theta} = 1$.

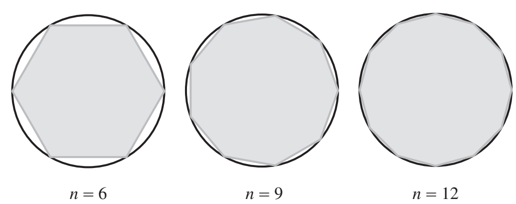


FIGURE 8

SOLUTION

(a) As $n \to \infty$, the n-gon approaches a circle of radius 1. Therefore, the perimeter of the n-gon approaches the circumference of the unit circle as $n \to \infty$. That is, $P(n) \to 2\pi$ as $n \to \infty$.

(b) Each side of the n-gon is the third side of an isosceles triangle with equal length sides of length 1 and angle $\theta = \frac{2\pi}{n}$ between the equal length sides. The length of each side of the n-gon is therefore

$$\sqrt{1^2 + 1^2 - 2\cos\frac{2\pi}{n}} = \sqrt{2(1 - \cos\frac{2\pi}{n})} = \sqrt{4\sin^2\frac{\pi}{n}} = 2\sin\frac{\pi}{n}.$$

Finally,

$$P(n) = 2n \sin\frac{\pi}{n}.$$

(c) Combining parts (a) and (b),

$$\lim_{n \to \infty} P(n) = \lim_{n \to \infty} 2n \sin\frac{\pi}{n} = 2\pi.$$

Dividing both sides of this last expression by 2π yields

$$\lim_{n \to \infty} \frac{n}{\pi} \sin\frac{\pi}{n} = 1.$$

(d) Let $\theta = \frac{\pi}{n}$. Then $\theta \to 0$ as $n \to \infty$,

$$\frac{n}{\pi} \sin\frac{\pi}{n} = \frac{1}{\theta}\sin\theta = \frac{\sin\theta}{\theta},$$

and

$$\lim_{n \to \infty} \frac{n}{\pi} \sin\frac{\pi}{n} = \lim_{\theta \to 0} \frac{\sin\theta}{\theta} = 1.$$

44. Physicists have observed that Einstein's theory of **special relativity** reduces to Newtonian mechanics in the limit as $c \to \infty$, where c is the speed of light. This is illustrated by a stone tossed up vertically from ground level so that it returns to earth one second later. Using Newton's Laws, we find that the stone's maximum height is $h = g/8$ meters ($g = 9.8$ m/s^2). According to special relativity, the stone's mass depends on its velocity divided by c, and the maximum height is

$$h(c) = c\sqrt{c^2/g^2 + 1/4} - c^2/g$$

Prove that $\lim_{c \to \infty} h(c) = g/8$.

SOLUTION Write

$$h(c) = c\sqrt{c^2/g^2 + 1/4} - c^2/g = \left(c\sqrt{c^2/g^2 + 1/4} - c^2/g\right)\frac{c\sqrt{c^2/g^2 + 1/4} + c^2/g}{c\sqrt{c^2/g^2 + 1/4} + c^2/g}$$
$$= \frac{c^2(c^2/g^2 + 1/4) - c^4/g^2}{c\sqrt{c^2/g^2 + 1/4} + c^2/g} = \frac{c^2/4}{c\sqrt{c^2/g^2 + 1/4} + c^2/g}.$$

Thus,

$$\lim_{c\to\infty} h(c) = \lim_{c\to\infty} \frac{c^2/4}{c\sqrt{c^2/g^2 + 1/4} + c^2/g} = \frac{c^2/4}{2c^2/g} = \frac{g}{8}.$$

Further Insights and Challenges

45. Every limit as $x \to \infty$ can be rewritten as a one-sided limit as $t \to 0+$, where $t = x^{-1}$. Setting $g(t) = f(t^{-1})$, we have

$$\lim_{x\to\infty} f(x) = \lim_{t\to 0+} g(t)$$

Show that $\lim_{x\to\infty} \frac{3x^2 - x}{2x^2 + 5} = \lim_{t\to 0+} \frac{3 - t}{2 + 5t^2}$, and evaluate using the Quotient Law.

SOLUTION Let $t = x^{-1}$. Then $x = t^{-1}$, $t \to 0+$ as $x \to \infty$, and

$$\frac{3x^2 - x}{2x^2 + 5} = \frac{3t^{-2} - t^{-1}}{2t^{-2} + 5} = \frac{3 - t}{2 + 5t^2}.$$

Thus,

$$\lim_{x\to\infty} \frac{3x^2 - x}{2x^2 + 5} = \lim_{t\to 0+} \frac{3 - t}{2 + 5t^2} = \frac{3}{2}.$$

46. Rewrite the following as one-sided limits as in Exercise 45 and evaluate.

(a) $\lim_{x\to\infty} \frac{3 - 12x^3}{4x^3 + 3x + 1}$

(b) $\lim_{x\to\infty} e^{1/x}$

(c) $\lim_{x\to\infty} x \sin\frac{1}{x}$

(d) $\lim_{x\to\infty} \ln\left(\frac{x+1}{x-1}\right)$

SOLUTION

(a) Let $t = x^{-1}$. Then $x = t^{-1}$, $t \to 0+$ as $x \to \infty$, and

$$\frac{3 - 12x^3}{4x^3 + 3x + 1} = \frac{3 - 12t^{-3}}{4t^{-3} + 3t^{-1} + 1} = \frac{3t^3 - 12}{4 + 3t^2 + t^3}.$$

Thus,

$$\lim_{x\to\infty} \frac{3 - 12x^3}{4x^3 + 3x + 1} = \lim_{t\to 0+} \frac{3t^3 - 12}{4 + 3t^2 + t^3} = \frac{-12}{4} = -3.$$

(b) Let $t = x^{-1}$. Then $x = t^{-1}$, $t \to 0+$ as $x \to \infty$, and $e^{1/x} = e^t$. Thus,

$$\lim_{x\to\infty} e^{1/x} = \lim_{t\to 0+} e^t = e^0 = 1.$$

(c) Let $t = x^{-1}$. Then $x = t^{-1}$, $t \to 0+$ as $x \to \infty$, and

$$x \sin\frac{1}{x} = \frac{1}{t}\sin t = \frac{\sin t}{t}.$$

Thus,

$$\lim_{x\to\infty} x \sin\frac{1}{x} = \lim_{t\to 0+} \frac{\sin t}{t} = 1.$$

(d) Let $t = x^{-1}$. Then $x = t^{-1}$, $t \to 0+$ as $x \to \infty$, and

$$\frac{x+1}{x-1} = \frac{t^{-1}+1}{t^{-1}-1} = \frac{1+t}{1-t}.$$

Thus,

$$\lim_{x\to\infty} \ln\left(\frac{x+1}{x-1}\right) = \lim_{t\to 0+} \ln\left(\frac{1+t}{1-t}\right) = \ln 1 = 0.$$

47. Let $G(b) = \lim_{x\to\infty}(1+b^x)^{1/x}$ for $b \geq 0$. Investigate $G(b)$ numerically and graphically for $b = 0.2, 0.8, 2, 3, 5$ (and additional values if necessary). Then make a conjecture for the value of $G(b)$ as a function of b. Draw a graph of $y = G(b)$. Does $G(b)$ appear to be continuous? We will evaluate $G(b)$ using L'Hôpital's Rule in Section 4.5 (see Exercise 69 in Section 4.5).

SOLUTION

- $b = 0.2$:

x	5	10	50	100
$f(x)$	1.000064	1.000000	1.000000	1.000000

It appears that $G(0.2) = 1$.

- $b = 0.8$:

x	5	10	50	100
$f(x)$	1.058324	1.010251	1.000000	1.000000

It appears that $G(0.8) = 1$.

- $b = 2$:

x	5	10	50	100
$f(x)$	2.012347	2.000195	2.000000	2.000000

It appears that $G(2) = 2$.

- $b = 3$:

x	5	10	50	100
$f(x)$	3.002465	3.000005	3.000000	3.000000

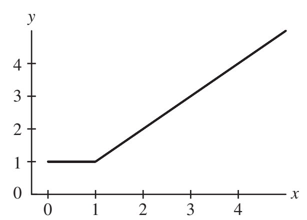
It appears that $G(3) = 3$.

- $b = 5$:

x	5	10	50	100
$f(x)$	5.000320	5.000000	5.000000	5.000000

It appears that $G(5) = 5$.

Based on these observations we conjecture that $G(b) = 1$ if $0 \leq b \leq 1$ and $G(b) = b$ for $b > 1$. The graph of $y = G(b)$ is shown below; the graph does appear to be continuous.



2.8 Intermediate Value Theorem

Preliminary Questions

1. Prove that $f(x) = x^2$ takes on the value 0.5 in the interval [0, 1].

SOLUTION Observe that $f(x) = x^2$ is continuous on [0, 1] with $f(0) = 0$ and $f(1) = 1$. Because $f(0) < 0.5 < f(1)$, the Intermediate Value Theorem guarantees there is a $c \in [0, 1]$ such that $f(c) = 0.5$.

2. The temperature in Vancouver was 8°C at 6 AM and rose to 20°C at noon. Which assumption about temperature allows us to conclude that the temperature was 15°C at some moment of time between 6 AM and noon?

SOLUTION We must assume that temperature is a continuous function of time.

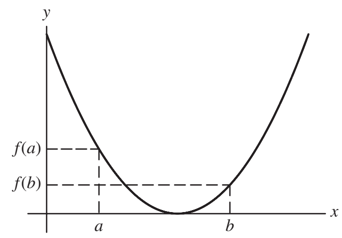
3. What is the graphical interpretation of the IVT?

SOLUTION If f is continuous on $[a, b]$, then the horizontal line $y = k$ for every k between $f(a)$ and $f(b)$ intersects the graph of $y = f(x)$ at least once.

4. Show that the following statement is false by drawing a graph that provides a counterexample:

If $f(x)$ is continuous and has a root in $[a, b]$, then $f(a)$ and $f(b)$ have opposite signs.

SOLUTION



5. Assume that $f(t)$ is continuous on [1, 5] and that $f(1) = 20$, $f(5) = 100$. Determine whether each of the following statements is always true, never true, or sometimes true.

(a) $f(c) = 3$ has a solution with $c \in [1, 5]$.
(b) $f(c) = 75$ has a solution with $c \in [1, 5]$.
(c) $f(c) = 50$ has no solution with $c \in [1, 5]$.
(d) $f(c) = 30$ has exactly one solution with $c \in [1, 5]$.

SOLUTION

(a) This statement is sometimes true.
(b) This statement is always true.
(c) This statement is never true.
(d) This statement is sometimes true.

Exercises

1. Use the IVT to show that $f(x) = x^3 + x$ takes on the value 9 for some x in [1, 2].

SOLUTION Observe that $f(1) = 2$ and $f(2) = 10$. Since f is a polynomial, it is continuous everywhere; in particular on [1, 2]. Therefore, by the IVT there is a $c \in [1, 2]$ such that $f(c) = 9$.

2. Show that $g(t) = \dfrac{t}{t+1}$ takes on the value 0.499 for some t in [0, 1].

SOLUTION $g(0) = 0$ and $g(1) = \frac{1}{2}$. Since $g(t)$ is continuous for all $x \neq -1$, and since $0 < 0.4999 < \frac{1}{2}$, the IVT states that $g(t) = 0.4999$ for some t between 0 and 1.

3. Show that $g(t) = t^2 \tan t$ takes on the value $\frac{1}{2}$ for some t in $\left[0, \frac{\pi}{4}\right]$.

SOLUTION $g(0) = 0$ and $g(\frac{\pi}{4}) = \frac{\pi^2}{16}$. $g(t)$ is continuous for all t between 0 and $\frac{\pi}{4}$, and $0 < \frac{1}{2} < \frac{\pi^2}{16}$; therefore, by the IVT, there is a $c \in [0, \frac{\pi}{4}]$ such that $g(c) = \frac{1}{2}$.

4. Show that $f(x) = \dfrac{x^2}{x^7+1}$ takes on the value 0.4.

SOLUTION $f(0) = 0 < 0.4$. $f(1) = \frac{1}{2} > 0.4$. $f(x)$ is continuous at all points x where $x \neq -1$, therefore $f(x) = 0.4$ for some x between 0 and 1.

5. Show that $\cos x = x$ has a solution in the interval $[0, 1]$. *Hint:* Show that $f(x) = x - \cos x$ has a zero in $[0, 1]$.

SOLUTION Let $f(x) = x - \cos x$. Observe that f is continuous with $f(0) = -1$ and $f(1) = 1 - \cos 1 \approx 0.46$. Therefore, by the IVT there is a $c \in [0, 1]$ such that $f(c) = c - \cos c = 0$. Thus $c = \cos c$ and hence the equation $\cos x = x$ has a solution c in $[0, 1]$.

6. Use the IVT to find an interval of length $\frac{1}{2}$ containing a root of $f(x) = x^3 + 2x + 1$.

SOLUTION Let $f(x) = x^3 + 2x + 1$. Observe that $f(-1) = -2$ and $f(0) = 1$. Since f is continuous, we may conclude by the IVT that f has a root in $[-1, 0]$. Now, $f(-\frac{1}{2}) = -\frac{1}{8}$ so $f(-\frac{1}{2})$ and $f(0)$ are of opposite sign. Therefore, the IVT guarantees that f has a root on $[-\frac{1}{2}, 0]$.

In Exercises 7–16, prove using the IVT.

7. $\sqrt{c} + \sqrt{c+2} = 3$ has a solution.

SOLUTION Let $f(x) = \sqrt{x} + \sqrt{x+2} - 3$. Note that f is continuous on $\left[\frac{1}{4}, 2\right]$ with $f(\frac{1}{4}) = \sqrt{\frac{1}{4}} + \sqrt{\frac{9}{4}} - 3 = -1$ and $f(2) = \sqrt{2} - 1 \approx 0.41$. Therefore, by the IVT there is a $c \in \left[\frac{1}{4}, 2\right]$ such that $f(c) = \sqrt{c} + \sqrt{c+2} - 3 = 0$. Thus $\sqrt{c} + \sqrt{c+2} = 3$ and hence the equation $\sqrt{x} + \sqrt{x+2} = 3$ has a solution c in $\left[\frac{1}{4}, 2\right]$.

8. For all integers n, $\sin nx = \cos x$ for some $x \in [0, \pi]$.

SOLUTION For each integer n, let $f(x) = \sin nx - \cos x$. Observe that f is continuous with $f(0) = -1$ and $f(\pi) = 1$. Therefore, by the IVT there is a $c \in [0, \pi]$ such that $f(c) = \sin nc - \cos c = 0$. Thus $\sin nc = \cos c$ and hence the equation $\sin nx = \cos x$ has a solution c in the interval $[0, \pi]$.

9. $\sqrt{2}$ exists. *Hint:* Consider $f(x) = x^2$.

SOLUTION Let $f(x) = x^2$. Observe that f is continuous with $f(1) = 1$ and $f(2) = 4$. Therefore, by the IVT there is a $c \in [1, 2]$ such that $f(c) = c^2 = 2$. This proves the existence of $\sqrt{2}$, a number whose square is 2.

10. A positive number c has an nth root for all positive integers n.

SOLUTION If $c = 1$, then $\sqrt[n]{c} = 1$. Now, suppose $c \neq 1$. Let $f(x) = x^n - c$, and let $b = \max\{1, c\}$. Then, if $c > 1$, $b^n = c^n > c$, and if $c < 1$, $b^n = 1 > c$. So $b^n > c$. Now observe that $f(0) = -c < 0$ and $f(b) = b^n - c > 0$. Since f is continuous on $[0, b]$, by the intermediate value theorem, there is some $d \in [0, b]$ such that $f(d) = 0$. We can refer to d as $\sqrt[n]{c}$.

11. For all positive integers k, $\cos x = x^k$ has a solution.

SOLUTION For each positive integer k, let $f(x) = x^k - \cos x$. Observe that f is continuous on $\left[0, \frac{\pi}{2}\right]$ with $f(0) = -1$ and $f(\frac{\pi}{2}) = \left(\frac{\pi}{2}\right)^k > 0$. Therefore, by the IVT there is a $c \in \left[0, \frac{\pi}{2}\right]$ such that $f(c) = c^k - \cos(c) = 0$. Thus $\cos c = c^k$ and hence the equation $\cos x = x^k$ has a solution c in the interval $\left[0, \frac{\pi}{2}\right]$.

12. $2^x = bx$ has a solution if $b > 2$.

SOLUTION Let $f(x) = 2^x - bx$. Observe that f is continuous on $[0, 1]$ with $f(0) = 1 > 0$ and $f(1) = 2 - b < 0$. Therefore, by the IVT, there is a $c \in [0, 1]$ such that $f(c) = 2^c - bc = 0$.

13. $2^x + 3^x = 4^x$ has a solution.

SOLUTION Let $f(x) = 2^x + 3^x - 4^x$. Observe that f is continuous on $[0, 2]$ with $f(0) = 1 > 0$ and $f(2) = -3 < 0$. Therefore, by the IVT, there is a $c \in (0, 2)$ such that $f(c) = 2^c + 3^c - 4^c = 0$.

14. $\cos x = \cos^{-1} x$ has a solution in $(0, 1)$.

SOLUTION Let $f(x) = \cos x - \cos^{-1} x$. Observe that f is continuous on $[0, 1]$ with $f(0) = 1 - \frac{\pi}{2} < 0$ and $f(1) = \cos 1 - 0 \approx 0.54 > 0$. Therefore, by the IVT, there is a $c \in (0, 1)$ such that $f(c) = \cos c - \cos^{-1} c = 0$.

15. $e^x + \ln x = 0$ has a solution.

SOLUTION Let $f(x) = e^x + \ln x$. Observe that f is continuous on $[e^{-2}, 1]$ with $f(e^{-2}) = e^{e^{-2}} - 2 < 0$ and $f(1) = e > 0$. Therefore, by the IVT, there is a $c \in (e^{-2}, 1) \subset (0, 1)$ such that $f(c) = e^c + \ln c = 0$.

16. $\tan^{-1} x = \cos^{-1} x$ has a solution.

SOLUTION Let $f(x) = \tan^{-1} x - \cos^{-1} x$. Observe that f is continuous on $[0, 1]$ with $f(0) = \tan^{-1} 0 - \cos^{-1} 0 = -\frac{\pi}{2} < 0$ and $f(1) = \tan^{-1} 1 - \cos^{-1} 1 = \frac{\pi}{4} > 0$. Therefore, by the IVT, there is a $c \in (0, 1)$ such that $f(c) = \tan^{-1} c - \cos^{-1} c = 0$.

17. Carry out three steps of the Bisection Method for $f(x) = 2^x - x^3$ as follows:

(a) Show that $f(x)$ has a zero in $[1, 1.5]$.

(b) Show that $f(x)$ has a zero in $[1.25, 1.5]$.

(c) Determine whether $[1.25, 1.375]$ or $[1.375, 1.5]$ contains a zero.

SOLUTION Note that $f(x)$ is continuous for all x.

(a) $f(1) = 1$, $f(1.5) = 2^{1.5} - (1.5)^3 < 3 - 3.375 < 0$. Hence, $f(x) = 0$ for some x between 1 and 1.5.

(b) $f(1.25) \approx 0.4253 > 0$ and $f(1.5) < 0$. Hence, $f(x) = 0$ for some x between 1.25 and 1.5.

(c) $f(1.375) \approx -0.0059$. Hence, $f(x) = 0$ for some x between 1.25 and 1.375.

18. Figure 4 shows that $f(x) = x^3 - 8x - 1$ has a root in the interval $[2.75, 3]$. Apply the Bisection Method twice to find an interval of length $\frac{1}{16}$ containing this root.

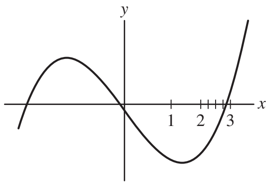


FIGURE 4 Graph of $y = x^3 - 8x - 1$.

SOLUTION Let $f(x) = x^3 - 8x - 1$. Observe that f is continuous with $f(2.75) = -2.203125$ and $f(3) = 2$. Therefore, by the IVT there is a $c \in [2.75, 3]$ such that $f(c) = 0$. The midpoint of the interval $[2.75, 3]$ is 2.875 and $f(2.875) = -0.236$. Hence, $f(x) = 0$ for some x between 2.875 and 3. The midpoint of the interval $[2.875, 3]$ is 2.9375 and $f(2.9375) = 0.84$. Thus, $f(x) = 0$ for some x between 2.875 and 2.9375.

19. Find an interval of length $\frac{1}{4}$ in $[1, 2]$ containing a root of the equation $x^7 + 3x - 10 = 0$.

SOLUTION Let $f(x) = x^7 + 3x - 10$. Observe that f is continuous with $f(1) = -6$ and $f(2) = 124$. Therefore, by the IVT there is a $c \in [1, 2]$ such that $f(c) = 0$. $f(1.5) \approx 11.59 > 0$, so $f(c) = 0$ for some $c \in [1, 1.5]$. $f(1.25) \approx -1.48 < 0$, and so $f(c) = 0$ for some $c \in [1.25, 1.5]$. This means that $[1.25, 1.5]$ is an interval of length 0.25 containing a root of $f(x)$.

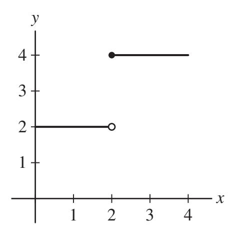
20. Show that $\tan^3\theta - 8\tan^2\theta + 17\tan\theta - 8 = 0$ has a root in $[0.5, 0.6]$. Apply the Bisection Method twice to find an interval of length 0.025 containing this root.

SOLUTION Let $f(x) = \tan^3\theta - 8\tan^2\theta + 17\tan\theta - 8$. Since $f(0.5) = -0.937387 < 0$ and $f(0.6) = 0.206186 > 0$, we conclude that $f(x) = 0$ has a root in $[0.5, 0.6]$. Since $f(0.55) = -0.35393 < 0$ and $f(0.6) > 0$, we can conclude that $f(x) = 0$ has a root in $[0.55, 0.6]$. Since $f(0.575) = -0.0707752 < 0$, we can conclude that f has a root on $[0.575, 0.6]$.

In Exercises 21–24, draw the graph of a function $f(x)$ *on* $[0, 4]$ *with the given property.*

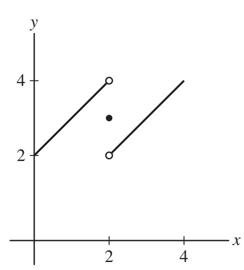
21. Jump discontinuity at $x = 2$ and does not satisfy the conclusion of the IVT.

SOLUTION The function graphed below has a jump discontinuity at $x = 2$. Note that while $f(0) = 2$ and $f(4) = 4$, there is no point c in the interval $[0, 4]$ such that $f(c) = 3$. Accordingly, the conclusion of the IVT is *not* satisfied.



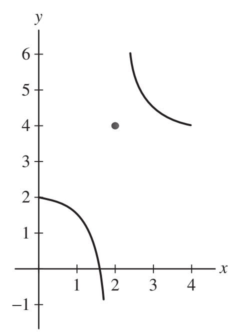
22. Jump discontinuity at $x = 2$ and satisfies the conclusion of the IVT on $[0, 4]$.

SOLUTION The function graphed below has a jump discontinuity at $x = 2$. Note that for every value M between $f(0) = 2$ and $f(4) = 4$, there *is* a point c in the interval $[0, 4]$ such that $f(c) = M$. Accordingly, the conclusion of the IVT *is* satisfied.



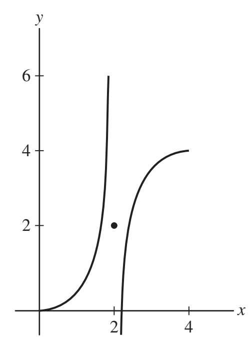
23. Infinite one-sided limits at $x = 2$ and does not satisfy the conclusion of the IVT.

SOLUTION The function graphed below has infinite one-sided limits at $x = 2$. Note that while $f(0) = 2$ and $f(4) = 4$, there is no point c in the interval $[0, 4]$ such that $f(c) = 3$. Accordingly, the conclusion of the IVT is *not* satisfied.



24. Infinite one-sided limits at $x = 2$ and satisfies the conclusion of the IVT on $[0, 4]$.

SOLUTION The function graphed below has infinite one-sided limits at $x = 2$. Note that for every value M between $f(0) = 0$ and $f(4) = 4$, there *is* a point c in the interval $[0, 4]$ such that $f(c) = M$. Accordingly, the conclusion of the IVT *is* satisfied.



25. Can Corollary 2 be applied to $f(x) = x^{-1}$ on $[-1, 1]$? Does $f(x)$ have any roots?

SOLUTION No, because $f(x) = x^{-1}$ is not continuous on $[-1, 1]$. Even though $f(-1) = -1 < 0$ and $f(1) = 1 > 0$, the function has no roots between $x = -1$ and $x = 1$. In fact, this function has no roots at all.

Further Insights and Challenges

26. Take any map and draw a circle on it anywhere (Figure 5). Prove that at any moment in time there exists a pair of diametrically opposite points A and B on that circle corresponding to locations where the temperatures at that moment are equal. *Hint:* Let θ be an angular coordinate along the circle and let $f(\theta)$ be the difference in temperatures at the locations corresponding to θ and $\theta + \pi$.

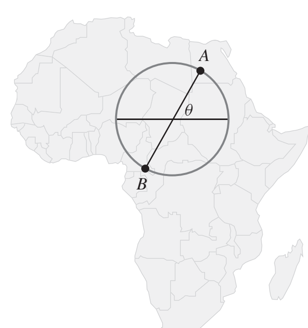


FIGURE 5 $f(\theta)$ is the difference between the temperatures at A and B.

SOLUTION Say the circle has (fixed but arbitrary) radius r and use polar coordinates with the pole at the center of the circle. For $0 \le \theta \le 2\pi$, let $T(\theta)$ be the temperature at the point $(r\cos\theta, r\sin\theta)$. We assume this temperature varies continuously. For $0 \le \theta \le \pi$, define f as the difference $f(\theta) = T(\theta) - T(\theta + \pi)$. Then f is continuous on $[0, \pi]$. There are three cases.

- If $f(0) = T(0) - T(\pi) = 0$, then $T(0) = T(\pi)$ and we have found a pair of diametrically opposite points on the circle at which the temperatures are equal.

- If $f(0) = T(0) - T(\pi) > 0$, then

$$f(\pi) = T(\pi) - T(2\pi) = T(\pi) - T(0) < 0.$$

[Note that the angles 0 and 2π correspond to the same point, $(x, y) = (r, 0)$.] Since f is continuous on $[0, \pi]$, we have by the IVT that $f(c) = T(c) - T(c + \pi) = 0$ for some $c \in [0, \pi]$. Accordingly, $T(c) = T(c + \pi)$ and we have again found a pair of diametrically opposite points on the circle at which the temperatures are equal.

- If $f(0) = T(0) - T(\pi) < 0$, then

$$f(\pi) = T(\pi) - T(2\pi) = T(\pi) - T(0) > 0.$$

Since f is continuous on $[0, \pi]$, we have by the IVT that $f(d) = T(d) - T(d + \pi) = 0$ for some $d \in [0, \pi]$. Accordingly, $T(d) = T(d + \pi)$ and once more we have found a pair of diametrically opposite points on the circle at which the temperatures are equal.

CONCLUSION: There is always a pair of diametrically opposite points on the circle at which the temperatures are equal.

27. Show that if $f(x)$ is continuous and $0 \le f(x) \le 1$ for $0 \le x \le 1$, then $f(c) = c$ for some c in $[0, 1]$ (Figure 6).

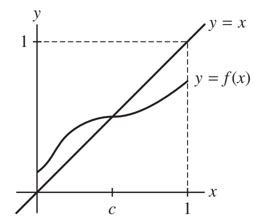

FIGURE 6 A function satisfying $0 \le f(x) \le 1$ for $0 \le x \le 1$.

SOLUTION If $f(0) = 0$, the proof is done with $c = 0$. We may assume that $f(0) > 0$. Let $g(x) = f(x) - x$. $g(0) = f(0) - 0 = f(0) > 0$. Since $f(x)$ is continuous, the Rule of Differences dictates that $g(x)$ is continuous. We need to prove that $g(c) = 0$ for some $c \in [0, 1]$. Since $f(1) \le 1$, $g(1) = f(1) - 1 \le 0$. If $g(1) = 0$, the proof is done with $c = 1$, so let's assume that $g(1) < 0$.

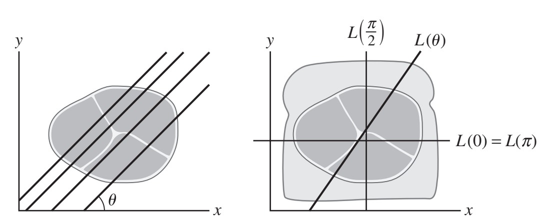
We now have a continuous function $g(x)$ on the interval $[0, 1]$ such that $g(0) > 0$ and $g(1) < 0$. From the IVT, there must be some $c \in [0, 1]$ so that $g(c) = 0$, so $f(c) - c = 0$ and so $f(c) = c$.

This is a simple case of a very general, useful, and beautiful theorem called the **Brouwer fixed point theorem**.

28. Use the IVT to show that if $f(x)$ is continuous and one-to-one on an interval $[a, b]$, then $f(x)$ is either an increasing or a decreasing function.

SOLUTION Let $f(x)$ be a continuous, one-to-one function on the interval $[a, b]$. Suppose for sake of contradiction that $f(x)$ is neither increasing nor decreasing on $[a, b]$. Now, $f(x)$ cannot be constant for that would contradict the condition that $f(x)$ is one-to-one. It follows that somewhere on $[a, b]$, $f(x)$ must transition from increasing to decreasing or from decreasing to increasing. To be specific, suppose $f(x)$ is increasing for $x_1 < x < x_2$ and decreasing for $x_2 < x < x_3$. Let k be any number between $\max\{f(x_1), f(x_3)\}$ and $f(x_2)$. Because $f(x)$ is continuous, the IVT guarantees there exists a $c_1 \in (x_1, x_2)$ such that $f(c_1) = k$; moreover, there exists a $c_2 \in (x_2, x_3)$ such that $f(c_2) = k$. However, this contradicts the condition that $f(x)$ is one-to-one. A similar analysis for the case when $f(x)$ is decreasing for $x_1 < x < x_2$ and increasing for $x_2 < x < x_3$ again leads to a contradiction. Therefore, $f(x)$ must either be increasing or decreasing on $[a, b]$.

29. **Ham Sandwich Theorem** Figure 7(A) shows a slice of ham. Prove that for any angle θ $(0 \le \theta \le \pi)$, it is possible to cut the slice in half with a cut of incline θ. *Hint:* The lines of inclination θ are given by the equations $y = (\tan\theta)x + b$, where b varies from $-\infty$ to ∞. Each such line divides the slice into two pieces (one of which may be empty). Let $A(b)$ be the amount of ham to the left of the line minus the amount to the right, and let A be the total area of the ham. Show that $A(b) = -A$ if b is sufficiently large and $A(b) = A$ if b is sufficiently negative. Then use the IVT. This works if $\theta \ne 0$ or $\frac{\pi}{2}$. If $\theta = 0$, define $A(b)$ as the amount of ham above the line $y = b$ minus the amount below. How can you modify the argument to work when $\theta = \frac{\pi}{2}$ (in which case $\tan\theta = \infty$)?



(A) Cutting a slice of ham at an angle θ.

(B) A slice of ham on top of a slice of bread.

FIGURE 7

SOLUTION Let θ be such that $\theta \neq \frac{\pi}{2}$. For any b, consider the line $L(\theta)$ drawn at angle θ to the x axis starting at $(0, b)$. This line has formula $y = (\tan\theta)x + b$. Let $A(b)$ be the amount of ham above the line minus that below the line.

Let $A > 0$ be the area of the ham. We have to accept the following (reasonable) assumptions:

- For low enough $b = b_0$, the line $L(\theta)$ lies entirely below the ham, so that $A(b_0) = A - 0 = A$.
- For high enough b_1, the line $L(\theta)$ lies entirely above the ham, so that $A(b_1) = 0 - A = -A$.
- $A(b)$ is continuous as a function of b.

Under these assumptions, we see $A(b)$ is a continuous function satisfying $A(b_0) > 0$ and $A(b_1) < 0$ for some $b_0 < b_1$. By the IVT, $A(b) = 0$ for some $b \in [b_0, b_1]$.

Suppose that $\theta = \frac{\pi}{2}$. Let the line $L(c)$ be the vertical line through $(c, 0)$ $(x = c)$. Let $A(c)$ be the area of ham to the left of $L(c)$ minus that to the right of $L(c)$. Since $L(0)$ lies entirely to the left of the ham, $A(0) = 0 - A = -A$. For some $c = c_1$ sufficiently large, $L(c)$ lies entirely to the right of the ham, so that $A(c_1) = A - 0 = A$. Hence $A(c)$ is a continuous function of c such that $A(0) < 0$ and $A(c_1) > 0$. By the IVT, there is some $c \in [0, c_1]$ such that $A(c) = 0$.

30. Figure 7(B) shows a slice of ham on a piece of bread. Prove that it is possible to slice this open-faced sandwich so that each part has equal amounts of ham and bread. *Hint:* By Exercise 29, for all $0 \le \theta \le \pi$ there is a line $L(\theta)$ of incline θ (which we assume is unique) that divides the ham into two equal pieces. Let $B(\theta)$ denote the amount of bread to the left of (or above) $L(\theta)$ minus the amount to the right (or below). Notice that $L(\pi)$ and $L(0)$ are the same line, but $B(\pi) = -B(0)$ since left and right get interchanged as the angle moves from 0 to π. Assume that $B(\theta)$ is continuous and apply the IVT. (By a further extension of this argument, one can prove the full "Ham Sandwich Theorem," which states that if you allow the knife to cut at a slant, then it is possible to cut a sandwich consisting of a slice of ham and two slices of bread so that all three layers are divided in half.)

SOLUTION For each angle θ, $0 \le \theta < \pi$, let $L(\theta)$ be the line at angle θ to the x-axis that slices the ham exactly in half, as shown in Figure 7. Let $L(0) = L(\pi)$ be the horizontal line cutting the ham in half, also as shown. For θ and $L(\theta)$ thus defined, let $B(\theta) =$ the amount of bread to the left of $L(\theta)$ minus that to the right of $L(\theta)$.

To understand this argument, one must understand what we mean by "to the left" or "to the right". Here, we mean to the left or right of the line as viewed in the direction θ. Imagine you are walking along the line in direction θ (directly right if $\theta = 0$, directly left if $\theta = \pi$, etc).

We will further accept the fact that B is continuous as a function of θ, which seems intuitively obvious. We need to prove that $B(c) = 0$ for some angle c.

Since $L(0)$ and $L(\pi)$ are drawn in opposite direction, $B(0) = -B(\pi)$. If $B(0) > 0$, we apply the IVT on $[0, \pi]$ with $B(0) > 0$, $B(\pi) < 0$, and B continuous on $[0, \pi]$; by IVT, $B(c) = 0$ for some $c \in [0, \pi]$. On the other hand, if $B(0) < 0$, then we apply the IVT with $B(0) < 0$ and $B(\pi) > 0$. If $B(0) = 0$, we are also done; $L(0)$ is the appropriate line.

2.9 The Formal Definition of a Limit

Preliminary Questions

1. Given that $\lim_{x\to 0} \cos x = 1$, which of the following statements is true?

(a) If $|\cos x - 1|$ is very small, then x is close to 0.

(b) There is an $\epsilon > 0$ such that $|x| < 10^{-5}$ if $0 < |\cos x - 1| < \epsilon$.

(c) There is a $\delta > 0$ such that $|\cos x - 1| < 10^{-5}$ if $0 < |x| < \delta$.

(d) There is a $\delta > 0$ such that $|\cos x| < 10^{-5}$ if $0 < |x - 1| < \delta$.

SOLUTION The true statement is **(c)**: There is a $\delta > 0$ such that $|\cos x - 1| < 10^{-5}$ if $0 < |x| < \delta$.

2. Suppose it is known that for a given ϵ and δ, $|f(x) - 2| < \epsilon$ if $0 < |x - 3| < \delta$. Which of the following statements must also be true?

(a) $|f(x) - 2| < \epsilon$ if $0 < |x - 3| < 2\delta$

(b) $|f(x) - 2| < 2\epsilon$ if $0 < |x - 3| < \delta$

(c) $|f(x) - 2| < \dfrac{\epsilon}{2}$ if $0 < |x - 3| < \dfrac{\delta}{2}$

(d) $|f(x) - 2| < \epsilon$ if $0 < |x - 3| < \dfrac{\delta}{2}$

SOLUTION Statements **(b)** and **(d)** are true.

Exercises

1. Based on the information conveyed in Figure 5(A), find values of L, ϵ, and $\delta > 0$ such that the following statement holds: $|f(x) - L| < \epsilon$ if $|x| < \delta$.

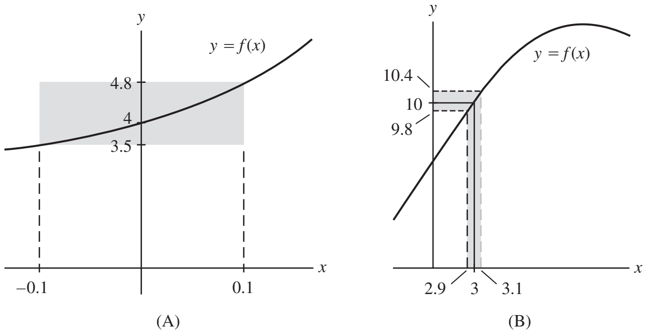


FIGURE 5

SOLUTION We see $-0.1 < x < 0.1$ forces $3.5 < f(x) < 4.8$. Rewritten, this means that $|x - 0| < 0.1$ implies that $|f(x) - 4| < 0.8$. Replacing numbers where appropriate in the definition of the limit $|x - c| < \delta$ implies $|f(x) - L| < \epsilon$, we get $L = 4$, $\epsilon = 0.8$, $c = 0$, and $\delta = 0.1$.

2. Based on the information conveyed in Figure 5(B), find values of c, L, ϵ, and $\delta > 0$ such that the following statement holds: $|f(x) - L| < \epsilon$ if $|x - c| < \delta$.

SOLUTION From the shaded region in the graph, we can see that $9.8 < f(x) < 10.4$ whenever $2.9 < x < 3.1$. Rewriting these double inequalities as absolute value inequalities, we get $|f(x) - 10| < 0.4$ whenever $|x - 3| < 0.1$. Replacing numbers where appropriate in the definition of the limit $|x - c| < \delta$ implies $|f(x) - L| < \epsilon$, we get $L = 10$, $\epsilon = 0.4$, $c = 3$, and $\delta = 0.1$.

3. Consider $\lim_{x\to 4} f(x)$, where $f(x) = 8x + 3$.

(a) Show that $|f(x) - 35| = 8|x - 4|$.

(b) Show that for any $\epsilon > 0$, $|f(x) - 35| < \epsilon$ if $|x - 4| < \delta$, where $\delta = \frac{\epsilon}{8}$. Explain how this proves rigorously that $\lim_{x\to 4} f(x) = 35$.

SOLUTION

(a) $|f(x) - 35| = |8x + 3 - 35| = |8x - 32| = |8(x - 4)| = 8\,|x - 4|$. (Remember that the last step is justified because $8 > 0$).

(b) Let $\epsilon > 0$. Let $\delta = \epsilon/8$ and suppose $|x - 4| < \delta$. By part **(a)**, $|f(x) - 35| = 8|x - 4| < 8\delta$. Substituting $\delta = \epsilon/8$, we see $|f(x) - 35| < 8\epsilon/8 = \epsilon$. We see that, for any $\epsilon > 0$, we found an appropriate δ so that $|x - 4| < \delta$ implies $|f(x) - 35| < \epsilon$. Hence $\lim_{x\to 4} f(x) = 35$.

4. Consider $\lim_{x\to 2} f(x)$, where $f(x) = 4x - 1$.

(a) Show that $|f(x) - 7| < 4\delta$ if $|x - 2| < \delta$.

(b) Find a δ such that

$$|f(x) - 7| < 0.01 \qquad \text{if} \qquad |x - 2| < \delta$$

(c) Prove rigorously that $\lim_{x\to 2} f(x) = 7$.

SOLUTION

(a) If $0 < |x - 2| < \delta$, then $|(4x - 1) - 7| = 4|x - 2| < 4\delta$.

(b) If $0 < |x - 2| < \delta = 0.0025$, then $|(4x - 1) - 7| = 4|x - 2| < 4\delta = 0.01$.

(c) Let $\epsilon > 0$ be given. Then whenever $0 < |x - 2| < \delta = \epsilon/4$, we have $|(4x - 1) - 7| = 4|x - 2| < 4\delta = \epsilon$. Since ϵ was arbitrary, we conclude that $\lim_{x\to 2}(4x - 1) = 7$.

5. Consider $\lim_{x\to 2} x^2 = 4$ (refer to Example 2).

(a) Show that $|x^2 - 4| < 0.05$ if $0 < |x - 2| < 0.01$.

(b) Show that $|x^2 - 4| < 0.0009$ if $0 < |x - 2| < 0.0002$.

(c) Find a value of δ such that $|x^2 - 4|$ is less than 10^{-4} if $0 < |x - 2| < \delta$.

SOLUTION

(a) If $0 < |x - 2| < \delta = 0.01$, then $|x| < 3$ and $\left|x^2 - 4\right| = |x - 2||x + 2| \le |x - 2|\,(|x| + 2) < 5|x - 2| < 0.05$.

(b) If $0 < |x-2| < \delta = 0.0002$, then $|x| < 2.0002$ and

$$\left|x^2-4\right| = |x-2||x+2| \le |x-2|\,(|x|+2) < 4.0002|x-2| < 0.00080004 < 0.0009.$$

(c) Note that $\left|x^2-4\right| = |(x+2)(x-2)| \le |x+2|\,|x-2|$. Since $|x-2|$ can get arbitrarily small, we can require $|x-2| < 1$ so that $1 < x < 3$. This ensures that $|x+2|$ is at most 5. Now we know that $\left|x^2-4\right| \le 5|x-2|$. Let $\delta = 10^{-5}$. Then, if $|x-2| < \delta$, we get $\left|x^2-4\right| \le 5|x-2| < 5 \times 10^{-5} < 10^{-4}$ as desired.

6. With regard to the limit $\lim_{x\to 5} x^2 = 25$,

(a) Show that $|x^2-25| < 11|x-5|$ if $4 < x < 6$. *Hint:* Write $|x^2-25| = |x+5| \cdot |x-5|$.
(b) Find a δ such that $|x^2-25| < 10^{-3}$ if $|x-5| < \delta$.
(c) Give a rigorous proof of the limit by showing that $|x^2-25| < \epsilon$ if $0 < |x-5| < \delta$, where δ is the smaller of $\frac{\epsilon}{11}$ and 1.

SOLUTION

(a) If $4 < x < 6$, then $|x-5| < \delta = 1$ and $\left|x^2-25\right| = |x-5||x+5| \le |x-5|\,(|x|+5) < 11|x-5|$.

(b) If $0 < |x-5| < \delta = \frac{0.001}{11}$, then $x < 6$ and $\left|x^2-25\right| = |x-5||x+5| \le |x-5|\,(|x|+5) < 11|x-5| < 0.001$.

(c) Let $0 < |x-5| < \delta = \min\left\{1, \frac{\epsilon}{11}\right\}$. Since $\delta < 1$, $|x-5| < \delta < 1$ implies $4 < x < 6$. Specifically, $x < 6$ and

$$\left|x^2-25\right| = |x-5||x+5| \le |x-5|\,(|x|+5) < |x-5|(6+5) = 11|x-5|.$$

Since δ is also less than $\epsilon/11$, we can conclude $11|x-5| < 11(\epsilon/11) = \epsilon$, thus completing the rigorous proof that $|x^2-25| < \epsilon$ if $|x-5| < \delta$.

7. Refer to Example 3 to find a value of $\delta > 0$ such that

$$\left|\frac{1}{x} - \frac{1}{3}\right| < 10^{-4} \qquad \text{if} \qquad 0 < |x-3| < \delta$$

SOLUTION The Example shows that for any $\epsilon > 0$ we have

$$\left|\frac{1}{x} - \frac{1}{3}\right| \le \epsilon \quad \text{if } |x-3| < \delta$$

where δ is the smaller of the numbers 6ϵ and 1. In our case, we may take $\delta = 6 \times 10^{-4}$.

8. Use Figure 6 to find a value of $\delta > 0$ such that the following statement holds: $\left|1/x^2 - \frac{1}{4}\right| < \epsilon$ if $|x-2| < \delta$ for $\epsilon = 0.03$. Then find a value of δ that works for $\epsilon = 0.01$.

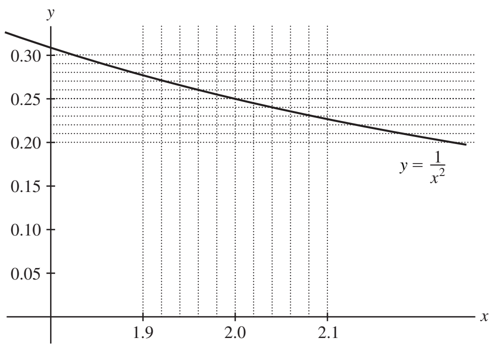

FIGURE 6

SOLUTION From Figure 6, we see that $0.22 < \frac{1}{x^2} < 0.28$ for $1.9 < x < 2.1$. Rewriting these expressions using absolute values yields

$$\left|\frac{1}{x^2} - \frac{1}{4}\right| < 0.03$$

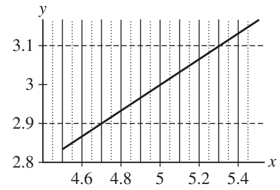
for $|x-2| < 0.1$. Thus, for $\epsilon = 0.03$, we may take $\delta = 0.1$. Additionally, we see that $0.24 < \frac{1}{x^2} < 0.26$ for $1.96 < x < 2.04$. Rewriting these expressions using absolute values yields

$$\left|\frac{1}{x^2} - \frac{1}{4}\right| < 0.01$$

for $|x-2| < 0.04$. Thus, for $\epsilon = 0.01$, we may take $\delta = 0.04$.

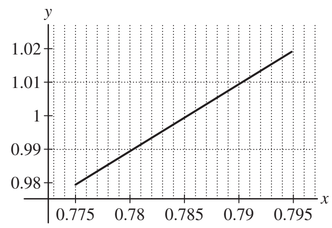
9. GU Plot $f(x) = \sqrt{2x-1}$ together with the horizontal lines $y = 2.9$ and $y = 3.1$. Use this plot to find a value of $\delta > 0$ such that $|\sqrt{2x-1} - 3| < 0.1$ if $|x - 5| < \delta$.

SOLUTION From the plot below, we see that $\delta = 0.25$ will guarantee that $|\sqrt{2x-1} - 3| < 0.1$ whenever $|x - 5| \le \delta$.



10. GU Plot $f(x) = \tan x$ together with the horizontal lines $y = 0.99$ and $y = 1.01$. Use this plot to find a value of $\delta > 0$ such that $|\tan x - 1| < 0.01$ if $\left|x - \frac{\pi}{4}\right| < \delta$.

SOLUTION From the plot below, we see that $\delta = 0.005$ will guarantee that $|\tan x - 1| < 0.01$ whenever $|x - \frac{\pi}{4}| \le \delta$.

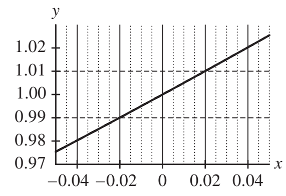


11. GU The number e has the following property: $\lim_{x\to 0} \frac{e^x - 1}{x} = 1$. Use a plot of $f(x) = \frac{e^x - 1}{x}$ to find a value of $\delta > 0$ such that $|f(x) - 1| < 0.01$ if $|x - 1| < \delta$.

SOLUTION From the plot below, we see that $\delta = 0.02$ will guarantee that

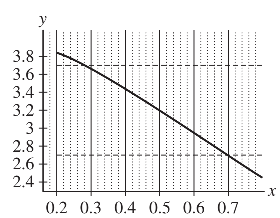
$$\left|\frac{e^x - 1}{x} - 1\right| < 0.01$$

whenever $|x| < \delta$.

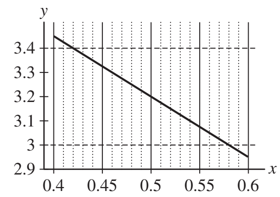


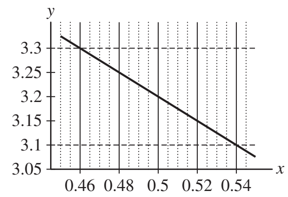
12. GU Let $f(x) = \frac{4}{x^2+1}$ and $\epsilon = 0.5$. Using a plot of $f(x)$, find a value of $\delta > 0$ such that $\left|f(x) - \frac{16}{5}\right| < \epsilon$ for $\left|x - \frac{1}{2}\right| < \delta$. Repeat for $\epsilon = 0.2$ and 0.1.

SOLUTION From the plot below, we see that $\delta = 0.18$ will guarantee that $|f(x) - \frac{16}{5}| < 0.5$ whenever $|x - \frac{1}{2}| < \delta$.



When $\epsilon = 0.2$, we see that $\delta = 0.075$ will guarantee $|f(x) - \frac{16}{5}| < \epsilon$ whenever $|x - \frac{1}{2}| < \delta$ (examine the plot below at the left); when $\epsilon = 0.1$, $\delta = 0.035$ will guarantee $|f(x) - \frac{16}{5}| < \epsilon$ whenever $|x - \frac{1}{2}| < \delta$ (examine the plot below at the right).





13. Consider $\lim_{x\to 2} \dfrac{1}{x}$.

(a) Show that if $|x-2| < 1$, then

$$\left|\frac{1}{x} - \frac{1}{2}\right| < \frac{1}{2}|x-2|$$

(b) Let δ be the smaller of 1 and 2ϵ. Prove:

$$\left|\frac{1}{x} - \frac{1}{2}\right| < \epsilon \qquad \text{if} \qquad 0 < |x-2| < \delta$$

(c) Find a $\delta > 0$ such that $\left|\frac{1}{x} - \frac{1}{2}\right| < 0.01$ if $|x-2| < \delta$.

(d) Prove rigorously that $\lim_{x\to 2} \dfrac{1}{x} = \dfrac{1}{2}$.

SOLUTION

(a) Since $|x-2| < 1$, it follows that $1 < x < 3$, in particular that $x > 1$. Because $x > 1$, then $\dfrac{1}{x} < 1$ and

$$\left|\frac{1}{x} - \frac{1}{2}\right| = \left|\frac{2-x}{2x}\right| = \frac{|x-2|}{2x} < \frac{1}{2}|x-2|.$$

(b) Let $\delta = \min\{1, 2\epsilon\}$ and suppose that $|x-2| < \delta$. Then by part (a) we have

$$\left|\frac{1}{x} - \frac{1}{2}\right| < \frac{1}{2}|x-2| < \frac{1}{2}\delta < \frac{1}{2}\cdot 2\epsilon = \epsilon.$$

(c) Choose $\delta = 0.02$. Then $\left|\dfrac{1}{x} - \dfrac{1}{2}\right| < \dfrac{1}{2}\delta = 0.01$ by part (b).

(d) Let $\epsilon > 0$ be given. Then whenever $0 < |x-2| < \delta = \min\{1, 2\epsilon\}$, we have

$$\left|\frac{1}{x} - \frac{1}{2}\right| < \frac{1}{2}\delta \le \epsilon.$$

Since ϵ was arbitrary, we conclude that $\lim_{x\to 2} \dfrac{1}{x} = \dfrac{1}{2}$.

14. Consider $\lim_{x\to 1} \sqrt{x+3}$.

(a) Show that $|\sqrt{x+3} - 2| < \frac{1}{2}|x-1|$ if $|x-1| < 4$. *Hint:* Multiply the inequality by $|\sqrt{x+3} + 2|$ and observe that $|\sqrt{x+3} + 2| > 2$.

(b) Find $\delta > 0$ such that $|\sqrt{x+3} - 2| < 10^{-4}$ for $|x-1| < \delta$.

(c) Prove rigorously that the limit is equal to 2.

SOLUTION

(a) $|x-1| < 4$ implies that $-3 < x < 5$. Since $x > -3$, then $\sqrt{x+3}$ is defined (and positive), whence

$$\left|\sqrt{x+3} - 2\right| = \left|\frac{\left(\sqrt{x+3} - 2\right)}{1}\,\frac{\left(\sqrt{x+3} + 2\right)}{\left(\sqrt{x+3} + 2\right)}\right| = \frac{|x-1|}{\sqrt{x+3}+2} < \frac{|x-1|}{2}.$$

(b) Choose $\delta = 0.0002$. Then provided $0 < |x-1| < \delta$, we have $x > -3$ and therefore

$$\left|\sqrt{x+3} - 2\right| < \frac{|x-1|}{2} < \frac{\delta}{2} = 0.0001$$

by part (a).

(c) Let $\epsilon > 0$ be given. Then whenever $0 < |x-1| < \delta = \min\{2\epsilon, 4\}$, we have $x > -3$ and thus

$$\left|\sqrt{x+3}-2\right| = \left|\frac{\left(\sqrt{x+3}-2\right)}{1}\,\frac{\left(\sqrt{x+3}+2\right)}{\left(\sqrt{x+3}+2\right)}\right| = \frac{|x-1|}{\sqrt{x+3}+2} < \frac{2\epsilon}{2} = \epsilon.$$

Since ϵ was arbitrary, we conclude that $\lim_{x\to 1}\sqrt{x+3} = 2$.

15. Let $f(x) = \sin x$. Using a calculator, we find:

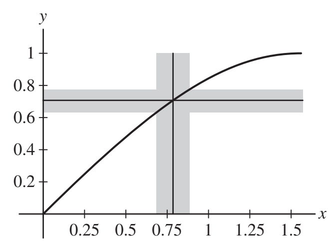
$$f\left(\frac{\pi}{4}-0.1\right) \approx 0.633, \quad f\left(\frac{\pi}{4}\right) \approx 0.707, \quad f\left(\frac{\pi}{4}+0.1\right) \approx 0.774$$

Use these values and the fact that $f(x)$ is increasing on $\left[0, \frac{\pi}{2}\right]$ to justify the statement

$$\left|f(x) - f\left(\frac{\pi}{4}\right)\right| < 0.08 \qquad \text{if} \qquad \left|x - \frac{\pi}{4}\right| < 0.1$$

Then draw a figure like Figure 3 to illustrate this statement.

SOLUTION Since $f(x)$ is increasing on the interval, the three $f(x)$ values tell us that $0.633 \le f(x) \le 0.774$ for all x between $\frac{\pi}{4} - 0.1$ and $\frac{\pi}{4} + 0.1$. We may subtract $f(\frac{\pi}{4})$ from the inequality for $f(x)$. This show that, for $\frac{\pi}{4} - 0.1 < x < \frac{\pi}{4} + 0.1$, $0.633 - f(\frac{\pi}{4}) \le f(x) - f(\frac{\pi}{4}) \le 0.774 - f(\frac{\pi}{4})$. This means that, if $|x - \frac{\pi}{4}| < 0.1$, then $0.633 - 0.707 \le f(x) - f(\frac{\pi}{4}) \le 0.774 - 0.707$, so $-0.074 \le f(x) - f(\frac{\pi}{4}) \le 0.067$. Then $-0.08 < f(x) - f(\frac{\pi}{4}) < 0.08$ follows from this, so $|x - \frac{\pi}{4}| < 0.1$ implies $|f(x) - f(\frac{\pi}{4})| < 0.08$. The figure below illustrates this.



16. Adapt the argument in Example 1 to prove rigorously that $\lim_{x\to c}(ax+b) = ac+b$, where a, b, c are arbitrary.

SOLUTION $|f(x) - (ac+b)| = |(ax+b) - (ac+b)| = |a(x-c)| = |a|\,|x-c|$. This says the gap is $|a|$ times as large as $|x-c|$. Let $\epsilon > 0$. Let $\delta = \epsilon/|a|$. If $|x-c| < \delta$, we get $|f(x) - (ac+b)| = |a|\,|x-c| < |a|\epsilon/|a| = \epsilon$, which is what we had to prove.

17. Adapt the argument in Example 2 to prove rigorously that $\lim_{x\to c} x^2 = c^2$ for all c.

SOLUTION To relate the gap to $|x-c|$, we take

$$\left|x^2 - c^2\right| = |(x+c)(x-c)| = |x+c|\,|x-c|.$$

We choose δ in two steps. First, since we are requiring $|x-c|$ to be small, we require $\delta < |c|$, so that x lies between 0 and $2c$. This means that $|x+c| < 3|c|$, so $|x-c||x+c| < 3|c|\delta$. Next, we require that $\delta < \dfrac{\epsilon}{3|c|}$, so

$$|x-c||x+c| < \frac{\epsilon}{3|c|}3|c| = \epsilon,$$

and we are done.

Therefore, given $\epsilon > 0$, we let

$$\delta = \min\left\{|c|, \frac{\epsilon}{3|c|}\right\}.$$

Then, for $|x-c| < \delta$, we have

$$|x^2 - c^2| = |x-c|\,|x+c| < 3|c|\delta < 3|c|\frac{\epsilon}{3|c|} = \epsilon.$$

18. Adapt the argument in Example 3 to prove rigorously that $\lim_{x\to c} x^{-1} = \frac{1}{c}$ for all $c \neq 0$.

SOLUTION Suppose that $c \neq 0$. To relate the gap to $|x-c|$, we find:

$$\left|x^{-1} - \frac{1}{c}\right| = \left|\frac{c-x}{cx}\right| = \frac{|x-c|}{|cx|}$$

Since $|x-c|$ is required to be small, we may assume from the outset that $|x-c| < |c|/2$, so that x is between $|c|/2$ and $3|c|/2$. This forces $|cx| > |c|/2$, from which

$$\frac{|x-c|}{|cx|} < \frac{2}{|c|}|x-c|.$$

If $\delta < \epsilon(\frac{|c|}{2})$,

$$\left|x^{-1} - \frac{1}{c}\right| < \frac{2}{|c|}|x-c| < \frac{2}{|c|}\frac{|c|}{2}\epsilon = \epsilon.$$

Therefore, given $\epsilon > 0$ we let

$$\delta = \min\left(\frac{|c|}{2}, \epsilon\left(\frac{|c|}{2}\right)\right).$$

We have shown that $|x^{-1} - \frac{1}{c}| < \epsilon$ if $0 < |x-c| < \delta$.

In Exercises 19–24, use the formal definition of the limit to prove the statement rigorously.

19. $\lim_{x\to 4} \sqrt{x} = 2$

SOLUTION Let $\epsilon > 0$ be given. We bound $|\sqrt{x} - 2|$ by multiplying $\dfrac{\sqrt{x}+2}{\sqrt{x}+2}$.

$$|\sqrt{x}-2| = \left|\sqrt{x}-2\left(\frac{\sqrt{x}+2}{\sqrt{x}+2}\right)\right| = \left|\frac{x-4}{\sqrt{x}+2}\right| = |x-4|\left|\frac{1}{\sqrt{x}+2}\right|.$$

We can assume $\delta < 1$, so that $|x-4| < 1$, and hence $\sqrt{x}+2 > \sqrt{3}+2 > 3$. This gives us

$$|\sqrt{x}-2| = |x-4|\left|\frac{1}{\sqrt{x}+2}\right| < |x-4|\frac{1}{3}.$$

Let $\delta = \min(1, 3\epsilon)$. If $|x-4| < \delta$,

$$|\sqrt{x}-2| = |x-4|\left|\frac{1}{\sqrt{x}+2}\right| < |x-4|\frac{1}{3} < \delta\frac{1}{3} < 3\epsilon\frac{1}{3} = \epsilon,$$

thus proving the limit rigorously.

20. $\lim_{x\to 1}(3x^2 + x) = 4$

SOLUTION Let $\epsilon > 0$ be given. We bound $\left|(3x^2+x)-4\right|$ using quadratic factoring.

$$\left|(3x^2+x)-4\right| = \left|3x^2+x-4\right| = |(3x+4)(x-1)| = |x-1||3x+4|.$$

Let $\delta = \min(1, \frac{\epsilon}{10})$. Since $\delta < 1$, we get $|3x+4| < 10$, so that

$$\left|(3x^2+x)-4\right| = |x-1||3x+4| < 10|x-1|.$$

Since $\delta < \frac{\epsilon}{10}$, we get

$$\left|(3x^2+x)-4\right| < 10|x-1| < 10\frac{\epsilon}{10} = \epsilon.$$

21. $\lim_{x\to 1} x^3 = 1$

SOLUTION Let $\epsilon > 0$ be given. We bound $\left|x^3 - 1\right|$ by factoring the difference of cubes:

$$\left|x^3-1\right| = \left|(x^2+x+1)(x-1)\right| = |x-1|\left|x^2+x+1\right|.$$

Let $\delta = \min(1, \frac{\epsilon}{7})$, and assume $|x-1| < \delta$. Since $\delta < 1$, $0 < x < 2$. Since $x^2 + x + 1$ increases as x increases for $x > 0$, $x^2 + x + 1 < 7$ for $0 < x < 2$, and so

$$\left|x^3 - 1\right| = |x-1|\left|x^2 + x + 1\right| < 7|x-1| < 7\frac{\epsilon}{7} = \epsilon$$

and the limit is rigorously proven.

22. $\lim_{x\to 0}(x^2 + x^3) = 0$

SOLUTION Let $\epsilon > 0$ be given. Now,

$$|(x^2 + x^3) - 0| = |x|\,|x|\,|x+1|.$$

Let $\delta = \min(1, \frac{1}{2}\epsilon)$, and suppose $|x| < \delta$. Since $\delta < 1$, $|x| < 1$, so $-1 < x < 1$. This means $|1 + x| < 2$, so that $|x|\,|x+1| < 2$. Thus,

$$\left|(x^2 + x^3) - 0\right| = |x|\,|x|\,|x+1| < 2|x| < 2 \cdot \frac{1}{2}\epsilon = \epsilon.$$

and the limit is rigorously proven.

23. $\lim_{x\to 2} x^{-2} = \frac{1}{4}$

SOLUTION Let $\epsilon > 0$ be given. First, we bound $x^{-2} - \frac{1}{4}$:

$$\left|x^{-2} - \frac{1}{4}\right| = \left|\frac{4 - x^2}{4x^2}\right| = |2-x|\left|\frac{2+x}{4x^2}\right|.$$

Let $\delta = \min(1, \frac{4}{5}\epsilon)$, and suppose $|x-2| < \delta$. Since $\delta < 1$, $|x-2| < 1$, so $1 < x < 3$. This means that $4x^2 > 4$ and $|2+x| < 5$, so that $\dfrac{2+x}{4x^2} < \frac{5}{4}$. We get:

$$\left|x^{-2} - \frac{1}{4}\right| = |2-x|\left|\frac{2+x}{4x^2}\right| < \frac{5}{4}|x-2| < \frac{5}{4}\cdot\frac{4}{5}\epsilon = \epsilon.$$

and the limit is rigorously proven.

24. $\lim_{x\to 0} x\sin\frac{1}{x} = 0$

SOLUTION Let $\epsilon > 0$ be given. Let $\delta = \epsilon$, and assume $|x - 0| = |x| < \delta$. We bound $x \sin\frac{1}{x}$.

$$\left|x\sin\frac{1}{x} - 0\right| = |x|\left|\sin\frac{1}{x}\right| < |x| < \delta = \epsilon.$$

25. Let $f(x) = \dfrac{x}{|x|}$. Prove rigorously that $\lim_{x\to 0} f(x)$ does not exist. *Hint:* Show that for any L, there always exists some x such that $|x| < \delta$ but $|f(x) - L| \ge \frac{1}{2}$, no matter how small δ is taken.

SOLUTION Let L be any real number. Let $\delta > 0$ be any small positive number. Let $x = \frac{\delta}{2}$, which satisfies $|x| < \delta$, and $f(x) = 1$. We consider two cases:

- $(|f(x) - L| \ge \frac{1}{2})$: we are done.
- $(|f(x) - L| < \frac{1}{2})$: This means $\frac{1}{2} < L < \frac{3}{2}$. In this case, let $x = -\frac{\delta}{2}$. $f(x) = -1$, and so $\frac{3}{2} < L - f(x)$.

In either case, there exists an x such that $|x| < \frac{\delta}{2}$, but $|f(x) - L| \ge \frac{1}{2}$.

26. Prove rigorously that $\lim_{x\to 0}|x| = 0$.

SOLUTION Let $\epsilon > 0$ be given and take $\delta = \epsilon$. Then, whenever $|x| < \delta$,

$$||x| - 0| = |x| < \delta = \epsilon,$$

thus proving the limit rigorously.

27. Let $f(x) = \min(x, x^2)$, where $\min(a, b)$ is the minimum of a and b. Prove rigorously that $\lim_{x\to 1} f(x) = 1$.

SOLUTION Let $\epsilon > 0$ and let $\delta = \min(1, \frac{\epsilon}{2})$. Then, whenever $|x - 1| < \delta$, it follows that $0 < x < 2$. If $1 < x < 2$, then $\min(x, x^2) = x$ and

$$|f(x) - 1| = |x - 1| < \delta < \frac{\epsilon}{2} < \epsilon.$$

On the other hand, if $0 < x < 1$, then $\min(x, x^2) = x^2$, $|x + 1| < 2$ and

$$|f(x) - 1| = |x^2 - 1| = |x - 1|\,|x + 1| < 2\delta < \epsilon.$$

Thus, whenever $|x - 1| < \delta$, $|f(x) - 1| < \epsilon$.

28. Prove rigorously that $\lim_{x\to 0} \sin \frac{1}{x}$ does not exist.

SOLUTION Let $\delta > 0$ be a given small positive number, and let L be any real number. We will prove that $\left|\sin \frac{1}{x} - L\right| \geq \frac{1}{2}$ for some x such that $|x| < \delta$.

Let $N > 0$ be a positive integer large enough so that $\frac{2}{(4N+1)\pi} < \delta$. Let

$$x_1 = \frac{2}{(4N+1)\pi},$$

$$x_2 = \frac{2}{(4N+3)\pi}.$$

$$x_2 < x_1 < \delta.$$

$$\sin\frac{1}{x_1} = \sin\frac{(4N+1)\pi}{2} = 1 \quad \text{and} \quad \sin\frac{1}{x_2} = \sin\frac{(4N+3)\pi}{2} = -1.$$

If $|\sin \frac{1}{x_1} - L| \geq \frac{1}{2}$, we are done. Therefore, let's assume that $|\sin \frac{1}{x_1} - L| < \frac{1}{2}$. $-\frac{1}{2} < \sin\frac{1}{x_1} - L < \frac{1}{2}$, so $L - \frac{1}{2} < \sin\frac{1}{x_1} = 1 < L + \frac{1}{2}$. This means $L > \frac{1}{2}$, so that $|\sin\frac{1}{x_2} - L| = |-1 - L| > \frac{3}{2}$. In either case, there is an x such that $|x| < \delta$ but $|\sin\frac{1}{x} - L| \geq \frac{1}{2}$, so no limit L can exist.

29. First, use the identity

$$\sin x + \sin y = 2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)$$

to verify the relation

$$\sin(a+h) - \sin a = h\frac{\sin(h/2)}{h/2}\cos\left(a + \frac{h}{2}\right) \qquad \boxed{6}$$

Then use the inequality $\left|\frac{\sin x}{x}\right| \leq 1$ for $x \neq 0$ to show that $|\sin(a+h) - \sin a| < |h|$ for all a. Finally, prove rigorously that $\lim_{x\to a} \sin x = \sin a$.

SOLUTION We first write

$$\sin(a+h) - \sin a = \sin(a+h) + \sin(-a).$$

Applying the identity with $x = a + h$, $y = -a$, yields:

$$\begin{aligned}\sin(a+h) - \sin a &= \sin(a+h) + \sin(-a) = 2\sin\left(\frac{a+h-a}{2}\right)\cos\left(\frac{2a+h}{2}\right)\\ &= 2\sin\left(\frac{h}{2}\right)\cos\left(a+\frac{h}{2}\right) = 2\left(\frac{h}{h}\right)\sin\left(\frac{h}{2}\right)\cos\left(a+\frac{h}{2}\right) = h\frac{\sin(h/2)}{h/2}\cos\left(a+\frac{h}{2}\right).\end{aligned}$$

Therefore,

$$|\sin(a+h) - \sin a| = |h|\left|\frac{\sin(h/2)}{h/2}\right|\left|\cos\left(a+\frac{h}{2}\right)\right|.$$

Using the fact that $\left|\frac{\sin\theta}{\theta}\right| < 1$ and that $|\cos\theta| \leq 1$, and making the substitution $h = x - a$, we see that this last relation is equivalent to

$$|\sin x - \sin a| < |x - a|.$$

Now, to prove the desired limit, let $\epsilon > 0$, and take $\delta = \epsilon$. If $|x - a| < \delta$, then

$$|\sin x - \sin a| < |x - a| < \delta = \epsilon,$$

Therefore, a δ was found for arbitrary ϵ, and the proof is complete.

Further Insights and Challenges

30. Uniqueness of the Limit Prove that a function converges to at most one limiting value. In other words, use the limit definition to prove that if $\lim_{x\to c} f(x) = L_1$ and $\lim_{x\to c} f(x) = L_2$, then $L_1 = L_2$.

SOLUTION Let $\epsilon > 0$ be given. Since $\lim_{x\to c} f(x) = L_1$, there exists δ_1 such that if $|x - c| < \delta_1$ then $|f(x) - L_1| < \epsilon$. Similarly, since $\lim_{x\to c} f(x) = L_2$, there exists δ_2 such that if $|x - c| < \delta_2$ then $|f(x) - L_2| < \epsilon$. Now let $|x - c| < \min(\delta_1, \delta_2)$ and observe that

$$\begin{aligned}|L_1 - L_2| &= |L_1 - f(x) + f(x) - L_2| \\ &\le |L_1 - f(x)| + |f(x) - L_2| \\ &= |f(x) - L_1| + |f(x) - L_2| < 2\epsilon.\end{aligned}$$

So, $|L_1 - L_2| < 2\epsilon$ for any $\epsilon > 0$. We have $|L_1 - L_2| = \lim_{\epsilon\to 0} |L_1 - L_2| < \lim_{\epsilon\to 0} 2\epsilon = 0$. Therefore, $|L_1 - L_2| = 0$ and, hence, $L_1 = L_2$.

In Exercises 31–33, prove the statement using the formal limit definition.

31. The Constant Multiple Law [Theorem 1, part (ii) in Section 2.3, p. 77]

SOLUTION Suppose that $\lim_{x\to c} f(x) = L$. We wish to prove that $\lim_{x\to c} af(x) = aL$.

Let $\epsilon > 0$ be given. $\epsilon/|a|$ is also a positive number. Since $\lim_{x\to c} f(x) = L$, we know there is a $\delta > 0$ such that $|x - c| < \delta$ forces $|f(x) - L| < \epsilon/|a|$. Suppose $|x - c| < \delta$. $|af(x) - aL| = |a||f(x) - aL| < |a|(\epsilon/|a|) = \epsilon$, so the rule is proven.

32. The Squeeze Theorem. (Theorem 1 in Section 2.6, p. 96)

SOLUTION *Proof of the Squeeze Theorem.* Suppose that (i) the inequalities $h(x) \le f(x) \le g(x)$ hold for all x near (but not equal to) a and (ii) $\lim_{x\to a} h(x) = \lim_{x\to a} g(x) = L$. Let $\epsilon > 0$ be given.

- By (i), there exists a $\delta_1 > 0$ such that $h(x) \le f(x) \le g(x)$ whenever $0 < |x - a| < \delta_1$.
- By (ii), there exist $\delta_2 > 0$ and $\delta_3 > 0$ such that $|h(x) - L| < \epsilon$ whenever $0 < |x - a| < \delta_2$ and $|g(x) - L| < \epsilon$ whenever $0 < |x - a| < \delta_3$.
- Choose $\delta = \min\{\delta_1, \delta_2, \delta_3\}$. Then whenever $0 < |x - a| < \delta$ we have $L - \epsilon < h(x) \le f(x) \le g(x) < L + \epsilon$; i.e., $|f(x) - L| < \epsilon$. Since ϵ was arbitrary, we conclude that $\lim_{x\to a} f(x) = L$.

33. The Product Law [Theorem 1, part (iii) in Section 2.3, p. 77]. *Hint:* Use the identity

$$f(x)g(x) - LM = (f(x) - L)\,g(x) + L(g(x) - M)$$

SOLUTION Before we can prove the Product Law, we need to establish one preliminary result. We are given that $\lim_{x\to c} g(x) = M$. Consequently, if we set $\epsilon = 1$, then the definition of a limit guarantees the existence of a $\delta_1 > 0$ such that whenever $0 < |x - c| < \delta_1$, $|g(x) - M| < 1$. Applying the inequality $|g(x)| - |M| \le |g(x) - M|$, it follows that $|g(x)| < 1 + |M|$. In other words, because $\lim_{x\to c} g(x) = M$, there exists a $\delta_1 > 0$ such that $|g(x)| < 1 + |M|$ whenever $0 < |x - c| < \delta_1$.

We can now prove the Product Law. Let $\epsilon > 0$. As proven above, because $\lim_{x\to c} g(x) = M$, there exists a $\delta_1 > 0$ such that $|g(x)| < 1 + |M|$ whenever $0 < |x - c| < \delta_1$. Furthermore, by the definition of a limit, $\lim_{x\to c} g(x) = M$ implies there exists a $\delta_2 > 0$ such that $|g(x) - M| < \frac{\epsilon}{2(1+|L|)}$ whenever $0 < |x - c| < \delta_2$. We have included the "1+" in the denominator to avoid division by zero in case $L = 0$. The reason for including the factor of 2 in the denominator will become clear shortly. Finally, because $\lim_{x\to c} f(x) = L$, there exists a $\delta_3 > 0$ such that $|f(x) - L| < \frac{\epsilon}{2(1+|M|)}$ whenever $0 < |x - c| < \delta_3$. Now, let $\delta = \min(\delta_1, \delta_2, \delta_3)$. Then, for all x satisfying $0 < |x - c| < \delta$, we have

$$\begin{aligned}|f(x)g(x) - LM| &= |(f(x) - L)g(x) + L(g(x) - M)| \\ &\le |f(x) - L|\,|g(x)| + |L|\,|g(x) - M| \\ &< \frac{\epsilon}{2(1+|M|)}(1 + |M|) + |L|\frac{\epsilon}{2(1+|L|)} \\ &< \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon.\end{aligned}$$

Hence,

$$\lim_{x\to c} f(x)g(x) = LM = \lim_{x\to c} f(x) \cdot \lim_{x\to c} g(x).$$

34. Let $f(x) = 1$ if x is rational and $f(x) = 0$ if x is irrational. Prove that $\lim_{x\to c} f(x)$ does not exist for any c.

SOLUTION Let c be any number, and let $\delta > 0$ be an arbitrary small number. We will prove that there is an x such that $|x - c| < \delta$, but $|f(x) - f(c)| > \frac{1}{2}$. c must be either irrational or rational. If c is rational, then $f(c) = 1$. Since the irrational numbers are dense, there is at least one irrational number z such that $|z - c| < \delta$. $|f(z) - f(c)| = 1 > \frac{1}{2}$, so the function is discontinuous at $x = c$. On the other hand, if c is irrational, then there is a *rational* number q such that $|q - c| < \delta$. $|f(q) - f(c)| = |1 - 0| = 1 > \frac{1}{2}$, so the function is discontinuous at $x = c$.

35. Here is a function with strange continuity properties:

$$f(x) = \begin{cases} \dfrac{1}{q} & \text{if } x \text{ is the rational number } p/q \text{ in lowest terms} \\ 0 & \text{if } x \text{ is an irrational number} \end{cases}$$

(a) Show that $f(x)$ is discontinuous at c if c is rational. *Hint:* There exist irrational numbers arbitrarily close to c.

(b) Show that $f(x)$ is continuous at c if c is irrational. *Hint:* Let I be the interval $\{x : |x - c| < 1\}$. Show that for any $Q > 0$, I contains at most finitely many fractions p/q with $q < Q$. Conclude that there is a δ such that all fractions in $\{x : |x - c| < \delta\}$ have a denominator larger than Q.

SOLUTION

(a) Let c be any rational number and suppose that, in lowest terms, $c = p/q$, where p and q are integers. To prove the discontinuity of f at c, we must show there is an $\epsilon > 0$ such that for any $\delta > 0$ there is an x for which $|x - c| < \delta$, but that $|f(x) - f(c)| > \epsilon$. Let $\epsilon = \frac{1}{2q}$ and $\delta > 0$. Since there is at least one irrational number between any two distinct real numbers, there is some irrational x between c and $c + \delta$. Hence, $|x - c| < \delta$, but $|f(x) - f(c)| = |0 - \frac{1}{q}| = \frac{1}{q} > \frac{1}{2q} = \epsilon$.

(b) Let c be irrational, let $\epsilon > 0$ be given, and let $N > 0$ be a prime integer sufficiently large so that $\frac{1}{N} < \epsilon$. Let $\frac{p_1}{q_1}, \dots, \frac{p_m}{q_m}$ be all rational numbers $\frac{p}{q}$ in lowest terms such that $|\frac{p}{q} - c| < 1$ and $q < N$. Since N is finite, this is a finite list; hence, one number $\frac{p_i}{q_i}$ in the list must be closest to c. Let $\delta = \frac{1}{2}|\frac{p_i}{q_i} - c|$. By construction, $|\frac{p_i}{q_i} - c| > \delta$ for all $i = 1 \dots m$. Therefore, for any rational number $\frac{p}{q}$ such that $|\frac{p}{q} - c| < \delta$, $q > N$, so $\frac{1}{q} < \frac{1}{N} < \epsilon$.

Therefore, for any *rational* number x such that $|x - c| < \delta$, $|f(x) - f(c)| < \epsilon$. $|f(x) - f(c)| = 0$ for any irrational number x, so $|x - c| < \delta$ implies that $|f(x) - f(c)| < \epsilon$ for any number x.

CHAPTER REVIEW EXERCISES

1. The position of a particle at time t (s) is $s(t) = \sqrt{t^2 + 1}$ m. Compute its average velocity over [2, 5] and estimate its instantaneous velocity at $t = 2$.

SOLUTION Let $s(t) = \sqrt{t^2 + 1}$. The average velocity over [2, 5] is

$$\frac{s(5) - s(2)}{5 - 2} = \frac{\sqrt{26} - \sqrt{5}}{3} \approx 0.954 \text{ m/s}.$$

From the data in the table below, we estimate that the instantaneous velocity at $t = 2$ is approximately 0.894 m/s.

interval	[1.9, 2]	[1.99, 2]	[1.999, 2]	[2, 2.001]	[2, 2.01]	[2, 2.1]
average ROC	0.889769	0.893978	0.894382	0.894472	0.894873	0.898727

2. The "wellhead" price p of natural gas in the United States (in dollars per 1000 ft^3) on the first day of each month in 2008 is listed in the table below.

J	F	M	A	M	J
6.99	7.55	8.29	8.94	9.81	10.82
J	A	S	O	N	D
10.62	8.32	7.27	6.36	5.97	5.87

Compute the average rate of change of p (in dollars per 1000 ft^3 per month) over the quarterly periods January–March, April–June, and July–September.

SOLUTION To determine the average rate of change in price over the first quarter, divide the difference between the April and January prices by the three-month duration of the quarter. This yields

$$\frac{8.94 - 6.99}{3} = 0.65 \text{ dollars per 1000 ft}^3 \text{ per month.}$$

In a similar manner, we calculate the average rates of change for the second and third quarters of the year to be

$$\frac{10.62 - 8.94}{3} = 0.56 \text{ dollars per 1000 ft}^3 \text{ per month.}$$

and

$$\frac{6.36 - 10.62}{3} = -1.42 \text{ dollars per 1000 ft}^3 \text{ per month.}$$

3. For a whole number n, let $P(n)$ be the number of *partitions* of n, that is, the number of ways of writing n as a sum of one or more whole numbers. For example, $P(4) = 5$ since the number 4 can be partitioned in five different ways: 4, $3+1$, $2+2$, $2+1+1$, and $1+1+1+1$. Treating $P(n)$ as a continuous function, use Figure 1 to estimate the rate of change of $P(n)$ at $n = 12$.

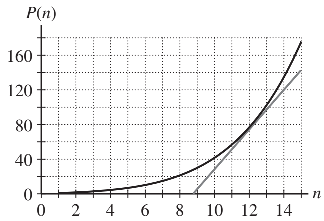


FIGURE 1 Graph of $P(n)$.

SOLUTION The tangent line drawn in the figure appears to pass through the points (15, 140) and (10.5, 40). We therefore estimate that the rate of change of $P(n)$ at $n = 12$ is

$$\frac{140 - 40}{15 - 10.5} = \frac{100}{4.5} = \frac{200}{9}.$$

4. The average velocity v (m/s) of an oxygen molecule in the air at temperature T (°C) is $v = 25.7\sqrt{273.15 + T}$. What is the average speed at $T = 25°$ (room temperature)? Estimate the rate of change of average velocity with respect to temperature at $T = 25°$. What are the units of this rate?

SOLUTION Let $v(T) = 25.7\sqrt{273.15 + T}$. The average velocity at $T = 25°$C is

$$v(25) = 25.7\sqrt{273.15 + 25} \approx 443.76 \text{ m/s.}$$

From the data in the table below, we estimate that the rate of change of velocity with respect to temperature when $T = 25°$C is 0.7442 m/s^2.

interval	[24.9, 25]	[24.99, 25]	[24.999, 25]	[25, 25.001]	[25, 25.01]	[25, 25.1]
average ROC	0.744256	0.744199	0.744193	0.744195	0.744187	0.744131

In Exercises 5–10, estimate the limit numerically to two decimal places or state that the limit does not exist.

5. $\lim_{x\to 0} \frac{1 - \cos^3(x)}{x^2}$

SOLUTION Let $f(x) = \frac{1-\cos^3 x}{x^2}$. The data in the table below suggests that

$$\lim_{x\to 0} \frac{1 - \cos^3 x}{x^2} \approx 1.50.$$

In constructing the table, we take advantage of the fact that f is an even function.

x	± 0.001	± 0.01	± 0.1
$f(x)$	1.500000	1.499912	1.491275

(The exact value is $\frac{3}{2}$.)

6. $\lim_{x \to 1} x^{1/(x-1)}$

SOLUTION Let $f(x) = x^{1/(x-1)}$. The data in the table below suggests that

$$\lim_{x \to 1} x^{1/(x-1)} \approx 2.72.$$

x	0.9	0.99	0.999	1.001	1.01	1.1
$f(x)$	2.867972	2.731999	2.719642	2.716924	2.704814	2.593742

(The exact value is e.)

7. $\lim_{x \to 2} \frac{x^x - 4}{x^2 - 4}$

SOLUTION Let $f(x) = \frac{x^x - 4}{x^2 - 4}$. The data in the table below suggests that

$$\lim_{x \to 2} \frac{x^x - 4}{x^2 - 4} \approx 1.69.$$

x	1.9	1.99	1.999	2.001	2.01	2.1
$f(x)$	1.575461	1.680633	1.691888	1.694408	1.705836	1.828386

(The exact value is $1 + \ln 2$.)

8. $\lim_{x \to 2} \frac{x - 2}{\ln(3x - 5)}$

SOLUTION Let $f(x) = \frac{x-2}{\ln(3x-5)}$. The data in the table below suggests that

$$\lim_{x \to 2} \frac{x - 2}{\ln(3x - 5)} \approx 0.33.$$

x	1.9	1.99	1.999	2.001	2.01	2.1
$f(x)$	0.280367	0.328308	0.332833	0.333833	0.338309	0.381149

(The exact value is $1/3$.)

9. $\lim_{x \to 1} \left(\frac{7}{1 - x^7} - \frac{3}{1 - x^3} \right)$

SOLUTION Let $f(x) = \left(\frac{7}{1-x^7} - \frac{3}{1-x^3} \right)$. The data in the table below suggests that

$$\lim_{x \to 1} \left(\frac{7}{1 - x^7} - \frac{3}{1 - x^3} \right) \approx 2.00.$$

x	0.9	0.99	0.999	1.001	1.01	1.1
$f(x)$	2.347483	2.033498	2.003335	1.996668	1.966835	1.685059

(The exact value is 2.)

10. $\lim_{x \to 2} \frac{3^x - 9}{5^x - 25}$

SOLUTION Let $f(x) = \frac{3^x - 9}{5^x - 25}$. The data in the table below suggests that

$$\lim_{x \to 2} \frac{3^x - 9}{5^x - 25} \approx 0.246.$$

x	1.9	1.99	1.999	2.001	2.01	2.1
$f(x)$	0.251950	0.246365	0.245801	0.245675	0.245110	0.239403

(The exact value is $\frac{9}{25} \frac{\ln 3}{\ln 5}$.)

In Exercises 11–50, evaluate the limit if it exists. If not, determine whether the one-sided limits exist (finite or infinite).

11. $\lim_{x\to 4}(3+x^{1/2})$

SOLUTION $\lim_{x\to 4}(3+x^{1/2}) = 3+\sqrt{4} = 5.$

12. $\lim_{x\to 1}\frac{5-x^2}{4x+7}$

SOLUTION $\lim_{x\to 1}\frac{5-x^2}{4x+7} = \frac{5-1^2}{4(1)+7} = \frac{4}{11}.$

13. $\lim_{x\to -2}\frac{4}{x^3}$

SOLUTION $\lim_{x\to -2}\frac{4}{x^3} = \frac{4}{(-2)^3} = -\frac{1}{2}.$

14. $\lim_{x\to -1}\frac{3x^2+4x+1}{x+1}$

SOLUTION $\lim_{x\to -1}\frac{3x^2+4x+1}{x+1} = \lim_{x\to -1}\frac{(3x+1)(x+1)}{x+1} = \lim_{x\to -1}(3x+1) = 3(-1)+1 = -2.$

15. $\lim_{t\to 9}\frac{\sqrt{t}-3}{t-9}$

SOLUTION $\lim_{t\to 9}\frac{\sqrt{t}-3}{t-9} = \lim_{t\to 9}\frac{\sqrt{t}-3}{(\sqrt{t}-3)(\sqrt{t}+3)} = \lim_{t\to 9}\frac{1}{\sqrt{t}+3} = \frac{1}{\sqrt{9}+3} = \frac{1}{6}.$

16. $\lim_{x\to 3}\frac{\sqrt{x+1}-2}{x-3}$

SOLUTION

$$\begin{aligned}\lim_{x\to 3}\frac{\sqrt{x+1}-2}{x-3} &= \lim_{x\to 3}\frac{\sqrt{x+1}-2}{x-3}\cdot\frac{\sqrt{x+1}+2}{\sqrt{x+1}+2} = \lim_{x\to 3}\frac{(x+1)-4}{(x-3)(\sqrt{x+1}+2)}\\ &= \lim_{x\to 3}\frac{1}{\sqrt{x+1}+2} = \frac{1}{\sqrt{3+1}+2} = \frac{1}{4}.\end{aligned}$$

17. $\lim_{x\to 1}\frac{x^3-x}{x-1}$

SOLUTION $\lim_{x\to 1}\frac{x^3-x}{x-1} = \lim_{x\to 1}\frac{x(x-1)(x+1)}{x-1} = \lim_{x\to 1}x(x+1) = 1(1+1) = 2.$

18. $\lim_{h\to 0}\frac{2(a+h)^2-2a^2}{h}$

SOLUTION

$$\lim_{h\to 0}\frac{2(a+h)^2-2a^2}{h} = \lim_{h\to 0}\frac{2a^2+4ah+2h^2-2a^2}{h} = \lim_{h\to 0}\frac{h(4a+2h)}{h} = \lim_{h\to 0}(4a+2h) = 4a+2(0) = 4a.$$

19. $\lim_{t\to 9}\frac{t-6}{\sqrt{t}-3}$

SOLUTION Because the one-sided limits

$$\lim_{t\to 9-}\frac{t-6}{\sqrt{t}-3} = -\infty \qquad \text{and} \qquad \lim_{t\to 9+}\frac{t-6}{\sqrt{t}-3} = \infty,$$

are not equal, the two-sided limit

$$\lim_{t\to 9}\frac{t-6}{\sqrt{t}-3} \qquad \text{does not exist.}$$

20. $\lim_{s \to 0} \frac{1 - \sqrt{s^2 + 1}}{s^2}$

SOLUTION

$$\lim_{s \to 0} \frac{1 - \sqrt{s^2+1}}{s^2} = \lim_{s \to 0} \frac{1 - \sqrt{s^2+1}}{s^2} \cdot \frac{1 + \sqrt{s^2+1}}{1 + \sqrt{s^2+1}} = \lim_{s \to 0} \frac{1 - (s^2+1)}{s^2(1 + \sqrt{s^2+1})}$$
$$= \lim_{s \to 0} \frac{-1}{1 + \sqrt{s^2+1}} = \frac{-1}{1 + \sqrt{0^2+1}} = -\frac{1}{2}.$$

21. $\lim_{x \to -1+} \frac{1}{x+1}$

SOLUTION For $x > -1$, $x + 1 > 0$. Therefore,

$$\lim_{x \to -1+} \frac{1}{x+1} = \infty.$$

22. $\lim_{y \to \frac{1}{3}} \frac{3y^2 + 5y - 2}{6y^2 - 5y + 1}$

SOLUTION

$$\lim_{y \to \frac{1}{3}} \frac{3y^2 + 5y - 2}{6y^2 - 5y + 1} = \lim_{y \to \frac{1}{3}} \frac{(3y-1)(y+2)}{(3y-1)(2y-1)} = \lim_{y \to \frac{1}{3}} \frac{y+2}{2y-1} = -7.$$

23. $\lim_{x \to 1} \frac{x^3 - 2x}{x - 1}$

SOLUTION Because the one-sided limits

$$\lim_{x \to 1-} \frac{x^3 - 2x}{x - 1} = \infty \qquad \text{and} \qquad \lim_{x \to 1+} \frac{x^3 - 2x}{x - 1} = -\infty,$$

are not equal, the two-sided limit

$$\lim_{x \to 1} \frac{x^3 - 2x}{x - 1} \qquad \text{does not exist.}$$

24. $\lim_{a \to b} \frac{a^2 - 3ab + 2b^2}{a - b}$

SOLUTION $\lim_{a \to b} \frac{a^2 - 3ab + 2b^2}{a - b} = \lim_{a \to b} \frac{(a-b)(a-2b)}{a-b} = \lim_{a \to b} (a - 2b) = b - 2b = -b.$

25. $\lim_{x \to 0} \frac{e^{3x} - e^x}{e^x - 1}$

SOLUTION

$$\lim_{x \to 0} \frac{e^{3x} - e^x}{e^x - 1} = \lim_{x \to 0} \frac{e^x(e^x - 1)(e^x + 1)}{e^x - 1} = \lim_{x \to 0} e^x(e^x + 1) = 1 \cdot 2 = 2.$$

26. $\lim_{\theta \to 0} \frac{\sin 5\theta}{\theta}$

SOLUTION

$$\lim_{\theta \to 0} \frac{\sin 5\theta}{\theta} = 5 \lim_{\theta \to 0} \frac{\sin 5\theta}{5\theta} = 5(1) = 5.$$

27. $\lim_{x \to 1.5} \frac{[x]}{x}$

SOLUTION $\lim_{x \to 1.5} \frac{[x]}{x} = \frac{[1.5]}{1.5} = \frac{1}{1.5} = \frac{2}{3}.$

28. $\lim_{\theta \to \frac{\pi}{4}} \sec\theta$

SOLUTION

$$\lim_{\theta \to \frac{\pi}{4}} \sec\theta = \sec\frac{\pi}{4} = \sqrt{2}.$$

29. $\lim_{z\to -3} \frac{z+3}{z^2+4z+3}$

SOLUTION

$$\lim_{z\to -3} \frac{z+3}{z^2+4z+3} = \lim_{z\to -3} \frac{z+3}{(z+3)(z+1)} = \lim_{z\to -3} \frac{1}{z+1} = -\frac{1}{2}.$$

30. $\lim_{x\to 1} \frac{x^3-ax^2+ax-1}{x-1}$

SOLUTION Using

$$x^3-ax^2+ax-1 = (x-1)(x^2+x+1) - ax(x-1) = (x-1)(x^2+x-ax+1)$$

we find

$$\lim_{x\to 1} \frac{x^3-ax^2+ax-1}{x-1} = \lim_{x\to 1} \frac{(x-1)(x^2+x-ax+1)}{x-1} = \lim_{x\to 1}(x^2+x-ax+1)$$
$$= 1^2+1-a(1)+1 = 3-a.$$

31. $\lim_{x\to b} \frac{x^3-b^3}{x-b}$

SOLUTION $\lim_{x\to b} \frac{x^3-b^3}{x-b} = \lim_{x\to b} \frac{(x-b)(x^2+xb+b^2)}{x-b} = \lim_{x\to b}(x^2+xb+b^2) = b^2+b(b)+b^2 = 3b^2.$

32. $\lim_{x\to 0} \frac{\sin 4x}{\sin 3x}$

SOLUTION

$$\lim_{x\to 0} \frac{\sin 4x}{\sin 3x} = \frac{4}{3} \lim_{x\to 0} \frac{\sin 4x}{4x} \cdot \frac{3x}{\sin 3x} = \frac{4}{3} \lim_{x\to 0} \frac{\sin 4x}{4x} \cdot \lim_{x\to 0} \frac{3x}{\sin 3x} = \frac{4}{3}(1)(1) = \frac{4}{3}.$$

33. $\lim_{x\to 0} \left(\frac{1}{3x} - \frac{1}{x(x+3)}\right)$

SOLUTION $\lim_{x\to 0} \left(\frac{1}{3x} - \frac{1}{x(x+3)}\right) = \lim_{x\to 0} \frac{(x+3)-3}{3x(x+3)} = \lim_{x\to 0} \frac{1}{3(x+3)} = \frac{1}{3(0+3)} = \frac{1}{9}.$

34. $\lim_{\theta\to \frac{1}{4}} 3^{\tan(\pi\theta)}$

SOLUTION

$$\lim_{\theta\to \frac{1}{4}} 3^{\tan(\pi\theta)} = 3^{\tan(\pi/4)} = 3^1 = 3.$$

35. $\lim_{x\to 0-} \frac{[x]}{x}$

SOLUTION For x sufficiently close to zero but negative, $[x] = -1$. Therefore,

$$\lim_{x\to 0-} \frac{[x]}{x} = \lim_{x\to 0-} \frac{-1}{x} = \infty.$$

36. $\lim_{x\to 0+} \frac{[x]}{x}$

SOLUTION For x sufficiently close to zero but positive, $[x] = 0$. Therefore,

$$\lim_{x\to 0+} \frac{[x]}{x} = \lim_{x\to 0+} \frac{0}{x} = 0.$$

37. $\lim_{\theta\to \frac{\pi}{2}} \theta \sec\theta$

SOLUTION Because the one-sided limits

$$\lim_{\theta\to \frac{\pi}{2}-} \theta\sec\theta = \infty \qquad \text{and} \qquad \lim_{\theta\to \frac{\pi}{2}+} \theta\sec\theta = -\infty$$

are not equal, the two-sided limit

$$\lim_{\theta \to \frac{\pi}{2}} \theta \sec \theta \qquad \text{does not exist.}$$

38. $\lim_{y \to 2} \ln\left(\sin \frac{\pi}{y}\right)$

SOLUTION

$$\lim_{y \to 2} \ln\left(\sin \frac{\pi}{y}\right) = \ln\left(\sin \frac{\pi}{2}\right) = \ln 1 = 0.$$

39. $\lim_{\theta \to 0} \frac{\cos \theta - 2}{\theta}$

SOLUTION Because the one-sided limits

$$\lim_{\theta \to 0-} \frac{\cos \theta - 2}{\theta} = \infty \qquad \text{and} \qquad \lim_{\theta \to 0+} \frac{\cos \theta - 2}{\theta} = -\infty$$

are not equal, the two-sided limit

$$\lim_{\theta \to 0} \frac{\cos \theta - 2}{\theta} \qquad \text{does not exist.}$$

40. $\lim_{x \to 4.3} \frac{1}{x - [x]}$

SOLUTION $\lim_{x \to 4.3} \frac{1}{x - [x]} = \frac{1}{4.3 - [4.3]} = \frac{1}{0.3} = \frac{10}{3}.$

41. $\lim_{x \to 2-} \frac{x - 3}{x - 2}$

SOLUTION For x close to 2 but less than 2, $x - 3 < 0$ and $x - 2 < 0$. Therefore,

$$\lim_{x \to 2-} \frac{x - 3}{x - 2} = \infty.$$

42. $\lim_{t \to 0} \frac{\sin^2 t}{t^3}$

SOLUTION Note that

$$\frac{\sin^2 t}{t^3} = \frac{\sin t}{t} \cdot \frac{\sin t}{t} \cdot \frac{1}{t}.$$

As $t \to 0$, each factor of $\frac{\sin t}{t}$ approaches 1; however, the factor $\frac{1}{t}$ tends to $-\infty$ as $t \to 0-$ and tends to ∞ as $t \to 0+$. Consequently,

$$\lim_{t \to 0-} \frac{\sin^2 t}{t^3} = -\infty, \quad \lim_{t \to 0+} \frac{\sin^2 t}{t^3} = \infty$$

and

$$\lim_{t \to 0} \frac{\sin^2 t}{t^3} \qquad \text{does not exist.}$$

43. $\lim_{x \to 1+} \left(\frac{1}{\sqrt{x - 1}} - \frac{1}{\sqrt{x^2 - 1}}\right)$

SOLUTION $\lim_{x \to 1+} \left(\frac{1}{\sqrt{x - 1}} - \frac{1}{\sqrt{x^2 - 1}}\right) = \lim_{x \to 1+} \frac{\sqrt{x + 1} - 1}{\sqrt{x^2 - 1}} = \infty.$

44. $\lim_{t \to e} \sqrt{t}(\ln t - 1)$

SOLUTION

$$\lim_{t \to e} \sqrt{t}(\ln t - 1) = \lim_{t \to e} \sqrt{t} \cdot \lim_{t \to e} (\ln t - 1) = \sqrt{e}(\ln e - 1) = 0.$$

45. $\lim_{x\to\frac{\pi}{2}} \tan x$

SOLUTION Because the one-sided limits

$$\lim_{x\to\frac{\pi}{2}-} \tan x = \infty \qquad \text{and} \qquad \lim_{x\to\frac{\pi}{2}+} \tan x = -\infty$$

are not equal, the two-sided limit

$$\lim_{x\to\frac{\pi}{2}} \tan x \qquad \text{does not exist.}$$

46. $\lim_{t\to 0} \cos \frac{1}{t}$

SOLUTION As $t \to 0$, $\frac{1}{t}$ grows without bound and $\cos(\frac{1}{t})$ oscillates faster and faster. Consequently,

$$\lim_{t\to 0} \cos\left(\frac{1}{t}\right) \qquad \text{does not exist.}$$

The same is true for both one-sided limits.

47. $\lim_{t\to 0+} \sqrt{t}\cos \frac{1}{t}$

SOLUTION For $t > 0$,

$$-1 \le \cos\left(\frac{1}{t}\right) \le 1,$$

so

$$-\sqrt{t} \le \sqrt{t}\cos\left(\frac{1}{t}\right) \le \sqrt{t}.$$

Because

$$\lim_{t\to 0+} -\sqrt{t} = \lim_{t\to 0+} \sqrt{t} = 0,$$

it follows from the Squeeze Theorem that

$$\lim_{t\to 0+} \sqrt{t}\cos\left(\frac{1}{t}\right) = 0.$$

48. $\lim_{x\to 5+} \frac{x^2-24}{x^2-25}$

SOLUTION For x close to 5 but larger than 5, $x^2 - 24 > 0$ and $x^2 - 25 > 0$. Therefore,

$$\lim_{x\to 5+} \frac{x^2-24}{x^2-25} = \infty.$$

49. $\lim_{x\to 0} \frac{\cos x - 1}{\sin x}$

SOLUTION

$$\lim_{x\to 0} \frac{\cos x - 1}{\sin x} = \lim_{x\to 0} \frac{\cos x - 1}{\sin x} \cdot \frac{\cos x + 1}{\cos x + 1} = \lim_{x\to 0} \frac{-\sin^2 x}{\sin x(\cos x + 1)} = -\lim_{x\to 0} \frac{\sin x}{\cos x + 1} = -\frac{0}{1+1} = 0.$$

50. $\lim_{\theta\to 0} \frac{\tan\theta - \sin\theta}{\sin^3\theta}$

SOLUTION

$$\lim_{\theta\to 0} \frac{\tan\theta - \sin\theta}{\sin^3\theta} = \lim_{\theta\to 0} \frac{\sec\theta - 1}{\sin^2\theta} = \lim_{\theta\to 0} \frac{\sec\theta - 1}{\sin^2\theta} \cdot \frac{\sec\theta + 1}{\sec\theta + 1} = \lim_{\theta\to 0} \frac{\tan^2\theta}{\sin^2\theta(\sec\theta + 1)}$$

$$= \lim_{\theta\to 0} \frac{\sec^2\theta}{\sec\theta + 1} = \frac{1}{1+1} = \frac{1}{2}.$$

51. Find the left- and right-hand limits of the function $f(x)$ in Figure 2 at $x = 0, 2, 4$. State whether $f(x)$ is left- or right-continuous (or both) at these points.

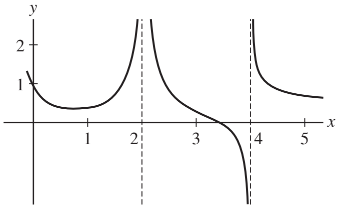

FIGURE 2

SOLUTION According to the graph of $f(x)$,

$$\lim_{x\to 0-} f(x) = \lim_{x\to 0+} f(x) = 1$$
$$\lim_{x\to 2-} f(x) = \lim_{x\to 2+} f(x) = \infty$$
$$\lim_{x\to 4-} f(x) = -\infty$$
$$\lim_{x\to 4+} f(x) = \infty.$$

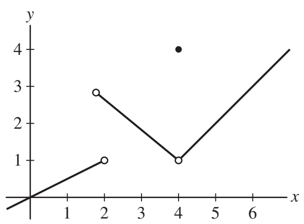
The function is both left- and right-continuous at $x = 0$ and neither left- nor right-continuous at $x = 2$ and $x = 4$.

52. Sketch the graph of a function $f(x)$ such that

(a) $\lim_{x\to 2-} f(x) = 1$, $\quad \lim_{x\to 2+} f(x) = 3$

(b) $\lim_{x\to 4} f(x)$ exists but does not equal $f(4)$.

SOLUTION

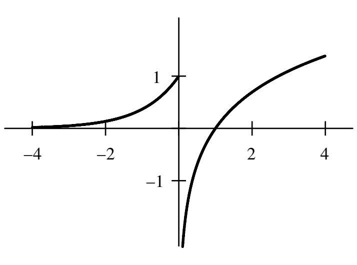


53. Graph $h(x)$ and describe the discontinuity:

$$h(x) = \begin{cases} e^x & \text{for } x \le 0 \\ \ln x & \text{for } x > 0 \end{cases}$$

Is $h(x)$ left- or right-continuous?

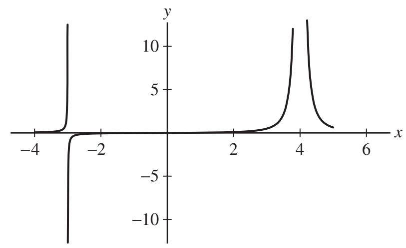
SOLUTION The graph of $h(x)$ is shown below. At $x = 0$, the function has an infinite discontinuity but is left-continuous.



54. Sketch the graph of a function $g(x)$ such that

$$\lim_{x\to -3-} g(x) = \infty, \qquad \lim_{x\to -3+} g(x) = -\infty, \qquad \lim_{x\to 4} g(x) = \infty$$

SOLUTION



55. Find the points of discontinuity of

$$g(x) = \begin{cases} \cos\left(\frac{\pi x}{2}\right) & \text{for } |x| < 1 \\ |x-1| & \text{for } |x| \ge 1 \end{cases}$$

Determine the type of discontinuity and whether $g(x)$ is left- or right-continuous.

SOLUTION First note that $\cos\left(\frac{\pi x}{2}\right)$ is continuous for $-1 < x < 1$ and that $|x-1|$ is continuous for $x \le -1$ and for $x \ge 1$. Thus, the only points at which $g(x)$ might be discontinuous are $x = \pm 1$. At $x = 1$, we have

$$\lim_{x\to 1-} g(x) = \lim_{x\to 1-} \cos\left(\frac{\pi x}{2}\right) = \cos\left(\frac{\pi}{2}\right) = 0$$

and

$$\lim_{x\to 1+} g(x) = \lim_{x\to 1+} |x-1| = |1-1| = 0,$$

so $g(x)$ is continuous at $x = 1$. On the other hand, at $x = -1$,

$$\lim_{x\to -1+} g(x) = \lim_{x\to -1+} \cos\left(\frac{\pi x}{2}\right) = \cos\left(-\frac{\pi}{2}\right) = 0$$

and

$$\lim_{x\to -1-} g(x) = \lim_{x\to -1-} |x-1| = |-1-1| = 2,$$

so $g(x)$ has a jump discontinuity at $x = -1$. Since $g(-1) = 2$, $g(x)$ is left-continuous at $x = -1$.

56. Show that $f(x) = xe^{\sin x}$ is continuous on its domain.

SOLUTION Because e^x and $\sin x$ are continuous for all real numbers, their composition, $e^{\sin x}$ is continuous for all real numbers. Moreover, x is continuous for all real numbers, so the product $xe^{\sin x}$ is continuous for all real numbers. Thus, $f(x) = xe^{\sin x}$ is continuous for all real numbers.

57. Find a constant b such that $h(x)$ is continuous at $x = 2$, where

$$h(x) = \begin{cases} x+1 & \text{for } |x| < 2 \\ b - x^2 & \text{for } |x| \ge 2 \end{cases}$$

With this choice of b, find all points of discontinuity.

SOLUTION To make $h(x)$ continuous at $x = 2$, we must have the two one-sided limits as x approaches 2 be equal. With

$$\lim_{x\to 2-} h(x) = \lim_{x\to 2-} (x+1) = 2+1 = 3$$

and

$$\lim_{x\to 2+} h(x) = \lim_{x\to 2+} (b - x^2) = b - 4,$$

it follows that we must choose $b = 7$. Because $x+1$ is continuous for $-2 < x < 2$ and $7 - x^2$ is continuous for $x \le -2$ and for $x \ge 2$, the only possible point of discontinuity is $x = -2$. At $x = -2$,

$$\lim_{x\to -2+} h(x) = \lim_{x\to -2+} (x+1) = -2+1 = -1$$

and

$$\lim_{x\to -2-} h(x) = \lim_{x\to -2-} (7 - x^2) = 7 - (-2)^2 = 3,$$

so $h(x)$ has a jump discontinuity at $x = -2$.

In Exercises 58–63, find the horizontal asymptotes of the function by computing the limits at infinity.

58. $f(x) = \dfrac{9x^2 - 4}{2x^2 - x}$

SOLUTION Because

$$\lim_{x\to\infty} \frac{9x^2 - 4}{2x^2 - x} = \lim_{x\to\infty} \frac{9 - 4/x^2}{2 - 1/x} = \frac{9}{2}$$

and

$$\lim_{x\to-\infty} \frac{9x^2 - 4}{2x^2 - x} = \lim_{x\to-\infty} \frac{9 - 4/x^2}{2 - 1/x} = \frac{9}{2},$$

it follows that the graph of $y = \dfrac{9x^2 - 4}{2x^2 - x}$ has a horizontal asymptote of $\frac{9}{2}$.

59. $f(x) = \dfrac{x^2 - 3x^4}{x - 1}$

SOLUTION Because

$$\lim_{x\to\infty} \frac{x^2 - 3x^4}{x - 1} = \lim_{x\to\infty} \frac{1/x^2 - 3}{1/x^3 - 1/x^4} = -\infty$$

and

$$\lim_{x\to-\infty} \frac{x^2 - 3x^4}{x - 1} = \lim_{x\to-\infty} \frac{1/x^2 - 3}{1/x^3 - 1/x^4} = \infty,$$

it follows that the graph of $y = \dfrac{x^2 - 3x^4}{x - 1}$ does not have any horizontal asymptotes.

60. $f(u) = \dfrac{8u - 3}{\sqrt{16u^2 + 6}}$

SOLUTION Because

$$\lim_{u\to\infty} \frac{8u - 3}{\sqrt{16u^2 + 6}} = \lim_{u\to\infty} \frac{8 - 3/u}{\sqrt{16 + 6/u^2}} = \frac{8}{\sqrt{16}} = 2$$

and

$$\lim_{u\to-\infty} \frac{8u - 3}{\sqrt{16u^2 + 6}} = \lim_{u\to-\infty} \frac{8 - 3/u}{-\sqrt{16 + 6/u^2}} = \frac{8}{-\sqrt{16}} = -2,$$

it follows that the graph of $y = \dfrac{8u - 3}{\sqrt{16u^2 + 6}}$ has horizontal asymptotes of $y = \pm 2$.

61. $f(u) = \dfrac{2u^2 - 1}{\sqrt{6 + u^4}}$

SOLUTION Because

$$\lim_{u\to\infty} \frac{2u^2 - 1}{\sqrt{6 + u^4}} = \lim_{u\to\infty} \frac{2 - 1/u^2}{\sqrt{6/u^4 + 1}} = \frac{2}{\sqrt{1}} = 2$$

and

$$\lim_{u\to-\infty} \frac{2u^2 - 1}{\sqrt{6 + u^4}} = \lim_{u\to-\infty} \frac{2 - 1/u^2}{\sqrt{6/u^4 + 1}} = \frac{2}{\sqrt{1}} = 2,$$

it follows that the graph of $y = \dfrac{2u^2 - 1}{\sqrt{6 + u^4}}$ has a horizontal asymptote of $y = 2$.

62. $f(x) = \dfrac{3x^{2/3} + 9x^{3/7}}{7x^{4/5} - 4x^{-1/3}}$

SOLUTION Because

$$\lim_{x\to\infty} \frac{3x^{2/3} + 9x^{3/7}}{7x^{4/5} - 4x^{-1/3}} = \lim_{x\to\infty} \frac{3x^{-2/15} + 9x^{-13/35}}{7 - x^{-17/15}} = 0$$

and

$$\lim_{x\to-\infty} \frac{3x^{2/3} + 9x^{3/7}}{7x^{4/5} - 4x^{-1/3}} = \lim_{x\to-\infty} \frac{3x^{-2/15} + 9x^{-13/35}}{7 - x^{-17/15}} = 0,$$

it follows that the graph of $y = \dfrac{3x^{2/3} + 9x^{3/7}}{7x^{4/5} - 4x^{-1/3}}$ has a horizontal asymptote of $y = 0$.

63. $f(t) = \dfrac{t^{1/3} - t^{-1/3}}{(t - t^{-1})^{1/3}}$

SOLUTION Because

$$\lim_{t\to\infty} \frac{t^{1/3} - t^{-1/3}}{(t - t^{-1})^{1/3}} = \lim_{t\to\infty} \frac{1 - t^{-2/3}}{(1 - t^{-2})^{1/3}} = \frac{1}{1^{1/3}} = 1$$

and

$$\lim_{t\to-\infty} \frac{t^{1/3} - t^{-1/3}}{(t - t^{-1})^{1/3}} = \lim_{t\to-\infty} \frac{1 - t^{-2/3}}{(1 - t^{-2})^{1/3}} = \frac{1}{1^{1/3}} = 1,$$

it follows that the graph of $y = \dfrac{t^{1/3} - t^{-1/3}}{(t - t^{-1})^{1/3}}$ has a horizontal asymptote of $y = 1$.

64. Calculate (a)–(d), assuming that

$$\lim_{x\to 3} f(x) = 6, \qquad \lim_{x\to 3} g(x) = 4$$

(a) $\lim_{x\to 3} (f(x) - 2g(x))$

(b) $\lim_{x\to 3} x^2 f(x)$

(c) $\lim_{x\to 3} \dfrac{f(x)}{g(x) + x}$

(d) $\lim_{x\to 3} (2g(x)^3 - g(x)^{3/2})$

SOLUTION

(a) $\lim_{x\to 3} (f(x) - 2g(x)) = \lim_{x\to 3} f(x) - 2\lim_{x\to 3} g(x) = 6 - 2(4) = -2.$

(b) $\lim_{x\to 3} x^2 f(x) = \lim_{x\to 3} x^2 \cdot \lim_{x\to 3} f(x) = 3^2 \cdot 6 = 54.$

(c) $\lim_{x\to 3} \dfrac{f(x)}{g(x) + x} = \dfrac{\lim_{x\to 3} f(x)}{\lim_{x\to 3}(g(x) + x)} = \dfrac{6}{\lim_{x\to 3} g(x) + \lim_{x\to 3} x} = \dfrac{6}{4 + 3} = \dfrac{6}{7}.$

(d) $\lim_{x\to 3} (2g(x)^3 - g(x)^{3/2}) = 2\left(\lim_{x\to 3} g(x)\right)^3 - \left(\lim_{x\to 3} g(x)\right)^{3/2} = 2(4)^3 - 4^{3/2} = 120.$

65. Assume that the following limits exist:

$$A = \lim_{x\to a} f(x), \qquad B = \lim_{x\to a} g(x), \qquad L = \lim_{x\to a} \frac{f(x)}{g(x)}$$

Prove that if $L = 1$, then $A = B$. *Hint:* You cannot use the Quotient Law if $B = 0$, so apply the Product Law to L and B instead.

SOLUTION Suppose the limits A, B, and L all exist and $L = 1$. Then

$$B = B \cdot 1 = B \cdot L = \lim_{x\to a} g(x) \cdot \lim_{x\to a} \frac{f(x)}{g(x)} = \lim_{x\to a} g(x) \frac{f(x)}{g(x)} = \lim_{x\to a} f(x) = A.$$

66. $\boxed{\text{GU}}$ Define $g(t) = (1 + 2^{1/t})^{-1}$ for $t \neq 0$. How should $g(0)$ be defined to make $g(t)$ left-continuous at $t = 0$?

SOLUTION Because

$$\lim_{t\to 0-} (1 + 2^{1/t})^{-1} = \left[\lim_{t\to 0-} (1 + 2^{1/t})\right]^{-1} = 1^{-1} = 1,$$

we should define $g(0) = 1$ to make $g(t)$ left-continuous at $t = 0$.

67. In the notation of Exercise 65, give an example where L exists but neither A nor B exists.

SOLUTION Suppose

$$f(x) = \frac{1}{(x-a)^3} \qquad \text{and} \qquad g(x) = \frac{1}{(x-a)^5}.$$

Then, neither A nor B exists, but

$$L = \lim_{x\to a} \frac{(x-a)^{-3}}{(x-a)^{-5}} = \lim_{x\to a} (x-a)^2 = 0.$$

68. True or false?

(a) If $\lim_{x\to 3} f(x)$ exists, then $\lim_{x\to 3} f(x) = f(3)$.

(b) If $\lim_{x\to 0} \frac{f(x)}{x} = 1$, then $f(0) = 0$.

(c) If $\lim_{x\to -7} f(x) = 8$, then $\lim_{x\to -7} \frac{1}{f(x)} = \frac{1}{8}$.

(d) If $\lim_{x\to 5+} f(x) = 4$ and $\lim_{x\to 5-} f(x) = 8$, then $\lim_{x\to 5} f(x) = 6$.

(e) If $\lim_{x\to 0} \frac{f(x)}{x} = 1$, then $\lim_{x\to 0} f(x) = 0$.

(f) If $\lim_{x\to 5} f(x) = 2$, then $\lim_{x\to 5} f(x)^3 = 8$.

SOLUTION

(a) False. The limit $\lim_{x\to 3} f(x)$ may exist and need not equal $f(3)$. The limit is equal to $f(3)$ if $f(x)$ is continuous at $x = 3$.

(b) False. The value of the limit $\lim_{x\to 0} \frac{f(x)}{x} = 1$ does not depend on the value $f(0)$, so $f(0)$ can have any value.

(c) True, by the Limit Laws.

(d) False. If the two one-sided limits are not equal, then the two-sided limit does not exist.

(e) True. Apply the Product Law to the functions $\frac{f(x)}{x}$ and x.

(f) True, by the Limit Laws.

69. Let $f(x) = x\left[\frac{1}{x}\right]$, where $[x]$ is the greatest integer function. Show that for $x \neq 0$,

$$\frac{1}{x} - 1 < \left[\frac{1}{x}\right] \leq \frac{1}{x}$$

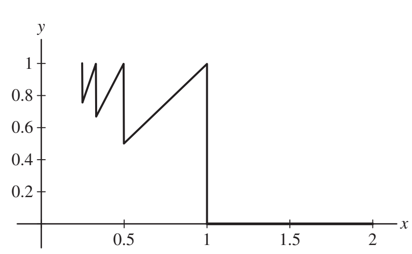
Then use the Squeeze Theorem to prove that

$$\lim_{x\to 0} x\left[\frac{1}{x}\right] = 1$$

Hint: Treat the one-sided limits separately.

SOLUTION

(a) The graph of $f(x) = x\left[\frac{1}{x}\right]$ over $[\frac{1}{4}, 2]$ is shown below.



(b) Let y be any real number. From the definition of the greatest integer function, it follows that $y - 1 < [y] \leq y$, with equality holding if and only if y is an integer. If $x \neq 0$, then $\frac{1}{x}$ is a real number, so

$$\frac{1}{x} - 1 < \left[\frac{1}{x}\right] \leq \frac{1}{x}.$$

Upon multiplying this inequality through by x, we find

$$1 - x < x\left[\frac{1}{x}\right] \le 1.$$

Because

$$\lim_{x\to 0}(1-x) = \lim_{x\to 0} 1 = 1,$$

it follows from the Squeeze Theorem that

$$\lim_{x\to 0} x\left[\frac{1}{x}\right] = 1.$$

70. Let r_1 and r_2 be the roots of $f(x) = ax^2 - 2x + 20$. Observe that $f(x)$ "approaches" the linear function $L(x) = -2x + 20$ as $a \to 0$. Because $r = 10$ is the unique root of $L(x)$, we might expect one of the roots of $f(x)$ to approach 10 as $a \to 0$ (Figure 3). Prove that the roots can be labeled so that $\lim_{a\to 0} r_1 = 10$ and $\lim_{a\to 0} r_2 = \infty$.

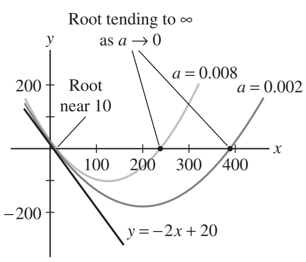


FIGURE 3 Graphs of $f(x) = ax^2 - 2x + 20$.

SOLUTION Using the quadratic formula, we find that the roots of the quadratic polynomial $f(x) = ax^2 - 2x + 20$ are

$$\frac{2 \pm \sqrt{4 - 80a}}{2a} = \frac{1 \pm \sqrt{1 - 20a}}{a} = \frac{20}{1 \pm \sqrt{1 - 20a}}.$$

Now let

$$r_1 = \frac{20}{1 + \sqrt{1 - 20a}} \qquad \text{and} \qquad r_2 = \frac{20}{1 - \sqrt{1 - 20a}}.$$

It is straightforward to calculate that

$$\lim_{a\to 0} r_1 = \lim_{a\to 0} \frac{20}{1 + \sqrt{1 - 20a}} = \frac{20}{2} = 10$$

and that

$$\lim_{a\to 0} r_2 = \lim_{a\to 0} \frac{20}{1 - \sqrt{1 - 20a}} = \infty$$

as desired.

71. Use the IVT to prove that the curves $y = x^2$ and $y = \cos x$ intersect.

SOLUTION Let $f(x) = x^2 - \cos x$. Note that any root of $f(x)$ corresponds to a point of intersection between the curves $y = x^2$ and $y = \cos x$. Now, $f(x)$ is continuous over the interval $[0, \frac{\pi}{2}]$, $f(0) = -1 < 0$ and $f(\frac{\pi}{2}) = \frac{\pi^2}{4} > 0$. Therefore, by the Intermediate Value Theorem, there exists a $c \in (0, \frac{\pi}{2})$ such that $f(c) = 0$; consequently, the curves $y = x^2$ and $y = \cos x$ intersect.

72. Use the IVT to prove that $f(x) = x^3 - \dfrac{x^2 + 2}{\cos x + 2}$ has a root in the interval $[0, 2]$.

SOLUTION Let $f(x) = x^3 - \frac{x^2+2}{\cos x+2}$. Because $\cos x + 2$ is never zero, $f(x)$ is continuous for all real numbers. Because

$$f(0) = -\frac{2}{3} < 0 \qquad \text{and} \qquad f(2) = 8 - \frac{6}{\cos 2 + 2} \approx 4.21 > 0,$$

the Intermediate Value Theorem guarantees there exists a $c \in (0, 2)$ such that $f(c) = 0$.

73. Use the IVT to show that $e^{-x^2} = x$ has a solution on $(0, 1)$.

SOLUTION Let $f(x) = e^{-x^2} - x$. Observe that f is continuous on $[0, 1]$ with $f(0) = e^0 - 0 = 1 > 0$ and $f(1) = e^{-1} - 1 < 0$. Therefore, the IVT guarantees there exists a $c \in (0, 1)$ such that $f(c) = e^{-c^2} - c = 0$.

74. Use the Bisection Method to locate a solution of $x^2 - 7 = 0$ to two decimal places.

SOLUTION Let $f(x) = x^2 - 7$. By trial and error, we find that $f(2.6) = -0.24 < 0$ and $f(2.7) = 0.29 > 0$. Because $f(x)$ is continuous on $[2.6, 2.7]$, it follows from the Intermediate Value Theorem that $f(x)$ has a root on $(2.6, 2.7)$. We approximate the root by the midpoint of the interval: $x = 2.65$. Now, $f(2.65) = 0.0225 > 0$. Because $f(2.6)$ and $f(2.65)$ are of opposite sign, the root must lie on $(2.6, 2.65)$. The midpoint of this interval is $x = 2.625$ and $f(2.625) < 0$; hence, the root must be on the interval $(2.625, 2.65)$. Continuing in this fashion, we construct the following sequence of intervals and midpoints.

interval	midpoint
(2.625, 2.65)	2.6375
(2.6375, 2.65)	2.64375
(2.64375, 2.65)	2.646875
(2.64375, 2.646875)	2.6453125
(2.6453125, 2.646875)	2.64609375

At this point, we note that, to two decimal places, one root of $x^2 - 7 = 0$ is 2.65.

75. Give an example of a (discontinuous) function that does not satisfy the conclusion of the IVT on $[-1, 1]$. Then show that the function

$$f(x) = \begin{cases} \sin \dfrac{1}{x} & x \neq 0 \\ 0 & x = 0 \end{cases}$$

satisfies the conclusion of the IVT on every interval $[-a, a]$, even though f is discontinuous at $x = 0$.

SOLUTION Let $g(x) = [x]$. This function is discontinuous on $[-1, 1]$ with $g(-1) = -1$ and $g(1) = 1$. For all $c \neq 0$, there is no x such that $g(x) = c$; thus, $g(x)$ does not satisfy the conclusion of the Intermediate Value Theorem on $[-1, 1]$.

Now, let

$$f(x) = \begin{cases} \sin\left(\frac{1}{x}\right) & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$$

and let $a > 0$. On the interval

$$x \in \left[\frac{a}{2 + 2\pi a}, \frac{a}{2}\right] \subset [-a, a],$$

$\frac{1}{x}$ runs from $\frac{2}{a}$ to $\frac{2}{a} + 2\pi$, so the sine function covers one full period and clearly takes on every value from $-\sin a$ through $\sin a$.

76. Let $f(x) = \dfrac{1}{x+2}$.

(a) Show that $\left|f(x) - \frac{1}{4}\right| < \dfrac{|x-2|}{12}$ if $|x - 2| < 1$. *Hint:* Observe that $|4(x + 2)| > 12$ if $|x - 2| < 1$.

(b) Find $\delta > 0$ such that $\left|f(x) - \frac{1}{4}\right| < 0.01$ for $|x - 2| < \delta$.

(c) Prove rigorously that $\lim_{x \to 2} f(x) = \frac{1}{4}$.

SOLUTION

(a) Let $f(x) = \frac{1}{x+2}$. Then

$$\left|f(x) - \frac{1}{4}\right| = \left|\frac{1}{x+2} - \frac{1}{4}\right| = \left|\frac{4 - (x+2)}{4(x+2)}\right| = \frac{|x-2|}{|4(x+2)|}.$$

If $|x - 2| < 1$, then $1 < x < 3$, so $3 < x + 2 < 5$ and $12 < 4(x + 2) < 20$. Hence,

$$\frac{1}{|4(x+2)|} < \frac{1}{12} \qquad \text{and} \qquad \left|f(x) - \frac{1}{4}\right| < \frac{|x-2|}{12}.$$

(b) If $|x-2|<\delta$, then by part (a),

$$\left|f(x)-\frac{1}{4}\right|<\frac{\delta}{12}.$$

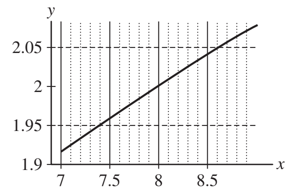
Choosing $\delta = 0.12$ will then guarantee that $|f(x)-\frac{1}{4}|<0.01$.

(c) Let $\epsilon > 0$ and take $\delta = \min\{1, 12\epsilon\}$. Then, whenever $|x-2|<\delta$,

$$\left|f(x)-\frac{1}{4}\right| = \left|\frac{1}{x+2}-\frac{1}{4}\right| = \frac{|2-x|}{4|x+2|} \le \frac{|x-2|}{12} < \frac{\delta}{12} = \epsilon.$$

77. GU Plot the function $f(x) = x^{1/3}$. Use the zoom feature to find a $\delta > 0$ such that $|x^{1/3}-2| < 0.05$ for $|x-8|<\delta$.

SOLUTION The graphs of $y = f(x) = x^{1/3}$ and the horizontal lines $y = 1.95$ and $y = 2.05$ are shown below. From this plot, we see that $\delta = 0.55$ guarantees that $|x^{1/3}-2| < 0.05$ whenever $|x-8|<\delta$.

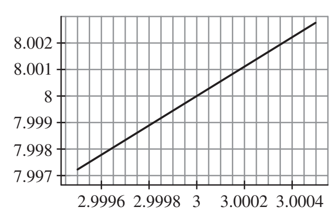


78. Use the fact that $f(x) = 2^x$ is increasing to find a value of δ such that $|2^x - 8| < 0.001$ if $|x-2|<\delta$. *Hint:* Find c_1 and c_2 such that $7.999 < f(c_1) < f(c_2) < 8.001$.

SOLUTION From the graph below, we see that

$$7.999 < f(2.99985) < f(3.00015) < 8.001.$$

Thus, with $\delta = 0.00015$, it follows that $|2^x - 8| < 0.001$ if $|x-3|<\delta$.



79. Prove rigorously that $\lim_{x\to -1}(4+8x) = -4$.

SOLUTION Let $\epsilon > 0$ and take $\delta = \epsilon/8$. Then, whenever $|x-(-1)| = |x+1| < \delta$,

$$|f(x)-(-4)| = |4+8x+4| = 8|x+1| < 8\delta = \epsilon.$$

80. Prove rigorously that $\lim_{x\to 3}(x^2-x) = 6$.

SOLUTION Let $\epsilon > 0$ and take $\delta = \min\{1, \epsilon/6\}$. Because $\delta \le 1$, $|x-3|<\delta$ guarantees $|x+2|<6$. Therefore, whenever $|x-3|<\delta$,

$$|f(x)-6| = |x^2-x-6| = |x-3|\,|x+2| < 6|x-3| < 6\delta \le \epsilon.$$

3 DIFFERENTIATION

3.1 Definition of the Derivative

Preliminary Questions

1. Which of the lines in Figure 10 are tangent to the curve?

FIGURE 10

SOLUTION Lines B and D are tangent to the curve.

2. What are the two ways of writing the difference quotient?

SOLUTION The difference quotient may be written either as

$$\frac{f(x) - f(a)}{x - a}$$

or as

$$\frac{f(a+h) - f(a)}{h}.$$

3. Find a and h such that $\frac{f(a+h) - f(a)}{h}$ is equal to the slope of the secant line between $(3, f(3))$ and $(5, f(5))$.

SOLUTION With $a = 3$ and $h = 2$, $\frac{f(a+h) - f(a)}{h}$ is equal to the slope of the secant line between the points $(3, f(3))$ and $(5, f(5))$ on the graph of $f(x)$.

4. Which derivative is approximated by $\frac{\tan\left(\frac{\pi}{4} + 0.0001\right) - 1}{0.0001}$?

SOLUTION $\frac{\tan(\frac{\pi}{4} + 0.0001) - 1}{0.0001}$ is a good approximation to the derivative of the function $f(x) = \tan x$ at $x = \frac{\pi}{4}$.

5. What do the following quantities represent in terms of the graph of $f(x) = \sin x$?

(a) $\sin 1.3 - \sin 0.9$ **(b)** $\frac{\sin 1.3 - \sin 0.9}{0.4}$ **(c)** $f'(0.9)$

SOLUTION Consider the graph of $y = \sin x$.

(a) The quantity $\sin 1.3 - \sin 0.9$ represents the difference in height between the points $(0.9, \sin 0.9)$ and $(1.3, \sin 1.3)$.

(b) The quantity $\frac{\sin 1.3 - \sin 0.9}{0.4}$ represents the slope of the secant line between the points $(0.9, \sin 0.9)$ and $(1.3, \sin 1.3)$ on the graph.

(c) The quantity $f'(0.9)$ represents the slope of the tangent line to the graph at $x = 0.9$.

Exercises

1. Let $f(x) = 5x^2$. Show that $f(3 + h) = 5h^2 + 30h + 45$. Then show that

$$\frac{f(3+h) - f(3)}{h} = 5h + 30$$

and compute $f'(3)$ by taking the limit as $h \to 0$.

SOLUTION With $f(x) = 5x^2$, it follows that

$$f(3+h) = 5(3+h)^2 = 5(9+6h+h^2) = 45 + 30h + 5h^2.$$

Using this result, we find

$$\frac{f(3+h) - f(3)}{h} = \frac{45 + 30h + 5h^2 - 5 \cdot 9}{h} = \frac{45 + 30h + 5h^2 - 45}{h} = \frac{30h + 5h^2}{h} = 30 + 5h.$$

As $h \to 0$, $30 + 5h \to 30$, so $f'(3) = 30$.

2. Let $f(x) = 2x^2 - 3x - 5$. Show that the secant line through $(2, f(2))$ and $(2+h, f(2+h))$ has slope $2h + 5$. Then use this formula to compute the slope of:

(a) The secant line through $(2, f(2))$ and $(3, f(3))$

(b) The tangent line at $x = 2$ (by taking a limit)

SOLUTION The formula for the slope of the secant line is

$$\frac{f(2+h) - f(2)}{2+h-2} = \frac{[2(2+h)^2 - 3(2+h) - 5] - (8 - 6 - 5)}{h} = \frac{2h^2 + 5h}{h} = 2h + 5$$

(a) To find the slope of the secant line through $(2, f(2))$ and $(3, f(3))$, we take $h = 1$, so the slope is $2(1) + 5 = 7$.

(b) As $h \to 0$, the slope of the secant line approaches $2(0) + 5 = 5$. Hence, the slope of the tangent line at $x = 2$ is 5.

In Exercises 3–6, compute $f'(a)$ in two ways, using Eq. (1) and Eq. (2).

3. $f(x) = x^2 + 9x, \quad a = 0$

SOLUTION Let $f(x) = x^2 + 9x$. Then

$$f'(0) = \lim_{h\to 0} \frac{f(0+h) - f(0)}{h} = \lim_{h\to 0} \frac{(0+h)^2 + 9(0+h) - 0}{h} = \lim_{h\to 0} \frac{9h + h^2}{h} = \lim_{h\to 0}(9+h) = 9.$$

Alternately,

$$f'(0) = \lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{x^2 + 9x - 0}{x} = \lim_{x\to 0}(x+9) = 9.$$

4. $f(x) = x^2 + 9x, \quad a = 2$

SOLUTION Let $f(x) = x^2 + 9x$. Then

$$f'(2) = \lim_{h\to 0} \frac{f(2+h) - f(2)}{h} = \lim_{h\to 0} \frac{(2+h)^2 + 9(2+h) - 22}{h} = \lim_{h\to 0} \frac{13h + h^2}{h} = \lim_{h\to 0}(13+h) = 13.$$

Alternately,

$$f'(2) = \lim_{x\to 2} \frac{f(x) - f(2)}{x - 2} = \lim_{x\to 2} \frac{x^2 + 9x - (2^2 + 9(2))}{x - 2} = \lim_{x\to 2} \frac{(x-2)(x+11)}{x - 2} = \lim_{x\to 2}(x+11) = 13.$$

5. $f(x) = 3x^2 + 4x + 2, \quad a = -1$

SOLUTION Let $f(x) = 3x^2 + 4x + 2$. Then

$$f'(-1) = \lim_{h\to 0} \frac{f(-1+h) - f(-1)}{h} = \lim_{h\to 0} \frac{3(-1+h)^2 + 4(-1+h) + 2 - 1}{h}$$
$$= \lim_{h\to 0} \frac{3h^2 - 2h}{h} = \lim_{h\to 0} (3h - 2) = -2.$$

Alternately,

$$f'(-1) = \lim_{x\to -1} \frac{f(x) - f(-1)}{x - (-1)} = \lim_{x\to -1} \frac{3x^2 + 4x + 2 - 1}{x + 1}$$
$$= \lim_{x\to -1} \frac{(3x+1)(x+1)}{x+1} = \lim_{x\to -1} (3x + 1) = -2.$$

6. $f(x) = x^3, \quad a = 2$

SOLUTION Let $f(x) = x^3$. Then

$$f'(2) = \lim_{h\to 0} \frac{f(2+h) - f(2)}{h} = \lim_{h\to 0} \frac{(2+h)^3 - 8}{h}$$
$$= \lim_{h\to 0} \frac{8 + 12h + 6h^2 + h^3 - 8}{h} = \lim_{h\to 0} (12 + 6h + h^2) = 12.$$

Alternately,

$$f'(2) = \lim_{x\to 2} \frac{f(x) - f(2)}{x - 2} = \lim_{x\to 2} \frac{x^3 - 8}{x - 2}$$
$$= \lim_{x\to 2} \frac{(x-2)(x^2 + 2x + 4)}{x - 2} = \lim_{x\to 2} (x^2 + 2x + 4) = 12.$$

In Exercises 7–10, refer to Figure 11.

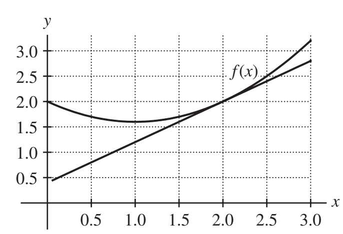


FIGURE 11

7. Find the slope of the secant line through $(2, f(2))$ and $(2.5, f(2.5))$. Is it larger or smaller than $f'(2)$? Explain.

SOLUTION From the graph, it appears that $f(2.5) = 2.5$ and $f(2) = 2$. Thus, the slope of the secant line through $(2, f(2))$ and $(2.5, f(2.5))$ is

$$\frac{f(2.5) - f(2)}{2.5 - 2} = \frac{2.5 - 2}{2.5 - 2} = 1.$$

From the graph, it is also clear that the secant line through $(2, f(2))$ and $(2.5, f(2.5))$ has a larger slope than the tangent line at $x = 2$. In other words, the slope of the secant line through $(2, f(2))$ and $(2.5, f(2.5))$ is larger than $f'(2)$.

8. Estimate $\dfrac{f(2+h) - f(2)}{h}$ for $h = -0.5$. What does this quantity represent? Is it larger or smaller than $f'(2)$? Explain.

SOLUTION With $h = -0.5$, $2 + h = 1.5$. Moreover, from the graph it appears that $f(1.5) = 1.7$ and $f(2) = 2$. Thus,

$$\frac{f(2+h) - f(2)}{h} = \frac{1.7 - 2}{-0.5} = 0.6.$$

This quantity represents the slope of the secant line through the points $(2, f(2))$ and $(1.5, f(1.5))$. It is clear from the graph that the secant line through the points $(2, f(2))$ and $(1.5, f(1.5))$ has a smaller slope than the tangent line at $x = 2$. In other words, $\dfrac{f(2+h) - f(2)}{h}$ for $h = -0.5$ is smaller than $f'(2)$.

9. Estimate $f'(1)$ and $f'(2)$.

SOLUTION From the graph, it appears that the tangent line at $x = 1$ would be horizontal. Thus, $f'(1) \approx 0$. The tangent line at $x = 2$ appears to pass through the points $(0.5, 0.8)$ and $(2, 2)$. Thus

$$f'(2) \approx \frac{2 - 0.8}{2 - 0.5} = 0.8.$$

10. Find a value of h for which $\dfrac{f(2+h) - f(2)}{h} = 0$.

SOLUTION In order for

$$\frac{f(2+h) - f(2)}{h}$$

to be equal to zero, we must have $f(2+h) = f(2)$. Now, $f(2) = 2$, and the only other point on the graph with a y-coordinate of 2 is $f(0) = 2$. Thus, $2 + h = 0$, or $h = -2$.

In Exercises 11–14, refer to Figure 12.

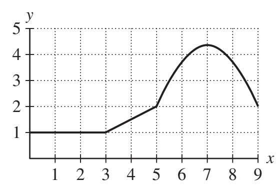

FIGURE 12 Graph of $f(x)$.

11. Determine $f'(a)$ for $a = 1, 2, 4, 7$.

SOLUTION Remember that the value of the derivative of f at $x = a$ can be interpreted as the slope of the line tangent to the graph of $y = f(x)$ at $x = a$. From Figure 12, we see that the graph of $y = f(x)$ is a horizontal line (that is, a line with zero slope) on the interval $0 \le x \le 3$. Accordingly, $f'(1) = f'(2) = 0$. On the interval $3 \le x \le 5$, the graph of $y = f(x)$ is a line of slope $\frac{1}{2}$; thus, $f'(4) = \frac{1}{2}$. Finally, the line tangent to the graph of $y = f(x)$ at $x = 7$ is horizontal, so $f'(7) = 0$.

12. For which values of x is $f'(x) < 0$?

SOLUTION If $f'(x) < 0$, then the slope of the tangent line at x is negative. Graphically, this would mean that the value of the function was decreasing for increasing x. From the graph, it follows that $f'(x) < 0$ for $7 < x < 9$.

13. Which is larger, $f'(5.5)$ or $f'(6.5)$?

SOLUTION The line tangent to the graph of $y = f(x)$ at $x = 5.5$ has a larger slope than the line tangent to the graph of $y = f(x)$ at $x = 6.5$. Therefore, $f'(5.5)$ is larger than $f'(6.5)$.

14. Show that $f'(3)$ does not exist.

SOLUTION Because

$$\lim_{h \to 0-} \frac{f(3+h) - f(3)}{h} = 0 \qquad \text{but} \qquad \lim_{h \to 0+} \frac{f(3+h) - f(3)}{h} = \frac{1}{2},$$

it follows that

$$f'(3) = \lim_{h \to 0} \frac{f(3+h) - f(3)}{h}$$

does not exist.

In Exercises 15–18, use the limit definition to calculate the derivative of the linear function.

15. $f(x) = 7x - 9$

SOLUTION

$$\lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{7(a+h) - 9 - (7a - 9)}{h} = \lim_{h\to 0} 7 = 7.$$

16. $f(x) = 12$

SOLUTION

$$\lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{12 - 12}{h} = \lim_{h\to 0} 0 = 0.$$

17. $g(t) = 8 - 3t$

SOLUTION

$$\lim_{h\to 0} \frac{g(a+h) - g(a)}{h} = \lim_{h\to 0} \frac{8 - 3(a+h) - (8 - 3a)}{h} = \lim_{h\to 0} \frac{-3h}{h} = \lim_{h\to 0} (-3) = -3.$$

18. $k(z) = 14z + 12$

SOLUTION

$$\lim_{h\to 0} \frac{k(a+h) - k(a)}{h} = \lim_{h\to 0} \frac{14(a+h) + 12 - (14a + 12)}{h} = \lim_{h\to 0} \frac{14h}{h} = \lim_{h\to 0} 14 = 14.$$

19. Find an equation of the tangent line at $x = 3$, assuming that $f(3) = 5$ and $f'(3) = 2$?

SOLUTION By definition, the equation of the tangent line to the graph of $f(x)$ at $x = 3$ is $y = f(3) + f'(3)(x - 3) = 5 + 2(x - 3) = 2x - 1$.

20. Find $f(3)$ and $f'(3)$, assuming that the tangent line to $y = f(x)$ at $a = 3$ has equation $y = 5x + 2$.

SOLUTION The slope of the tangent line to $y = f(x)$ at $a = 3$ is $f'(3)$ by definition, therefore $f'(3) = 5$. Also by definition, the tangent line to $y = f(x)$ at $a = 3$ goes through $(3, f(3))$, so $f(3) = 17$.

21. Describe the tangent line at an arbitrary point on the "curve" $y = 2x + 8$.

SOLUTION Since $y = 2x + 8$ represents a straight line, the tangent line at any point is the line itself, $y = 2x + 8$.

22. Suppose that $f(2 + h) - f(2) = 3h^2 + 5h$. Calculate:

(a) The slope of the secant line through $(2, f(2))$ and $(6, f(6))$

(b) $f'(2)$

SOLUTION Let f be a function such that $f(2 + h) - f(2) = 3h^2 + 5h$.

(a) We take $h = 4$ to compute the slope of the secant line through $(2, f(2))$ and $(6, f(6))$:

$$\frac{f(4+2) - f(2)}{(4+2) - 2} = \frac{3(4)^2 + 5(4)}{4} = 17$$

(b) $f'(2) = \lim_{h\to 0} \frac{f(2+h) - f(2)}{h} = \lim_{h\to 0} \frac{3h^2 + 5h}{h} = \lim_{h\to 0} (3h + 5) = 5.$

23. Let $f(x) = \frac{1}{x}$. Does $f(-2 + h)$ equal $\frac{1}{-2 + h}$ or $\frac{1}{-2} + \frac{1}{h}$? Compute the difference quotient at $a = -2$ with $h = 0.5$.

SOLUTION Let $f(x) = \frac{1}{x}$. Then

$$f(-2 + h) = \frac{1}{-2 + h}.$$

With $a = -2$ and $h = 0.5$, the difference quotient is

$$\frac{f(a+h) - f(a)}{h} = \frac{f(-1.5) - f(-2)}{0.5} = \frac{\frac{1}{-1.5} - \frac{1}{-2}}{0.5} = -\frac{1}{3}.$$

24. Let $f(x) = \sqrt{x}$. Does $f(5+h)$ equal $\sqrt{5+h}$ or $\sqrt{5} + \sqrt{h}$? Compute the difference quotient at $a = 5$ with $h = 1$.

SOLUTION Let $f(x) = \sqrt{x}$. Then $f(5+h) = \sqrt{5+h}$. With $a = 5$ and $h = 1$, the difference quotient is

$$\frac{f(a+h) - f(a)}{h} = \frac{f(5+1) - f(5)}{1} = \frac{\sqrt{6} - \sqrt{5}}{1} = \sqrt{6} - \sqrt{5}.$$

25. Let $f(x) = 1/\sqrt{x}$. Compute $f'(5)$ by showing that

$$\frac{f(5+h) - f(5)}{h} = -\frac{1}{\sqrt{5}\sqrt{5+h}(\sqrt{5+h} + \sqrt{5})}$$

SOLUTION Let $f(x) = 1/\sqrt{x}$. Then

$$\begin{aligned}\frac{f(5+h) - f(5)}{h} &= \frac{\frac{1}{\sqrt{5+h}} - \frac{1}{\sqrt{5}}}{h} = \frac{\sqrt{5} - \sqrt{5+h}}{h\sqrt{5}\sqrt{5+h}} \\ &= \frac{\sqrt{5} - \sqrt{5+h}}{h\sqrt{5}\sqrt{5+h}}\left(\frac{\sqrt{5} + \sqrt{5+h}}{\sqrt{5} + \sqrt{5+h}}\right) \\ &= \frac{5 - (5+h)}{h\sqrt{5}\sqrt{5+h}(\sqrt{5+h} + \sqrt{5})} = -\frac{1}{\sqrt{5}\sqrt{5+h}(\sqrt{5+h} + \sqrt{5})}.\end{aligned}$$

Thus,

$$\begin{aligned}f'(5) &= \lim_{h \to 0} \frac{f(5+h) - f(5)}{h} = \lim_{h \to 0} -\frac{1}{\sqrt{5}\sqrt{5+h}(\sqrt{5+h} + \sqrt{5})} \\ &= -\frac{1}{\sqrt{5}\,\sqrt{5}(\sqrt{5} + \sqrt{5})} = -\frac{1}{10\sqrt{5}}.\end{aligned}$$

26. Find an equation of the tangent line to the graph of $f(x) = 1/\sqrt{x}$ at $x = 9$.

SOLUTION Let $f(x) = 1/\sqrt{x}$. Then

$$\begin{aligned}\frac{f(9+h) - f(9)}{h} &= \frac{\frac{1}{\sqrt{9+h}} - \frac{1}{3}}{h} = \frac{3 - \sqrt{9+h}}{3h\sqrt{9+h}} \\ &= \frac{3 - \sqrt{9+h}}{3h\sqrt{9+h}}\left(\frac{3 + \sqrt{9+h}}{3 + \sqrt{9+h}}\right) \\ &= \frac{9 - (9+h)}{3h\sqrt{9+h}(\sqrt{9+h} + 3)} = -\frac{1}{3\sqrt{9+h}(\sqrt{9+h} + 3)}.\end{aligned}$$

Thus,

$$\begin{aligned}f'(9) &= \lim_{h \to 0} \frac{f(9+h) - f(9)}{h} = \lim_{h \to 0} -\frac{1}{3\sqrt{9+h}(\sqrt{9+h} + 3)} \\ &= -\frac{1}{9(3+3)} = -\frac{1}{54}.\end{aligned}$$

Because $f(9) = \frac{1}{3}$, it follows that an equation of the tangent line to the graph of $f(x) = 1/\sqrt{x}$ at $x = 9$ is

$$y = f'(9)(x - 9) + f(9) = -\frac{1}{54}(x - 9) + \frac{1}{3}.$$

In Exercises 27–44, use the limit definition to compute $f'(a)$ and find an equation of the tangent line.

27. $f(x) = 2x^2 + 10x, \quad a = 3$

SOLUTION Let $f(x) = 2x^2 + 10x$. Then

$$f'(3) = \lim_{h\to 0} \frac{f(3+h) - f(3)}{h} = \lim_{h\to 0} \frac{2(3+h)^2 + 10(3+h) - 48}{h}$$
$$= \lim_{h\to 0} \frac{18 + 12h + 2h^2 + 30 + 10h - 48}{h} = \lim_{h\to 0} (22 + 2h) = 22.$$

At $a = 3$, the tangent line is

$$y = f'(3)(x-3) + f(3) = 22(x-3) + 48 = 22x - 18.$$

28. $f(x) = 4 - x^2, \quad a = -1$

SOLUTION Let $f(x) = 4 - x^2$. Then

$$f'(-1) = \lim_{h\to 0} \frac{f(-1+h) - f(-1)}{h} = \lim_{h\to 0} \frac{4 - (-1+h)^2 - 3}{h}$$
$$= \lim_{h\to 0} \frac{4 - (1 - 2h + h^2) - 3}{h}$$
$$= \lim_{h\to 0} (2 - h) = 2.$$

At $a = -1$, the tangent line is

$$y = f'(-1)(x+1) + f(-1) = 2(x+1) + 3 = 2x + 5.$$

29. $f(t) = t - 2t^2, \quad a = 3$

SOLUTION Let $f(t) = t - 2t^2$. Then

$$f'(3) = \lim_{h\to 0} \frac{f(3+h) - f(3)}{h} = \lim_{h\to 0} \frac{(3+h) - 2(3+h)^2 - (-15)}{h}$$
$$= \lim_{h\to 0} \frac{3 + h - 18 - 12h - 2h^2 + 15}{h}$$
$$= \lim_{h\to 0} (-11 - 2h) = -11.$$

At $a = 3$, the tangent line is

$$y = f'(3)(t-3) + f(3) = -11(t-3) - 15 = -11t + 18.$$

30. $f(x) = 8x^3, \quad a = 1$

SOLUTION Let $f(x) = 8x^3$. Then

$$f'(1) = \lim_{h\to 0} \frac{f(1+h) - f(1)}{h} = \lim_{h\to 0} \frac{8(1+h)^3 - 8}{h}$$
$$= \lim_{h\to 0} \frac{8 + 24h + 24h^2 + 8h^3 - 8}{h}$$
$$= \lim_{h\to 0} (24 + 24h + 8h^2) = 24.$$

At $a = 1$, the tangent line is

$$y = f'(1)(x-1) + f(1) = 24(x-1) + 8 = 24x - 16.$$

31. $f(x) = x^3 + x, \quad a = 0$

SOLUTION Let $f(x) = x^3 + x$. Then

$$f'(0) = \lim_{h\to 0} \frac{f(h) - f(0)}{h} = \lim_{h\to 0} \frac{h^3 + h - 0}{h}$$
$$= \lim_{h\to 0} (h^2 + 1) = 1.$$

At $a = 0$, the tangent line is

$$y = f'(0)(x - 0) + f(0) = x.$$

32. $f(t) = 2t^3 + 4t, \quad a = 4$

SOLUTION Let $f(t) = 2t^3 + 4t$. Then

$$f'(4) = \lim_{h\to 0} \frac{f(4+h) - f(4)}{h} = \lim_{h\to 0} \frac{2(4+h)^3 + 4(4+h) - 144}{h}$$
$$= \lim_{h\to 0} \frac{128 + 96h + 24h^2 + 2h^3 + 16 + 4h - 144}{h}$$
$$= \lim_{h\to 0} (100 + 24h + 2h^2) = 100.$$

At $a = 4$, the tangent line is

$$y = f'(4)(t - 4) + f(4) = 100(t - 4) + 144 = 100t - 256.$$

33. $f(x) = x^{-1}, \quad a = 8$

SOLUTION Let $f(x) = x^{-1}$. Then

$$f'(8) = \lim_{h\to 0} \frac{f(8+h) - f(8)}{h} = \lim_{h\to 0} \frac{\frac{1}{8+h} - \left(\frac{1}{8}\right)}{h} = \lim_{h\to 0} \frac{\frac{8-8-h}{8(8+h)}}{h} = \lim_{h\to 0} \frac{-h}{(64+8h)h} = -\frac{1}{64}$$

The tangent at $a = 8$ is

$$y = f'(8)(x - 8) + f(8) = -\frac{1}{64}(x - 8) + \frac{1}{8} = -\frac{1}{64}x + \frac{1}{4}.$$

34. $f(x) = x + x^{-1}, \quad a = 4$

SOLUTION Let $f(x) = x + x^{-1}$. Then

$$f'(4) = \lim_{h\to 0} \frac{f(4+h) - f(4)}{h} = \lim_{h\to 0} \frac{4 + h + \frac{1}{4+h} - 4 - \frac{1}{4}}{h} = \lim_{h\to 0} \frac{h + \frac{4-4-h}{4(4+h)}}{h} = \lim_{h\to 0} \left(1 - \frac{1}{16+4h}\right) = \frac{15}{16}$$

The tangent at $a = 4$ is

$$y = f'(4)(x - 4) + f(4) = \frac{15}{16}(x - 4) + \frac{17}{4} = \frac{15}{16}x + \frac{1}{2}.$$

35. $f(x) = \dfrac{1}{x+3}, \quad a = -2$

SOLUTION Let $f(x) = \frac{1}{x+3}$. Then

$$f'(-2) = \lim_{h\to 0} \frac{f(-2+h) - f(-2)}{h} = \lim_{h\to 0} \frac{\frac{1}{-2+h+3} - 1}{h} = \lim_{h\to 0} \frac{\frac{1}{1+h} - 1}{h} = \lim_{h\to 0} \frac{-h}{h(1+h)} = \lim_{h\to 0} \frac{-1}{1+h} = -1.$$

The tangent line at $a = -2$ is

$$y = f'(-2)(x + 2) + f(-2) = -1(x + 2) + 1 = -x - 1.$$

36. $f(t) = \dfrac{2}{1-t}, \quad a = -1$

SOLUTION Let $f(t) = \frac{2}{1-t}$. Then

$$f'(-1) = \lim_{h\to 0} \frac{f(-1+h) - f(-1)}{h} = \lim_{h\to 0} \frac{\frac{2}{1-(-1+h)} - 1}{h} = \lim_{h\to 0} \frac{2-(2-h)}{h(2-h)} = \lim_{h\to 0} \frac{1}{2-h} = \frac{1}{2}.$$

At $a = -1$, the tangent line is

$$y = f'(-1)(x+1) + f(-1) = \frac{1}{2}(x+1) + 1 = \frac{1}{2}x + \frac{3}{2}.$$

37. $f(x) = \sqrt{x+4}, \quad a = 1$

SOLUTION Let $f(x) = \sqrt{x+4}$. Then

$$f'(1) = \lim_{h\to 0} \frac{f(1+h) - f(1)}{h} = \lim_{h\to 0} \frac{\sqrt{h+5} - \sqrt{5}}{h} = \lim_{h\to 0} \frac{\sqrt{h+5} - \sqrt{5}}{h} \cdot \frac{\sqrt{h+5} + \sqrt{5}}{\sqrt{h+5} + \sqrt{5}}$$
$$= \lim_{h\to 0} \frac{h}{h(\sqrt{h+5} + \sqrt{5})} = \lim_{h\to 0} \frac{1}{\sqrt{h+5} + \sqrt{5}} = \frac{1}{2\sqrt{5}}.$$

The tangent line at $a = 1$ is

$$y = f'(1)(x-1) + f(1) = \frac{1}{2\sqrt{5}}(x-1) + \sqrt{5} = \frac{1}{2\sqrt{5}}x + \frac{9}{2\sqrt{5}}.$$

38. $f(t) = \sqrt{3t+5}, \quad a = -1$

SOLUTION Let $f(t) = \sqrt{3t+5}$. Then

$$f'(-1) = \lim_{h\to 0} \frac{f(-1+h) - f(-1)}{h} = \lim_{h\to 0} \frac{\sqrt{3h+2} - \sqrt{2}}{h} = \lim_{h\to 0} \frac{\sqrt{3h+2} - \sqrt{2}}{h} \cdot \frac{\sqrt{3h+2} + \sqrt{2}}{\sqrt{3h+2} + \sqrt{2}}$$
$$= \lim_{h\to 0} \frac{3h}{h(\sqrt{3h+2} + \sqrt{2})} = \lim_{h\to 0} \frac{3}{\sqrt{3h+2} + \sqrt{2}} = \frac{3}{2\sqrt{2}}.$$

The tangent line at $a = -1$ is

$$y = f'(-1)(t+1) + f(-1) = \frac{3}{2\sqrt{2}}(t+1) + \sqrt{2} = \frac{3}{2\sqrt{2}}t + \frac{7}{2\sqrt{2}}.$$

39. $f(x) = \dfrac{1}{\sqrt{x}}, \quad a = 4$

SOLUTION Let $f(x) = \dfrac{1}{\sqrt{x}}$. Then

$$f'(4) = \lim_{h\to 0} \frac{f(4+h) - f(4)}{h} = \lim_{h\to 0} \frac{\frac{1}{\sqrt{4+h}} - \frac{1}{2}}{h} = \lim_{h\to 0} \frac{\frac{2-\sqrt{4+h}}{2\sqrt{4+h}} \cdot \frac{2+\sqrt{4+h}}{2+\sqrt{4+h}}}{h} = \lim_{h\to 0} \frac{\frac{4-4-h}{4\sqrt{4+h}+2(4+h)}}{h}$$
$$= \lim_{h\to 0} \frac{-1}{4\sqrt{4+h} + 2(4+h)} = -\frac{1}{16}.$$

At $a = 4$ the tangent line is

$$y = f'(4)(x-4) + f(4) = -\frac{1}{16}(x-4) + \frac{1}{2} = -\frac{1}{16}x + \frac{3}{4}.$$

40. $f(x) = \dfrac{1}{\sqrt{2x+1}}, \quad a = 4$

SOLUTION Let $f(x) = \dfrac{1}{\sqrt{2x+1}}$. Then

$$f'(4) = \lim_{h\to 0} \frac{f(4+h) - f(4)}{h} = \lim_{h\to 0} \frac{\frac{1}{\sqrt{2h+9}} - \frac{1}{3}}{h} = \lim_{h\to 0} \frac{\frac{3-\sqrt{2h+9}}{3\sqrt{2h+9}} \cdot \frac{3+\sqrt{2h+9}}{3+\sqrt{2h+9}}}{h} = \lim_{h\to 0} \frac{\frac{9-2h-9}{9\sqrt{2h+9}+3(2h+9)}}{h}$$
$$= \lim_{h\to 0} \frac{-2}{9\sqrt{2h+9} + 3(2h+9)} = -\frac{1}{27}.$$

At $a = 4$ the tangent line is

$$y = f'(4)(x-4) + f(4) = -\frac{1}{27}(x-4) + \frac{1}{3} = -\frac{1}{27}x + \frac{13}{27}.$$

41. $f(t) = \sqrt{t^2+1}, \quad a = 3$

SOLUTION Let $f(t) = \sqrt{t^2+1}$. Then

$$\begin{aligned} f'(3) &= \lim_{h\to 0} \frac{f(3+h) - f(3)}{h} = \lim_{h\to 0} \frac{\sqrt{10+6h+h^2} - \sqrt{10}}{h} \\ &= \lim_{h\to 0} \frac{\sqrt{10+6h+h^2} - \sqrt{10}}{h} \cdot \frac{\sqrt{10+6h+h^2} + \sqrt{10}}{\sqrt{10+6h+h^2} + \sqrt{10}} \\ &= \lim_{h\to 0} \frac{6h+h^2}{h(\sqrt{10+6h+h^2} + \sqrt{10})} = \lim_{h\to 0} \frac{6+h}{\sqrt{10+6h+h^2} + \sqrt{10}} = \frac{3}{\sqrt{10}}. \end{aligned}$$

The tangent line at $a = 3$ is

$$y = f'(3)(t-3) + f(3) = \frac{3}{\sqrt{10}}(t-3) + \sqrt{10} = \frac{3}{\sqrt{10}}t + \frac{1}{\sqrt{10}}.$$

42. $f(x) = x^{-2}, \quad a = -1$

SOLUTION Let $f(x) = \frac{1}{x^2}$. Then

$$f'(-1) = \lim_{h\to 0} \frac{f(-1+h) - f(-1)}{h} = \lim_{h\to 0} \frac{\frac{1}{(-1+h)^2} - 1}{h} = \lim_{h\to 0} \frac{\frac{h(2-h)}{(-1+h)^2}}{h} = \lim_{h\to 0} \frac{2-h}{(-1+h)^2} = 2.$$

The tangent line at $a = -1$ is

$$y = f'(-1)(x+1) + f(-1) = 2(x+1) + 1 = 2x + 3.$$

43. $f(x) = \dfrac{1}{x^2+1}, \quad a = 0$

SOLUTION Let $f(x) = \dfrac{1}{x^2+1}$. Then

$$f'(0) = \lim_{h\to 0} \frac{f(0+h) - f(0)}{h} = \lim_{h\to 0} \frac{\frac{1}{(0+h)^2+1} - 1}{h} = \lim_{h\to 0} \frac{\frac{-h^2}{h^2+1}}{h} = \lim_{h\to 0} \frac{-h}{h^2+1} = 0.$$

The tangent line at $a = 0$ is

$$y = f(0) + f'(0)(x-0) = 1 + 0(x-1) = 1.$$

44. $f(t) = t^{-3}, \quad a = 1$

SOLUTION Let $f(t) = \dfrac{1}{t^3}$. Then

$$f'(1) = \lim_{h\to 0} \frac{f(1+h) - f(h)}{h} = \lim_{h\to 0} \frac{\frac{1}{(1+h)^3} - 1}{h} = \lim_{h\to 0} \frac{\frac{-h\left(3+3h+h^2\right)}{(1+h)^3}}{h} = \lim_{h\to 0} \frac{-(3+3h+h^2)}{(1+h)^3} = -3.$$

The tangent line at $a = 1$ is

$$y = f'(1)(t-1) + f(1) = -3(t-1) + 1 = -3t + 4.$$

45. Figure 13 displays data collected by the biologist Julian Huxley (1887–1975) on the average antler weight W of male red deer as a function of age t. Estimate the derivative at $t = 4$. For which values of t is the slope of the tangent line equal to zero? For which values is it negative?

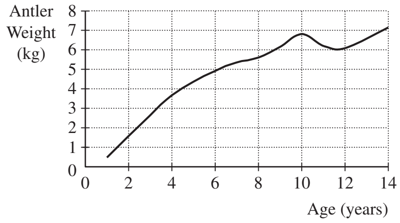

FIGURE 13

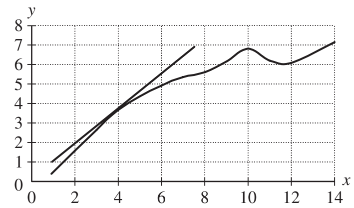
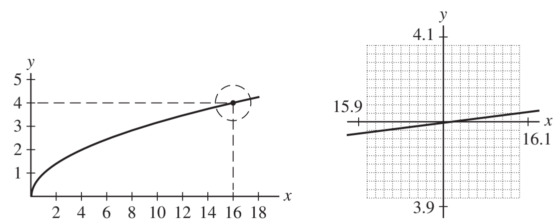
SOLUTION Let $W(t)$ denote the antler weight as a function of age. The "tangent line" sketched in the figure below passes through the points $(1, 1)$ and $(6, 5.5)$. Therefore

$$W'(4) \approx \frac{5.5 - 1}{6 - 1} = 0.9 \text{ kg/year}.$$

If the slope of the tangent is zero, the tangent line is horizontal. This appears to happen at roughly $t = 10$ and at $t = 11.6$. The slope of the tangent line is negative when the height of the graph decreases as we move to the right. For the graph in Figure 13, this occurs for $10 < t < 11.6$.



46. Figure 14(A) shows the graph of $f(x) = \sqrt{x}$. The close-up in Figure 14(B) shows that the graph is nearly a straight line near $x = 16$. Estimate the slope of this line and take it as an estimate for $f'(16)$. Then compute $f'(16)$ and compare with your estimate.



(A) Graph of $y = \sqrt{x}$ (B) Zoom view near (16, 4)

FIGURE 14

SOLUTION From the close-up in Figure 14(B), the line appears to pass through the points $(15.92, 3.99)$ and $(16.08, 4.01)$. Thus,

$$f'(16) \approx \frac{4.01 - 3.99}{16.08 - 15.92} = \frac{0.02}{0.16} = 0.125.$$

With $f(x) = \sqrt{x}$,

$$f'(16) = \lim_{h \to 0} \frac{\sqrt{16 + h} - 4}{h} \cdot \frac{\sqrt{16 + h} + 4}{\sqrt{16 + h} + 4} = \lim_{h \to 0} \frac{16 + h - 16}{h(\sqrt{16 + h} + 4)} = \lim_{h \to 0} \frac{1}{\sqrt{16 + h} + 4} = \frac{1}{8} = 0.125,$$

which is consistent with the approximation obtained from the close-up graph.

47. $\boxed{\text{GU}}$ Let $f(x) = \dfrac{4}{1 + 2^x}$.

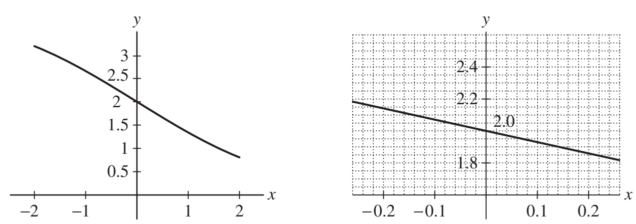
(a) Plot $f(x)$ over $[-2, 2]$. Then zoom in near $x = 0$ until the graph appears straight, and estimate the slope $f'(0)$.

(b) Use (a) to find an approximate equation to the tangent line at $x = 0$. Plot this line and $f(x)$ on the same set of axes.

SOLUTION

(a) The figure below at the left shows the graph of $f(x) = \frac{4}{1+2^x}$ over $[-2, 2]$. The figure below at the right is a close-up near $x = 0$. From the close-up, we see that the graph is nearly straight and passes through the points $(-0.22, 2.15)$ and $(0.22, 1.85)$. We therefore estimate

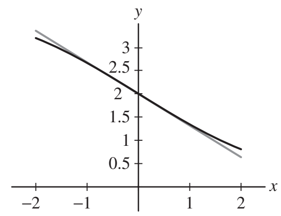
$$f'(0) \approx \frac{1.85 - 2.15}{0.22 - (-0.22)} = \frac{-0.3}{0.44} = -0.68$$



(b) Using the estimate for $f'(0)$ obtained in part (a), the approximate equation of the tangent line is

$$y = f'(0)(x-0) + f(0) = -0.68x + 2.$$

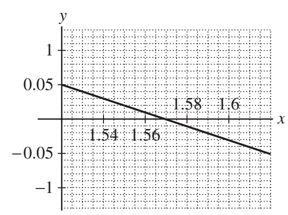
The figure below shows the graph of $f(x)$ and the approximate tangent line.



48. GU Let $f(x) = \cot x$. Estimate $f'\left(\frac{\pi}{2}\right)$ graphically by zooming in on a plot of $f(x)$ near $x = \frac{\pi}{2}$.

SOLUTION The figure below shows a close-up of the graph of $f(x) = \cot x$ near $x = \frac{\pi}{2} \approx 1.5708$. From the close-up, we see that the graph is nearly straight and passes through the points $(1.53, 0.04)$ and $(1.61, -0.04)$. We therefore estimate

$$f'\left(\frac{\pi}{2}\right) \approx \frac{-0.04 - 0.04}{1.61 - 1.53} = \frac{-0.08}{0.08} = -1$$



49. Determine the intervals along the x-axis on which the derivative in Figure 15 is positive.

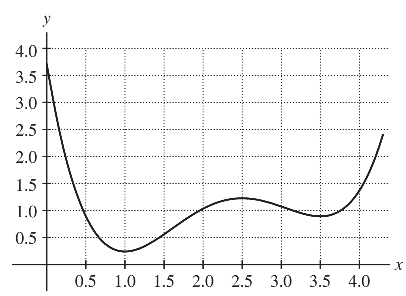


FIGURE 15

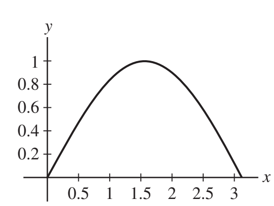
SOLUTION The derivative (that is, the slope of the tangent line) is positive when the height of the graph increases as we move to the right. From Figure 15, this appears to be true for $1 < x < 2.5$ and for $x > 3.5$.

50. Sketch the graph of $f(x) = \sin x$ on $[0, \pi]$ and guess the value of $f'\left(\frac{\pi}{2}\right)$. Then calculate the difference quotient at $x = \frac{\pi}{2}$ for two small positive and negative values of h. Are these calculations consistent with your guess?

SOLUTION Here is the graph of $y = \sin x$ on $[0, \pi]$.



At $x = \frac{\pi}{2}$, we're at the peak of the sine graph. The tangent line appears to be horizontal, so the slope is 0; hence, $f'(\frac{\pi}{2})$ appears to be 0.

h	-0.01	-0.001	-0.0001	0.0001	0.001	0.01
$\dfrac{\sin(\frac{\pi}{2}+h)-1}{h}$	0.005	0.0005	0.00005	-0.00005	-0.0005	-0.005

These numerical calculations are consistent with our guess.

In Exercises 51–56, each limit represents a derivative $f'(a)$. Find $f(x)$ and a.

51. $\lim\limits_{h\to 0} \dfrac{(5+h)^3 - 125}{h}$

SOLUTION The difference quotient $\dfrac{(5+h)^3-125}{h}$ has the form $\dfrac{f(a+h)-f(a)}{h}$ where $f(x) = x^3$ and $a = 5$.

52. $\lim\limits_{x\to 5} \dfrac{x^3 - 125}{x - 5}$

SOLUTION The difference quotient $\dfrac{x^3-125}{x-5}$ has the form $\dfrac{f(x)-f(a)}{x-a}$ where $f(x) = x^3$ and $a = 5$.

53. $\lim\limits_{h\to 0} \dfrac{\sin\left(\frac{\pi}{6}+h\right) - 0.5}{h}$

SOLUTION The difference quotient $\dfrac{\sin(\frac{\pi}{6}+h)-.5}{h}$ has the form $\dfrac{f(a+h)-f(a)}{h}$ where $f(x) = \sin x$ and $a = \frac{\pi}{6}$.

54. $\lim\limits_{x\to \frac{1}{4}} \dfrac{x^{-1} - 4}{x - \frac{1}{4}}$

SOLUTION The difference quotient $\dfrac{\frac{1}{x}-4}{x-\frac{1}{4}}$ has the form $\dfrac{f(x)-f(a)}{x-a}$ where $f(x) = \frac{1}{x}$ and $a = \frac{1}{4}$.

55. $\lim\limits_{h\to 0} \dfrac{5^{2+h} - 25}{h}$

SOLUTION The difference quotient $\dfrac{5^{(2+h)}-25}{h}$ has the form $\dfrac{f(a+h)-f(a)}{h}$ where $f(x) = 5^x$ and $a = 2$.

56. $\lim\limits_{h\to 0} \dfrac{5^h - 1}{h}$

SOLUTION The difference quotient $\dfrac{5^h-1}{h}$ has the form $\dfrac{f(a+h)-f(a)}{h}$ where $f(x) = 5^x$ and $a = 0$.

57. Apply the method of Example 6 to $f(x) = \sin x$ to determine $f'\left(\frac{\pi}{4}\right)$ accurately to four decimal places.

SOLUTION We know that

$$f'(\pi/4) = \lim_{h\to 0} \frac{f(\pi/4+h) - f(\pi/4)}{h} = \lim_{h\to 0} \frac{\sin(\pi/4+h) - \sqrt{2}/2}{h}.$$

Creating a table of values of h close to zero:

h	-0.001	-0.0001	-0.00001	0.00001	0.0001	0.001
$\dfrac{\sin(\frac{\pi}{4}+h) - (\sqrt{2}/2)}{h}$	0.7074602	0.7071421	0.7071103	0.7071033	0.7070714	0.7067531

Accurate up to four decimal places, $f'(\frac{\pi}{4}) \approx 0.7071$.

58. Apply the method of Example 6 to $f(x) = \cos x$ to determine $f'\left(\frac{\pi}{5}\right)$ accurately to four decimal places. Use a graph of $f(x)$ to explain how the method works in this case.

SOLUTION We know that

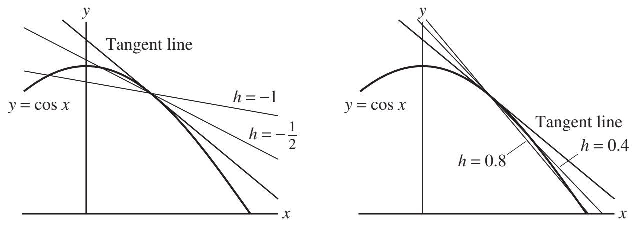
$$f'\left(\frac{\pi}{5}\right) = \lim_{h\to 0} \frac{f(\pi/5+h) - f(\pi/5)}{h} = \lim_{h\to 0} \frac{\cos(\frac{\pi}{5}+h) - \cos(\frac{\pi}{5})}{h}.$$

We make a chart using values of h close to zero:

h	-0.001	-0.0001	-0.00001
$\dfrac{\cos(\frac{\pi}{5}+h) - \cos(\frac{\pi}{5})}{h}$	-0.587381	-0.587745	-0.587781
h	0.001	0.0001	0.00001
$\dfrac{\cos(\frac{\pi}{5}+h) - \cos(\frac{\pi}{5})}{h}$	-0.588190	-0.587826	-0.587789

$f'(\frac{\pi}{5}) \approx -0.5878$.

The figures shown below illustrate why this procedure works. From the figure on the left, we see that for $h < 0$, the slope of the secant line is greater (less negative) than the slope of the tangent line. On the other hand, from the figure on the right, we see that for $h > 0$, the slope of the secant line is less (more negative) than the slope of the tangent line. Thus, the slope of the tangent line must fall between the slope of a secant line with $h > 0$ and the slope of a secant line with $h < 0$.



59. For each graph in Figure 16, determine whether $f'(1)$ is larger or smaller than the slope of the secant line between $x = 1$ and $x = 1 + h$ for $h > 0$. Explain.

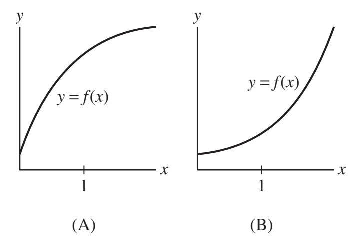


FIGURE 16

SOLUTION

- On curve (A), $f'(1)$ is larger than

$$\frac{f(1+h) - f(1)}{h};$$

  the curve is bending downwards, so that the secant line to the right is at a lower angle than the tangent line. We say such a curve is **concave down**, and that its derivative is *decreasing*.
- On curve (B), $f'(1)$ is smaller than

$$\frac{f(1+h) - f(1)}{h};$$

  the curve is bending upwards, so that the secant line to the right is at a steeper angle than the tangent line. We say such a curve is **concave up**, and that its derivative is *increasing*.

60. Refer to the graph of $f(x) = 2^x$ in Figure 17.

(a) Explain graphically why, for $h > 0$,

$$\frac{f(-h) - f(0)}{-h} \le f'(0) \le \frac{f(h) - f(0)}{h}$$

(b) Use (a) to show that $0.69314 \le f'(0) \le 0.69315$.

(c) Similarly, compute $f'(x)$ to four decimal places for $x = 1, 2, 3, 4$.

(d) Now compute the ratios $f'(x)/f'(0)$ for $x = 1, 2, 3, 4$. Can you guess an approximate formula for $f'(x)$?

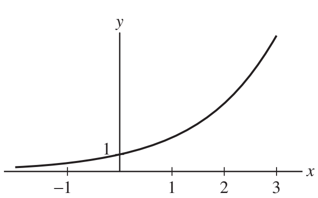

FIGURE 17 Graph of $f(x) = 2^x$.

SOLUTION

(a) In the graph, the inequality

$$f'(0) \le \frac{f(h) - f(0)}{h}$$

holds for positive values of h, since the difference quotient

$$\frac{f(h) - f(0)}{h}$$

is an increasing function of h. (The slopes of the secant lines between $(0, f(0))$ and a nearby point increase as the nearby point moves from left to right.) Hence the slopes of the secant lines between $(0, f(0))$ and a nearby point to the right, $(h, f(h))$ (where h is positive) exceed $f'(0)$. Similarly, for $h > 0$, $-h$ is negative and 0 lies to the right of $-h$. Consequently, the slope of the secant line between $(0, f(0))$ and a nearby point to the left, $(-h, f(-h))$ is less than $f'(0)$. Therefore, the inequality

$$f'(0) \ge \frac{f(-h) - f(0)}{-h}$$

holds for $h > 0$.

(b) For $h = 0.00001$, we have

$$\frac{f(h) - f(0)}{h} = \frac{2^h - 1}{h} \approx 0.69315,$$

and

$$\frac{f(-h) - f(0)}{-h} \approx 0.69314.$$

In light of (a), $0.69314 \le f'(0) \le 0.69315$.

(c) We'll use the same values of $h = \pm 0.00001$ and compute difference quotients at $x = 1, 2, 3, 4$.

- Since $1.386290 \le f'(1) \le 1.386299$, we conclude that $f'(1) \approx 1.3863$ to four decimal places.
- Since $2.772579 \le f'(2) \le 2.772598$, we conclude that $f'(2) \approx 2.7726$ to four decimal places.
- Since $5.545158 \le f'(3) \le 5.545197$, we conclude that $f'(3) \approx 5.5452$ to four decimal places.
- With $h = \pm 0.000001$, $11.090351 \le f'(4) \le 11.090359$, so we conclude that $f'(4) \approx 11.0904$ to four decimal places.

(d)

x	1	2	3	4
$f'(x)/f'(0)$	2	4	8	16

Looking at this table, we guess that $f'(x)/f'(0) = 2^x$. In other words, $f'(x) = 2^x f'(0)$.

61. $\boxed{\text{GU}}$ Sketch the graph of $f(x) = x^{5/2}$ on $[0, 6]$.

(a) Use the sketch to justify the inequalities for $h > 0$:

$$\frac{f(4) - f(4-h)}{h} \le f'(4) \le \frac{f(4+h) - f(4)}{h}$$

(b) Use (a) to compute $f'(4)$ to four decimal places.

(c) Use a graphing utility to plot $f(x)$ and the tangent line at $x = 4$, using your estimate for $f'(4)$.

SOLUTION

(a) The slope of the secant line between points $(4, f(4))$ and $(4+h, f(4+h))$ is

$$\frac{f(4+h) - f(4)}{h}.$$

$x^{5/2}$ is a smooth curve increasing at a faster rate as $x \to \infty$. Therefore, if $h > 0$, then the slope of the secant line is greater than the slope of the tangent line at $f(4)$, which happens to be $f'(4)$. Likewise, if $h < 0$, the slope of the secant line is less than the slope of the tangent line at $f(4)$, which happens to be $f'(4)$.

(b) We know that

$$f'(4) = \lim_{h \to 0} \frac{f(4+h) - f(4)}{h} = \lim_{h \to 0} \frac{(4+h)^{5/2} - 32}{h}.$$

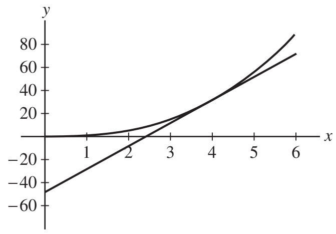
Creating a table with values of h close to zero:

h	-0.0001	-0.00001	0.00001	0.0001
$\dfrac{(4+h)^{5/2}-32}{h}$	19.999625	19.99999	20.0000	20.0000375

Thus, $f'(4) \approx 20.0000$.

(c) Using the estimate for $f'(4)$ obtained in part (b), the equation of the line tangent to $f(x) = x^{5/2}$ at $x = 4$ is

$$y = f'(4)(x-4) + f(4) = 20(x-4) + 32 = 20x - 48.$$

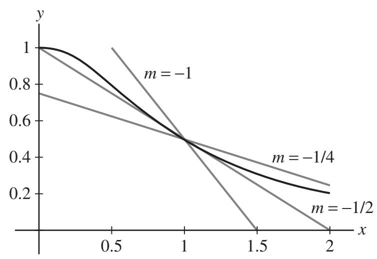


62. GU Verify that $P = \left(1, \frac{1}{2}\right)$ lies on the graphs of both $f(x) = 1/(1+x^2)$ and $L(x) = \frac{1}{2} + m(x-1)$ for every slope m. Plot $f(x)$ and $L(x)$ on the same axes for several values of m until you find a value of m for which $y = L(x)$ appears tangent to the graph of $f(x)$. What is your estimate for $f'(1)$?

SOLUTION Let $f(x) = \dfrac{1}{1+x^2}$ and $L(x) = \frac{1}{2} + m(x-1)$. Because

$$f(1) = \frac{1}{1+1^2} = \frac{1}{2} \qquad \text{and} \qquad L(1) = \frac{1}{2} + m(1-1) = \frac{1}{2},$$

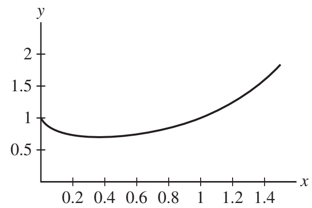
it follows that $P = (1, \frac{1}{2})$ lies on the graphs of both functions. A plot of $f(x)$ and $L(x)$ on the same axes for several values of m is shown below. The graph of $L(x)$ with $m = -\frac{1}{2}$ appears to be tangent to the graph of $f(x)$ at $x = 1$. We therefore estimate $f'(1) = -\frac{1}{2}$.



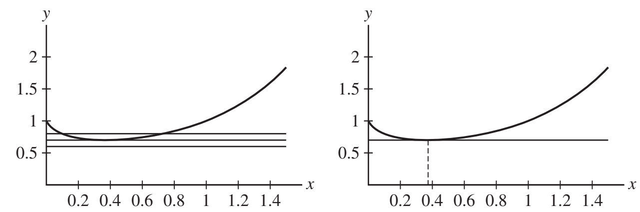
63. GU Use a plot of $f(x) = x^x$ to estimate the value c such that $f'(c) = 0$. Find c to sufficient accuracy so that

$$\left|\frac{f(c+h) - f(c)}{h}\right| \le 0.006 \qquad \text{for} \quad h = \pm 0.001$$

SOLUTION Here is a graph of $f(x) = x^x$ over the interval $[0, 1.5]$.



The graph shows one location with a horizontal tangent line. The figure below at the left shows the graph of $f(x)$ together with the horizontal lines $y = 0.6$, $y = 0.7$ and $y = 0.8$. The line $y = 0.7$ is very close to being tangent to the graph of $f(x)$. The figure below at the right refines this estimate by graphing $f(x)$ and $y = 0.69$ on the same set of axes. The point of tangency has an x-coordinate of roughly 0.37, so $c \approx 0.37$.



We note that

$$\left| \frac{f(0.37 + 0.001) - f(0.37)}{0.001} \right| \approx 0.00491 < 0.006$$

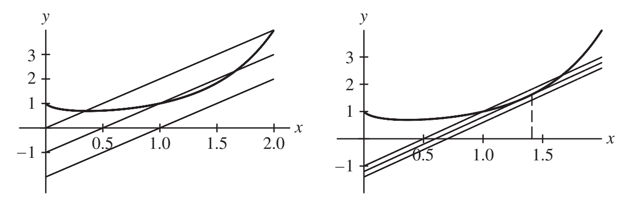
and

$$\left| \frac{f(0.37 - 0.001) - f(0.37)}{0.001} \right| \approx 0.00304 < 0.006,$$

so we have determined c to the desired accuracy.

64. GU Plot $f(x) = x^x$ and $y = 2x + a$ on the same set of axes for several values of a until the line becomes tangent to the graph. Then estimate the value c such that $f'(c) = 2$.

SOLUTION The figure below on the left shows the graphs of the function $f(x) = x^x$ together with the lines $y = 2x$, $y = 2x - 1$, and $y = 2x - 2$; the figure on the right shows the graphs of $f(x) = x^x$ together with the lines $y = 2x - 1$, $y = 2x - 1.2$, and $y = 2x - 1.4$. The graph of $y = 2x - 1.2$ appears to be tangent to the graph of $f(x)$ at $x \approx 1.4$. We therefore estimate that $f'(1.4) = 2$.



In Exercises 65–71, estimate derivatives using the ***symmetric difference quotient*** *(SDQ), defined as the average of the difference quotients at h and $-h$:*

$$\frac{1}{2}\left(\frac{f(a+h) - f(a)}{h} + \frac{f(a-h) - f(a)}{-h} \right) = \frac{f(a+h) - f(a-h)}{2h} \qquad \boxed{4}$$

The SDQ usually gives a better approximation to the derivative than the difference quotient.

65. The vapor pressure of water at temperature T (in kelvins) is the atmospheric pressure P at which no net evaporation takes place. Use the following table to estimate $P'(T)$ for $T = 303, 313, 323, 333, 343$ by computing the SDQ given by Eq. (4) with $h = 10$.

T (K)	293	303	313	323	333	343	353
P (atm)	0.0278	0.0482	0.0808	0.1311	0.2067	0.3173	0.4754

SOLUTION Using equation (4),

$$P'(303) \approx \frac{P(313) - P(293)}{20} = \frac{0.0808 - 0.0278}{20} = 0.00265 \text{ atm/K};$$

$$P'(313) \approx \frac{P(323) - P(303)}{20} = \frac{0.1311 - 0.0482}{20} = 0.004145 \text{ atm/K};$$

$$P'(323) \approx \frac{P(333) - P(313)}{20} = \frac{0.2067 - 0.0808}{20} = 0.006295 \text{ atm/K};$$

$$P'(333) \approx \frac{P(343) - P(323)}{20} = \frac{0.3173 - 0.1311}{20} = 0.00931 \text{ atm/K};$$

$$P'(343) \approx \frac{P(353) - P(333)}{20} = \frac{0.4754 - 0.2067}{20} = 0.013435 \text{ atm/K}$$

66. Use the SDQ with $h = 1$ year to estimate $P'(T)$ in the years 2000, 2002, 2004, 2006, where $P(T)$ is the U.S. ethanol production (Figure 18). Express your answer in the correct units.

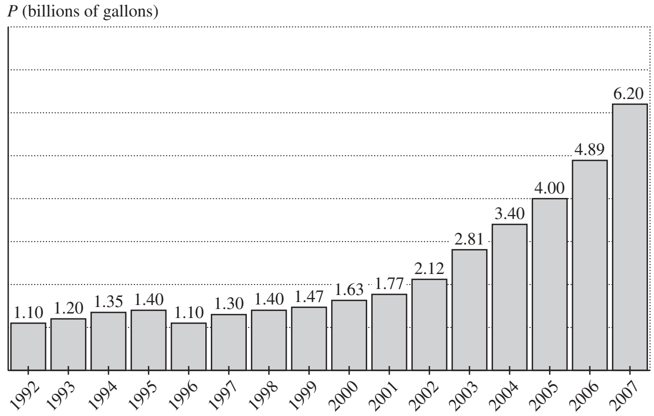


FIGURE 18 U.S. Ethanol Production

SOLUTION Using equation (4),

$$P'(2000) \approx \frac{P(2001) - P(1999)}{2} = \frac{1.77 - 1.47}{2} = 0.15 \text{ billions of gallons/yr;}$$

$$P'(2002) \approx \frac{P(2003) - P(2001)}{2} = \frac{2.81 - 1.77}{2} = 0.52 \text{ billions of gallons/yr;}$$

$$P'(2004) \approx \frac{P(2005) - P(2003)}{2} = \frac{4 - 2.81}{2} = 0.595 \text{ billions of gallons/yr;}$$

$$P'(2006) \approx \frac{P(2007) - P(2005)}{2} = \frac{6.2 - 4}{2} = 1.1 \text{ billions of gallons/yr}$$

In Exercises 67 and 68, traffic speed S along a certain road (in km/h) varies as a function of traffic density q (number of cars per km of road). Use the following data to answer the questions:

q (density)	60	70	80	90	100
S (speed)	72.5	67.5	63.5	60	56

67. Estimate $S'(80)$.

SOLUTION Let $S(q)$ be the function determining S given q. Using equation (4) with $h = 10$,

$$S'(80) \approx \frac{S(90) - S(70)}{20} = \frac{60 - 67.5}{20} = -0.375;$$

with $h = 20$,

$$S'(80) \approx \frac{S(100) - S(60)}{40} = \frac{56 - 72.5}{40} = -0.4125;$$

The mean of these two symmetric difference quotients is -0.39375 kph·km/car.

68. Explain why $V = qS$, called *traffic volume*, is equal to the number of cars passing a point per hour. Use the data to estimate $V'(80)$.

SOLUTION The traffic speed S has units of km/hour, and the traffic density has units of cars/km. Therefore, the traffic volume $V = Sq$ has units of cars/hour. A table giving the values of V follows.

q	60	70	80	90	100
V	4350	4725	5080	5400	5600

To estimate dV/dq, we take the mean of the symmetric difference quotients. With $h = 10$,

$$V'(80) \approx \frac{V(90) - V(70)}{20} = \frac{5400 - 4725}{20} = 33.75;$$

with $h = 20$,

$$V'(80) \approx \frac{V(100) - V(60)}{40} = \frac{5600 - 4350}{40} = 31.25;$$

The mean of the symmetric difference quotients is 32.5. Hence $dV/dq \approx 32.5$ cars per hour when $q = 80$.

Exercises 69–71: The current (in amperes) at time t (in seconds) flowing in the circuit in Figure 19 is given by Kirchhoff's Law:

$$i(t) = Cv'(t) + R^{-1}v(t)$$

where $v(t)$ is the voltage (in volts), C the capacitance (in farads), and R the resistance (in ohms, Ω).

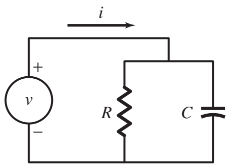

FIGURE 19

69. Calculate the current at $t = 3$ if

$$v(t) = 0.5t + 4 \text{ V}$$

where $C = 0.01$ F and $R = 100\ \Omega$.

SOLUTION Since $v(t)$ is a line with slope 0.5, $v'(t) = 0.5$ volts/s for all t. From the formula, $i(3) = Cv'(3) + (1/R)v(3) = 0.01(0.5) + (1/100)(5.5) = 0.005 + 0.055 = 0.06$ amperes.

70. Use the following data to estimate $v'(10)$ (by an SDQ). Then estimate $i(10)$, assuming $C = 0.03$ and $R = 1000$.

t	9.8	9.9	10	10.1	10.2
$v(t)$	256.52	257.32	258.11	258.9	259.69

SOLUTION Taking $h = 0.1$, we find

$$v'(10) \approx \frac{v(10.1) - v(9.9)}{0.2} = \frac{258.9 - 257.32}{0.2} = 7.9 \text{ volts/s.}$$

Thus,

$$i(10) = 0.03(7.9) + \frac{1}{1000}(258.11) = 0.49511 \text{ amperes.}$$

71. Assume that $R = 200\ \Omega$ but C is unknown. Use the following data to estimate $v'(4)$ (by an SDQ) and deduce an approximate value for the capacitance C.

t	3.8	3.9	4	4.1	4.2
$v(t)$	388.8	404.2	420	436.2	452.8
$i(t)$	32.34	33.22	34.1	34.98	35.86

SOLUTION Solving $i(4) = Cv'(4) + (1/R)v(4)$ for C yields

$$C = \frac{i(4) - (1/R)v(4)}{v'(4)} = \frac{34.1 - \frac{420}{200}}{v'(4)}.$$

To compute C, we first approximate $v'(4)$. Taking $h = 0.1$, we find

$$v'(4) \approx \frac{v(4.1) - v(3.9)}{0.2} = \frac{436.2 - 404.2}{0.2} = 160.$$

Plugging this in to the equation above yields

$$C \approx \frac{34.1 - 2.1}{160} = 0.2 \text{ farads.}$$

Further Insights and Challenges

72. The SDQ usually approximates the derivative much more closely than does the ordinary difference quotient. Let $f(x) = 2^x$ and $a = 0$. Compute the SDQ with $h = 0.001$ and the ordinary difference quotients with $h = \pm 0.001$. Compare with the actual value, which is $f'(0) = \ln 2$.

SOLUTION Let $f(x) = 2^x$ and $a = 0$.

- The ordinary difference quotient for $h = -0.001$ is 0.69290701 and for $h = 0.001$ is 0.69338746.
- The symmetric difference quotient for $h = 0.001$ is 0.69314724.
- Clearly the symmetric difference quotient gives a better estimate of the derivative $f'(0) = \ln 2 \approx 0.69314718$.

73. Explain how the symmetric difference quotient defined by Eq. (4) can be interpreted as the slope of a secant line.

SOLUTION The symmetric difference quotient

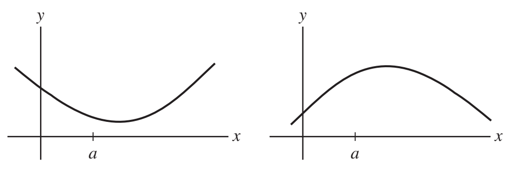
$$\frac{f(a+h) - f(a-h)}{2h}$$

is the slope of the secant line connecting the points $(a - h, f(a - h))$ and $(a + h, f(a + h))$ on the graph of f; the difference in the function values is divided by the difference in the x-values.

74. Which of the two functions in Figure 20 satisfies the inequality

$$\frac{f(a+h) - f(a-h)}{2h} \le \frac{f(a+h) - f(a)}{h}$$

for $h > 0$? Explain in terms of secant lines.



(A) (B)

FIGURE 20

SOLUTION Figure (A) satisfies the inequality

$$\frac{f(a+h) - f(a-h)}{2h} \le \frac{f(a+h) - f(a)}{h}$$

since in this graph the symmetric difference quotient has a larger negative slope than the ordinary right difference quotient. [In figure (B), the symmetric difference quotient has a larger positive slope than the ordinary right difference quotient and therefore does *not* satisfy the stated inequality.]

75. Show that if $f(x)$ is a quadratic polynomial, then the SDQ at $x = a$ (for any $h \neq 0$) is *equal* to $f'(a)$. Explain the graphical meaning of this result.

SOLUTION Let $f(x) = px^2 + qx + r$ be a quadratic polynomial. We compute the SDQ at $x = a$.

$$\begin{aligned}\frac{f(a+h) - f(a-h)}{2h} &= \frac{p(a+h)^2 + q(a+h) + r - (p(a-h)^2 + q(a-h) + r)}{2h} \\ &= \frac{pa^2 + 2pah + ph^2 + qa + qh + r - pa^2 + 2pah - ph^2 - qa + qh - r}{2h} \\ &= \frac{4pah + 2qh}{2h} = \frac{2h(2pa + q)}{2h} = 2pa + q\end{aligned}$$

Since this doesn't depend on h, the limit, which is equal to $f'(a)$, is also $2pa + q$. Graphically, this result tells us that the secant line to a parabola passing through points chosen symmetrically about $x = a$ is always parallel to the tangent line at $x = a$.

76. Let $f(x) = x^{-2}$. Compute $f'(1)$ by taking the limit of the SDQs (with $a = 1$) as $h \to 0$.

SOLUTION Let $f(x) = x^{-2}$. With $a = 1$, the symmetric difference quotient is

$$\frac{f(1+h) - f(1-h)}{2h} = \frac{\frac{1}{(1+h)^2} - \frac{1}{(1-h)^2}}{2h} = \frac{(1-h)^2 - (1+h)^2}{2h(1-h)^2(1+h)^2} = \frac{-4h}{2h(1-h)^2(1+h)^2} = -\frac{2}{(1-h)^2(1+h)^2}.$$

Therefore,

$$f'(1) = \lim_{h \to 0} -\frac{2}{(1-h)^2(1+h)^2} = -2.$$

3.2 The Derivative as a Function

Preliminary Questions

1. What is the slope of the tangent line through the point $(2, f(2))$ if $f'(x) = x^3$?

SOLUTION The slope of the tangent line through the point $(2, f(2))$ is given by $f'(2)$. Since $f'(x) = x^3$, it follows that $f'(2) = 2^3 = 8$.

2. Evaluate $(f - g)'(1)$ and $(3f + 2g)'(1)$ assuming that $f'(1) = 3$ and $g'(1) = 5$.

SOLUTION $(f - g)'(1) = f'(1) - g'(1) = 3 - 5 = -2$ and $(3f + 2g)'(1) = 3f'(1) + 2g'(1) = 3(3) + 2(5) = 19$.

3. To which of the following does the Power Rule apply?

(a) $f(x) = x^2$ **(b)** $f(x) = 2^e$
(c) $f(x) = x^e$ **(d)** $f(x) = e^x$
(e) $f(x) = x^x$ **(f)** $f(x) = x^{-4/5}$

SOLUTION

(a) Yes. x^2 is a power function, so the Power Rule can be applied.
(b) Yes. 2^e is a constant function, so the Power Rule can be applied.
(c) Yes. x^e is a power function, so the Power Rule can be applied.
(d) No. e^x is an exponential function (the base is constant while the exponent is a variable), so the Power Rule does not apply.
(e) No. x^x is not a power function because both the base and the exponent are variable, so the Power Rule does not apply.
(f) Yes. $x^{-4/5}$ is a power function, so the Power Rule can be applied.

4. Choose (a) or (b). The derivative does not exist if the tangent line is: (a) horizontal (b) vertical.

SOLUTION The derivative does not exist when: (b) the tangent line is vertical. At a horizontal tangent, the derivative is zero.

5. Which property distinguishes $f(x) = e^x$ from all other exponential functions $g(x) = b^x$?

SOLUTION The line tangent to $f(x) = e^x$ at $x = 0$ has slope equal to 1.

Exercises

In Exercises 1–6, compute $f'(x)$ using the limit definition.

1. $f(x) = 3x - 7$

SOLUTION Let $f(x) = 3x - 7$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{3(x+h) - 7 - (3x - 7)}{h} = \lim_{h\to 0} \frac{3h}{h} = 3.$$

2. $f(x) = x^2 + 3x$

SOLUTION Let $f(x) = x^2 + 3x$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{(x+h)^2 + 3(x+h) - (x^2 + 3x)}{h}$$
$$= \lim_{h\to 0} \frac{2xh + h^2 + 3h}{h} = \lim_{h\to 0} (2x + h + 3) = 2x + 3.$$

3. $f(x) = x^3$

SOLUTION Let $f(x) = x^3$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{(x+h)^3 - x^3}{h} = \lim_{h\to 0} \frac{x^3 + 3x^2h + 3xh^2 + h^3 - x^3}{h}$$
$$= \lim_{h\to 0} \frac{3x^2h + 3xh^2 + h^3}{h} = \lim_{h\to 0} (3x^2 + 3xh + h^2) = 3x^2.$$

4. $f(x) = 1 - x^{-1}$

SOLUTION Let $f(x) = 1 - x^{-1}$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{1 - \frac{1}{x+h} - \left(1 - \frac{1}{x}\right)}{h} = \lim_{h\to 0} \frac{\frac{(x+h)-x}{x(x+h)}}{h} = \lim_{h\to 0} \frac{1}{x(x+h)} = \frac{1}{x^2}.$$

5. $f(x) = x - \sqrt{x}$

SOLUTION Let $f(x) = x - \sqrt{x}$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{x + h - \sqrt{x+h} - (x - \sqrt{x})}{h} = 1 - \lim_{h\to 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} \cdot \left(\frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}}\right)$$

$$= 1 - \lim_{h\to 0} \frac{(x+h) - x}{h(\sqrt{x+h} + \sqrt{x})} = 1 - \lim_{h\to 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = 1 - \frac{1}{2\sqrt{x}}.$$

6. $f(x) = x^{-1/2}$

SOLUTION Let $f(x) = x^{-1/2}$. Then,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{\frac{1}{\sqrt{x+h}} - \frac{1}{\sqrt{x}}}{h} = \lim_{h\to 0} \frac{\sqrt{x} - \sqrt{x+h}}{h\sqrt{x+h}\sqrt{x}}$$

Multiplying the numerator and denominator of the expression by $\sqrt{x} + \sqrt{x+h}$, we obtain:

$$f'(x) = \lim_{h\to 0} \frac{\sqrt{x} - \sqrt{x+h}}{h\sqrt{x+h}\sqrt{x}} \frac{\sqrt{x} + \sqrt{x+h}}{\sqrt{x} + \sqrt{x+h}} = \lim_{h\to 0} \frac{x - (x+h)}{h\sqrt{x+h}\sqrt{x}(\sqrt{x} + \sqrt{x+h})}$$

$$= \lim_{h\to 0} \frac{-1}{\sqrt{x+h}\sqrt{x}(\sqrt{x} + \sqrt{x+h})} = \frac{-1}{\sqrt{x}\sqrt{x}(2\sqrt{x})} = \frac{-1}{2x\sqrt{x}}.$$

In Exercises 7–14, use the Power Rule to compute the derivative.

7. $\left.\frac{d}{dx} x^4\right|_{x=-2}$

SOLUTION $\frac{d}{dx}\left(x^4\right) = 4x^3$ so $\left.\frac{d}{dx} x^4\right|_{x=-2} = 4(-2)^3 = -32.$

8. $\left.\frac{d}{dt} t^{-3}\right|_{t=4}$

SOLUTION $\frac{d}{dt}\left(t^{-3}\right) = -3t^{-4}$ so $\left.\frac{d}{dt} t^{-3}\right|_{t=4} = -3(4)^{-4} = -\frac{3}{256}.$

9. $\left.\frac{d}{dt} t^{2/3}\right|_{t=8}$

SOLUTION $\frac{d}{dt}\left(t^{2/3}\right) = \frac{2}{3}t^{-1/3}$ so $\left.\frac{d}{dt} t^{2/3}\right|_{t=8} = \frac{2}{3}(8)^{-1/3} = \frac{1}{3}.$

10. $\left.\frac{d}{dt} t^{-2/5}\right|_{t=1}$

SOLUTION $\frac{d}{dt}\left(t^{-2/5}\right) = -\frac{2}{5}t^{-7/5}$ so $\left.\frac{d}{dt} t^{-2/5}\right|_{t=1} = -\frac{2}{5}(1)^{-7/5} = -\frac{2}{5}.$

11. $\frac{d}{dx} x^{0.35}$

SOLUTION $\frac{d}{dx}\left(x^{0.35}\right) = 0.35(x^{0.35-1}) = 0.35x^{-0.65}.$

12. $\dfrac{d}{dx}\,x^{14/3}$

SOLUTION $\dfrac{d}{dx}\left(x^{14/3}\right) = \dfrac{14}{3}\left(x^{(14/3)-1}\right) = \dfrac{14}{3}x^{11/3}.$

13. $\dfrac{d}{dt}\,t^{\sqrt{17}}$

SOLUTION $\dfrac{d}{dt}\left(t^{\sqrt{17}}\right) = \sqrt{17}t^{\sqrt{17}-1}$

14. $\dfrac{d}{dt}\,t^{-\pi^2}$

SOLUTION $\dfrac{d}{dt}(t^{-\pi^2}) = -\pi^2 t^{-\pi^2-1}$

In Exercises 15–18, compute $f'(x)$ and find an equation of the tangent line to the graph at $x = a$.

15. $f(x) = x^4, \quad a = 2$

SOLUTION Let $f(x) = x^4$. Then, by the Power Rule, $f'(x) = 4x^3$. The equation of the tangent line to the graph of $f(x)$ at $x = 2$ is

$$y = f'(2)(x-2) + f(2) = 32(x-2) + 16 = 32x - 48.$$

16. $f(x) = x^{-2}, \quad a = 5$

SOLUTION Let $f(x) = x^{-2}$. Using the Power Rule, $f'(x) = -2x^{-3}$. The equation of the tangent line to the graph of $f(x)$ at $x = 5$ is

$$y = f'(5)(x-5) + f(5) = -\frac{2}{125}(x-5) + \frac{1}{25} = -\frac{2}{125}x + \frac{3}{25}.$$

17. $f(x) = 5x - 32\sqrt{x}, \quad a = 4$

SOLUTION Let $f(x) = 5x - 32x^{1/2}$. Then $f'(x) = 5 - 16x^{-1/2}$. In particular, $f'(4) = -3$. The tangent line at $x = 4$ is

$$y = f'(4)(x-4) + f(4) = -3(x-4) - 44 = -3x - 32.$$

18. $f(x) = \sqrt[3]{x}, \quad a = 8$

SOLUTION Let $f(x) = \sqrt[3]{x} = x^{1/3}$. Then $f'(x) = \frac{1}{3}(x^{1/3-1}) = \frac{1}{3}x^{-2/3}$. In particular, $f'(8) = \frac{1}{3}\left(\frac{1}{4}\right) = \frac{1}{12}$. $f(8) = 2$, so the tangent line at $x = 8$ is

$$y = f'(8)(x-8) + f(8) = \frac{1}{12}(x-8) + 2 = \frac{1}{12}x + \frac{4}{3}.$$

19. Calculate:

(a) $\dfrac{d}{dx}12e^x$ **(b)** $\dfrac{d}{dt}(25t - 8e^t)$ **(c)** $\dfrac{d}{dt}e^{t-3}$

Hint for (c): Write e^{t-3} as $e^{-3}e^t$.

SOLUTION

(a) $\dfrac{d}{dx}12e^x = 12\dfrac{d}{dx}e^x = 12e^x.$

(b) $\dfrac{d}{dt}(25t - 8e^t) = 25\dfrac{d}{dt}t - 8\dfrac{d}{dt}e^t = 25 - 8e^t.$

(c) $\dfrac{d}{dt}e^{t-3} = e^{-3}\dfrac{d}{dt}e^t = e^{-3}\cdot e^t = e^{t-3}.$

20. Find an equation of the tangent line to $y = 24e^x$ at $x = 2$.

SOLUTION Let $f(x) = 24e^x$. Then $f(2) = 24e^2$, $f'(x) = 24e^x$, and $f'(2) = 24e^2$. The equation of the tangent line is

$$y = f'(2)(x-2) + f(2) = 24e^2(x-2) + 24e^2.$$

In Exercises 21–32, calculate the derivative.

21. $f(x) = 2x^3 - 3x^2 + 5$

SOLUTION $\dfrac{d}{dx}\left(2x^3 - 3x^2 + 5\right) = 6x^2 - 6x.$

22. $f(x) = 2x^3 - 3x^2 + 2x$

SOLUTION $\frac{d}{dx}\left(2x^3 - 3x^2 + 2x\right) = 6x^2 - 6x + 2.$

23. $f(x) = 4x^{5/3} - 3x^{-2} - 12$

SOLUTION $\frac{d}{dx}\left(4x^{5/3} - 3x^{-2} - 12\right) = \frac{20}{3}x^{2/3} + 6x^{-3}.$

24. $f(x) = x^{5/4} + 4x^{-3/2} + 11x$

SOLUTION $\frac{d}{dx}\left(x^{5/4} + 4x^{-3/2} + 11x\right) = \frac{5}{4}x^{1/4} - 6x^{-5/2} + 11.$

25. $g(z) = 7z^{-5/14} + z^{-5} + 9$

SOLUTION $\frac{d}{dz}\left(7z^{-5/14} + z^{-5} + 9\right) = -\frac{5}{2}z^{-19/14} - 5z^{-6}.$

26. $h(t) = 6\sqrt{t} + \frac{1}{\sqrt{t}}$

SOLUTION $\frac{d}{dt}\left(6t^{1/2} + t^{-1/2}\right) = 3t^{-1/2} - \frac{1}{2}t^{-3/2}.$

27. $f(s) = \sqrt[4]{s} + \sqrt[3]{s}$

SOLUTION $f(s) = \sqrt[4]{s} + \sqrt[3]{s} = s^{1/4} + s^{1/3}$. In this form, we can apply the Sum and Power Rules.

$$\frac{d}{ds}\left(s^{1/4} + s^{1/3}\right) = \frac{1}{4}(s^{(1/4)-1}) + \frac{1}{3}(s^{(1/3)-1}) = \frac{1}{4}s^{-3/4} + \frac{1}{3}s^{-2/3}.$$

28. $W(y) = 6y^4 + 7y^{2/3}$

SOLUTION $\frac{d}{dy}\left(6y^4 + 7y^{2/3}\right) = 24y^3 + \frac{14}{3}y^{-1/3}.$

29. $g(x) = e^2$

SOLUTION Because e^2 is a constant, $\frac{d}{dx}e^2 = 0.$

30. $f(x) = 3e^x - x^3$

SOLUTION $\frac{d}{dx}\left(3e^x - x^3\right) = 3e^x - 3x^2.$

31. $h(t) = 5e^{t-3}$

SOLUTION $\frac{d}{dt}5e^{t-3} = 5e^{-3}\frac{d}{dt}e^t = 5e^{-3}e^t = 5e^{t-3}.$

32. $f(x) = 9 - 12x^{1/3} + 8e^x$

SOLUTION $\frac{d}{dx}\left(9 - 12x^{1/3} + 8e^x\right) = -4x^{-2/3} + 8e^x.$

In Exercises 33–36, calculate the derivative by expanding or simplifying the function.

33. $P(s) = (4s - 3)^2$

SOLUTION $P(s) = (4s - 3)^2 = 16s^2 - 24s + 9$. Thus,

$$\frac{dP}{ds} = 32s - 24.$$

34. $Q(r) = (1 - 2r)(3r + 5)$

SOLUTION $Q(r) = (1 - 2r)(3r + 5) = -6r^2 - 7r + 5$. Thus,

$$\frac{dQ}{dr} = -12r - 7.$$

35. $g(x) = \dfrac{x^2 + 4x^{1/2}}{x^2}$

SOLUTION $g(x) = \dfrac{x^2 + 4x^{1/2}}{x^2} = 1 + 4x^{-3/2}$. Thus,

$$\frac{dg}{dx} = -6x^{-5/2}.$$

36. $s(t) = \dfrac{1 - 2t}{t^{1/2}}$

SOLUTION $s(t) = \dfrac{1 - 2t}{t^{1/2}} = t^{-1/2} - 2t^{1/2}$. Thus,

$$\frac{ds}{dt} = -\frac{1}{2}t^{-3/2} - t^{-1/2}.$$

In Exercises 37–42, calculate the derivative indicated.

37. $\left.\dfrac{dT}{dC}\right|_{C=8}$, $\quad T = 3C^{2/3}$

SOLUTION With $T(C) = 3C^{2/3}$, we have $\dfrac{dT}{dC} = 2C^{-1/3}$. Therefore,

$$\left.\frac{dT}{dC}\right|_{C=8} = 2(8)^{-1/3} = 1.$$

38. $\left.\dfrac{dP}{dV}\right|_{V=-2}$, $\quad P = \dfrac{7}{V}$

SOLUTION With $P = 7V^{-1}$, we have $\dfrac{dP}{dV} = -7V^{-2}$. Therefore,

$$\left.\frac{dP}{dV}\right|_{V=-2} = -7(-2)^{-2} = -\frac{7}{4}.$$

39. $\left.\dfrac{ds}{dz}\right|_{z=2}$, $\quad s = 4z - 16z^2$

SOLUTION With $s = 4z - 16z^2$, we have $\dfrac{ds}{dz} = 4 - 32z$. Therefore,

$$\left.\frac{ds}{dz}\right|_{z=2} = 4 - 32(2) = -60.$$

40. $\left.\dfrac{dR}{dW}\right|_{W=1}$, $\quad R = W^{\pi}$

SOLUTION Let $R(W) = W^{\pi}$. Then $dR/dW = \pi W^{\pi-1}$. Therefore,

$$\left.\frac{dR}{dW}\right|_{W=1} = \pi(1)^{\pi-1} = \pi.$$

41. $\left.\dfrac{dr}{dt}\right|_{t=4}$, $\quad r = t - e^t$

SOLUTION With $r = t - e^t$, we have $\dfrac{dr}{dt} = 1 - e^t$. Therefore,

$$\left.\frac{dr}{dt}\right|_{t=4} = 1 - e^4.$$

42. $\left.\dfrac{dp}{dh}\right|_{h=4}, \quad p = 7e^{h-2}$

SOLUTION With $p = 7e^{h-2}$, we have $\dfrac{dp}{dh} = 7e^{h-2}$. Therefore,

$$\left.\frac{dp}{dh}\right|_{h=4} = 7e^{4-2} = 7e^2.$$

43. Match the functions in graphs (A)–(D) with their derivatives (I)–(III) in Figure 13. Note that two of the functions have the same derivative. Explain why.

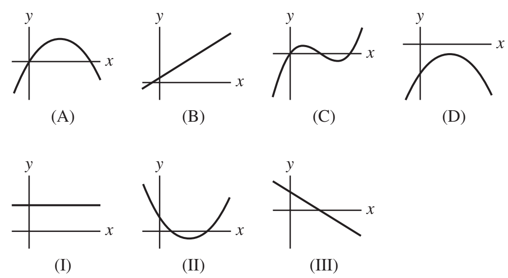


FIGURE 13

SOLUTION

- Consider the graph in (A). On the left side of the graph, the slope of the tangent line is positive but on the right side the slope of the tangent line is negative. Thus the derivative should transition from positive to negative with increasing x. This matches the graph in (III).
- Consider the graph in (B). This is a linear function, so its slope is constant. Thus the derivative is constant, which matches the graph in (I).
- Consider the graph in (C). Moving from left to right, the slope of the tangent line transitions from positive to negative then back to positive. The derivative should therefore be negative in the middle and positive to either side. This matches the graph in (II).
- Consider the graph in (D). On the left side of the graph, the slope of the tangent line is positive but on the right side the slope of the tangent line is negative. Thus the derivative should transition from positive to negative with increasing x. This matches the graph in (III).

Note that the functions whose graphs are shown in (A) and (D) have the same derivative. This happens because the graph in (D) is just a vertical translation of the graph in (A), which means the two functions differ by a constant. The derivative of a constant is zero, so the two functions end up with the same derivative.

44. Of the two functions f and g in Figure 14, which is the derivative of the other? Justify your answer.

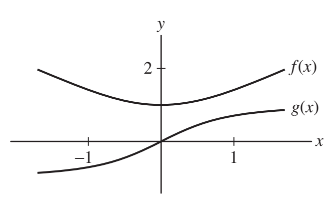

FIGURE 14

SOLUTION $g(x)$ is the derivative of $f(x)$. For $f(x)$ the slope is negative for negative values of x until $x = 0$, where there is a horizontal tangent, and then the slope is positive for positive values of x. Notice that $g(x)$ is negative for negative values of x, goes through the origin at $x = 0$, and then is positive for positive values of x.

45. Assign the labels $f(x)$, $g(x)$, and $h(x)$ to the graphs in Figure 15 in such a way that $f'(x) = g(x)$ and $g'(x) = h(x)$.

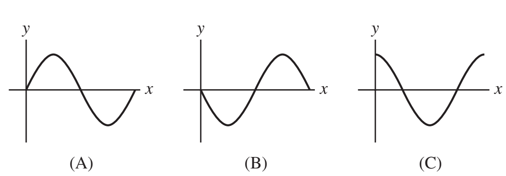

FIGURE 15

SOLUTION Consider the graph in (A). Moving from left to right, the slope of the tangent line is positive over the first quarter of the graph, negative in the middle half and positive again over the final quarter. The derivative of this function must therefore be negative in the middle and positive on either side. This matches the graph in (C).

Now focus on the graph in (C). The slope of the tangent line is negative over the left half and positive on the right half. The derivative of this function therefore needs to be negative on the left and positive on the right. This description matches the graph in (B).

We should therefore label the graph in (A) as $f(x)$, the graph in (B) as $h(x)$, and the graph in (C) as $g(x)$. Then $f'(x) = g(x)$ and $g'(x) = h(x)$.

46. According to the *peak oil theory*, first proposed in 1956 by geophysicist M. Hubbert, the total amount of crude oil $Q(t)$ produced worldwide up to time t has a graph like that in Figure 16.

(a) Sketch the derivative $Q'(t)$ for $1900 \le t \le 2150$. What does $Q'(t)$ represent?

(b) In which year (approximately) does $Q'(t)$ take on its maximum value?

(c) What is $L = \lim_{t\to\infty} Q(t)$? And what is its interpretation?

(d) What is the value of $\lim_{t\to\infty} Q'(t)$?

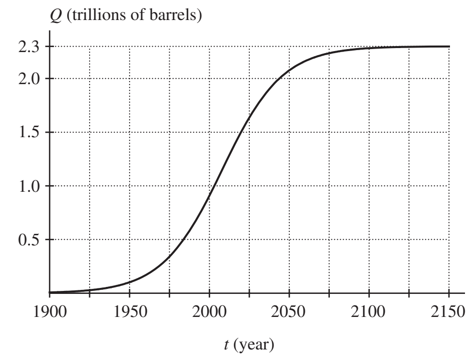

FIGURE 16 Total oil production up to time t

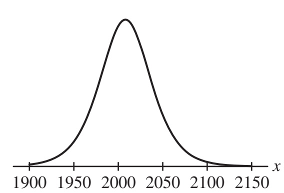
SOLUTION

(a) One possible derivative sketch is shown below. Because the graph of $Q(t)$ is roughly horizontal around $t = 1900$, the graph of $Q'(t)$ begins near zero. Until roughly $t = 2000$, the graph of $Q(t)$ increases more and more rapidly, so the graph of $Q'(t)$ increases. Thereafter, the graph of $Q(t)$ increases more and more gradually, so the graph of $Q'(t)$ decreases. Around $t = 2150$, the graph of $Q(t)$ is again roughly horizontal, so the graph of $Q'(t)$ returns to zero. Note that $Q'(t)$ represents the rate of change in total worldwide oil production; that is, the number of barrels produced per year.



(b) The graph of $Q(t)$ appears to be increasing most rapidly around the year 2000, so $Q'(t)$ takes on its maximum value around the year 2000.

(c) From Figure 16

$$L = \lim_{t\to\infty} Q(t) = 2.3$$

trillion barrels of oil. This value represents the total number of barrels of oil that can be produced by the planet.

(d) Because the graph of $Q(t)$ appears to approach a horizontal line as $t \to \infty$, it appears that

$$\lim_{t\to\infty} Q'(t) = 0.$$

47.  Use the table of values of $f(x)$ to determine which of (A) or (B) in Figure 17 is the graph of $f'(x)$. Explain.

x	0	0.5	1	1.5	2	2.5	3	3.5	4
$f(x)$	10	55	98	139	177	210	237	257	268

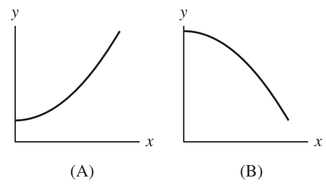


FIGURE 17 Which is the graph of $f'(x)$?

SOLUTION The increment between successive x values in the table is a constant 0.5 but the increment between successive $f(x)$ values decreases from 45 to 43 to 41 to 38 and so on. Thus the difference quotients decrease with increasing x, suggesting that $f'(x)$ decreases as a function of x. Because the graph in (B) depicts a decreasing function, (B) might be the graph of the derivative of $f(x)$.

48. Let R be a variable and r a constant. Compute the derivatives:

(a) $\frac{d}{dR}R$ **(b)** $\frac{d}{dR}r$ **(c)** $\frac{d}{dR}r^2R^3$

SOLUTION

(a) $\frac{d}{dR}R = 1$, since R is a linear function of R with slope 1.

(b) $\frac{d}{dR}r = 0$, since r is a constant.

(c) We apply the Linearity and Power Rules:

$$\frac{d}{dR}r^2R^3 = r^2\frac{d}{dR}R^3 = r^2\big(3(R^2)\big) = 3r^2R^2.$$

49. Compute the derivatives, where c is a constant.

(a) $\frac{d}{dt}ct^3$ **(b)** $\frac{d}{dy}(9c^2y^3 - 24c)$ **(c)** $\frac{d}{dz}(5z + 4cz^2)$

SOLUTION

(a) $\frac{d}{dt}ct^3 = 3ct^2$.

(b) $\frac{d}{dz}(5z + 4cz^2) = 5 + 8cz$.

(c) $\frac{d}{dy}(9c^2y^3 - 24c) = 27c^2y^2$.

50. Find the points on the graph of $f(x) = 12x - x^3$ where the tangent line is horizontal.

SOLUTION Let $f(x) = 12x - x^3$. Solve $f'(x) = 12 - 2x^2 = 0$ to obtain $x = \pm\sqrt{6}$. Thus, the graph of $f(x) = 12x - x^3$ has a horizontal tangent line at two points: $(\sqrt{6}, 6\sqrt{6})$ and $(-\sqrt{6}, -6\sqrt{6})$.

51. Find the points on the graph of $y = x^2 + 3x - 7$ at which the slope of the tangent line is equal to 4.

SOLUTION Let $y = x^2 + 3x - 7$. Solving $dy/dx = 2x + 3 = 4$ yields $x = \frac{1}{2}$.

52. 3.2.52 Find the values of x where $y = x^3$ and $y = x^2 + 5x$ have parallel tangent lines.

SOLUTION Let $f(x) = x^3$ and $g(x) = x^2 + 5x$. The graphs have parallel tangent lines when $f'(x) = g'(x)$. Hence, we solve $f'(x) = 3x^2 = 2x + 5 = g'(x)$ to obtain $x = \frac{5}{3}$ and $x = -1$.

53. Determine a and b such that $p(x) = x^2 + ax + b$ satisfies $p(1) = 0$ and $p'(1) = 4$.

SOLUTION Let $p(x) = x^2 + ax + b$ satisfy $p(1) = 0$ and $p'(1) = 4$. Now, $p'(x) = 2x + a$. Therefore $0 = p(1) = 1 + a + b$ and $4 = p'(1) = 2 + a$; i.e., $a = 2$ and $b = -3$.

54. Find all values of x such that the tangent line to $y = 4x^2 + 11x + 2$ is steeper than the tangent line to $y = x^3$.

SOLUTION Let $f(x) = 4x^2 + 11x + 2$ and let $g(x) = x^3$. We need all x such that $f'(x) > g'(x)$.

$$\begin{aligned} f'(x) &> g'(x) \\ 8x + 11 &> 3x^2 \\ 0 &> 3x^2 - 8x - 11 \\ 0 &> (3x - 11)(x + 1). \end{aligned}$$

The product $(3x - 11)(x + 1) = 0$ when $x = -1$ and when $x = \frac{11}{3}$. We therefore examine the intervals $x < -1$, $-1 < x < \frac{11}{3}$ and $x > \frac{11}{3}$. For $x < -1$ and for $x > \frac{11}{3}$, $(3x - 11)(x + 1) > 0$, whereas for $-1 < x < \frac{11}{3}$, $(3x - 11)(x + 1) < 0$. The solution set is therefore $-1 < x < \frac{11}{3}$.

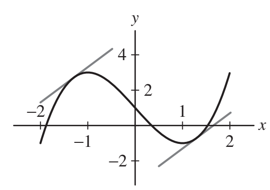
55. Let $f(x) = x^3 - 3x + 1$. Show that $f'(x) \geq -3$ for all x and that, for every $m > -3$, there are precisely two points where $f'(x) = m$. Indicate the position of these points and the corresponding tangent lines for one value of m in a sketch of the graph of $f(x)$.

SOLUTION Let $P = (a, b)$ be a point on the graph of $f(x) = x^3 - 3x + 1$.

- The derivative satisfies $f'(x) = 3x^2 - 3 \geq -3$ since $3x^2$ is nonnegative.
- Suppose the slope m of the tangent line is greater than -3. Then $f'(a) = 3a^2 - 3 = m$, whence

$$a^2 = \frac{m+3}{3} > 0 \quad \text{and thus} \quad a = \pm\sqrt{\frac{m+3}{3}}.$$

- The two parallel tangent lines with slope 2 are shown with the graph of $f(x)$ here.



56. Show that the tangent lines to $y = \frac{1}{3}x^3 - x^2$ at $x = a$ and at $x = b$ are parallel if $a = b$ or $a + b = 2$.

SOLUTION Let $P = (a, f(a))$ and $Q = (b, f(b))$ be points on the graph of $y = f(x) = \frac{1}{3}x^3 - x^2$. Equate the slopes of the tangent lines at the points P and Q: $a^2 - 2a = b^2 - 2b$. Thus $a^2 - 2a - b^2 + 2b = 0$. Now,

$$a^2 - 2a - b^2 + 2b = (a - b)(a + b) - 2(a - b) = (a - 2 + b)(a - b);$$

therefore, either $a = b$ (i.e., P and Q are the same point) or $a + b = 2$.

57. Compute the derivative of $f(x) = x^{3/2}$ using the limit definition. *Hint:* Show that

$$\frac{f(x+h) - f(x)}{h} = \frac{(x+h)^3 - x^3}{h}\left(\frac{1}{\sqrt{(x+h)^3} + \sqrt{x^3}}\right)$$

SOLUTION Once we have the difference of square roots, we multiply by the conjugate to solve the problem.

$$\begin{aligned} f'(x) = \lim_{h\to 0} \frac{(x+h)^{3/2} - x^{3/2}}{h} &= \lim_{h\to 0} \frac{\sqrt{(x+h)^3} - \sqrt{x^3}}{h}\left(\frac{\sqrt{(x+h)^3} + \sqrt{x^3}}{\sqrt{(x+h)^3} + \sqrt{x^3}}\right) \\ &= \lim_{h\to 0} \frac{(x+h)^3 - x^3}{h}\left(\frac{1}{\sqrt{(x+h)^3} + \sqrt{x^3}}\right). \end{aligned}$$

The first factor of the expression in the last line is clearly the limit definition of the derivative of x^3, which is $3x^2$. The second factor can be evaluated, so

$$\frac{d}{dx}x^{3/2} = 3x^2 \frac{1}{2\sqrt{x^3}} = \frac{3}{2}x^{1/2}.$$

58. Use the limit definition of $m(b)$ to approximate $m(4)$. Then estimate the slope of the tangent line to $y = 4^x$ at $x = 0$ and $x = 2$.

SOLUTION Recall

$$m(4) = \lim_{h\to 0}\left(\frac{4^h - 1}{h}\right).$$

Using a table of values, we find

h	$\frac{4^h - 1}{h}$
0.01	1.39595
0.001	1.38726
0.0001	1.38639
0.00001	1.38630

Thus $m(4) \approx 1.386$. Knowing that $y'(x) = m(4)\cdot 4^x$, it follows that $y'(0) \approx 1.386$ and $y'(2) \approx 1.386 \cdot 16 = 22.176$.

59. Let $f(x) = xe^x$. Use the limit definition to compute $f'(0)$, and find the equation of the tangent line at $x = 0$.

SOLUTION Let $f(x) = xe^x$. Then $f(0) = 0$, and

$$f'(0) = \lim_{h\to 0}\frac{f(0+h) - f(0)}{h} = \lim_{h\to 0}\frac{he^h - 0}{h} = \lim_{h\to 0} e^h = 1.$$

The equation of the tangent line is

$$y = f'(0)(x-0) + f(0) = 1(x-0) + 0 = x.$$

60. The average speed (in meters per second) of a gas molecule is

$$v_{\text{avg}} = \sqrt{\frac{8RT}{\pi M}}$$

where T is the temperature (in kelvins), M is the molar mass (in kilograms per mole), and $R = 8.31$. Calculate dv_{avg}/dT at $T = 300$ K for oxygen, which has a molar mass of 0.032 kg/mol.

SOLUTION Using the form $v_{av} = (8RT/(\pi M))^{1/2} = \sqrt{8R/(\pi M)}T^{1/2}$, where M and R are constant, we use the Power Rule to compute the derivative dv_{av}/dT.

$$\frac{d}{dT}\sqrt{8R/(\pi M)}T^{1/2} = \sqrt{8R/(\pi M)}\frac{d}{dT}T^{1/2} = \sqrt{8R/(\pi M)}\frac{1}{2}(T^{(1/2)-1}).$$

In particular, if $T = 300^\circ$K,

$$\frac{d}{dT}v_{av} = \sqrt{8(8.31)/(\pi(0.032))}\frac{1}{2}(300)^{-1/2} = 0.74234 \text{ m/(s}\cdot\text{K)}.$$

61. Biologists have observed that the pulse rate P (in beats per minute) in animals is related to body mass (in kilograms) by the approximate formula $P = 200m^{-1/4}$. This is one of many *allometric scaling laws* prevalent in biology. Is $|dP/dm|$ an increasing or decreasing function of m? Find an equation of the tangent line at the points on the graph in Figure 18 that represent goat ($m = 33$) and man ($m = 68$).

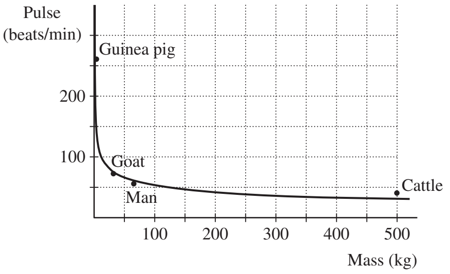


FIGURE 18

SOLUTION $dP/dm = -50m^{-5/4}$. For $m > 0$, $|dP/dm| = |50m^{-5/4}|$. $|dP/dm| \to 0$ as m gets larger; $|dP/dm|$ gets smaller as m gets bigger.

For each $m = c$, the equation of the tangent line to the graph of P at m is

$$y = P'(c)(m - c) + P(c).$$

For a goat ($m = 33$ kg), $P(33) = 83.445$ beats per minute (bpm) and

$$\frac{dP}{dm} = -50(33)^{-5/4} \approx -0.63216 \text{ bpm/kg}.$$

Hence, $y = -0.63216(m - 33) + 83.445$.

For a man ($m = 68$ kg), we have $P(68) = 69.647$ bpm and

$$\frac{dP}{dm} = -50(68)^{-5/4} \approx -0.25606 \text{ bpm/kg}.$$

Hence, the tangent line has formula $y = -0.25606(m - 68) + 69.647$.

62. Some studies suggest that kidney mass K in mammals (in kilograms) is related to body mass m (in kilograms) by the approximate formula $K = 0.007m^{0.85}$. Calculate dK/dm at $m = 68$. Then calculate the derivative with respect to m of the relative kidney-to-mass ratio K/m at $m = 68$.

SOLUTION

$$\frac{dK}{dm} = 0.007(0.85)m^{-0.15} = 0.00595m^{-0.15};$$

hence,

$$\left.\frac{dK}{dm}\right|_{m=68} = 0.00595(68)^{-0.15} = 0.00315966.$$

Because

$$\frac{K}{m} = 0.007\frac{m^{0.85}}{m} = 0.007m^{-0.15},$$

we find

$$\frac{d}{dm}\left(\frac{K}{m}\right) = 0.007\frac{d}{dm}m^{-0.15} = -0.00105m^{-1.15},$$

and

$$\left.\frac{d}{dm}\left(\frac{K}{m}\right)\right|_{m=68} = -8.19981 \times 10^{-6} \text{ kg}^{-1}.$$

63. The Clausius–Clapeyron Law relates the *vapor pressure* of water P (in atmospheres) to the temperature T (in kelvins):

$$\frac{dP}{dT} = k\frac{P}{T^2}$$

where k is a constant. Estimate dP/dT for $T = 303, 313, 323, 333, 343$ using the data and the approximation

$$\frac{dP}{dT} \approx \frac{P(T+10) - P(T-10)}{20}$$

T (K)	293	303	313	323	333	343	353
P (atm)	0.0278	0.0482	0.0808	0.1311	0.2067	0.3173	0.4754

Do your estimates seem to confirm the Clausius–Clapeyron Law? What is the approximate value of k?

SOLUTION Using the indicated approximation to the first derivative, we calculate

$$P'(303) \approx \frac{P(313) - P(293)}{20} = \frac{0.0808 - 0.0278}{20} = 0.00265 \text{ atm/K};$$
$$P'(313) \approx \frac{P(323) - P(303)}{20} = \frac{0.1311 - 0.0482}{20} = 0.004145 \text{ atm/K};$$
$$P'(323) \approx \frac{P(333) - P(313)}{20} = \frac{0.2067 - 0.0808}{20} = 0.006295 \text{ atm/K};$$

$$P'(333) \approx \frac{P(343) - P(323)}{20} = \frac{0.3173 - 0.1311}{20} = 0.00931 \text{ atm/K};$$
$$P'(343) \approx \frac{P(353) - P(333)}{20} = \frac{0.4754 - 0.2067}{20} = 0.013435 \text{ atm/K}$$

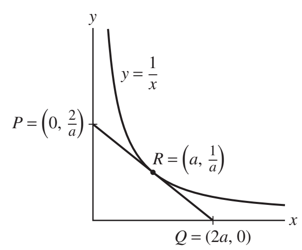
If the Clausius–Clapeyron law is valid, then $\frac{T^2}{P}\frac{dP}{dT}$ should remain constant as T varies. Using the data for vapor pressure and temperature and the approximate derivative values calculated above, we find

T (K)	303	313	323	333	343
$\frac{T^2}{P}\frac{dP}{dT}$	5047.59	5025.76	5009.54	4994.57	4981.45

These values are roughly constant, suggesting that the Clausius–Clapeyron law is valid, and that $k \approx 5000$.

64. Let L be the tangent line to the hyperbola $xy = 1$ at $x = a$, where $a > 0$. Show that the area of the triangle bounded by L and the coordinate axes does not depend on a.

SOLUTION Let $f(x) = x^{-1}$. The tangent line to f at $x = a$ is $y = f'(a)(x - a) + f(a) = -\frac{1}{a^2}(x - a) + \frac{1}{a}$. The y-intercept of this line (where $x = 0$) is $\frac{2}{a}$. Its x-intercept (where $y = 0$) is $2a$. Hence the area of the triangle bounded by the tangent line and the coordinate axes is $A = \frac{1}{2}bh = \frac{1}{2}(2a)\left(\frac{2}{a}\right) = 2$, which is independent of a.



65. In the setting of Exercise 64, show that the point of tangency is the midpoint of the segment of L lying in the first quadrant.

SOLUTION In the previous exercise, we saw that the tangent line to the hyperbola $xy = 1$ or $y = \frac{1}{x}$ at $x = a$ has y-intercept $P = (0, \frac{2}{a})$ and x-intercept $Q = (2a, 0)$. The midpoint of the line segment connecting P and Q is thus

$$\left(\frac{0 + 2a}{2}, \frac{\frac{2}{a} + 0}{2}\right) = \left(a, \frac{1}{a}\right),$$

which is the point of tangency.

66. Match functions (A)–(C) with their derivatives (I)–(III) in Figure 19.

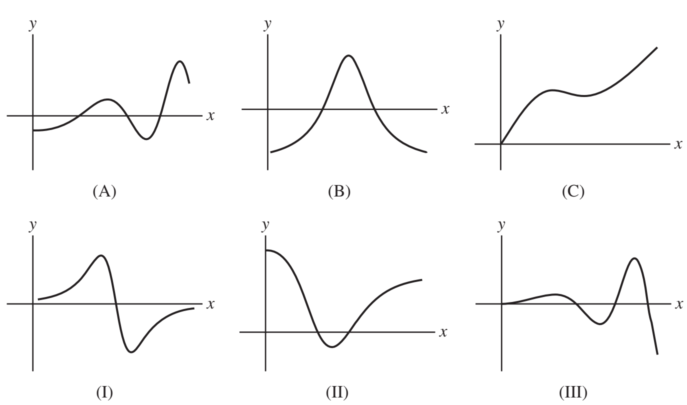


FIGURE 19

SOLUTION Note that the graph in (A) has three locations with a horizontal tangent line. The derivative must therefore cross the x-axis in three locations, which matches (III).

The graph in (B) has only one location with a horizontal tangent line, so its derivative should cross the x-axis only once. Thus, (I) is the graph corresponding to the derivative of (B).

Finally, the graph in (B) has two locations with a horizontal tangent line, so its derivative should cross the x-axis twice. Thus, (II) is the graph corresponding to the derivative of (C).

67. Make a rough sketch of the graph of the derivative of the function in Figure 20(A).

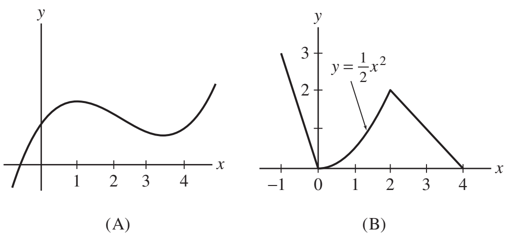

FIGURE 20

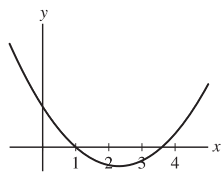
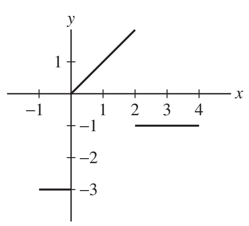
SOLUTION The graph has a tangent line with negative slope approximately on the interval (1, 3.6), and has a tangent line with a positive slope elsewhere. This implies that the derivative must be negative on the interval (1, 3.6) and positive elsewhere. The graph may therefore look like this:



68. Graph the derivative of the function in Figure 20(B), omitting points where the derivative is not defined.

SOLUTION On $(-1, 0)$, the graph is a line with slope -3, so the derivative is equal to -3. The derivative on $(0, 2)$ is x. Finally, on $(2, 4)$ the function is a line with slope -1, so the derivative is equal to -1. Combining this information leads to the graph:



69. Sketch the graph of $f(x) = x\,|x|$. Then show that $f'(0)$ exists.

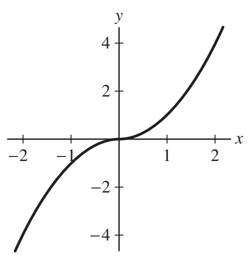
SOLUTION For $x < 0$, $f(x) = -x^2$, and $f'(x) = -2x$. For $x > 0$, $f(x) = x^2$, and $f'(x) = 2x$. At $x = 0$, we find

$$\lim_{h\to 0+} \frac{f(0+h) - f(0)}{h} = \lim_{h\to 0+} \frac{h^2}{h} = 0$$

and

$$\lim_{h\to 0-} \frac{f(0+h) - f(0)}{h} = \lim_{h\to 0-} \frac{-h^2}{h} = 0.$$

Because the two one-sided limits exist and are equal, it follows that $f'(0)$ exists and is equal to zero. Here is the graph of $f(x) = x|x|$.



70. Determine the values of x at which the function in Figure 21 is: (a) discontinuous, and (b) nondifferentiable.

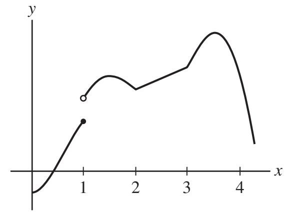


FIGURE 21

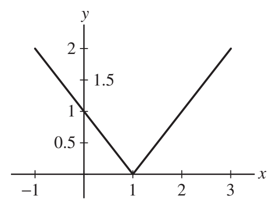
SOLUTION The function is discontinuous at those points where it is undefined or there is a break in the graph. On the interval $[0, 4]$, there is only one such point, at $x = 1$.

The function is nondifferentiable at those points where it is discontinuous or where it has a corner or cusp. In addition to the point $x = 1$ we already know about, the function is nondifferentiable at $x = 2$ and $x = 3$.

In Exercises 71–76, find the points c (if any) such that $f'(c)$ does not exist.

71. $f(x) = |x - 1|$

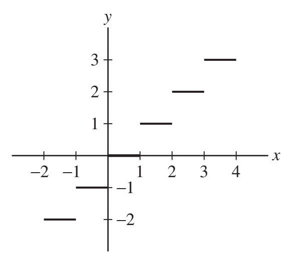
SOLUTION



Here is the graph of $f(x) = |x - 1|$. Its derivative does not exist at $x = 1$. At that value of x there is a sharp corner.

72. $f(x) = [x]$

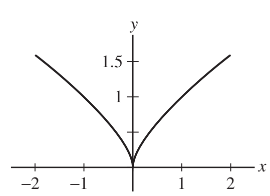
SOLUTION



Here is the graph of $f(x) = [x]$. This is the integer step function graph. Its derivative does not exist at all x values that are integers. At those values of x the graph is discontinuous.

73. $f(x) = x^{2/3}$

SOLUTION Here is the graph of $f(x) = x^{2/3}$. Its derivative does not exist at $x = 0$. At that value of x, there is a sharp corner or "cusp".

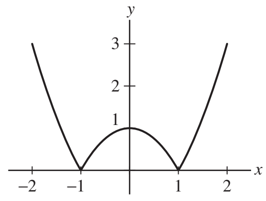


74. $f(x) = x^{3/2}$

SOLUTION The function is differentiable on its entire domain, $\{x : x \geq 0\}$. The formula is $\frac{d}{dx}x^{3/2} = \frac{3}{2}x^{1/2}$.

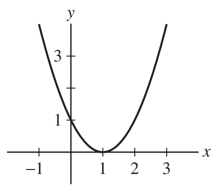
75. $f(x) = |x^2 - 1|$

SOLUTION Here is the graph of $f(x) = \left|x^2 - 1\right|$. Its derivative does not exist at $x = -1$ or at $x = 1$. At these values of x, the graph has sharp corners.



76. $f(x) = |x - 1|^2$

SOLUTION

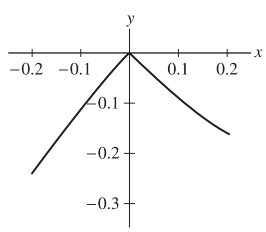


This is the graph of $f(x) = |x - 1|^2$. Its derivative exists everywhere.

GU *In Exercises 77–82, zoom in on a plot of $f(x)$ at the point $(a, f(a))$ and state whether or not $f(x)$ appears to be differentiable at $x = a$. If it is nondifferentiable, state whether the tangent line appears to be vertical or does not exist.*

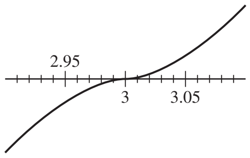
77. $f(x) = (x - 1)|x|, \quad a = 0$

SOLUTION The graph of $f(x) = (x - 1)|x|$ for x near 0 is shown below. Because the graph has a sharp corner at $x = 0$, it appears that f is not differentiable at $x = 0$. Moreover, the tangent line does not exist at this point.



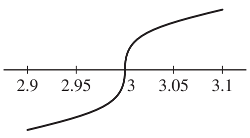
78. $f(x) = (x - 3)^{5/3}, \quad a = 3$

SOLUTION The graph of $f(x) = (x - 3)^{5/3}$ for x near 3 is shown below. From this graph, it appears that f is differentiable at $x = 3$, with a horizontal tangent line.



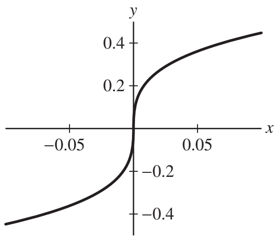
79. $f(x) = (x - 3)^{1/3}, \quad a = 3$

SOLUTION The graph of $f(x) = (x - 3)^{1/3}$ for x near 3 is shown below. From this graph, it appears that f is not differentiable at $x = 3$. Moreover, the tangent line appears to be vertical.



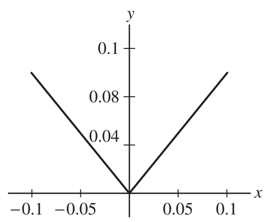
80. $f(x) = \sin(x^{1/3})$, $\quad a = 0$

SOLUTION The graph of $f(x) = \sin(x^{1/3})$ for x near 0 is shown below. From this graph, it appears that f is not differentiable at $x = 0$. Moreover, the tangent line appears to be vertical.



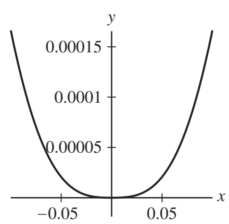
81. $f(x) = |\sin x|$, $\quad a = 0$

SOLUTION The graph of $f(x) = |\sin x|$ for x near 0 is shown below. Because the graph has a sharp corner at $x = 0$, it appears that f is not differentiable at $x = 0$. Moreover, the tangent line does not exist at this point.



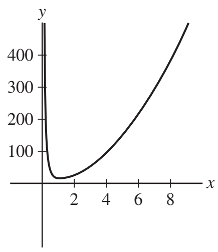
82. $f(x) = |x - \sin x|$, $\quad a = 0$

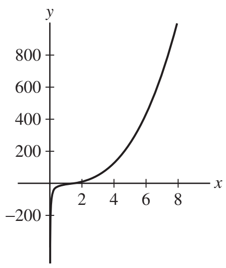
SOLUTION The graph of $f(x) = |x - \sin x|$ for x near 0 is shown below. From this graph, it appears that f is differentiable at $x = 0$, with a horizontal tangent line.



83. GU Plot the derivative $f'(x)$ of $f(x) = 2x^3 - 10x^{-1}$ for $x > 0$ (set the bounds of the viewing box appropriately) and observe that $f'(x) > 0$. What does the positivity of $f'(x)$ tell us about the graph of $f(x)$ itself? Plot $f(x)$ and confirm this conclusion.

SOLUTION Let $f(x) = 2x^3 - 10x^{-1}$. Then $f'(x) = 6x^2 + 10x^{-2}$. The graph of $f'(x)$ is shown in the figure below at the left and it is clear that $f'(x) > 0$ for all $x > 0$. The positivity of $f'(x)$ tells us that the graph of $f(x)$ is increasing for $x > 0$. This is confirmed in the figure below at the right, which shows the graph of $f(x)$.





84. Find the coordinates of the point P in Figure 22 at which the tangent line passes through $(5, 0)$.

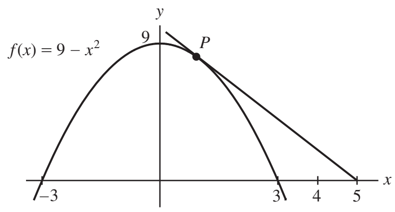


FIGURE 22 Graph of $f(x) = 9 - x^2$.

SOLUTION Let $f(x) = 9 - x^2$, and suppose P has coordinates $(a, 9 - a^2)$. Because $f'(x) = -2x$, the slope of the line tangent to the graph of $f(x)$ at P is $-2a$, and the equation of the tangent line is

$$y = f'(a)(x - a) + f(a) = -2a(x - a) + 9 - a^2 = -2ax + 9 + a^2.$$

In order for this line to pass through the point $(5, 0)$, we must have

$$0 = -10a + 9 + a^2 = (a - 9)(a - 1).$$

Thus, $a = 1$ or $a = 9$. We exclude $a = 9$ because from Figure 22 we are looking for an x-coordinate between 0 and 5. Thus, the point P has coordinates $(1, 8)$.

Exercises 85–88 refer to Figure 23. Length QR is called the subtangent *at P, and length RT is called the* subnormal*.*

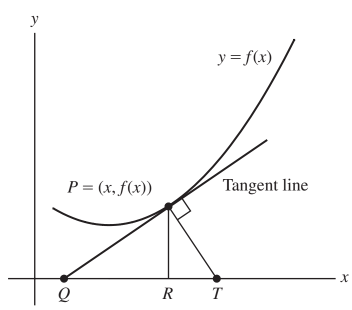

FIGURE 23

85. Calculate the subtangent of

$$f(x) = x^2 + 3x \quad \text{at } x = 2$$

SOLUTION Let $f(x) = x^2 + 3x$. Then $f'(x) = 2x + 3$, and the equation of the tangent line at $x = 2$ is

$$y = f'(2)(x - 2) + f(2) = 7(x - 2) + 10 = 7x - 4.$$

This line intersects the x-axis at $x = \frac{4}{7}$. Thus Q has coordinates $(\frac{4}{7}, 0)$, R has coordinates $(2, 0)$ and the subtangent is

$$2 - \frac{4}{7} = \frac{10}{7}.$$

86. Show that the subtangent of $f(x) = e^x$ is everywhere equal to 1.

SOLUTION Let $f(x) = e^x$. Then $f'(x) = e^x$, and the equation of the tangent line at $x = a$ is

$$y = f'(a)(x - a) + f(a) = e^a(x - a) + e^a.$$

This line intersects the x-axis at $x = a - 1$. Thus, Q has coordinates $(a - 1, 0)$, R has coordinates $(a, 0)$ and the subtangent is

$$a - (a - 1) = 1.$$

87. Prove in general that the subnormal at P is $|f'(x)f(x)|$.

SOLUTION The slope of the tangent line at P is $f'(x)$. The slope of the line normal to the graph at P is then $-1/f'(x)$, and the normal line intersects the x-axis at the point T with coordinates $(x + f(x)f'(x), 0)$. The point R has coordinates $(x, 0)$, so the subnormal is

$$|x + f(x)f'(x) - x| = |f(x)f'(x)|.$$

88. Show that $\overline{PQ}$ has length $|f(x)|\sqrt{1+f'(x)^{-2}}$.

SOLUTION The coordinates of the point P are $(x, f(x))$, the coordinates of the point R are $(x, 0)$ and the coordinates of the point Q are

$$\left(x - \frac{f(x)}{f'(x)}, 0\right).$$

Thus, $\overline{PR} = |f(x)|$, $\overline{QR} = \left|\frac{f(x)}{f'(x)}\right|$, and by the Pythagorean Theorem

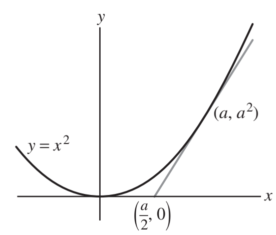
$$\overline{PQ} = \sqrt{\left(\frac{f(x)}{f'(x)}\right)^2 + (f(x))^2} = |f(x)|\sqrt{1+f'(x)^{-2}}.$$

89. Prove the following theorem of Apollonius of Perga (the Greek mathematician born in 262 BCE who gave the parabola, ellipse, and hyperbola their names): The subtangent of the parabola $y = x^2$ at $x = a$ is equal to $a/2$.

SOLUTION Let $f(x) = x^2$. The tangent line to f at $x = a$ is

$$y = f'(a)(x-a) + f(a) = 2a(x-a) + a^2 = 2ax - a^2.$$

The x-intercept of this line (where $y = 0$) is $\frac{a}{2}$ as claimed.



90. Show that the subtangent to $y = x^3$ at $x = a$ is equal to $\frac{1}{3}a$.

SOLUTION Let $f(x) = x^3$. Then $f'(x) = 3x^2$, and the equation of the tangent line t $x = a$ is

$$y = f'(a)(x-a) + f(a) = 3a^2(x-a) + a^3 = 3a^2x - 2a^3.$$

This line intersects the x-axis at $x = 2a/3$. Thus, Q has coordinates $(2a/3, 0)$, R has coordinates $(a, 0)$ and the subtangent is

$$a - \frac{2}{3}a = \frac{1}{3}a.$$

91. Formulate and prove a generalization of Exercise 90 for $y = x^n$.

SOLUTION Let $f(x) = x^n$. Then $f'(x) = nx^{n-1}$, and the equation of the tangent line t $x = a$ is

$$y = f'(a)(x-a) + f(a) = na^{n-1}(x-a) + a^n = na^{n-1}x - (n-1)a^n.$$

This line intersects the x-axis at $x = (n-1)a/n$. Thus, Q has coordinates $((n-1)a/n, 0)$, R has coordinates $(a, 0)$ and the subtangent is

$$a - \frac{n-1}{n}a = \frac{1}{n}a.$$

Further Insights and Challenges

92. Two small arches have the shape of parabolas. The first is given by $f(x) = 1 - x^2$ for $-1 \le x \le 1$ and the second by $g(x) = 4 - (x-4)^2$ for $2 \le x \le 6$. A board is placed on top of these arches so it rests on both (Figure 24). What is the slope of the board? *Hint:* Find the tangent line to $y = f(x)$ that intersects $y = g(x)$ in exactly one point.

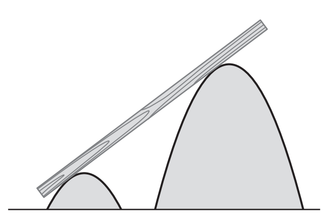


FIGURE 24

SOLUTION At the points where the board makes contact with the arches the slope of the board must be equal to the slope of the arches (and hence they are equal to each other). Suppose $(t, f(t))$ is the point where the board touches the left hand arch. The tangent line here (the line the board defines) is given by

$$y = f'(t)(x - t) + f(t).$$

This line must hit the other arch in exactly one point. In other words, if we plug in $y = g(x)$ to get

$$g(x) = f'(t)(x - t) + f(t)$$

there can only be one solution for x in terms of t. Computing f' and plugging in we get

$$4 - (x^2 - 8x + 16) = -2tx + 2t^2 + 1 - t^2$$

which simplifies to

$$x^2 - 2tx - 8x + t^2 + 13 = 0.$$

This is a quadratic equation $ax^2 + bx + c = 0$ with $a = 1$, $b = (-2t - 8)$ and $c = t^2 + 13$. By the quadratic formula we know there is a unique solution for x iff $b^2 - 4ac = 0$. In our case this means

$$(2t + 8)^2 = 4(t^2 + 13).$$

Solving this gives $t = -3/8$ and plugging into f' shows the slope of the board must be $3/4$.

93. A vase is formed by rotating $y = x^2$ around the y-axis. If we drop in a marble, it will either touch the bottom point of the vase or be suspended above the bottom by touching the sides (Figure 25). How small must the marble be to touch the bottom?

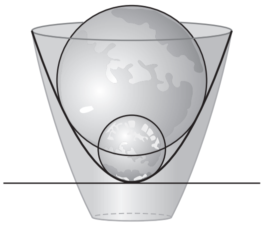

FIGURE 25

SOLUTION Suppose a circle is tangent to the parabola $y = x^2$ at the point (t, t^2). The slope of the parabola at this point is $2t$, so the slope of the radius of the circle at this point is $-\frac{1}{2t}$ (since it is perpendicular to the tangent line of the circle). Thus the center of the circle must be where the line given by $y = -\frac{1}{2t}(x - t) + t^2$ crosses the y-axis. We can find the y-coordinate by setting $x = 0$: we get $y = \frac{1}{2} + t^2$. Thus, the radius extends from $(0, \frac{1}{2} + t^2)$ to (t, t^2) and

$$r = \sqrt{\left(\frac{1}{2} + t^2 - t^2\right)^2 + t^2} = \sqrt{\frac{1}{4} + t^2}.$$

This radius is greater than $\frac{1}{2}$ whenever $t > 0$; so, if a marble has radius $> 1/2$ it sits on the edge of the vase, but if it has radius $\leq 1/2$ it rolls all the way to the bottom.

94. Let $f(x)$ be a differentiable function, and set $g(x) = f(x + c)$, where c is a constant. Use the limit definition to show that $g'(x) = f'(x + c)$. Explain this result graphically, recalling that the graph of $g(x)$ is obtained by shifting the graph of $f(x)$ c units to the left (if $c > 0$) or right (if $c < 0$).

SOLUTION

- Let $g(x) = f(x + c)$. Using the limit definition,

$$g'(x) = \lim_{h\to 0} \frac{g(x+h) - g(x)}{h} = \lim_{h\to 0} \frac{f((x+h)+c) - f(x+c)}{h}$$
$$= \lim_{h\to 0} \frac{f((x+c)+h) - f(x+c)}{h} = f'(x+c).$$

- The graph of $g(x)$ is obtained by shifting $f(x)$ to the left by c units. This implies that $g'(x)$ is equal to $f'(x)$ shifted to the left by c units, which happens to be $f'(x + c)$. Therefore, $g'(x) = f'(x + c)$.

95. Negative Exponents Let n be a whole number. Use the Power Rule for x^n to calculate the derivative of $f(x) = x^{-n}$ by showing that

$$\frac{f(x+h) - f(x)}{h} = \frac{-1}{x^n(x+h)^n} \frac{(x+h)^n - x^n}{h}$$

SOLUTION Let $f(x) = x^{-n}$ where n is a positive integer.

- The difference quotient for f is

$$\frac{f(x+h) - f(x)}{h} = \frac{(x+h)^{-n} - x^{-n}}{h} = \frac{\frac{1}{(x+h)^n} - \frac{1}{x^n}}{h} = \frac{\frac{x^n-(x+h)^n}{x^n(x+h)^n}}{h}$$
$$= \frac{-1}{x^n(x+h)^n} \frac{(x+h)^n - x^n}{h}.$$

- Therefore,

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{-1}{x^n(x+h)^n} \frac{(x+h)^n - x^n}{h}$$
$$= \lim_{h\to 0} \frac{-1}{x^n(x+h)^n} \lim_{h\to 0} \frac{(x+h)^n - x^n}{h} = -x^{-2n} \frac{d}{dx}\left(x^n\right).$$

- From above, we continue: $f'(x) = -x^{-2n}\frac{d}{dx}\left(x^n\right) = -x^{-2n} \cdot nx^{n-1} = -nx^{-n-1}$. Since n is a positive integer, $k = -n$ is a negative integer and we have $\frac{d}{dx}\left(x^k\right) = \frac{d}{dx}\left(x^{-n}\right) = -nx^{-n-1} = kx^{k-1}$; i.e. $\frac{d}{dx}\left(x^k\right) = kx^{k-1}$ for negative integers k.

96. Verify the Power Rule for the exponent $1/n$, where n is a positive integer, using the following trick: Rewrite the difference quotient for $y = x^{1/n}$ at $x = b$ in terms of $u = (b+h)^{1/n}$ and $a = b^{1/n}$.

SOLUTION Substituting $x = (b+h)^{1/n}$ and $a = b^{1/n}$ into the left-hand side of equation (3) yields

$$\frac{x^n - a^n}{x - a} = \frac{(b+h) - b}{(b+h)^{1/n} - b^{1/n}} = \frac{h}{(b+h)^{1/n} - b^{1/n}}$$

whereas substituting these same expressions into the right-hand side of equation (3) produces

$$\frac{x^n - a^n}{x - a} = (b+h)^{\frac{n-1}{n}} + (b+h)^{\frac{n-2}{n}} b^{1/n} + (b+h)^{\frac{n-3}{n}} b^{2/n} + \cdots + b^{\frac{n-1}{n}};$$

hence,

$$\frac{(b+h)^{1/n} - b^{1/n}}{h} = \frac{1}{(b+h)^{\frac{n-1}{n}} + (b+h)^{\frac{n-2}{n}} b^{1/n} + (b+h)^{\frac{n-3}{n}} b^{2/n} + \cdots + b^{\frac{n-1}{n}}}.$$

If we take $f(x) = x^{1/n}$, then, using the previous expression,

$$f'(b) = \lim_{h\to 0} \frac{(b+h)^{1/n} - b^{1/n}}{h} = \frac{1}{nb^{\frac{n-1}{n}}} = \frac{1}{n} b^{\frac{1}{n}-1}.$$

Replacing b by x, we have $f'(x) = \frac{1}{n}x^{\frac{1}{n}-1}$.

97. Infinitely Rapid Oscillations Define

$$f(x) = \begin{cases} x \sin \dfrac{1}{x} & x \neq 0 \\ 0 & x = 0 \end{cases}$$

Show that $f(x)$ is continuous at $x = 0$ but $f'(0)$ does not exist (see Figure 24).

SOLUTION Let $f(x) = \begin{cases} x\sin\left(\frac{1}{x}\right) & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$. As $x \to 0$,

$$|f(x) - f(0)| = \left| x \sin\left(\frac{1}{x}\right) - 0\right| = |x| \left|\sin\left(\frac{1}{x}\right)\right| \to 0$$

since the values of the sine lie between -1 and 1. Hence, by the Squeeze Theorem, $\lim_{x\to 0} f(x) = f(0)$ and thus f is continuous at $x = 0$.

As $x \to 0$, the difference quotient at $x = 0$,

$$\frac{f(x) - f(0)}{x - 0} = \frac{x \sin\left(\frac{1}{x}\right) - 0}{x - 0} = \sin\left(\frac{1}{x}\right)$$

does *not* converge to a limit since it oscillates infinitely through every value between -1 and 1. Accordingly, $f'(0)$ does not exist.

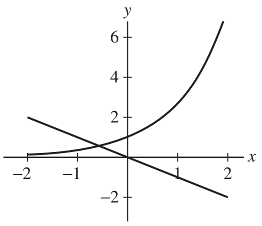
98. For which value of λ does the equation $e^x = \lambda x$ have a unique solution? For which values of λ does it have at least one solution? For intuition, plot $y = e^x$ and the line $y = \lambda x$.

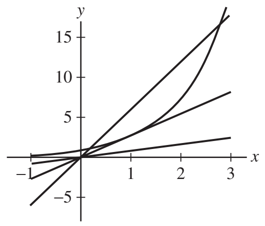
SOLUTION First, note that when $\lambda = 0$, the equation $e^x = 0 \cdot x = 0$ has no real solution. For $\lambda \neq 0$, we observe that solutions to the equation $e^x = \lambda x$ correspond to points of intersection between the graphs of $y = e^x$ and $y = \lambda x$. When $\lambda < 0$, the two graphs intersect at only one location (see the graph below at the left). On the other hand, when $\lambda > 0$, the graphs may have zero, one or two points of intersection (see the graph below at the right). Note that the graphs have one point of intersection when $y = \lambda x$ is the tangent line to $y = e^x$. Thus, not only do we require $e^x = \lambda x$, but also $e^x = \lambda$. It then follows that the point of intersection satisfies $\lambda = \lambda x$, so $x = 1$. This then gives $\lambda = e$.

Therefore the equation $e^x = \lambda x$:

(a) has at least one solution when $\lambda < 0$ and when $\lambda \geq e$;

(b) has a unique solution when $\lambda < 0$ and when $\lambda = e$.





3.3 Product and Quotient Rules

Preliminary Questions

1. Are the following statements true or false? If false, state the correct version.

(a) fg denotes the function whose value at x is $f(g(x))$.

(b) f/g denotes the function whose value at x is $f(x)/g(x)$.

(c) The derivative of the product is the product of the derivatives.

(d) $\left.\dfrac{d}{dx}(fg)\right|_{x=4} = f(4)g'(4) - g(4)f'(4)$

(e) $\left.\dfrac{d}{dx}(fg)\right|_{x=0} = f(0)g'(0) + g(0)f'(0)$

SOLUTION

(a) False. The notation fg denotes the function whose value at x is $f(x)g(x)$.

(b) True.

(c) False. The derivative of a product fg is $f'(x)g(x) + f(x)g'(x)$.

(d) False. $\left.\dfrac{d}{dx}(fg)\right|_{x=4} = f(4)g'(4) + g(4)f'(4)$.

(e) True.

2. Find $(f/g)'(1)$ if $f(1) = f'(1) = g(1) = 2$ and $g'(1) = 4$.

SOLUTION $\left.\dfrac{d}{dx}(f/g)\right|_{x=1} = [g(1)f'(1) - f(1)g'(1)]/g(1)^2 = [2(2) - 2(4)]/2^2 = -1$.

3. Find $g(1)$ if $f(1) = 0$, $f'(1) = 2$, and $(fg)'(1) = 10$.

SOLUTION $(fg)'(1) = f(1)g'(1) + f'(1)g(1)$, so $10 = 0 \cdot g'(1) + 2g(1)$ and $g(1) = 5$.

Exercises

In Exercises 1–6, use the Product Rule to calculate the derivative.

1. $f(x) = x^3(2x^2 + 1)$

SOLUTION Let $f(x) = x^3(2x^2 + 1)$. Then

$$f'(x) = x^3 \frac{d}{dx}(2x^2 + 1) + (2x^2 + 1)\frac{d}{dx}x^3 = x^3(4x) + (2x^2 + 1)(3x^2) = 10x^4 + 3x^2.$$

2. $f(x) = (3x - 5)(2x^2 - 3)$

SOLUTION Let $f(x) = (3x - 5)(2x^2 - 3)$. Then

$$f'(x) = (3x - 5)\frac{d}{dx}(2x^2 - 3) + (2x^2 - 3)\frac{d}{dx}(3x - 5) = (3x - 5)(4x) + (2x^2 - 3)(3) = 18x^2 - 20x - 9.$$

3. $f(x) = x^2 e^x$

SOLUTION Let $f(x) = x^2 e^x$. Then

$$f'(x) = x^2 \frac{d}{dx}e^x + e^x \frac{d}{dx}x^2 = x^2 e^x + e^x(2x) = e^x(x^2 + 2x).$$

4. $f(x) = (2x - 9)(4e^x + 1)$

SOLUTION Let $f(x) = (2x - 9)(4e^x + 1)$. Then

$$f'(x) = (2x - 9)\frac{d}{dx}(4e^x + 1) + (4e^x + 1)\frac{d}{dx}(2x - 9) = (2x - 9)(4e^x) + (4e^x + 1)(2) = 8xe^x - 28e^x + 2.$$

5. $\left.\dfrac{dh}{ds}\right|_{s=4}$, $\quad h(s) = (s^{-1/2} + 2s)(7 - s^{-1})$

SOLUTION Let $h(s) = (s^{-1/2} + 2s)(7 - s^{-1})$. Then

$$\begin{aligned}\frac{dh}{ds} &= (s^{-1/2} + 2s)\frac{d}{dx}(7 - s^{-1}) + (7 - s^{-1})\frac{d}{ds}\left(s^{-1/2} + 2s\right)\\ &= (s^{-1/2} + 2s)(s^{-2}) + (7 - s^{-1})\left(-\frac{1}{2}s^{-3/2} + 2\right) = -\frac{7}{2}s^{-3/2} + \frac{3}{2}s^{-5/2} + 14.\end{aligned}$$

Therefore,

$$\left.\frac{dh}{ds}\right|_{s=4} = -\frac{7}{2}(4)^{-3/2} + \frac{3}{2}(4)^{-5/2} + 14 = \frac{871}{64}.$$

6. $\left.\dfrac{dy}{dt}\right|_{t=2}$, $\quad y = (t - 8t^{-1})(e^t + t^2)$

SOLUTION Let $y(t) = (t - 8t^{-1})(e^t + t^2)$. Then

$$\begin{aligned}\frac{dy}{dt} &= (t - 8t^{-1})\frac{d}{dt}(e^t + t^2) + (e^t + t^2)\frac{d}{dt}(t - 8t^{-1})\\ &= (t - 8t^{-1})(e^t + 2t) + (e^t + t^2)(1 + 8t^{-2}).\end{aligned}$$

Therefore,

$$\left.\frac{dy}{dt}\right|_{t=2} = (2 - 4)(e^2 + 4) + (e^2 + 4)(1 + 2) = e^2 + 4.$$

In Exercises 7–12, use the Quotient Rule to calculate the derivative.

7. $f(x) = \dfrac{x}{x - 2}$

SOLUTION Let $f(x) = \frac{x}{x-2}$. Then

$$f'(x) = \frac{(x - 2)\frac{d}{dx}x - x\frac{d}{dx}(x - 2)}{(x - 2)^2} = \frac{(x - 2) - x}{(x - 2)^2} = \frac{-2}{(x - 2)^2}.$$

8. $f(x) = \dfrac{x+4}{x^2+x+1}$

SOLUTION Let $f(x) = \frac{x+4}{x^2+x+1}$. Then

$$f'(x) = \frac{(x^2+x+1)\frac{d}{dx}(x+4) - (x+4)\frac{d}{dx}(x^2+x+1)}{(x^2+x+1)^2}$$

$$= \frac{(x^2+x+1)-(x+4)(2x+1)}{(x^2+x+1)^2} = \frac{-x^2-8x-3}{(x^2+x+1)^2}.$$

9. $\left.\dfrac{dg}{dt}\right|_{t=-2}, \quad g(t) = \dfrac{t^2+1}{t^2-1}$

SOLUTION Let $g(t) = \dfrac{t^2+1}{t^2-1}$. Then

$$\frac{dg}{dt} = \frac{(t^2-1)\frac{d}{dt}(t^2+1) - (t^2+1)\frac{d}{dt}(t^2-1)}{(t^2-1)^2} = \frac{(t^2-1)(2t)-(t^2+1)(2t)}{(t^2-1)^2} = -\frac{4t}{(t^2-1)^2}.$$

Therefore,

$$\left.\frac{dg}{dt}\right|_{t=-2} = -\frac{4(-2)}{((-2)^2-1)^2} = \frac{8}{9}.$$

10. $\left.\dfrac{dw}{dz}\right|_{z=9}, \quad w = \dfrac{z^2}{\sqrt{z}+z}$

SOLUTION Let $w(z) = \dfrac{z^2}{\sqrt{z}+z}$. Then

$$\frac{dw}{dz} = \frac{(\sqrt{z}+z)\frac{d}{dz}z^2 - z^2\frac{d}{dz}(\sqrt{z}+z)}{(\sqrt{z}+z)^2} = \frac{2z(\sqrt{z}+z) - z^2((1/2)z^{-1/2}+1)}{(\sqrt{z}+z)^2} = \frac{(3/2)z^{3/2}+z^2}{(\sqrt{z}+z)^2}.$$

Therefore,

$$\left.\frac{dw}{dz}\right|_{z=9} = \frac{(3/2)(9)^{3/2}+9^2}{(\sqrt{9}+9)^2} = \frac{27}{32}.$$

11. $g(x) = \dfrac{1}{1+e^x}$

SOLUTION Let $g(x) = \dfrac{1}{1+e^x}$. Then

$$\frac{dg}{dx} = \frac{(1+e^x)\frac{d}{dx}1 - 1\frac{d}{dx}(1+e^x)}{(1+e^x)^2} = \frac{(1+e^x)(0)-e^x}{(1+e^x)^2} = -\frac{e^x}{(1+e^x)^2}.$$

12. $f(x) = \dfrac{e^x}{x^2+1}$

SOLUTION Let $f(x) = \dfrac{e^x}{x^2+1}$. Then

$$\frac{df}{dx} = \frac{(x^2+1)\frac{d}{dx}e^x - e^x\frac{d}{dx}(x^2+1)}{(x^2+1)^2} = \frac{(x^2+1)e^x - e^x(2x)}{(x^2+1)^2} = \frac{e^x(x-1)^2}{(x^2+1)^2}.$$

In Exercises 13–16, calculate the derivative in two ways. First use the Product or Quotient Rule; then rewrite the function algebraically and apply the Power Rule directly.

13. $f(t) = (2t+1)(t^2-2)$

SOLUTION Let $f(t) = (2t+1)(t^2-2)$. Then, using the Product Rule,

$$f'(t) = (2t+1)(2t) + (t^2-2)(2) = 6t^2+2t-4.$$

Multiplying out first, we find $f(t) = 2t^3+t^2-4t-2$. Therefore, $f'(t) = 6t^2+2t-4$.

14. $f(x) = x^2(3 + x^{-1})$

SOLUTION Let $f(x) = x^2(3 + x^{-1})$. Then, using the product rule, and then power and sum rules,

$$f'(x) = x^2(-x^{-2}) + (3 + x^{-1})(2x) = 6x + 1.$$

Multiplying out first, we find $f(x) = 3x^2 + x$. Then $f'(x) = 6x + 1$.

15. $h(t) = \dfrac{t^2 - 1}{t - 1}$

SOLUTION Let $h(t) = \frac{t^2-1}{t-1}$. Using the quotient rule,

$$f'(t) = \frac{(t-1)(2t) - (t^2-1)(1)}{(t-1)^2} = \frac{t^2 - 2t + 1}{(t-1)^2} = 1$$

for $t \neq 1$. Simplifying first, we find for $t \neq 1$,

$$h(t) = \frac{(t-1)(t+1)}{(t-1)} = t + 1.$$

Hence $h'(t) = 1$ for $t \neq 1$.

16. $g(x) = \dfrac{x^3 + 2x^2 + 3x^{-1}}{x}$

SOLUTION Let $g(x) = \frac{x^3+2x^2+3x^{-1}}{x}$. Using the quotient rule and the sum and power rules, and simplifying

$$g'(x) = \frac{x(3x^2 + 4x - 3x^{-2}) - (x^3 + 2x^2 + 3x^{-1})1}{x^2} = \frac{1}{x^2}\left(2x^3 + 2x^2 - 6x^{-1}\right) = 2x + 2 - 6x^{-3}.$$

Simplifying first yields $g(x) = x^2 + 2x + 3x^{-2}$, from which we calculate $g'(x) = 2x + 2 - 6x^{-3}$.

In Exercises 17–38, calculate the derivative.

17. $f(x) = (x^3 + 5)(x^3 + x + 1)$

SOLUTION Let $f(x) = (x^3 + 5)(x^3 + x + 1)$. Then

$$f'(x) = (x^3 + 5)(3x^2 + 1) + (x^3 + x + 1)(3x^2) = 6x^5 + 4x^3 + 18x^2 + 5.$$

18. $f(x) = (4e^x - x^2)(x^3 + 1)$

SOLUTION Let $f(x) = (4e^x - x^2)(x^3 + 1)$. Then

$$f'(x) = (4e^x - x^2)(3x^2) + (x^3 + 1)(4e^x - 2x) = e^x(4x^3 + 12x^2 + 4) - 5x^4 - 2x.$$

19. $\left.\dfrac{dy}{dx}\right|_{x=3}, \quad y = \dfrac{1}{x + 10}$

SOLUTION Let $y = \frac{1}{x+10}$. Using the quotient rule:

$$\frac{dy}{dx} = \frac{(x+10)(0) - 1(1)}{(x+10)^2} = -\frac{1}{(x+10)^2}.$$

Therefore,

$$\left.\frac{dy}{dx}\right|_{x=3} = -\frac{1}{(3+10)^2} = -\frac{1}{169}.$$

20. $\left.\dfrac{dz}{dx}\right|_{x=-2}, \quad z = \dfrac{x}{3x^2 + 1}$

SOLUTION Let $z = \frac{x}{3x^2+1}$. Using the quotient rule:

$$\frac{dz}{dx} = \frac{(3x^2+1)(1) - x(6x)}{(3x^2+1)^2} = \frac{1 - 3x^2}{(3x^2+1)^2}.$$

Therefore,

$$\left.\frac{dz}{dx}\right|_{x=-2} = \frac{1 - 3(-2)^2}{(3(-2)^2 + 1)^2} = -\frac{11}{169}.$$

21. $f(x) = (\sqrt{x}+1)(\sqrt{x}-1)$

SOLUTION Let $f(x) = (\sqrt{x}+1)(\sqrt{x}-1)$. Multiplying through first yields $f(x) = x - 1$ for $x \geq 0$. Therefore, $f'(x) = 1$ for $x \geq 0$. If we carry out the product rule on $f(x) = (x^{1/2}+1)(x^{1/2}-1)$, we get

$$f'(x) = (x^{1/2}+1)\left(\frac{1}{2}(x^{-1/2})\right) + (x^{1/2}-1)\left(\frac{1}{2}x^{-1/2}\right) = \frac{1}{2} + \frac{1}{2}x^{-1/2} + \frac{1}{2} - \frac{1}{2}x^{-1/2} = 1.$$

22. $f(x) = \dfrac{9x^{5/2}-2}{x}$

SOLUTION Let $f(x) = \frac{9x^{5/2}-2}{x} = 9x^{3/2} - 2x^{-1}$. Then $f'(x) = \frac{27}{2}x^{1/2} + 2x^{-2}$.

23. $\left.\dfrac{dy}{dx}\right|_{x=2}$, $\quad y = \dfrac{x^4-4}{x^2-5}$

SOLUTION Let $y = \dfrac{x^4-4}{x^2-5}$. Then

$$\frac{dy}{dx} = \frac{\left(x^2-5\right)\left(4x^3\right) - \left(x^4-4\right)(2x)}{\left(x^2-5\right)^2} = \frac{2x^5 - 20x^3 + 8x}{\left(x^2-5\right)^2}.$$

Therefore,

$$\left.\frac{dy}{dx}\right|_{x=2} = \frac{2(2)^5 - 20(2)^3 + 8(2)}{(2^2-5)^2} = -80.$$

24. $f(x) = \dfrac{x^4+e^x}{x+1}$

SOLUTION Let $f(x) = \dfrac{x^4+e^x}{x+1}$. Then

$$\frac{df}{dx} = \frac{(x+1)(4x^3+e^x) - (x^4+e^x)(1)}{(x+1)^2} = \frac{(x+1)(4x^3+e^x) - x^4 - e^x}{(x+1)^2}.$$

25. $\left.\dfrac{dz}{dx}\right|_{x=1}$, $\quad z = \dfrac{1}{x^3+1}$

SOLUTION Let $z = \frac{1}{x^3+1}$. Using the quotient rule:

$$\frac{dz}{dx} = \frac{(x^3+1)(0) - 1(3x^2)}{(x^3+1)^2} = -\frac{3x^2}{(x^3+1)^2}.$$

Therefore,

$$\left.\frac{dz}{dx}\right|_{x=1} = -\frac{3(1)^2}{(1^3+1)^2} = -\frac{3}{4}.$$

26. $f(x) = \dfrac{3x^3 - x^2 + 2}{\sqrt{x}}$

SOLUTION Let

$$f(x) = \frac{3x^3 - x^2 + 2}{\sqrt{x}} = \frac{3x^3 - x^2 + 2}{x^{1/2}}.$$

Using the quotient rule, and then simplifying by taking out the greatest negative factor:

$$f'(x) = \frac{(x^{1/2})(9x^2 - 2x) - (3x^3 - x^2 + 2)(\frac{1}{2}x^{-1/2})}{x} = \frac{1}{x^{3/2}}\left((9x^3 - 2x^2) - \frac{1}{2}(3x^3 - x^2 + 2)\right)$$
$$= \frac{1}{x^{3/2}}\left(\frac{15}{2}x^3 - \frac{3}{2}x^2 - 1\right).$$

Alternately, since there is a single exponent of x in the denominator, we could also simplify $f(x)$ first, getting $f(x) = 3x^{5/2} - x^{3/2} + 2x^{-1/2}$. Then $f'(x) = \frac{15}{2}x^{3/2} - \frac{3}{2}x^{1/2} - x^{-3/2}$. The two answers are the same.

27. $h(t) = \dfrac{t}{(t+1)(t^2+1)}$

SOLUTION Let $h(t) = \dfrac{t}{(t+1)(t^2+1)} = \dfrac{t}{t^3+t^2+t+1}$. Then

$$h'(t) = \frac{\left(t^3+t^2+t+1\right)(1) - t\left(3t^2+2t+1\right)}{\left(t^3+t^2+t+1\right)^2} = \frac{-2t^3-t^2+1}{\left(t^3+t^2+t+1\right)^2}.$$

28. $f(x) = x^{3/2}\left(2x^4 - 3x + x^{-1/2}\right)$

SOLUTION Let $f(x) = x^{3/2}(2x^4 - 3x + x^{-1/2})$. We multiply through the $x^{3/2}$ to get $f(x) = 2x^{11/2} - 3x^{5/2} + x$. Then $f'(x) = 11x^{9/2} - \frac{15}{2}x^{3/2} + 1$.

29. $f(t) = 3^{1/2} \cdot 5^{1/2}$

SOLUTION Let $f(t) = \sqrt{3}\sqrt{5}$. Then $f'(t) = 0$, since $f(t)$ is a *constant* function!

30. $h(x) = \pi^2(x-1)$

SOLUTION Let $h(x) = \pi^2(x-1)$. Then $h'(x) = \pi^2$.

31. $f(x) = (x+3)(x-1)(x-5)$

SOLUTION Let $f(x) = (x+3)(x-1)(x-5)$. Using the Product Rule inside the Product Rule with a first factor of $(x+3)$ and a second factor of $(x-1)(x-5)$, we find

$$f'(x) = (x+3)\left((x-1)(1) + (x-5)(1)\right) + (x-1)(x-5)(1) = 3x^2 - 6x - 13.$$

Alternatively,

$$f(x) = (x+3)\left(x^2 - 6x + 5\right) = x^3 - 3x^2 - 13x + 15.$$

Therefore, $f'(x) = 3x^2 - 6x - 13$.

32. $f(x) = e^x(x^2+1)(x+4)$

SOLUTION Let $f(x) = e^x(x^2+1)(x+4)$. Using the Product Rule inside the Product Rule with a first factor of e^x and a second factor of $(x^2+1)(x+4)$, we find

$$f'(x) = e^x\left((x^2+1)(1) + (x+4)(2x)\right) + (x^2+1)(x+4)e^x = (x^3+7x^2+9x+5)e^x.$$

33. $f(x) = \dfrac{e^x}{x+1}$

SOLUTION Let $f(x) = \dfrac{e^x}{(e^x+1)(x+1)}$. Then

$$f'(x) = \frac{(e^x+1)(x+1)e^x - e^x\left((e^x+1)(1) + (x+1)e^x\right)}{(e^x+1)^2(x+1)^2} = \frac{e^x(x-e^x)}{(e^x+1)^2(x+1)^2}.$$

34. $g(x) = \dfrac{e^{x+1}+e^x}{e+1}$

SOLUTION Let

$$g(x) = \frac{e^{x+1}+e^x}{e+1} = \frac{e^x(e+1)}{e+1} = e^x.$$

Then $g'(x) = e^x$.

35. $g(z) = \left(\dfrac{z^2-4}{z-1}\right)\left(\dfrac{z^2-1}{z+2}\right)$ *Hint:* Simplify first.

SOLUTION Let

$$g(z) = \left(\frac{z^2-4}{z-1}\right)\left(\frac{z^2-1}{z+2}\right) = \left(\frac{(z+2)(z-2)}{z-1}\right)\left(\frac{(z+1)(z-1)}{z+2}\right) = (z-2)(z+1)$$

for $z \neq -2$ and $z \neq 1$. Then,

$$g'(z) = (z+1)(1) + (z-2)(1) = 2z - 1.$$

36. $\dfrac{d}{dx}\Big((ax+b)(abx^2+1)\Big)$ $\quad$ (a, b constants)

SOLUTION Let $f(x) = (ax+b)(abx^2+1)$. Then

$$f'(x) = (ax+b)(2abx) + (abx^2+1)(a) = 3a^2bx^2 + a + 2ab^2x.$$

37. $\dfrac{d}{dt}\left(\dfrac{xt-4}{t^2-x}\right)$ $\quad$ (x constant)

SOLUTION Let $f(t) = \frac{xt-4}{t^2-x}$. Using the quotient rule:

$$f'(t) = \frac{(t^2-x)(x) - (xt-4)(2t)}{(t^2-x)^2} = \frac{xt^2 - x^2 - 2xt^2 + 8t}{(t^2-x)^2} = \frac{-xt^2 + 8t - x^2}{(t^2-x)^2}.$$

38. $\dfrac{d}{dx}\left(\dfrac{ax+b}{cx+d}\right)$ $\quad$ (a, b, c, d constants)

SOLUTION Let $f(x) = \left(\dfrac{ax+b}{cx+d}\right)$. Using the quotient rule:

$$f'(x) = \frac{(cx+d)a - (ax+b)c}{(cx+d)^2} = \frac{(ad-bc)}{(cx+d)^2}.$$

In Exercises 39–42, calculate the derivative using the values:

$f(4)$	$f'(4)$	$g(4)$	$g'(4)$
10	-2	5	-1

39. $(fg)'(4)$ and $(f/g)'(4)$.

SOLUTION Let $h = fg$ and $H = f/g$. Then $h' = fg' + gf'$ and $H' = \frac{gf' - fg'}{g^2}$. Finally,

$$h'(4) = f(4)g'(4) + g(4)f'(4) = (10)(-1) + (5)(-2) = -20,$$

and

$$H'(4) = \frac{g(4)f'(4) - f(4)g'(4)}{(g(4))^2} = \frac{(5)(-2) - (10)(-1)}{(5)^2} = 0.$$

40. $F'(4)$, where $F(x) = x^2 f(x)$.

SOLUTION Let $F(x) = x^2 f(x)$. Then $F'(x) = x^2 f'(x) + 2xf(x)$, and

$$F'(4) = 16f'(4) + 8f(4) = (16)(-2) + (8)(10) = 48.$$

41. $G'(4)$, where $G(x) = g(x)^2$.

SOLUTION Let $G(x) = g(x)^2 = g(x)g(x)$. Then $G'(x) = g(x)g'(x) + g(x)g'(x) = 2g(x)g'(x)$, and

$$G'(4) = 2g(4)g'(4) = 2(5)(-1) = -10.$$

42. $H'(4)$, where $H(x) = \dfrac{x}{g(x)f(x)}$.

SOLUTION Let $H(x) = \dfrac{x}{g(x)f(x)}$. Then

$$H'(x) = \frac{g(x)f(x)\cdot 1 - x(g(x)f'(x) + f(x)g'(x))}{(g(x)f(x))^2},$$

and

$$H'(4) = \frac{(5)(10) - 4((5)(-2) + (10)(-1))}{((5)(10))^2} = \frac{13}{250}.$$

43. Calculate $F'(0)$, where

$$F(x) = \frac{x^9 + x^8 + 4x^5 - 7x}{x^4 - 3x^2 + 2x + 1}$$

Hint: Do not calculate $F'(x)$. Instead, write $F(x) = f(x)/g(x)$ and express $F'(0)$ directly in terms of $f(0)$, $f'(0)$, $g(0)$, $g'(0)$.

SOLUTION Taking the hint, let

$$f(x) = x^9 + x^8 + 4x^5 - 7x$$

and let

$$g(x) = x^4 - 3x^2 + 2x + 1.$$

Then $F(x) = \frac{f(x)}{g(x)}$. Now,

$$f'(x) = 9x^8 + 8x^7 + 20x^4 - 7 \quad \text{and} \quad g'(x) = 4x^3 - 6x + 2.$$

Moreover, $f(0) = 0$, $f'(0) = -7$, $g(0) = 1$, and $g'(0) = 2$.

Using the quotient rule:

$$F'(0) = \frac{g(0)f'(0) - f(0)g'(0)}{(g(0))^2} = \frac{-7 - 0}{1} = -7.$$

44. Proceed as in Exercise 43 to calculate $F'(0)$, where

$$F(x) = \left(1 + x + x^{4/3} + x^{5/3}\right)\frac{3x^5 + 5x^4 + 5x + 1}{8x^9 - 7x^4 + 1}$$

SOLUTION Write $F(x) = f(x)(g(x)/h(x))$, where

$$f(x) = (1 + x + x^{4/3} + x^{5/3})$$
$$g(x) = 3x^5 + 5x^4 + 5x + 1$$

and

$$h(x) = 8x^9 - 7x^4 + 1.$$

Now, $f'(x) = 1 + \frac{4}{3}x^{\frac{1}{3}} + \frac{5}{3}x^{\frac{2}{3}}$, $g'(x) = 15x^4 + 20x^3 + 5$, and $h'(x) = 72x^8 - 28x^3$. Moreover, $f(0) = 1$, $f'(0) = 1$, $g(0) = 1$, $g'(0) = 5$, $h(0) = 1$, and $h'(0) = 0$. From the product and quotient rules,

$$F'(0) = f(0)\frac{h(0)g'(0) - g(0)h'(0)}{h(0)^2} + f'(0)(g(0)/h(0)) = 1\frac{1(5) - 1(0)}{1} + 1(1/1) = 6.$$

45. Use the Product Rule to calculate $\frac{d}{dx}e^{2x}$.

SOLUTION Note that $e^{2x} = e^x \cdot e^x$. Therefore

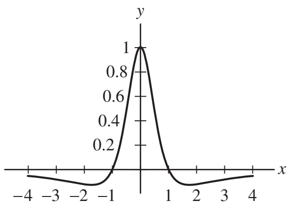
$$\frac{d}{dx}e^{2x} = \frac{d}{dx}(e^x \cdot e^x) = e^x \cdot e^x + e^x \cdot e^x = 2e^{2x}.$$

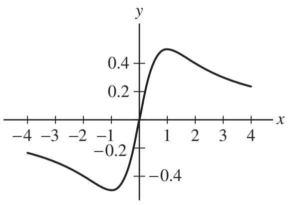
46. $\boxed{\text{GU}}$ Plot the derivative of $f(x) = x/(x^2 + 1)$ over $[-4, 4]$. Use the graph to determine the intervals on which $f'(x) > 0$ and $f'(x) < 0$. Then plot $f(x)$ and describe how the sign of $f'(x)$ is reflected in the graph of $f(x)$.

SOLUTION Let $f(x) = \dfrac{x}{x^2 + 1}$. Then

$$f'(x) = \frac{(x^2 + 1)(1) - x(2x)}{(x^2 + 1)^2} = \frac{1 - x^2}{(x^2 + 1)^2}.$$

The derivative is shown in the figure below at the left. From this plot we see that $f'(x) > 0$ for $-1 < x < 1$ and $f'(x) < 0$ for $|x| > 1$. The original function is plotted in the figure below at the right. Observe that the graph of $f(x)$ is increasing whenever $f'(x) > 0$ and that $f(x)$ is decreasing whenever $f'(x) < 0$.



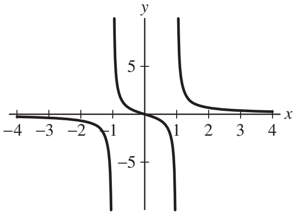


47. GU Plot $f(x) = x/(x^2 - 1)$ (in a suitably bounded viewing box). Use the plot to determine whether $f'(x)$ is positive or negative on its domain $\{x : x \neq \pm 1\}$. Then compute $f'(x)$ and confirm your conclusion algebraically.

SOLUTION Let $f(x) = \dfrac{x}{x^2 - 1}$. The graph of $f(x)$ is shown below. From this plot, we see that $f(x)$ is decreasing on its domain $\{x : x \neq \pm 1\}$. Consequently, $f'(x)$ must be negative. Using the quotient rule, we find

$$f'(x) = \frac{(x^2 - 1)(1) - x(2x)}{(x^2 - 1)^2} = -\frac{x^2 + 1}{(x^2 - 1)^2},$$

which is negative for all $x \neq \pm 1$.



48. Let $P = V^2 R/(R + r)^2$ as in Example 7. Calculate dP/dr, assuming that r is variable and R is constant.

SOLUTION Note that V is also constant. Let

$$f(r) = \frac{V^2 R}{(R + r)^2} = \frac{V^2 R}{R^2 + 2Rr + r^2}.$$

Using the quotient rule:

$$f'(r) = \frac{(R^2 + 2Rr + r^2)(0) - (V^2 R)(2R + 2r)}{(R + r)^4} = -\frac{2V^2 R(R + r)}{(R + r)^4} = -\frac{2V^2 R}{(R + r)^3}.$$

49. Find $a > 0$ such that the tangent line to the graph of

$$f(x) = x^2 e^{-x} \quad \text{at } x = a$$

passes through the origin (Figure 4).

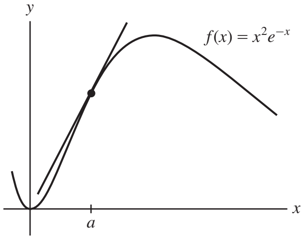


FIGURE 4

SOLUTION Let $f(x) = x^2 e^{-x}$. Then $f(a) = a^2 e^{-a}$,

$$f'(x) = -x^2 e^{-x} + 2xe^{-x} = e^{-x}(2x - x^2),$$

$f'(a) = (2a - a^2)e^{-a}$, and the equation of the tangent line to f at $x = a$ is

$$y = f'(a)(x - a) + f(a) = (2a - a^2)e^{-a}(x - a) + a^2 e^{-a}.$$

For this line to pass through the origin, we must have

$$0 = (2a - a^2)e^{-a}(-a) + a^2 e^{-a} = e^{-a}\left(a^2 - 2a^2 + a^3\right) = a^2 e^{-a}(a - 1).$$

Thus, $a = 0$ or $a = 1$. The only value $a > 0$ such that the tangent line to $f(x) = x^2 e^{-x}$ passes through the origin is therefore $a = 1$.

50. Current I (amperes), voltage V (volts), and resistance R (ohms) in a circuit are related by Ohm's Law, $I = V/R$.

(a) Calculate $\left.\frac{dI}{dR}\right|_{R=6}$ if V is constant with value $V = 24$.

(b) Calculate $\left.\frac{dV}{dR}\right|_{R=6}$ if I is constant with value $I = 4$.

SOLUTION

(a) According to Ohm's Law, $I = V/R = VR^{-1}$. Thus, using the power rule,

$$\frac{dI}{dR} = -VR^{-2}.$$

With $V = 24$ volts, it follows that

$$\left.\frac{dI}{dR}\right|_{R=6} = -24(6)^{-2} = -\frac{2}{3}\frac{\text{amps}}{\Omega}.$$

(b) Solving Ohm's Law for V yields $V = RI$. Thus

$$\frac{dV}{dR} = I \qquad \text{and} \qquad \left.\frac{dV}{dR}\right|_{I=4} = 4 \text{ amps}.$$

51. The revenue per month earned by the Couture clothing chain at time t is $R(t) = N(t)S(t)$, where $N(t)$ is the number of stores and $S(t)$ is average revenue per store per month. Couture embarks on a two-part campaign: (A) to build new stores at a rate of 5 stores per month, and (B) to use advertising to increase average revenue per store at a rate of \$10,000 per month. Assume that $N(0) = 50$ and $S(0) = \$150{,}000$.

(a) Show that total revenue will increase at the rate

$$\frac{dR}{dt} = 5S(t) + 10{,}000N(t)$$

Note that the two terms in the Product Rule correspond to the separate effects of increasing the number of stores on the one hand, and the average revenue per store on the other.

(b) Calculate $\left.\frac{dR}{dt}\right|_{t=0}$.

(c) If Couture can implement only one leg (A or B) of its expansion at $t = 0$, which choice will grow revenue most rapidly?

SOLUTION

(a) Given $R(t) = N(t)S(t)$, it follows that

$$\frac{dR}{dt} = N(t)S'(t) + S(t)N'(t).$$

We are told that $N'(t) = 5$ stores per month and $S'(t) = 10{,}000$ dollars per month. Therefore,

$$\frac{dR}{dt} = 5S(t) + 10{,}000N(t).$$

(b) Using part (a) and the given values of $N(0)$ and $S(0)$, we find

$$\left.\frac{dR}{dt}\right|_{t=0} = 5(150{,}000) + 10{,}000(50) = 1{,}250{,}000.$$

(c) From part (b), we see that of the two terms contributing to total revenue growth, the term $5S(0)$ is larger than the term $10{,}000N(0)$. Thus, if only one leg of the campaign can be implemented, it should be part A: increase the number of stores by 5 per month.

52. The **tip speed ratio** of a turbine (Figure 5) is the ratio $R = T/W$, where T is the speed of the tip of a blade and W is the speed of the wind. (Engineers have found empirically that a turbine with n blades extracts maximum power from the wind when $R = 2\pi/n$.) Calculate dR/dt (t in minutes) if $W = 35$ km/h and W decreases at a rate of 4 km/h per minute, and the tip speed has constant value $T = 150$ km/h.

FIGURE 5 Turbines on a wind farm

SOLUTION Let $R = T/W$. Then

$$\frac{dR}{dt} = \frac{WT' - TW'}{W^2}.$$

Using the values $T = 150$, $T' = 0$, $W = 35$ and $W' = -4$, we find

$$\frac{dR}{dt} = \frac{(35)(0) - 150(-4)}{35^2} = \frac{24}{49}.$$

53. The curve $y = 1/(x^2 + 1)$ is called the *witch of Agnesi* (Figure 6) after the Italian mathematician Maria Agnesi (1718–1799), who wrote one of the first books on calculus. This strange name is the result of a mistranslation of the Italian word *la versiera*, meaning "that which turns." Find equations of the tangent lines at $x = \pm 1$.

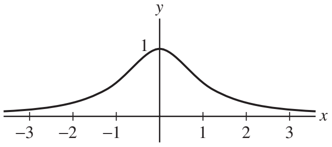

FIGURE 6 The witch of Agnesi.

SOLUTION Let $f(x) = \dfrac{1}{x^2 + 1}$. Then $f'(x) = \dfrac{(x^2 + 1)(0) - 1(2x)}{(x^2 + 1)^2} = -\dfrac{2x}{\left(x^2 + 1\right)^2}$.

- At $x = -1$, the tangent line is

$$y = f'(-1)(x + 1) + f(-1) = \frac{1}{2}(x + 1) + \frac{1}{2} = \frac{1}{2}x + 1.$$

- At $x = 1$, the tangent line is

$$y = f'(1)(x - 1) + f(1) = -\frac{1}{2}(x - 1) + \frac{1}{2} = -\frac{1}{2}x + 1.$$

54. Let $f(x) = g(x) = x$. Show that $(f/g)' \neq f'/g'$.

SOLUTION $(f/g) = (x/x) = 1$, so $(f/g)' = 0$. On the other hand, $(f'/g') = (x'/x') = (1/1) = 1$. We see that $0 \neq 1$.

55. Use the Product Rule to show that $(f^2)' = 2ff'$.

SOLUTION Let $g = f^2 = ff$. Then $g' = \left(f^2\right)' = (ff)' = ff' + ff' = 2ff'$.

56. Show that $(f^3)' = 3f^2 f'$.

SOLUTION Let $g = f^3 = fff$. Then

$$g' = \left(f^3\right)' = [f\,(ff)]' = f\left(ff' + ff'\right) + ff(f') = 3f^2 f'.$$

Further Insights and Challenges

57. Let f, g, h be differentiable functions. Show that $(fgh)'(x)$ is equal to

$$f(x)g(x)h'(x) + f(x)g'(x)h(x) + f'(x)g(x)h(x)$$

Hint: Write fgh as $f(gh)$.

SOLUTION Let $p = fgh$. Then

$$p' = (fgh)' = f\left(gh' + hg'\right) + ghf' = f'gh + fg'h + fgh'.$$

58. Prove the Quotient Rule using the limit definition of the derivative.

SOLUTION Let $p = \dfrac{f}{g}$. Suppose that f and g are differentiable at $x = a$ and that $g(a) \neq 0$. Then

$$p'(a) = \lim_{h\to 0} \frac{p(a+h) - p(a)}{h} = \lim_{h\to 0} \frac{\dfrac{f(a+h)}{g(a+h)} - \dfrac{f(a)}{g(a)}}{h} = \lim_{h\to 0} \frac{\dfrac{f(a+h)g(a) - f(a)g(a+h)}{g(a+h)g(a)}}{h}$$

$$= \lim_{h\to 0} \frac{f(a+h)g(a) - f(a)g(a) + f(a)g(a) - f(a)g(a+h)}{hg(a+h)g(a)}$$

$$= \lim_{h\to 0} \left(\frac{1}{g(a+h)g(a)} \left(g(a)\,\frac{f(a+h) - f(a)}{h} - f(a)\,\frac{g(a+h) - g(a)}{h} \right)\right)$$

$$= \left(\lim_{h\to 0} \frac{1}{g(a+h)g(a)}\right)\left(\left(g(a)\lim_{h\to 0} \frac{f(a+h) - f(a)}{h}\right) - \left(f(a)\lim_{h\to 0} \frac{g(a+h) - g(a)}{h}\right)\right)$$

$$= \frac{1}{(g(a))^2}\left(g(a)f'(a) - f(a)g'(a)\right) = \frac{g(a)f'(a) - f(a)g'(a)}{(g(a))^2}$$

In other words, $p' = \left(\dfrac{f}{g}\right)' = \dfrac{gf' - fg'}{g^2}$.

59. Derivative of the Reciprocal Use the limit definition to prove

$$\frac{d}{dx}\left(\frac{1}{f(x)}\right) = -\frac{f'(x)}{f^2(x)} \qquad \boxed{7}$$

Hint: Show that the difference quotient for $1/f(x)$ is equal to

$$\frac{f(x) - f(x+h)}{hf(x)f(x+h)}$$

SOLUTION Let $g(x) = \frac{1}{f(x)}$. We then compute the derivative of $g(x)$ using the difference quotient:

$$g'(x) = \lim_{h\to 0} \frac{g(x+h) - g(x)}{h} = \lim_{h\to 0} \frac{1}{h}\left(\frac{1}{f(x+h)} - \frac{1}{f(x)}\right) = \lim_{h\to 0} \frac{1}{h}\left(\frac{f(x) - f(x+h)}{f(x)f(x+h)}\right)$$

$$= -\lim_{h\to 0} \left(\frac{f(x+h) - f(x)}{h}\right)\left(\frac{1}{f(x)f(x+h)}\right).$$

We can apply the rule of products for limits. The first parenthetical expression is the difference quotient definition of $f'(x)$. The second can be evaluated at $h = 0$ to give $\frac{1}{(f(x))^2}$. Hence

$$g'(x) = \frac{d}{dx}\left(\frac{1}{f(x)}\right) = -\frac{f'(x)}{f^2(x)}.$$

60. Prove the Quotient Rule using Eq. (7) and the Product Rule.

SOLUTION Let $h(x) = \frac{f(x)}{g(x)}$. We can write $h(x) = f(x)\frac{1}{g(x)}$. Applying Eq. (7),

$$h'(x) = f(x)\left(\left(\frac{1}{g(x)}\right)'\right) + f'(x)\left(\frac{1}{g(x)}\right) = -f(x)\left(\frac{g'(x)}{(g(x))^2}\right) + \frac{f'(x)}{g(x)} = \frac{-f(x)g'(x) + f'(x)g(x)}{(g(x))^2}.$$

61. Use the limit definition of the derivative to prove the following special case of the Product Rule:

$$\frac{d}{dx}(xf(x)) = xf'(x) + f(x)$$

SOLUTION First note that because $f(x)$ is differentiable, it is also continuous. It follows that

$$\lim_{h\to 0} f(x+h) = f(x).$$

Now we tackle the derivative:

$$\begin{aligned}\frac{d}{dx}(xf(x)) &= \lim_{h\to 0}\frac{(x+h)f(x+h)-f(x)}{h} = \lim_{h\to 0}\left(x\frac{f(x+h)-f(x)}{h} + f(x+h)\right)\\ &= x\lim_{h\to 0}\frac{f(x+h)-f(x)}{h} + \lim_{h\to 0} f(x+h)\\ &= xf'(x) + f(x).\end{aligned}$$

62. Carry out Maria Agnesi's proof of the Quotient Rule from her book on calculus, published in 1748: Assume that f, g, and $h = f/g$ are differentiable. Compute the derivative of $hg = f$ using the Product Rule, and solve for h'.

SOLUTION Suppose that f, g, and h are differentiable functions with $h = f/g$.

- Then $hg = f$ and via the product rule $hg' + gh' = f'$.
- Solving for h' yields $h' = \dfrac{f' - hg'}{g} = \dfrac{f' - \frac{f}{g}g'}{g} = \dfrac{gf' - fg'}{g^2}$.

63. The Power Rule Revisited If you are familiar with *proof by induction*, use induction to prove the Power Rule for all whole numbers n. Show that the Power Rule holds for $n = 1$; then write x^n as $x \cdot x^{n-1}$ and use the Product Rule.

SOLUTION Let k be a positive integer. If $k = 1$, then $x^k = x$. Note that

$$\frac{d}{dx}\left(x^1\right) = \frac{d}{dx}(x) = 1 = 1x^0.$$

Hence the Power Rule holds for $k = 1$. Assume it holds for $k = n$ where $n \geq 2$. Then for $k = n+1$, we have

$$\begin{aligned}\frac{d}{dx}\left(x^k\right) = \frac{d}{dx}\left(x^{n+1}\right) &= \frac{d}{dx}\left(x\cdot x^n\right) = x\frac{d}{dx}\left(x^n\right) + x^n\frac{d}{dx}(x)\\ &= x\cdot nx^{n-1} + x^n \cdot 1 = (n+1)x^n = kx^{k-1}\end{aligned}$$

Accordingly, the Power Rule holds for all positive integers by induction.

Exercises 64 and 65: A basic fact of algebra states that c is a root of a polynomial $f(x)$ if and only if $f(x) = (x-c)g(x)$ for some polynomial $g(x)$. We say that c is a ***multiple root*** *if $f(x) = (x-c)^2h(x)$, where $h(x)$ is a polynomial.*

64. Show that c is a multiple root of $f(x)$ if and only if c is a root of both $f(x)$ and $f'(x)$.

SOLUTION Assume first that $f(c) = f'(c) = 0$ and let us show that c is a multiple root of $f(x)$. We have $f(x) = (x-c)g(x)$ for some polynomial $g(x)$ and so $f'(x) = (x-c)g'(x) + g(x)$. However, $f'(c) = 0 + g(c) = 0$, so c is also a root of $g(x)$ and hence $g(x) = (x-c)h(x)$ for some polynomial $h(x)$. We conclude that $f(x) = (x-c)^2h(x)$, which shows that c is a multiple root of $f(x)$.

Conversely, assume that c is a multiple root. Then $f(c) = 0$ and $f(x) = (x-c)^2g(x)$ for some polynomial $g(x)$. Then $f'(x) = (x-c)^2g'(x) + 2g(x)(x-c)$. Therefore, $f'(c) = (c-c)^2g'(c) + 2g(c)(c-c) = 0$.

65. Use Exercise 64 to determine whether $c = -1$ is a multiple root:

(a) $x^5 + 2x^4 - 4x^3 - 8x^2 - x + 2$

(b) $x^4 + x^3 - 5x^2 - 3x + 2$

SOLUTION

(a) To show that -1 is a multiple root of

$$f(x) = x^5 + 2x^4 - 4x^3 - 8x^2 - x + 2,$$

it suffices to check that $f(-1) = f'(-1) = 0$. We have $f(-1) = -1 + 2 + 4 - 8 + 1 + 2 = 0$ and

$$\begin{aligned}f'(x) &= 5x^4 + 8x^3 - 12x^2 - 16x - 1\\ f'(-1) &= 5 - 8 - 12 + 16 - 1 = 0\end{aligned}$$

(b) Let $f(x) = x^4 + x^3 - 5x^2 - 3x + 2$. Then $f'(x) = 4x^3 + 3x^2 - 10x - 3$. Because

$$f(-1) = 1 - 1 - 5 + 3 + 2 = 0$$

but

$$f'(-1) = -4 + 3 + 10 - 3 = 6 \neq 0,$$

it follows that $x = -1$ is a root of f, but not a multiple root.

66. Figure 7 is the graph of a polynomial with roots at A, B, and C. Which of these is a multiple root? Explain your reasoning using Exercise 64.

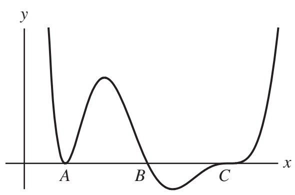

FIGURE 7

SOLUTION A on the figure is a multiple root. It is a multiple root because $f(x) = 0$ at A and because the tangent line to the graph at A is horizontal, so that $f'(x) = 0$ at A. For the same reasons, f also has a multiple root at C.

67. According to Eq. (6) in Section 3.2, $\frac{d}{dx}b^x = m(b)\,b^x$. Use the Product Rule to show that $m(ab) = m(a) + m(b)$.

SOLUTION

$$m(ab)(ab)^x = \frac{d}{dx}(ab)^x = \frac{d}{dx}\left(a^x b^x\right) = a^x \frac{d}{dx}b^x + b^x \frac{d}{dx}a^x = m(b)a^x b^x + m(a)a^x b^x = (m(a) + m(b))(ab)^x.$$

Thus, $m(ab) = m(a) + m(b)$.

3.4 Rates of Change

Preliminary Questions

1. Which units might be used for each rate of change?

(a) Pressure (in atmospheres) in a water tank with respect to depth

(b) The rate of a chemical reaction (change in concentration with respect to time with concentration in moles per liter)

SOLUTION

(a) The rate of change of pressure with respect to depth might be measured in atmospheres/meter.

(b) The reaction rate of a chemical reaction might be measured in moles/(liter·hour).

2. Two trains travel from New Orleans to Memphis in 4 hours. The first train travels at a constant velocity of 90 mph, but the velocity of the second train varies. What was the second train's average velocity during the trip?

SOLUTION Since both trains travel the same distance in the same amount of time, they have the same average velocity: 90 mph.

3. Estimate $f(26)$, assuming that $f(25) = 43$, $f'(25) = 0.75$.

SOLUTION $f(x) \approx f(25) + f'(25)(x - 25)$, so $f(26) \approx 43 + 0.75(26 - 25) = 43.75$.

4. The population $P(t)$ of Freedonia in 2009 was $P(2009) = 5$ million.

(a) What is the meaning of $P'(2009)$?

(b) Estimate $P(2010)$ if $P'(2009) = 0.2$.

SOLUTION

(a) Because $P(t)$ measures the population of Freedonia as a function of time, the derivative $P'(2009)$ measures the rate of change of the population of Freedonia in the year 2009.

(b) $P(2010) \approx P(2009) + P'(2010)$. Thus, if $P'(2009) = 0.2$, then $P(2009) \approx 5.2$ million.

Exercises

In Exercises 1–8, find the rate of change.

1. Area of a square with respect to its side s when $s = 5$.

SOLUTION Let the area be $A = f(s) = s^2$. Then the rate of change of A with respect to s is $d/ds(s^2) = 2s$. When $s = 5$, the area changes at a rate of 10 square units per unit increase. (Draw a 5×5 square on graph paper and trace the area added by increasing each side length by 1, excluding the corner, to see what this means.)

2. Volume of a cube with respect to its side s when $s = 5$.

SOLUTION Let the volume be $V = f(s) = s^3$. Then the rate of change of V with respect to s is $\frac{d}{ds}s^3 = 3s^2$. When $s = 5$, the volume changes at a rate of $3(5^2) = 75$ cubic units per unit increase.

3. Cube root $\sqrt[3]{x}$ with respect to x when $x = 1, 8, 27$.

SOLUTION Let $f(x) = \sqrt[3]{x}$. Writing $f(x) = x^{1/3}$, we see the rate of change of $f(x)$ with respect to x is given by $f'(x) = \frac{1}{3}x^{-2/3}$. The requested rates of change are given in the table that follows:

c	ROC of $f(x)$ with respect to x at $x = c$.
1	$f'(1) = \frac{1}{3}(1) = \frac{1}{3}$
8	$f'(8) = \frac{1}{3}(8^{-2/3}) = \frac{1}{3}(\frac{1}{4}) = \frac{1}{12}$
27	$f'(27) = \frac{1}{3}(27^{-2/3}) = \frac{1}{3}(\frac{1}{9}) = \frac{1}{27}$

4. The reciprocal $1/x$ with respect to x when $x = 1, 2, 3$.

SOLUTION Let $f(x) = x^{-1}$. The rate of change of $f(x)$ with respect to x is given by $f'(x) = -x^{-2}$. The requested rates of change are then -1 when $x = 1$, $-\frac{1}{4}$ when $x = 2$ and $-\frac{1}{9}$ when $x = 3$.

5. The diameter of a circle with respect to radius.

SOLUTION The relationship between the diameter d of a circle and its radius r is $d = 2r$. The rate of change of the diameter with respect to the radius is then $d' = 2$.

6. Surface area A of a sphere with respect to radius r ($A = 4\pi r^2$).

SOLUTION Because $A = 4\pi r^2$, the rate of change of the surface area of a sphere with respect to the radius is $A' = 8\pi r$.

7. Volume V of a cylinder with respect to radius if the height is equal to the radius.

SOLUTION The volume of the cylinder is $V = \pi r^2 h = \pi r^3$. Thus $dV/dr = 3\pi r^2$.

8. Speed of sound v (in m/s) with respect to air temperature T (in kelvins), where $v = 20\sqrt{T}$.

SOLUTION Because, $v = 20\sqrt{T} = 20T^{1/2}$, the rate of change of the speed of sound with respect to temperature is $v' = 10T^{-1/2} = \frac{10}{\sqrt{T}}$.

In Exercises 9–11, refer to Figure 10, the graph of distance $s(t)$ from the origin as a function of time for a car trip.

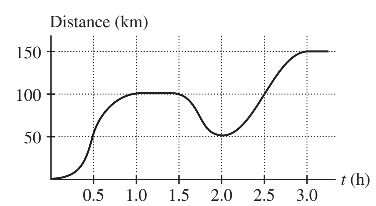

FIGURE 10 Distance from the origin versus time for a car trip.

9. Find the average velocity over each interval.

(a) [0, 0.5] **(b)** [0.5, 1] **(c)** [1, 1.5] **(d)** [1, 2]

SOLUTION

(a) The average velocity over the interval [0, 0.5] is

$$\frac{50 - 0}{0.5 - 0} = 100 \text{ km/hour}.$$

(b) The average velocity over the interval [0.5, 1] is

$$\frac{100-50}{1-0.5} = 100 \text{ km/hour.}$$

(c) The average velocity over the interval [1, 1.5] is

$$\frac{100-100}{1.5-1} = 0 \text{ km/hour.}$$

(d) The average velocity over the interval [1, 2] is

$$\frac{50-100}{2-1} = -50 \text{ km/hour.}$$

10. At what time is velocity at a maximum?

SOLUTION The velocity is maximum when the slope of the distance versus time curve is most positive. This appears to happen when $t = 0.5$ hours.

11. Match the descriptions (i)–(iii) with the intervals (a)–(c).

(i) Velocity increasing
(ii) Velocity decreasing
(iii) Velocity negative
(a) [0, 0.5]
(b) [2.5, 3]
(c) [1.5, 2]

SOLUTION

(a) **(i)** : The distance curve is increasing, and is also *bending* upward, so that distance is increasing at an increasing rate.

(b) **(ii)** : Over the interval [2.5, 3], the distance curve is flattening, showing that the car is slowing down; that is, the velocity is decreasing.

(c) **(iii)** : The distance curve is decreasing, so the tangent line has negative slope; this means the velocity is negative.

12. Use the data from Table 1 in Example 1 to calculate the average rate of change of Martian temperature T with respect to time t over the interval from 8:36 AM to 9:34 AM.

SOLUTION The time interval from 8:36 AM to 9:34 AM has length 58 minutes, and the change in temperature over this time interval is

$$\Delta T = -42 - (-47.7) = 5.7^\circ\text{C}.$$

The average rate of change is then

$$\frac{\Delta T}{\Delta t} = \frac{5.7}{58} \approx 0.0983^\circ\text{C/min} = 5.897^\circ\text{C/hr}.$$

13. Use Figure 3 from Example 1 to estimate the instantaneous rate of change of Martian temperature with respect to time (in degrees Celsius per hour) at $t = 4$ AM.

SOLUTION The segment of the temperature graph around $t = 4$ AM appears to be a straight line passing through roughly (1:36, -70) and (4:48, -75). The instantaneous rate of change of Martian temperature with respect to time at $t = 4$ AM is therefore approximately

$$\frac{dT}{dt} = \frac{-75-(-70)}{3.2} = -1.5625^\circ\text{C/hour}.$$

14. The temperature (in °C) of an object at time t (in minutes) is $T(t) = \frac{3}{8}t^2 - 15t + 180$ for $0 \le t \le 20$. At what rate is the object cooling at $t = 10$? (Give correct units.)

SOLUTION Given $T(t) = \frac{3}{8}t^2 - 15t + 180$, it follows that

$$T'(t) = \frac{3}{4}t - 15 \quad \text{and} \quad T'(10) = \frac{3}{4}(10) - 15 = -7.5^\circ\text{C/min}.$$

At $t = 10$, the object is cooling at the rate of 7.5°C/min.

15. The velocity (in cm/s) of blood molecules flowing through a capillary of radius 0.008 cm is $v = 6.4 \times 10^{-8} - 0.001r^2$, where r is the distance from the molecule to the center of the capillary. Find the rate of change of velocity with respect to r when $r = 0.004$ cm.

SOLUTION The rate of change of the velocity of the blood molecules is $v'(r) = -0.002r$. When $r = 0.004$ cm, this rate is -8×10^{-6} 1/s.

16. Figure 11 displays the voltage V across a capacitor as a function of time while the capacitor is being charged. Estimate the rate of change of voltage at $t = 20$ s. Indicate the values in your calculation and include proper units. Does voltage change more quickly or more slowly as time goes on? Explain in terms of tangent lines.

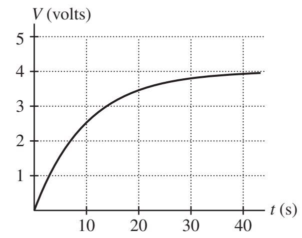

FIGURE 11

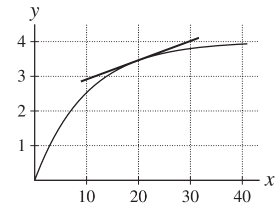
SOLUTION The tangent line sketched in the figure below appears to pass through the points (10, 3) and (30, 4). Thus, the rate of change of voltage at $t = 20$ seconds is approximately

$$\frac{4-3}{30-10} = 0.05 \text{ V/s}.$$

As we move to the right of the graph, the tangent lines to it grow shallower, indicating that the voltage changes more slowly as time goes on.



17. Use Figure 12 to estimate dT/dh at $h = 30$ and 70, where T is atmospheric temperature (in degrees Celsius) and h is altitude (in kilometers). Where is dT/dh equal to zero?

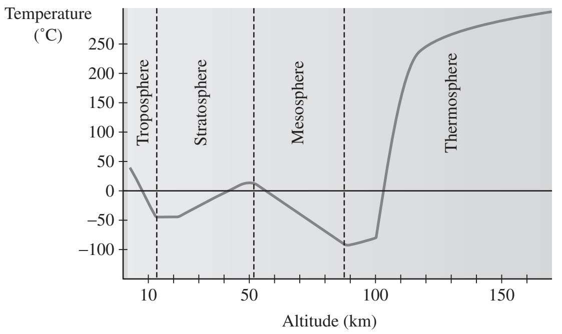


FIGURE 12 Atmospheric temperature versus altitude.

SOLUTION At $h = 30$ km, the graph of atmospheric temperature appears to be linear passing through the points $(23, -50)$ and (40, 0). The slope of this segment of the graph is then

$$\frac{0-(-50)}{40-23} = \frac{50}{17} = 2.94;$$

so

$$\left.\frac{dT}{dh}\right|_{h=30} \approx 2.94°\text{C/km}.$$

At $h = 70$ km, the graph of atmospheric temperature appears to be linear passing through the points (58, 0) and $(88, -100)$. The slope of this segment of the graph is then

$$\frac{-100-0}{88-58} = \frac{-100}{30} = -3.33;$$

so

$$\left.\frac{dT}{dh}\right|_{h=70} \approx -3.33°\text{C/km}.$$

$\frac{dT}{dh} = 0$ at those points where the tangent line on the graph is horizontal. This appears to happen over the interval [13, 23], and near the points $h = 50$ and $h = 90$.

18. The earth exerts a gravitational force of $F(r) = (2.99 \times 10^{16})/r^2$ newtons on an object with a mass of 75 kg located r meters from the center of the earth. Find the rate of change of force with respect to distance r at the surface of the earth.

SOLUTION The rate of change of force is $F'(r) = -5.98 \times 10^{16}/r^3$. Therefore,

$$F'(6.77 \times 10^6) = -5.98 \times 10^{16}/(6.77 \times 10^6)^3 = -1.93 \times 10^{-4} \text{ N/m}.$$

19. Calculate the rate of change of escape velocity $v_{\text{esc}} = (2.82 \times 10^7)r^{-1/2}$ m/s with respect to distance r from the center of the earth.

SOLUTION The rate that escape velocity changes is $v'_{\text{esc}}(r) = -1.41 \times 10^7 r^{-3/2}$.

20. The power delivered by a battery to an apparatus of resistance R (in ohms) is $P = 2.25R/(R + 0.5)^2$ watts. Find the rate of change of power with respect to resistance for $R = 3\ \Omega$ and $R = 5\ \Omega$.

SOLUTION

$$P'(R) = \frac{(R + 0.5)^2 2.25 - 2.25R(2R + 1)}{(R + 0.5)^4}.$$

Therefore, $P'(3) = -0.1312$ W/Ω and $P'(5) = -0.0609$ W/Ω.

21. The position of a particle moving in a straight line during a 5-s trip is $s(t) = t^2 - t + 10$ cm. Find a time t at which the instantaneous velocity is equal to the average velocity for the entire trip.

SOLUTION Let $s(t) = t^2 - t + 10$, $0 \le t \le 5$, with s in centimeters (cm) and t in seconds (s). The average velocity over the t-interval [0, 5] is

$$\frac{s(5) - s(0)}{5 - 0} = \frac{30 - 10}{5} = 4 \text{ cm/s}.$$

The (instantaneous) velocity is $v(t) = s'(t) = 2t - 1$. Solving $2t - 1 = 4$ yields $t = \frac{5}{2}$ s, the time at which the instantaneous velocity equals the calculated average velocity.

22. The height (in meters) of a helicopter at time t (in minutes) is $s(t) = 600t - 3t^3$ for $0 \le t \le 12$.

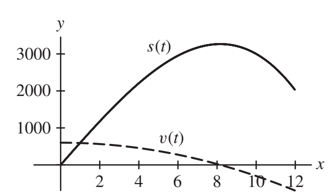
(a) Plot $s(t)$ and velocity $v(t)$.

(b) Find the velocity at $t = 8$ and $t = 10$.

(c) Find the maximum height of the helicopter.

SOLUTION

(a) With $s(t) = 600t - 3t^3$, it follows that $v(t) = 600 - 9t^2$. Plots of the position and the velocity are shown below.



(b) From part (a), we have $v(t) = 600 - 9t^2$. Thus, $v'(8) = 24$ meters/minute and $v'(10) = -300$ meters/minute.

(c) From the graph in part (a), we see that the helicopter achieves its maximum height when the velocity is zero. Solving $600 - 9t^2 = 0$ for t yields

$$t = \sqrt{\frac{600}{9}} = \frac{10}{3}\sqrt{6} \text{ minutes}.$$

The maximum height of the helicopter is then

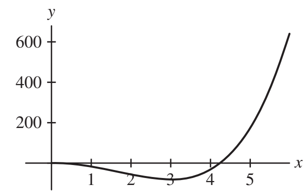
$$s\left(\frac{10}{3}\sqrt{6}\right) = \frac{4000}{3}\sqrt{6} \approx 3266 \text{ meters}.$$

23. A particle moving along a line has position $s(t) = t^4 - 18t^2$ m at time t seconds. At which times does the particle pass through the origin? At which times is the particle instantaneously motionless (that is, it has zero velocity)?

SOLUTION The particle passes through the origin when $s(t) = t^4 - 18t^2 = t^2(t^2 - 18) = 0$. This happens when $t = 0$ seconds and when $t = 3\sqrt{2} \approx 4.24$ seconds. With $s(t) = t^4 - 18t^2$, it follows that $v(t) = s'(t) = 4t^3 - 36t = 4t(t^2 - 9)$. The particle is therefore instantaneously motionless when $t = 0$ seconds and when $t = 3$ seconds.

24. $\boxed{\text{GU}}$ Plot the position of the particle in Exercise 23. What is the farthest distance to the left of the origin attained by the particle?

SOLUTION The plot of the position of the particle in Exercise 23 is shown below. Positive values of position correspond to distance to the right of the origin and negative values correspond to distance to the left of the origin. The most negative value of $s(t)$ occurs at $t = 3$ and is equal to $s(3) = 3^4 - 18(3)^2 = -81$. Thus, the particle achieves a maximum distance to the left of the origin of 81 meters.



25. A bullet is fired in the air vertically from ground level with an initial velocity 200 m/s. Find the bullet's maximum velocity and maximum height.

SOLUTION We employ Galileo's formula, $s(t) = s_0 + v_0 t - \frac{1}{2}gt^2 = 200t - 4.9t^2$, where the time t is in seconds (s) and the height s is in meters (m). The velocity is $v(t) = 200 - 9.8t$. The maximum velocity of 200 m/s occurs at $t = 0$. This is the initial velocity. The bullet reaches its maximum height when $v(t) = 200 - 9.8t = 0$; i.e., when $t \approx 20.41$ s. At this point, the height is 2040.82 m.

26. Find the velocity of an object dropped from a height of 300 m at the moment it hits the ground.

SOLUTION We employ Galileo's formula, $s(t) = s_0 + v_0 t - \frac{1}{2}gt^2 = 300 - 4.9t^2$, where the time t is in seconds (s) and the height s is in meters (m). When the ball hits the ground its height is 0. Solve $s(t) = 300 - 4.9t^2 = 0$ to obtain $t \approx 7.8246$ s. (We discard the negative time, which took place before the ball was dropped.) The velocity at impact is $v(7.8246) = -9.8(7.8246) \approx -76.68$ m/s. This signifies that the ball is *falling* at 76.68 m/s.

27. A ball tossed in the air vertically from ground level returns to earth 4 s later. Find the initial velocity and maximum height of the ball.

SOLUTION Galileo's formula gives $s(t) = s_0 + v_0 t - \frac{1}{2}gt^2 = v_0 t - 4.9t^2$, where the time t is in seconds (s) and the height s is in meters (m). When the ball hits the ground after 4 seconds its height is 0. Solve $0 = s(4) = 4v_0 - 4.9(4)^2$ to obtain $v_0 = 19.6$ m/s. The ball reaches its maximum height when $s'(t) = 0$, that is, when $19.6 - 9.8t = 0$, or $t = 2$ s. At this time, $t = 2$ s,

$$s(2) = 0 + 19.6(2) - \frac{1}{2}(9.8)(4) = 19.6 \text{ m}.$$

28. Olivia is gazing out a window from the tenth floor of a building when a bucket (dropped by a window washer) passes by. She notes that it hits the ground 1.5 s later. Determine the floor from which the bucket was dropped if each floor is 5 m high and the window is in the middle of the tenth floor. Neglect air friction.

SOLUTION Suppose H is the unknown height from which the bucket fell starting at time $t = 0$. The height of the bucket at time t is $s(t) = H - 4.9t^2$. Let T be the time when the bucket hits the ground (thus $S(T) = 0$). Olivia saw the bucket at time $T - 1.5$. The window is located 9.5 floors or 47.5 m above ground. So we have the equations

$$s(T - 1.5) = H - 4.9(T - 1.5)^2 = 47.5 \quad \text{and} \quad s(T) = H - 4.9T^2 = 0$$

Subtracting the second equation from the first, we obtain $-4.9(-3T + 2.25) = 47.5$, so $T \approx 4$ s. The second equation gives us $H = 4.9T^2 = 4.9(4)^2 \approx 78.4$ m. Since there are 5 m in a floor, the bucket was dropped $78.4/5 \approx 15.7$ floors above the ground. The bucket was dropped from the top of the 15th floor.

29. Show that for an object falling according to Galileo's formula, the average velocity over any time interval $[t_1, t_2]$ is equal to the average of the instantaneous velocities at t_1 and t_2.

SOLUTION The simplest way to proceed is to compute both values and show that they are equal. The average velocity over $[t_1, t_2]$ is

$$\frac{s(t_2) - s(t_1)}{t_2 - t_1} = \frac{(s_0 + v_0 t_2 - \frac{1}{2}gt_2^2) - (s_0 + v_0 t_1 - \frac{1}{2}gt_1^2)}{t_2 - t_1} = \frac{v_0(t_2 - t_1) + \frac{g}{2}(t_2{}^2 - t_1{}^2)}{t_2 - t_1}$$

$$= \frac{v_0(t_2 - t_1)}{t_2 - t_1} - \frac{g}{2}(t_2 + t_1) = v_0 - \frac{g}{2}(t_2 + t_1)$$

Whereas the average of the instantaneous velocities at the beginning and end of $[t_1, t_2]$ is

$$\frac{s'(t_1) + s'(t_2)}{2} = \frac{1}{2}\Big((v_0 - gt_1) + (v_0 - gt_2)\Big) = \frac{1}{2}(2v_0) - \frac{g}{2}(t_2 + t_1) = v_0 - \frac{g}{2}(t_2 + t_1).$$

The two quantities are the same.

30. An object falls under the influence of gravity near the earth's surface. Which of the following statements is true? Explain.

(a) Distance traveled increases by equal amounts in equal time intervals.
(b) Velocity increases by equal amounts in equal time intervals.
(c) The derivative of velocity increases with time.

SOLUTION For an object falling under the influence of gravity, Galileo's formula gives $s(t) = s_0 + v_0 t - \frac{1}{2}gt^2$.

(a) Since the height of the object varies quadratically with respect to time, it is *not* true that the object covers equal distance in equal time intervals.

(b) The velocity is $v(t) = s'(t) = v_0 - gt$. The velocity varies linearly with respect to time. Accordingly, the velocity decreases (becomes more negative) by equal amounts in equal time intervals. Moreover, its *speed* (the magnitude of velocity) increases by equal amounts in equal time intervals.

(c) Acceleration, the derivative of velocity with respect to time, is given by $a(t) = v'(t) = -g$. This is a *constant*; it does not change with time. Hence it is *not* true that acceleration (the derivative of velocity) increases with time.

31. By Faraday's Law, if a conducting wire of length ℓ meters moves at velocity v m/s perpendicular to a magnetic field of strength B (in teslas), a voltage of size $V = -B\ell v$ is induced in the wire. Assume that $B = 2$ and $\ell = 0.5$.

(a) Calculate dV/dv.
(b) Find the rate of change of V with respect to time t if $v = 4t + 9$.

SOLUTION

(a) Assuming that $B = 2$ and $l = 0.5$, $V = -2(.5)v = -v$. Therefore,

$$\frac{dV}{dv} = -1.$$

(b) If $v = 4t + 9$, then $V = -2(.5)(4t + 9) = -(4t + 9)$. Therefore, $\frac{dV}{dt} = -4$.

32. The voltage V, current I, and resistance R in a circuit are related by Ohm's Law: $V = IR$, where the units are volts, amperes, and ohms. Assume that voltage is constant with $V = 12$ volts. Calculate (specifying units):

(a) The average rate of change of I with respect to R for the interval from $R = 8$ to $R = 8.1$
(b) The rate of change of I with respect to R when $R = 8$
(c) The rate of change of R with respect to I when $I = 1.5$

SOLUTION Let $V = IR$ or $I = V/R = 12/R$ (since we are assuming $V = 12$ volts).

(a) The average rate of change is

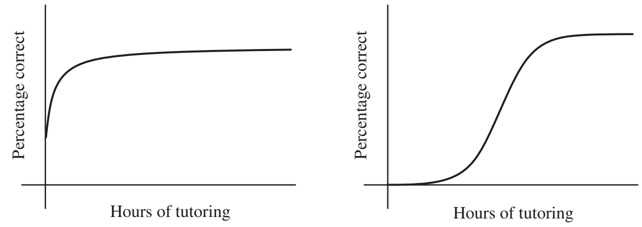
$$\frac{\Delta I}{\Delta R} = \frac{I(8.1) - I(8)}{8.1 - 8} = \frac{\frac{12}{8.1} - \frac{12}{8}}{0.1} \approx -0.185\ \text{A}/\Omega.$$

(b) $dI/dR = -12/R^2 = -12/8^2 = -0.1875\ \text{A}/\Omega$.
(c) With $R = 12/I$, we have $dR/dI = -12/I^2 = -12/1.5^2 \approx -5.33\ \Omega/\text{A}$.

33. Ethan finds that with h hours of tutoring, he is able to answer correctly $S(h)$ percent of the problems on a math exam. Which would you expect to be larger: $S'(3)$ or $S'(30)$? Explain.

SOLUTION One possible graph of $S(h)$ is shown in the figure below on the left. This graph indicates that in the early hours of working with the tutor, Ethan makes rapid progress in learning the material but eventually approaches either the limit of his ability to learn the material or the maximum possible score on the exam. In this scenario, $S'(3)$ would be larger than $S'(30)$.

An alternative graph of $S(h)$ is shown below on the right. Here, in the early hours of working with the tutor little progress is made (perhaps the tutor is assessing how much Ethan already knows, his learning style, his personality, etc.). This is followed by a period of rapid improvement and finally a leveling off as Ethan reaches his maximum score. In this scenario, $S'(3)$ and $S'(30)$ might be roughly equal.



34. Suppose $\theta(t)$ measures the angle between a clock's minute and hour hands. What is $\theta'(t)$ at 3 o'clock?

SOLUTION The minute hand makes one full revolution every 60 minutes, so the minute hand moves at a rate of

$$\frac{2\pi}{60} = \frac{\pi}{30} \text{ rad/min.}$$

The hour hand makes one-twelfth of a revolution every 60 minutes, so the hour hand moves with a rate of

$$\frac{\pi}{360} \text{ rad/min.}$$

At 3 o'clock, the movement of the minute hand works to decrease the angle between the minute and hour hands while the movement of the hour hand works to increase the angle. Therefore, at 3 o'clock,

$$\theta'(t) = \frac{\pi}{360} - \frac{\pi}{30} = -\frac{11\pi}{360} \text{ rad/min.}$$

35. To determine drug dosages, doctors estimate a person's body surface area (BSA) (in meters squared) using the formula $\text{BSA} = \sqrt{hm}/60$, where h is the height in centimeters and m the mass in kilograms. Calculate the rate of change of BSA with respect to mass for a person of constant height $h = 180$. What is this rate at $m = 70$ and $m = 80$? Express your result in the correct units. Does BSA increase more rapidly with respect to mass at lower or higher body mass?

SOLUTION Assuming constant height $h = 180$ cm, let $f(m) = \sqrt{hm}/60 = \frac{\sqrt{5}}{10}m$ be the formula for body surface area in terms of weight. The rate of change of BSA with respect to mass is

$$f'(m) = \frac{\sqrt{5}}{10}\left(\frac{1}{2}m^{-1/2}\right) = \frac{\sqrt{5}}{20\sqrt{m}}.$$

If $m = 70$ kg, this is

$$f'(70) = \frac{\sqrt{5}}{20\sqrt{70}} = \frac{\sqrt{14}}{280} \approx 0.0133631\frac{\text{m}^2}{\text{kg}}.$$

If $m = 80$ kg,

$$f'(80) = \frac{\sqrt{5}}{20\sqrt{80}} = \frac{1}{20\sqrt{16}} = \frac{1}{80}\frac{\text{m}^2}{\text{kg}}.$$

Because the rate of change of BSA depends on $1/\sqrt{m}$, it is clear that BSA increases more rapidly at lower body mass.

36. The atmospheric CO_2 level $A(t)$ at Mauna Loa, Hawaii at time t (in parts per million by volume) is recorded by the Scripps Institution of Oceanography. The values for the months January–December 2007 were

382.45, 383.68, 384.23, 386.26, 386.39, 385.87,
384.39, 381.78, 380.73, 380.81, 382.33, 383.69

(a) Assuming that the measurements were made on the first of each month, estimate $A'(t)$ on the 15th of the months January–November.

(b) In which months did $A'(t)$ take on its largest and smallest values?

(c) In which month was the CO_2 level most nearly constant?

SOLUTION

(a) The rate of change in the atmospheric CO_2 level on the 15th of each month can be estimated using the monthly differences $A(n) - A(n-1)$ for $2 \le n \le 12$. The estimates we obtain are:

$$1.23, 0.55, 2.03, 0.13, -0.52, -1.48, -2.61, -1.05, 0.08, 1.52, 1.36$$

t	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov
$P'(t)$	1.23	0.55	2.03	0.13	−0.52	−1.48	−2.61	−1.05	0.08	1.52	1.36

(b) According to the table in part (a), the maximum rate of change occurs in March and the minimum rate is in July.

(c) According to the table in part (a), the CO_2 level is most nearly constant in September.

37. The tangent lines to the graph of $f(x) = x^2$ grow steeper as x increases. At what rate do the slopes of the tangent lines increase?

SOLUTION Let $f(x) = x^2$. The slopes s of the tangent lines are given by $s = f'(x) = 2x$. The rate at which these slopes are increasing is $ds/dx = 2$.

38. Figure 13 shows the height y of a mass oscillating at the end of a spring. through one cycle of the oscillation. Sketch the graph of velocity as a function of time.

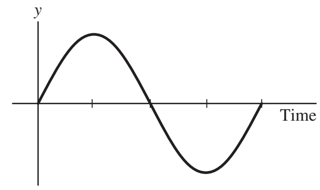


FIGURE 13

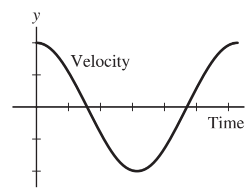
SOLUTION The position graph appears to break into four equal-sized components. Over the first quarter of the time interval, the position graph is rising but bending downward, eventually reaching a horizontal tangent. Thus, over the first quarter of the time interval, the velocity is positive but decreasing, eventually reaching 0. Continuing to examine the structure of the position graph produces the following graph of velocity:



In Exercises 39–46, use Eq. (3) to estimate the unit change.

39. Estimate $\sqrt{2} - \sqrt{1}$ and $\sqrt{101} - \sqrt{100}$. Compare your estimates with the actual values.

SOLUTION Let $f(x) = \sqrt{x} = x^{1/2}$. Then $f'(x) = \frac{1}{2}(x^{-1/2})$. We are using the derivative to estimate the average rate of change. That is,

$$\frac{\sqrt{x+h} - \sqrt{x}}{h} \approx f'(x),$$

so that

$$\sqrt{x+h} - \sqrt{x} \approx hf'(x).$$

Thus, $\sqrt{2} - \sqrt{1} \approx 1f'(1) = \frac{1}{2}(1) = \frac{1}{2}$. The actual value, to six decimal places, is 0.414214. Also, $\sqrt{101} - \sqrt{100} \approx 1f'(100) = \frac{1}{2}\left(\frac{1}{10}\right) = .05$. The actual value, to six decimal places, is 0.0498756.

40. Estimate $f(4) - f(3)$ if $f'(x) = 2^{-x}$. Then estimate $f(4)$, assuming that $f(3) = 12$.

SOLUTION Using the estimate that

$$\frac{f(x+h) - f(x)}{h} \approx f'(x),$$

so that $f(x+h) - f(x) \approx f'(x)h$ with $x = 3$, $h = 1$, we get

$$f(4) - f(3) \approx 2^{-3}(1) = \frac{1}{8}.$$

If $f(3) = 12$, then $f(4) \approx 12\frac{1}{8} = \frac{97}{8}$.

41. Let $F(s) = 1.1s + 0.05s^2$ be the stopping distance as in Example 3. Calculate $F(65)$ and estimate the increase in stopping distance if speed is increased from 65 to 66 mph. Compare your estimate with the actual increase.

SOLUTION Let $F(s) = 1.1s + .05s^2$ be as in Example 3. $F'(s) = 1.1 + 0.1s$.

- Then $F(65) = 282.75$ ft and $F'(65) = 7.6$ ft/mph.
- $F'(65) \approx F(66) - F(65)$ is approximately equal to the change in stopping distance per 1 mph increase in speed when traveling at 65 mph. Increasing speed from 65 to 66 therefore increases stopping distance by approximately 7.6 ft.
- The actual increase in stopping distance when speed increases from 65 mph to 66 mph is $F(66) - F(65) = 290.4 - 282.75 = 7.65$ feet, which differs by less than one percent from the estimate found using the derivative.

42. According to Kleiber's Law, the metabolic rate P (in kilocalories per day) and body mass m (in kilograms) of an animal are related by a *three-quarter-power law* $P = 73.3m^{3/4}$. Estimate the increase in metabolic rate when body mass increases from 60 to 61 kg.

SOLUTION Let $P(m) = 73.3m^{3/4}$ be the function relating body mass m to metabolic rate P. Then,

$$P'(m) = \frac{3}{4}(73.3)m^{-1/4} = 54.975m^{-1/4}$$

$$P(61) - P(60) \approx P'(60) = 54.975(60^{-1/4}) = 19.7527.$$

As body mass is increased from 60 to 61 kg, metabolic rate is increased by approximately 19.7527 kcal/day.

43. The dollar cost of producing x bagels is $C(x) = 300 + 0.25x - 0.5(x/1000)^3$. Determine the cost of producing 2000 bagels and estimate the cost of the 2001st bagel. Compare your estimate with the actual cost of the 2001st bagel.

SOLUTION Expanding the power of 3 yields

$$C(x) = 300 + 0.25x - 5 \times 10^{-10}x^3.$$

This allows us to get the derivative $C'(x) = 0.25 - 1.5 \times 10^{-9}x^2$. The cost of producing 2000 bagels is

$$C(2000) = 300 + 0.25(2000) - 0.5(2000/1000)^3 = 796$$

dollars. The cost of the 2001st bagel is, by definition, $C(2001) - C(2000)$. By the derivative estimate, $C(2001) - C(2000) \approx C'(2000)(1)$, so the cost of the 2001st bagel is approximately

$$C'(2000) = 0.25 - 1.5 \times 10^{-9}(2000^2) = \$0.244.$$

$C(2001) = 796.244$, so the *exact* cost of the 2001st bagel is indistinguishable from the estimated cost. The function is very nearly linear at this point.

44. Suppose the dollar cost of producing x video cameras is $C(x) = 500x - 0.003x^2 + 10^{-8}x^3$.

(a) Estimate the marginal cost at production level $x = 5000$ and compare it with the actual cost $C(5001) - C(5000)$.

(b) Compare the marginal cost at $x = 5000$ with the average cost per camera, defined as $C(x)/x$.

SOLUTION Let $C(x) = 500x - 0.003x^2 + 10^{-8}x^3$. Then

$$C'(x) = 500 - 0.006x + (3 \times 10^{-8})x^2.$$

(a) The cost difference is approximately $C'(5000) = 470.75$. The actual cost is $C(5001) - C(5000) = 470.747$, which is quite close to the marginal cost computed using the derivative.

(b) The average cost per camera is

$$\frac{C(5000)}{5000} = \frac{2426250}{5000} = 485.25,$$

which is slightly higher than the marginal cost.

45. Demand for a commodity generally decreases as the price is raised. Suppose that the demand for oil (per capita per year) is $D(p) = 900/p$ barrels, where p is the dollar price per barrel. Find the demand when $p = \$40$. Estimate the decrease in demand if p rises to \$41 and the increase if p declines to \$39.

SOLUTION $D(p) = 900p^{-1}$, so $D'(p) = -900p^{-2}$. When the price is \$40 a barrel, the per capita demand is $D(40) = 22.5$ barrels per year. With an increase in price from \$40 to \$41 a barrel, the change in demand $D(41) - D(40)$ is approximately $D'(40) = -900(40^{-2}) = -0.5625$ barrels a year. With a decrease in price from \$40 to \$39 a barrel, the change in demand $D(39) - D(40)$ is approximately $-D'(40) = +0.5625$. An increase in oil prices of a dollar leads to a decrease in demand of 0.5625 barrels a year, and a decrease of a dollar leads to an *increase* in demand of 0.5625 barrels a year.

46. The reproduction rate f of the fruit fly *Drosophila melanogaster*, grown in bottles in a laboratory, decreases with the number p of flies in the bottle. A researcher has found the number of offspring per female per day to be approximately $f(p) = (34 - 0.612p)p^{-0.658}$.

(a) Calculate $f(15)$ and $f'(15)$.

(b) Estimate the decrease in daily offspring per female when p is increased from 15 to 16. Is this estimate larger or smaller than the actual value $f(16) - f(15)$?

(c) $\boxed{\text{GU}}$ Plot $f(p)$ for $5 \le p \le 25$ and verify that $f(p)$ is a decreasing function of p. Do you expect $f'(p)$ to be positive or negative? Plot $f'(p)$ and confirm your expectation.

SOLUTION Let

$$f(p) = (34 - 0.612p)p^{-0.658} = 34p^{-0.658} - 0.612p^{0.342}.$$

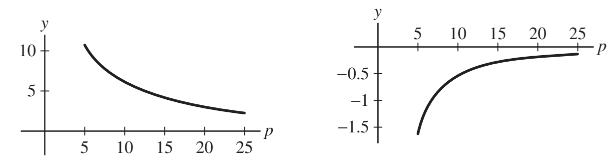
Then

$$f'(p) = -22.372p^{-1.658} - 0.209304p^{-0.658}.$$

(a) $f(15) = 34(15)^{-0.658} - 0.612(15)^{0.342} \approx 4.17767$ offspring per female per day and $f'(15) = -22.372(15)^{-1.658} - 0.209304(15)^{-0.658} \approx -0.28627$ offspring per female per day per fly.

(b) $f(16) - f(15) \approx f'(15) \approx -0.28627$. The decrease in daily offspring per female is estimated at 0.28627. $f(16) - f(15) = -0.272424$. The actual decrease in daily offspring per female is 0.272424. The actual decrease in daily offspring per female is less than the estimated decrease. This is because the graph of the function bends towards the x axis.

(c) The function $f(p)$ is plotted below at the left and is clearly a decreasing function of p; we therefore expect that $f'(p)$ will be negative. The plot of the derivative shown below at the right confirms our expectation.



47. According to Stevens' Law in psychology, the perceived magnitude of a stimulus is proportional (approximately) to a power of the actual intensity I of the stimulus. Experiments show that the *perceived brightness* B of a light satisfies $B = kI^{2/3}$, where I is the light intensity, whereas the *perceived heaviness* H of a weight W satisfies $H = kW^{3/2}$ (k is a constant that is different in the two cases). Compute dB/dI and dH/dW and state whether they are increasing or decreasing functions. Then explain the following statements:

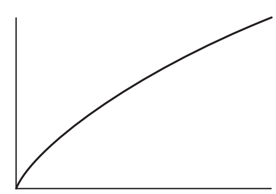
(a) A one-unit increase in light intensity is felt more strongly when I is small than when I is large.

(b) Adding another pound to a load W is felt more strongly when W is large than when W is small.

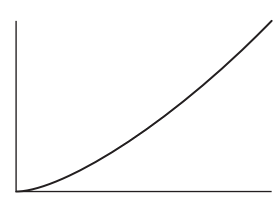
SOLUTION

(a) $dB/dI = \frac{2k}{3} I^{-1/3} = \frac{2k}{3I^{1/3}}$.

As I increases, dB/dI shrinks, so that the rate of change of perceived intensity decreases as the actual intensity increases. Increased light intensity has a *diminished return* in perceived intensity. A sketch of B against I is shown: See that the height of the graph increases more slowly as you move to the right.



(b) $dH/dW = \frac{3k}{2} W^{1/2}$. As W increases, dH/dW increases as well, so that the rate of change of perceived weight increases as weight increases. A sketch of H against W is shown: See that the graph becomes steeper as you move to the right.



48. Let $M(t)$ be the mass (in kilograms) of a plant as a function of time (in years). Recent studies by Niklas and Enquist have suggested that a remarkably wide range of plants (from algae and grass to palm trees) obey a *three-quarter-power growth law*—that is, $dM/dt = CM^{3/4}$ for some constant C.

(a) If a tree has a growth rate of 6 kg/yr when $M = 100$ kg, what is its growth rate when $M = 125$ kg?

(b) If $M = 0.5$ kg, how much more mass must the plant acquire to double its growth rate?

SOLUTION

(a) Suppose a tree has a growth rate dM/dt of 6 kg/yr when $M = 100$, then $6 = C(100^{3/4}) = 10C\sqrt{10}$, so that $C = \frac{3\sqrt{10}}{50}$. When $M = 125$,

$$\frac{dM}{dt} = C(125^{3/4}) = \frac{3\sqrt{10}}{50} 25(5^{1/4}) = 7.09306.$$

(b) The growth rate when $M = 0.5$ kg is $dM/dt = C(0.5^{3/4})$. To double the rate, we must find M so that $dM/dt = CM^{3/4} = 2C(0.5^{3/4})$. We solve for M.

$$CM^{3/4} = 2C(0.5^{3/4})$$

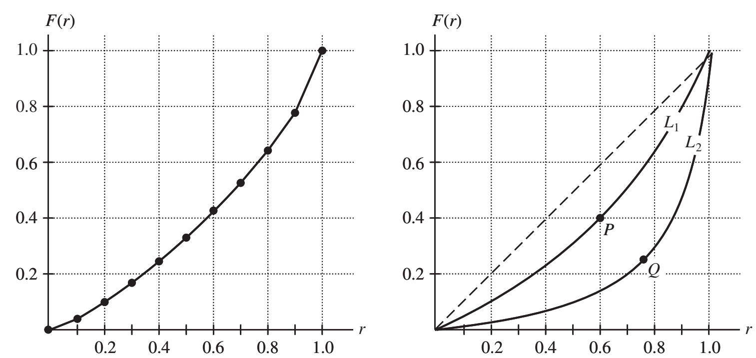
$$M^{3/4} = 2(0.5^{3/4})$$
$$M = (2(0.5^{3/4}))^{4/3} = 1.25992.$$

The plant must acquire the difference $1.25992 - 0.5 = 0.75992$ kg in order to double its growth rate.

Note that a doubling of growth rate requires *more* than a doubling of mass.

Further Insights and Challenges

Exercises 49–51: The ***Lorenz curve*** $y = F(r)$ *is used by economists to study income distribution in a given country (see Figure 14). By definition,* $F(r)$ *is the fraction of the total income that goes to the bottom* r*th part of the population, where* $0 \le r \le 1$*. For example, if* $F(0.4) = 0.245$*, then the bottom* 40% *of households receive* 24.5% *of the total income. Note that* $F(0) = 0$ *and* $F(1) = 1$.



(A) Lorenz curve for Sweden in 2004

(B) Two Lorenz curves: The tangent lines at P and Q have slope 1.

FIGURE 14

49. Our goal is to find an interpretation for $F'(r)$. The average income for a group of households is the total income going to the group divided by the number of households in the group. The national average income is $A = T/N$, where N is the total number of households and T is the total income earned by the entire population.

(a) Show that the average income among households in the bottom rth part is equal to $(F(r)/r)A$.

(b) Show more generally that the average income of households belonging to an interval $[r, r + \Delta r]$ is equal to

$$\left(\frac{F(r + \Delta r) - F(r)}{\Delta r}\right) A$$

(c) Let $0 \le r \le 1$. A household belongs to the $100r$th percentile if its income is greater than or equal to the income of $100r$ % of all households. Pass to the limit as $\Delta r \to 0$ in (b) to derive the following interpretation: A household in the $100r$th percentile has income $F'(r)A$. In particular, a household in the $100r$th percentile receives more than the national average if $F'(r) > 1$ and less if $F'(r) < 1$.

(d) For the Lorenz curves L_1 and L_2 in Figure 14(B), what percentage of households have above-average income?

SOLUTION

(a) The total income among households in the bottom rth part is $F(r)T$ and there are rN households in this part of the population. Thus, the average income among households in the bottom rth part is equal to

$$\frac{F(r)T}{rN} = \frac{F(r)}{r} \cdot \frac{T}{N} = \frac{F(r)}{r}A.$$

(b) Consider the interval $[r, r + \Delta r]$. The total income among households between the bottom rth part and the bottom $r + \Delta r$-th part is $F(r + \Delta r)T - F(r)T$. Moreover, the number of households covered by this interval is $(r + \Delta r)N - rN = \Delta r N$. Thus, the average income of households belonging to an interval $[r, r + \Delta r]$ is equal to

$$\frac{F(r + \Delta r)T - F(r)T}{\Delta r N} = \frac{F(r + \Delta r) - F(r)}{\Delta r} \cdot \frac{T}{N} = \frac{F(r + \Delta r) - F(r)}{\Delta r}A.$$

(c) Take the result from part (b) and let $\Delta r \to 0$. Because

$$\lim_{\Delta r \to 0} \frac{F(r + \Delta r) - F(r)}{\Delta r} = F'(r),$$

we find that a household in the $100r$th percentile has income $F'(r)A$.

(d) The point P in Figure 14(B) has an r-coordinate of 0.6, while the point Q has an r-coordinate of roughly 0.75. Thus, on curve L_1, 40% of households have $F'(r) > 1$ and therefore have above-average income. On curve L_2, roughly 25% of households have above-average income.

50. The following table provides values of $F(r)$ for Sweden in 2004. Assume that the national average income was $A = 30{,}000$ euros.

r	0	0.2	0.4	0.6	0.8	1
$F(r)$	0	0.01	0.245	0.423	0.642	1

(a) What was the average income in the lowest 40% of households?

(b) Show that the average income of the households belonging to the interval [0.4, 0.6] was 26,700 euros.

(c) Estimate $F'(0.5)$. Estimate the income of households in the 50th percentile? Was it greater or less than the national average?

SOLUTION

(a) The average income in the lowest 40% of households is $F'(0.4)A = 0.245(30{,}000) = 7350$ euros.

(b) The average income of the households belonging to the interval [0.4, 0.6] is

$$\frac{F(0.6) - F(0.4)}{0.2}A = \frac{0.423 - 0.245}{0.2}(30{,}000) = (0.89)(30{,}000) = 26700$$

euros.

(c) We estimate

$$F'(0.5) \approx \frac{F(0.6) - F(0.4)}{0.2} = \frac{0.423 - 0.245}{0.2} = 0.89.$$

The income of households in the 50th percentile is then $F'(0.5)A = 0.89(30{,}000) = 26{,}700$ euros, which is less than the national average.

51. Use Exercise 49 (c) to prove:

(a) $F'(r)$ is an increasing function of r.

(b) Income is distributed equally (all households have the same income) if and only if $F(r) = r$ for $0 \le r \le 1$.

SOLUTION

(a) Recall from Exercise 49 (c) that $F'(r)A$ is the income of a household in the $100r$-th percentile. Suppose $0 \le r_1 < r_2 \le 1$. Because $r_2 > r_1$, a household in the $100r_2$-th percentile must have income at least as large as a household in the $100r_1$-th percentile. Thus, $F'(r_2)A \ge F'(r_1)A$, or $F'(r_2) \ge F'(r_1)$. This implies $F'(r)$ is an increasing function of r.

(b) If $F(r) = r$ for $0 \le r \le 1$, then $F'(r) = 1$ and households in all percentiles have income equal to the national average; that is, income is distributed equally. Alternately, if income is distributed equally (all households have the same income), then $F'(r) = 1$ for $0 \le r \le 1$. Thus, F must be a linear function in r with slope 1. Moreover, the condition $F(0) = 0$ requires the F intercept of the line to be 0. Hence, $F(r) = 1 \cdot r + 0 = r$.

52. CAS Studies of Internet usage show that website popularity is described quite well by Zipf's Law, according to which the nth most popular website receives roughly the fraction $1/n$ of all visits. Suppose that on a particular day, the nth most popular site had approximately $V(n) = 10^6/n$ visitors (for $n \le 15{,}000$).

(a) Verify that the top 50 websites received nearly 45% of the visits. *Hint:* Let $T(N)$ denote the sum of $V(n)$ for $1 \le n \le N$. Use a computer algebra system to compute $T(45)$ and $T(15{,}000)$.

(b) Verify, by numerical experimentation, that when Eq. (3) is used to estimate $V(n+1) - V(n)$, the error in the estimate decreases as n grows larger. Find (again, by experimentation) an N such that the error is at most 10 for $n \ge N$.

(c) Using Eq. (3), show that for $n \ge 100$, the nth website received at most 100 more visitors than the $(n+1)$st website.

SOLUTION

(a) In Mathematica, using the command `Sum[10^6/n,{n,50}]` yields 4.49921×10^6 and the command `Sum[10^6/n,{n,15000}]` yields 1.01931×10^7. We see that the first 50 sites get around 4.4 million hits, nearly half the 10.19 million hits of the first 15000 sites.

(b) We use `V[n_] := 10^6/n`, and compute the error $V(n+1) - V(n) - V'(n)$ for various values of n. The table of values computed follows:

n	10	20	30	40	50
$(V(n+1) - V(n)) - V'(n)$	909.091	119.048	35.8423	15.2489	7.84314

The error decreases in every entry. Furthermore, for $n > 50$, the error appears to be less than 10.

(c) Since $V(n) = 10^6 n^{-1}$, $V'(n) = -10^6 n^{-2}$. The marginal derivative estimate Eq. (3) tells us that

$$V(n) - V(n+1) \approx -V'(n) = 10^6 n^{-2}.$$

If $n \ge 100$, $-V'(n) \le 10^6(100)^{-2} = 10^6(10^{-4}) = 100$. Therefore $V(n) - V(n+1) < 100$ for $n \ge 100$.

In Exercises 53 and 54, the average cost per unit at production level x is defined as $C_{\text{avg}}(x) = C(x)/x$, where $C(x)$ is the cost function. Average cost is a measure of the efficiency of the production process.

53. Show that $C_{\text{avg}}(x)$ is equal to the slope of the line through the origin and the point $(x, C(x))$ on the graph of $C(x)$. Using this interpretation, determine whether average cost or marginal cost is greater at points A, B, C, D in Figure 15.

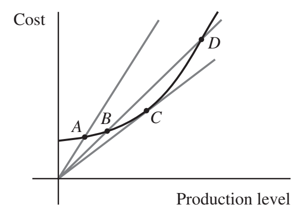


FIGURE 15 Graph of $C(x)$.

SOLUTION By definition, the slope of the line through the origin and $(x, C(x))$, that is, between $(0, 0)$ and $(x, C(x))$ is

$$\frac{C(x) - 0}{x - 0} = \frac{C(x)}{x} = C_{\text{av}}.$$

At point A, average cost is greater than marginal cost, as the line from the origin to A is steeper than the curve at this point (we see this because the line, tracing from the origin, crosses the curve from below). At point B, the average cost is still greater than the marginal cost. At the point C, the average cost and the marginal cost are nearly the same, since the tangent line and the line from the origin are nearly the same. The line from the origin to D crosses the cost curve from above, and so is less steep than the tangent line to the curve at D; the average cost at this point is less than the marginal cost.

54. The cost in dollars of producing alarm clocks is $C(x) = 50x^3 - 750x^2 + 3740x + 3750$ where x is in units of 1000.

(a) Calculate the average cost at $x = 4, 6, 8$, and 10.

(b) Use the graphical interpretation of average cost to find the production level x_0 at which average cost is lowest. What is the relation between average cost and marginal cost at x_0 (see Figure 16)?

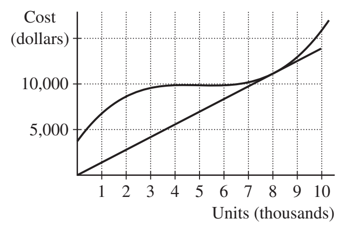

FIGURE 16 Cost function $C(x) = 50x^3 - 750x^2 + 3740x + 3750$.

SOLUTION Let $C(x) = 50x^3 - 750x^2 + 3740x + 3750$.

(a) The slope of the line through the origin and the point $(x, C(x))$ is

$$\frac{C(x) - 0}{x - 0} = \frac{C(x)}{x} = C_{\text{av}}(x),$$

the average cost.

x	4	6	8	10
$C(x)$	9910	9990	11270	16150
$C_{\text{av}}(x)$	2477.5	1665	1408.75	1615

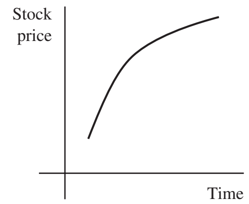
(b) The average cost is lowest at the point P_0 where the angle between the x-axis and the line through the origin and P_0 is lowest. This is at the point $(8, 11270)$, where the line through the origin and the graph of $C(x)$ meet in the figure above. You can see that the line is also tangent to the graph of $C(x)$, so the average cost and the marginal cost are equal at this point.

3.5 Higher Derivatives

Preliminary Questions

1. On September 4, 2003, the *Wall Street Journal* printed the headline "Stocks Go Higher, Though the Pace of Their Gains Slows." Rephrase this headline as a statement about the first and second time derivatives of stock prices and sketch a possible graph.

SOLUTION Because stocks are going higher, stock prices are increasing and the first derivative of stock prices must therefore be positive. On the other hand, because the pace of gains is slowing, the second derivative of stock prices must be negative.



2. True or false? The third derivative of position with respect to time is zero for an object falling to earth under the influence of gravity. Explain.

SOLUTION This statement is true. The acceleration of an object falling to earth under the influence of gravity is constant; hence, the second derivative of position with respect to time is constant. Because the third derivative is just the derivative of the second derivative and the derivative of a constant is zero, it follows that the third derivative is zero.

3. Which type of polynomial satisfies $f'''(x) = 0$ for all x?

SOLUTION The third derivative of all quadratic polynomials (polynomials of the form $ax^2 + bx + c$ for some constants a, b and c) is equal to 0 for all x.

4. What is the millionth derivative of $f(x) = e^x$?

SOLUTION Every derivative of $f(x) = e^x$ is e^x.

Exercises

In Exercises 1–16, calculate y'' and y'''.

1. $y = 14x^2$

SOLUTION Let $y = 14x^2$. Then $y' = 28x$, $y'' = 28$, and $y''' = 0$.

2. $y = 7 - 2x$

SOLUTION Let $y = 7 - 2x$. Then $y' = -2$, $y'' = 0$, and $y''' = 0$.

3. $y = x^4 - 25x^2 + 2x$

SOLUTION Let $y = x^4 - 25x^2 + 2x$. Then $y' = 4x^3 - 50x + 2$, $y'' = 12x^2 - 50$, and $y''' = 24x$.

4. $y = 4t^3 - 9t^2 + 7$

SOLUTION Let $y = 4t^3 - 9t^2 + 7$. Then $y' = 12t^2 - 18t$, $y'' = 24t - 18$, and $y''' = 24$.

5. $y = \dfrac{4}{3}\pi r^3$

SOLUTION Let $y = \frac{4}{3}\pi r^3$. Then $y' = 4\pi r^2$, $y'' = 8\pi r$, and $y''' = 8\pi$.

6. $y = \sqrt{x}$

SOLUTION Let $y = \sqrt{x} = x^{1/2}$. Then $y' = \frac{1}{2}x^{-1/2}$, $y'' = -\frac{1}{4}x^{-3/2}$, and $y''' = \frac{3}{8}x^{-5/2}$.

7. $y = 20t^{4/5} - 6t^{2/3}$

SOLUTION Let $y = 20t^{4/5} - 6t^{2/3}$. Then $y' = 16t^{-1/5} - 4t^{-1/3}$, $y'' = -\frac{16}{5}t^{-6/5} + \frac{4}{3}t^{-4/3}$, and $y''' = \frac{96}{25}t^{-11/15} - \frac{16}{9}t^{-7/3}$.

8. $y = x^{-9/5}$

SOLUTION Let $y = x^{-9/5}$. Then $y' = -\frac{9}{5}x^{-14/5}$, $y'' = \frac{126}{25}x^{-19/5}$, and $y''' = -\frac{2394}{125}x^{-24/5}$.

9. $y = z - \dfrac{4}{z}$

SOLUTION Let $y = z - 4z^{-1}$. Then $y' = 1 + 4z^{-2}$, $y'' = -8z^{-3}$, and $y''' = 24z^{-4}$.

10. $y = 5t^{-3} + 7t^{-8/3}$

SOLUTION Let $y = 5t^{-3} + 7t^{-8/3}$. Then $y' = -15t^{-4} - \frac{56}{3}t^{-11/3}$, $y'' = 60t^{-5} + \frac{616}{9}t^{-14/3}$, and $y''' = -300t^{-6} - \frac{8624}{27}t^{-17/3}$.

11. $y = \theta^2(2\theta + 7)$

SOLUTION Let $y = \theta^2(2\theta + 7) = 2\theta^3 + 7\theta^2$. Then $y' = 6\theta^2 + 14\theta$, $y'' = 12\theta + 14$, and $y''' = 12$.

12. $y = (x^2 + x)(x^3 + 1)$

SOLUTION Since we don't want to apply the product rule to an ever growing list of products, we multiply through first. Let $y = (x^2 + x)(x^3 + 1) = x^5 + x^4 + x^2 + x$. Then $y' = 5x^4 + 4x^3 + 2x + 1$, $y'' = 20x^3 + 12x^2 + 2$, and $y''' = 60x^2 + 24x$.

13. $y = \dfrac{x - 4}{x}$

SOLUTION Let $y = \frac{x-4}{x} = 1 - 4x^{-1}$. Then $y' = 4x^{-2}$, $y'' = -8x^{-3}$, and $y''' = 24x^{-4}$.

14. $y = \dfrac{1}{1 - x}$

SOLUTION Let $y = \frac{1}{1-x}$. Applying the quotient rule:

$$y' = \frac{(1-x)(0) - 1(-1)}{(1-x)^2} = \frac{1}{(1-x)^2} = \frac{1}{1 - 2x + x^2}$$

$$y'' = \frac{(1 - 2x + x^2)(0) - (1)(-2 + 2x)}{(1 - 2x + x^2)^2} = \frac{2 - 2x}{(1-x)^4} = \frac{2}{(1-x)^3} = \frac{2}{1 - 3x + 3x^2 - x^3}$$

$$y''' = \frac{(1 - 3x + 3x^2 - x^3)(0) - 2(-3 + 6x - 3x^2)}{(1 - 3x + 3x^2 - x^3)^2} = \frac{6(x^2 - 2x + 1)}{(1-x)^6} = \frac{6}{(1-x)^4}.$$

15. $y = x^5 e^x$

SOLUTION Let $y = x^5 e^x$. Then

$$\begin{aligned} y' &= x^5 e^x + 5x^4 e^x = (x^5 + 5x^4)e^x \\ y'' &= (x^5 + 5x^4)e^x + (5x^4 + 20x^3)e^x = (x^5 + 10x^4 + 20x^3)e^x \\ y''' &= (x^5 + 10x^4 + 20x^3)e^x + (5x^4 + 40x^3 + 60x^2)e^x = (x^5 + 15x^4 + 60x^3 + 60x^2)e^x. \end{aligned}$$

16. $y = \dfrac{e^x}{x}$

SOLUTION Let $y = \frac{e^x}{x} = x^{-1}e^x$. Then

$$\begin{aligned} y' &= x^{-1}e^x + e^x(-x^{-2}) = (x^{-1} - x^{-2})e^x \\ y'' &= (x^{-1} - x^{-2})e^x + e^x(-x^{-2} + 2x^{-3}) = (x^{-1} - 2x^{-2} + 2x^{-3})e^x \\ y''' &= (x^{-1} - 2x^{-2} + 2x^{-3})e^x + e^x(-x^{-2} + 4x^{-3} - 6x^{-4}) = (x^{-1} - 3x^{-2} + 6x^{-3} - 6x^{-4})e^x. \end{aligned}$$

In Exercises 17–26, calculate the derivative indicated.

17. $f^{(4)}(1)$, $\quad f(x) = x^4$

SOLUTION Let $f(x) = x^4$. Then $f'(x) = 4x^3$, $f''(x) = 12x^2$, $f'''(x) = 24x$, and $f^{(4)}(x) = 24$. Thus $f^{(4)}(1) = 24$.

18. $g'''(-1)$, $\quad g(t) = -4t^{-5}$

SOLUTION Let $g(t) = -4t^{-5}$. Then $g'(t) = 20t^{-6}$, $g''(t) = -120t^{-7}$, and $g'''(t) = 840t^{-8}$. Hence $g'''(-1) = 840$.

19. $\left.\dfrac{d^2y}{dt^2}\right|_{t=1}$, $\quad y = 4t^{-3} + 3t^2$

SOLUTION Let $y = 4t^{-3} + 3t^2$. Then $\frac{dy}{dt} = -12t^{-4} + 6t$ and $\frac{d^2y}{dt^2} = 48t^{-5} + 6$. Hence

$$\left.\frac{d^2y}{dt^2}\right|_{t=1} = 48(1)^{-5} + 6 = 54.$$

20. $\left.\dfrac{d^4 f}{dt^4}\right|_{t=1}$, $\quad f(t) = 6t^9 - 2t^5$

SOLUTION Let $f(t) = 6t^9 - 2t^5$. Then $\frac{df}{dt} = 54t^8 - 10t^4$, $\frac{d^2 f}{dt^2} = 432t^7 - 40t^3$, $\frac{d^3 f}{dt^3} = 3024t^6 - 120t^2$, and $\frac{d^4 f}{dt^4} = 18144t^5 - 240t$. Therefore,

$$\left.\frac{d^4 f}{dt^4}\right|_{t=1} = 17904.$$

21. $\left.\dfrac{d^4 x}{dt^4}\right|_{t=16}$, $\quad x = t^{-3/4}$

SOLUTION Let $x(t) = t^{-3/4}$. Then $\frac{dx}{dt} = -\frac{3}{4}t^{-7/4}$, $\frac{d^2x}{dt^2} = \frac{21}{16}t^{-11/4}$, $\frac{d^3x}{dt^3} = -\frac{231}{64}t^{-15/4}$, and $\frac{d^4x}{dt^4} = \frac{3465}{256}t^{-19/4}$. Thus

$$\left.\frac{d^4x}{dt^4}\right|_{t=16} = \frac{3465}{256}16^{-19/4} = \frac{3465}{134217728}.$$

22. $f'''(4)$, $\quad f(t) = 2t^2 - t$

SOLUTION Since $f(t) = 2t^2 - t$, $f'(t) = 4t - 1$, $f''(t) = 4$, and $f'''(t) = 0$ for all t. In particular, $f'''(4) = 0$.

23. $f'''(-3)$, $\quad f(x) = 4e^x - x^3$

SOLUTION Let $f(x) = 4e^x - x^3$. Then $f'(x) = 4e^x - 3x^2$, $f''(x) = 4e^x - 6x$, $f'''(x) = 4e^x - 6$, and $f'''(-3) = 4e^{-3} - 6$.

24. $f''(1)$, $\quad f(t) = \dfrac{t}{t+1}$

SOLUTION Let $f(t) = \dfrac{t}{t+1}$. Then

$$f'(t) = \frac{(t+1)(1) - (t)(1)}{(t+1)^2} = \frac{1}{(t+1)^2} = \frac{1}{t^2 + 2t + 1}$$

and

$$f''(t) = \frac{(t^2 + 2t + 1)(0) - 1(2t+2)}{(t^2 + 2t + 1)^2} = -\frac{2(t+1)}{(t+1)^4} = -\frac{2}{(t+1)^3}.$$

Thus, $f''(1) = -\dfrac{1}{4}$.

25. $h''(1)$, $\quad h(w) = \sqrt{w}e^w$

SOLUTION Let $h(w) = \sqrt{w}e^w = w^{1/2}e^w$. Then

$$h'(w) = w^{1/2}e^w + e^w\left(\frac{1}{2}w^{-1/2}\right) = \left(w^{1/2} + \frac{1}{2}w^{-1/2}\right)e^w$$

and

$$h''(w) = \left(w^{1/2} + \frac{1}{2}w^{-1/2}\right)e^w + e^w\left(\frac{1}{2}w^{-1/2} - \frac{1}{4}w^{-3/2}\right) = \left(w^{1/2} + w^{-1/2} - \frac{1}{4}w^{-3/2}\right)e^w.$$

Thus, $h''(1) = \dfrac{7}{4}e$.

26. $g''(0)$, $\quad g(s) = \dfrac{e^s}{s+1}$

SOLUTION Let $g(s) = \dfrac{e^s}{s+1}$. Then

$$g'(s) = \frac{(s+1)e^s - e^s(1)}{(s+1)^2} = \frac{se^s}{s^2 + 2s + 1}$$

and

$$g''(s) = \frac{(s^2 + 2s + 1)(se^s + e^s) - se^s(2s+2)}{(s^2 + 2s + 1)^2} = \frac{(s^2+1)e^s}{(s+1)^3}.$$

Thus, $g''(0) = 1$.

27. Calculate $y^{(k)}(0)$ for $0 \le k \le 5$, where $y = x^4 + ax^3 + bx^2 + cx + d$ (with a, b, c, d the constants).

SOLUTION Applying the power, constant multiple, and sum rules at each stage, we get (note $y^{(0)}$ is y by convention):

k	$y^{(k)}$
0	$x^4 + ax^3 + bx^2 + cx + d$
1	$4x^3 + 3ax^2 + 2bx + c$
2	$12x^2 + 6ax + 2b$
3	$24x + 6a$
4	24
5	0

from which we get $y^{(0)}(0) = d$, $y^{(1)}(0) = c$, $y^{(2)}(0) = 2b$, $y^{(3)}(0) = 6a$, $y^{(4)}(0) = 24$, and $y^{(5)}(0) = 0$.

28. Which of the following satisfy $f^{(k)}(x) = 0$ for all $k \ge 6$?

(a) $f(x) = 7x^4 + 4 + x^{-1}$ **(b)** $f(x) = x^3 - 2$

(c) $f(x) = \sqrt{x}$ **(d)** $f(x) = 1 - x^6$

(e) $f(x) = x^{9/5}$ **(f)** $f(x) = 2x^2 + 3x^5$

SOLUTION Equations (b) and (f) go to zero after the sixth derivative. We don't have to take the derivatives to see this.

- Look at (a). $f'(x) = 28x^3 - x^{-2}$. Every time we take higher derivatives of $f(x)$, the negative exponent will keep decreasing, and will never become zero.
- In the case of (b), we see that every derivative decreases the degree (the highest exponent) of the polynomial by one, so that $f^{(4)}(x) = 0$.
- For (c), $f'(x) = \frac{d}{dx}x^{1/2} = \frac{1}{2}x^{-1/2}$. Every further derivative of $f(x)$ is going to make the exponent more negative, so that it will never go to zero.
- In the case of (d), like (b), the highest exponent will decrease with every derivative, but 6 derivatives will leave the exponent zero, $f^{(6)}(x)$ will be $-6!$. This is easy to verify.
- (e) is like (c). Since the exponent is not a whole number, successive derivatives will make the exponent "pass over" zero, and go to negative infinity.
- In the case of (f), $f^{(5)}(x)$ is constant, so that $f^{(6)}(x) = 0$ for all x.

29. Use the result in Example 3 to find $\dfrac{d^6}{dx^6}\,x^{-1}$.

SOLUTION The equation in Example 3 indicates that

$$\frac{d^6}{dx^6}\,x^{-1} = (-1)^6 6! x^{-6-1}.$$

$(-1)^6 = 1$ and $6! = 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 720$, so

$$\frac{d^6}{dx^6}\,x^{-1} = 720x^{-7}.$$

30. Calculate the first five derivatives of $f(x) = \sqrt{x}$.

(a) Show that $f^{(n)}(x)$ is a multiple of $x^{-n+1/2}$.

(b) Show that $f^{(n)}(x)$ alternates in sign as $(-1)^{n-1}$ for $n \ge 1$.

(c) Find a formula for $f^{(n)}(x)$ for $n \ge 2$. *Hint:* Verify that the coefficient is $\pm 1 \cdot 3 \cdot 5 \cdots \dfrac{2n-3}{2^n}$.

SOLUTION We use the Power Rule:

$$\frac{df}{dx} = \frac{1}{2}x^{-1/2} \qquad \frac{d^4 f}{dx^4} = -\frac{5}{2}\left(\frac{3}{2}\right)\left(\frac{1}{2}\right)\left(\frac{1}{2}\right)x^{-7/2}$$

$$\frac{d^2 f}{dx^2} = -\frac{1}{2}\left(\frac{1}{2}\right)x^{-3/2} \qquad \frac{d^5 f}{dx^5} = \frac{7}{2}\left(\frac{5}{2}\right)\left(\frac{3}{2}\right)\left(\frac{1}{2}\right)\left(\frac{1}{2}\right)x^{-9/2}$$

$$\frac{d^3 f}{dx^3} = \frac{3}{2}\left(\frac{1}{2}\right)\left(\frac{1}{2}\right)x^{-5/2} \qquad \frac{d^6 f}{dx^6} = -\frac{9}{2}\left(\frac{7}{2}\right)\left(\frac{5}{2}\right)\left(\frac{3}{2}\right)\left(\frac{1}{2}\right)\left(\frac{1}{2}\right)x^{-11/2}$$

The pattern we see here is that the nth derivative is a multiple of $\pm x^{-n+\frac{1}{2}}$. Which multiple? The coefficient is the product of the odd numbers up to $2n-3$ divided by 2^n. Therefore we can write a general formula for the nth derivative as follows:

$$f^{(n)}(x) = (-1)^{n-1}\,\frac{1\cdot 3\cdot 5\cdots(2n-3)}{2^n}\,x^{-n+\frac{1}{2}}$$

In Exercises 31–36, find a general formula for $f^{(n)}(x)$.

31. $f(x) = x^{-2}$

SOLUTION $f'(x) = -2x^{-3}$, $f''(x) = 6x^{-4}$, $f'''(x) = -24x^{-5}$, $f^{(4)}(x) = 5\cdot 24x^{-6}$, ... From this we can conclude that the nth derivative can be written as $f^{(n)}(x) = (-1)^n(n+1)!x^{-(n+2)}$.

32. $f(x) = (x+2)^{-1}$

SOLUTION Let $f(x) = (x+2)^{-1} = \frac{1}{x+2}$. Then $f'(x) = -1(x+2)^{-2}$, $f''(x) = 2(x+2)^{-3}$, $f'''(x) = -6(x+2)^{-4}$, $f^{(4)}(x) = 24(x+2)^{-5}$, ... From this we conclude that the nth derivative can be written as

$$f^{(n)}(x) = (-1)^n n!(x+2)^{-(n+1)}.$$

33. $f(x) = x^{-1/2}$

SOLUTION $f'(x) = \frac{-1}{2}x^{-3/2}$. We will avoid simplifying numerators and denominators to find the pattern:

$$\begin{aligned}
f''(x) &= \frac{-3}{2}\frac{-1}{2}x^{-5/2} = (-1)^2\frac{3\times 1}{2^2}x^{-5/2}\\
f'''(x) &= -\frac{5}{2}\frac{3\times 1}{2^2}x^{-7/2} = (-1)^3\frac{5\times 3\times 1}{2^3}x^{-7/2}\\
&\vdots\\
f^{(n)}(x) &= (-1)^n\frac{(2n-1)\times(2n-3)\times\ldots\times 1}{2^n}\,x^{-(2n+1)/2}.
\end{aligned}$$

34. $f(x) = x^{-3/2}$

SOLUTION $f'(x) = \frac{-3}{2}x^{-5/2}$. We will avoid simplifying numerators and denominators to find the pattern:

$$\begin{aligned}
f''(x) &= \frac{-5}{2}\frac{-3}{2}x^{-7/2} = (-1)^2\frac{5\times 3}{2^2}x^{-7/2}\\
f'''(x) &= -\frac{7}{2}\frac{5\times 3}{2^2}x^{-9/2} = (-1)^3\frac{7\times 5\times 3}{2^3}x^{-9/2}\\
&\vdots\\
f^{(n)}(x) &= (-1)^n\frac{(2n+1)\times(2n-1)\times\ldots\times 3}{2^n}\,x^{-(2n+3)/2}.
\end{aligned}$$

35. $f(x) = xe^{-x}$

SOLUTION Let $f(x) = xe^{-x}$. Then

$$\begin{aligned}
f'(x) &= x(-e^{-x}) + e^{-x} = (1-x)e^{-x} = -(x-1)e^{-x}\\
f''(x) &= (1-x)(-e^{-x}) - e^{-x} = (x-2)e^{-x}\\
f'''(x) &= (x-2)(-e^{-x}) + e^{-x} = (3-x)e^{-x} = -(x-3)e^{-x}
\end{aligned}$$

From this we conclude that the nth derivative can be written as $f^{(n)}(x) = (-1)^n(x-n)e^{-x}$.

36. $f(x) = x^2e^x$

SOLUTION Let $f(x) = x^2e^x$. Then

$$\begin{aligned}
f'(x) &= x^2e^x + 2xe^x = (x^2+2x)e^x\\
f''(x) &= (x^2+2x)e^x + e^x(2x+2) = (x^2+4x+2)e^x\\
f'''(x) &= (x^2+4x+2)e^x + e^x(2x+4) = (x^2+6x+6)e^x\\
f^{(4)}(x) &= (x^2+6x+6)e^x + e^x(2x+6) = (x^2+8x+12)e^x
\end{aligned}$$

From this we conclude that the nth derivative can be written as $f^{(n)}(x) = (x^2+2nx+n(n-1))e^x$.

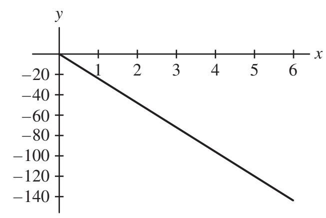
37. **(a)** Find the acceleration at time $t = 5$ min of a helicopter whose height is $s(t) = 300t - 4t^3$ m.

(b) Plot the acceleration $h''(t)$ for $0 \le t \le 6$. How does this graph show that the helicopter is slowing down during this time interval?

SOLUTION

(a) Let $s(t) = 300t - 4t^3$, with t in minutes and s in meters. The velocity is $v(t) = s'(t) = 300 - 12t^2$ and acceleration is $a(t) = s''(t) = -24t$. Thus $a(5) = -120$ m/min^2.

(b) The acceleration of the helicopter for $0 \le t \le 6$ is shown in the figure below. As the acceleration of the helicopter is negative, the velocity of the helicopter must be decreasing. Because the velocity is positive for $0 \le t \le 6$, the helicopter is slowing down.

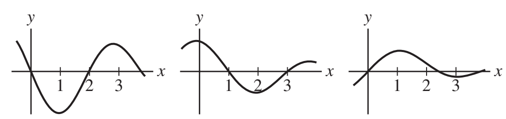


38. Find an equation of the tangent to the graph of $y = f'(x)$ at $x = 3$, where $f(x) = x^4$.

SOLUTION Let $f(x) = x^4$ and $g(x) = f'(x) = 4x^3$. Then $g'(x) = 12x^2$. The tangent line to g at $x = 3$ is given by

$$y = g'(3)(x - 3) + g(3) = 108(x - 3) + 108 = 108x - 216.$$

39. Figure 5 shows f, f', and f''. Determine which is which.



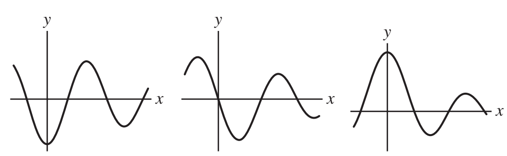
(A) (B) (C)

FIGURE 5

SOLUTION (a) f'' (b) f' (c) f.

The tangent line to (c) is horizontal at $x = 1$ and $x = 3$, where (b) has roots. The tangent line to (b) is horizontal at $x = 2$ and $x = 0$, where (a) has roots.

40. The second derivative f'' is shown in Figure 6. Which of (A) or (B) is the graph of f and which is f'?



$f''(x)$ (A) (B)

FIGURE 6

SOLUTION $f'(x) = A$ and $f(x) = B$.

41. Figure 7 shows the graph of the position s of an object as a function of time t. Determine the intervals on which the acceleration is positive.

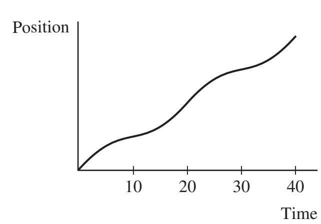


FIGURE 7

SOLUTION Roughly from time 10 to time 20 and from time 30 to time 40. The acceleration is positive over the same intervals over which the graph is bending upward.

42. Find a polynomial $f(x)$ that satisfies the equation $xf''(x) + f(x) = x^2$.

SOLUTION Since $xf''(x) + f(x) = x^2$, and x^2 is a polynomial, it seems reasonable to assume that $f(x)$ is a polynomial of some degree, call it n. The degree of $f''(x)$ is $n-2$, so the degree of $xf''(x)$ is $n-1$, and the degree of $xf''(x) + f(x)$ is n. Hence, $n = 2$, since the degree of x^2 is 2. Therefore, let $f(x) = ax^2 + bx + c$. Then $f'(x) = 2ax + b$ and $f''(x) = 2a$. Substituting into the equation $xf''(x) + f(x) = x^2$ yields $ax^2 + (2a+b)x + c = x^2$, an identity in x. Equating coefficients, we have $a = 1$, $2a + b = 0$, $c = 0$. Therefore, $b = -2$ and $f(x) = x^2 - 2x$.

43. Find a value of n such that $y = x^n e^x$ satisfies the equation $xy' = (x-3)y$.

SOLUTION Let $y = x^n e^x$. Then

$$y' = x^n e^x + nx^{n-1}e^x = x^{n-1}e^x(x+n),$$

and

$$xy' = x^n e^x(x+n) = (x+n)y.$$

Thus, $y = x^n e^x$ satisfies the equation $xy' = (x-3)y$ for $n = -3$.

44. Which of the following descriptions could *not* apply to Figure 8? Explain.

(a) Graph of acceleration when velocity is constant

(b) Graph of velocity when acceleration is constant

(c) Graph of position when acceleration is zero

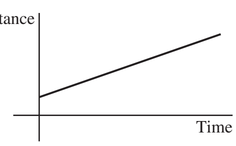

FIGURE 8

SOLUTION

(a) Does NOT apply to the figure because if $v(t) = C$ where C is a constant, then $a(t) = v'(t) = 0$, which is the horizontal line going through the origin.

(b) Can apply because the graph has a constant slope.

(c) Can apply because if we took this as a position graph, the velocity graph would be a horizontal line and thus, acceleration would be zero.

45. According to one model that takes into account air resistance, the acceleration $a(t)$ (in m/s^2) of a skydiver of mass m in free fall satisfies

$$a(t) = -9.8 + \frac{k}{m}v(t)^2$$

where $v(t)$ is velocity (negative since the object is falling) and k is a constant. Suppose that $m = 75$ kg and $k = 14$ kg/m.

(a) What is the object's velocity when $a(t) = -4.9$?

(b) What is the object's velocity when $a(t) = 0$? This velocity is the object's terminal velocity.

SOLUTION Solving $a(t) = -9.8 + \frac{k}{m}v(t)^2$ for the velocity and taking into account that the velocity is negative since the object is falling, we find

$$v(t) = -\sqrt{\frac{m}{k}(a(t) + 9.8)} = -\sqrt{\frac{75}{14}(a(t) + 9.8)}.$$

(a) Substituting $a(t) = -4.9$ into the above formula for the velocity, we find

$$v(t) = -\sqrt{\frac{75}{14}(4.9)} = -\sqrt{26.25} = -5.12 \text{ m/s}.$$

(b) When $a(t) = 0$,

$$v(t) = -\sqrt{\frac{75}{14}(9.8)} = -\sqrt{52.5} = -7.25 \text{ m/s}.$$

46. According to one model that attempts to account for air resistance, the distance $s(t)$ (in meters) traveled by a falling raindrop satisfies

$$\frac{d^2s}{dt^2} = g - \frac{0.0005}{D}\left(\frac{ds}{dt}\right)^2$$

where D is the raindrop diameter and $g = 9.8$ m/s^2. Terminal velocity v_{term} is defined as the velocity at which the drop has zero acceleration (one can show that velocity approaches v_{term} as time proceeds).

(a) Show that $v_{\text{term}} = \sqrt{2000gD}$.

(b) Find v_{term} for drops of diameter 10^{-3} m and 10^{-4} m.

(c) In this model, do raindrops accelerate more rapidly at higher or lower velocities?

SOLUTION

(a) v_{term} is found by setting $\frac{d^2s}{dt^2} = 0$, and solving for $\frac{ds}{dt} = v$.

$$0 = g - \frac{0.0005}{D}\left(\frac{ds}{dt}\right)^2$$

$$g = \frac{0.0005}{D}\left(\frac{ds}{dt}\right)^2$$

$$\frac{ds}{dt} = \sqrt{g\frac{D}{0.0005}} = \sqrt{2000gD} = v^{1/2}.$$

(b) If $D = 0.003$ ft,

$$v_{\text{term}} = \sqrt{2000g(0.003)} = \sqrt{58.8} = 7.668 \text{ m/s}.$$

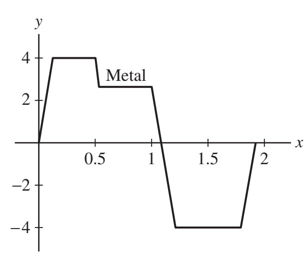
If $D = 0.0003$ ft,

$$v_{\text{term}} = \sqrt{2000g(0.0003)} = \sqrt{5.88} = 2.425 \text{ m/s}.$$

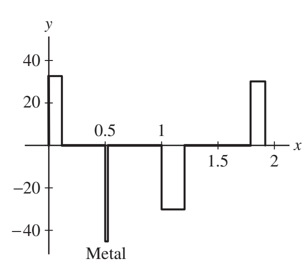
(c) The greater the velocity, the more gets subtracted from g in the formula for acceleration. Therefore, assuming velocity is less than v_{term}, greater velocities correspond to *lower* acceleration.

47. A servomotor controls the vertical movement of a drill bit that will drill a pattern of holes in sheet metal. The maximum vertical speed of the drill bit is 4 in./s, and while drilling the hole, it must move no more than 2.6 in./s to avoid warping the metal. During a cycle, the bit begins and ends at rest, quickly approaches the sheet metal, and quickly returns to its initial position after the hole is drilled. Sketch possible graphs of the drill bit's vertical velocity and acceleration. Label the point where the bit enters the sheet metal.

SOLUTION There will be multiple cycles, each of which will be more or less identical. Let $v(t)$ be the *downward* vertical velocity of the drill bit, and let $a(t)$ be the vertical acceleration. From the narrative, we see that $v(t)$ can be no greater than 4 and no greater than 2.6 while drilling is taking place. During each cycle, $v(t) = 0$ initially, $v(t)$ goes to 4 quickly. When the bit hits the sheet metal, $v(t)$ goes down to 2.6 quickly, at which it stays until the sheet metal is drilled through. As the drill pulls out, it reaches maximum non-drilling upward speed ($v(t) = -4$) quickly, and maintains this speed until it returns to rest. A possible plot follows:



A graph of the acceleration is extracted from this graph:



In Exercises 48 and 49, refer to the following. In a 1997 study, Boardman and Lave related the traffic speed S on a two-lane road to traffic density Q (number of cars per mile of road) by the formula

$$S = 2882Q^{-1} - 0.052Q + 31.73$$

for $60 \le Q \le 400$ *(Figure 9).*

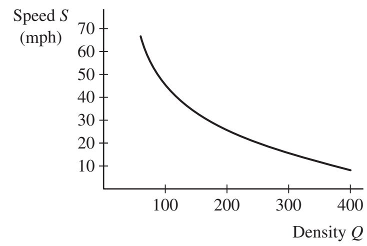


FIGURE 9 Speed as a function of traffic density.

48. Calculate dS/dQ and d^2S/dQ^2.

SOLUTION

$$dS/dQ = -2882Q^{-2} - 0.052$$
$$d^2S/dQ^2 = 5764Q^{-3}.$$

49. **(a)** Explain intuitively why we should expect that $dS/dQ < 0$.

(b) Show that $d^2S/dQ^2 > 0$. Then use the fact that $dS/dQ < 0$ and $d^2S/dQ^2 > 0$ to justify the following statement: *A one-unit increase in traffic density slows down traffic more when Q is small than when Q is large.*

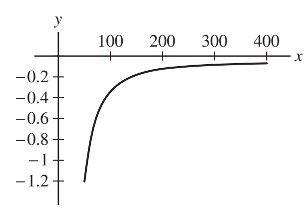
(c) GU Plot dS/dQ. Which property of this graph shows that $d^2S/dQ^2 > 0$?

SOLUTION

(a) Traffic speed must be reduced when the road gets more crowded so we expect dS/dQ to be negative. This is indeed the case since $dS/dQ = -0.052 - 2882/Q^2 < 0$.

(b) The decrease in speed due to a one-unit increase in density is approximately dS/dQ (a negative number). Since $d^2S/dQ^2 = 5764Q^{-3} > 0$ is positive, this tells us that dS/dQ gets larger as Q increases—and a negative number which gets larger is getting closer to zero. So the decrease in speed is smaller when Q is larger, that is, a one-unit increase in traffic density has a smaller effect when Q is large.

(c) dS/dQ is plotted below. The fact that this graph is increasing shows that $d^2S/dQ^2 > 0$.



50. CAS Use a computer algebra system to compute $f^{(k)}(x)$ for $k = 1, 2, 3$ for the following functions.

(a) $f(x) = (1 + x^3)^{5/3}$

(b) $f(x) = \dfrac{1 - x^4}{1 - 5x - 6x^2}$

SOLUTION

(a) Let $f(x) = (1 + x^3)^{5/3}$. Using a computer algebra system,

$$f'(x) = 5x^2(1 + x^3)^{2/3};$$
$$f''(x) = 10x(1 + x^3)^{2/3} + 10x^4(1 + x^3)^{-1/3}; \text{ and}$$
$$f'''(x) = 10(1 + x^3)^{2/3} + 60x^3(1 + x^3)^{-1/3} - 10x^6(1 + x^3)^{-4/3}.$$

(b) Let $f(x) = \dfrac{1 - x^4}{1 - 5x - 6x^2}$. Using a computer algebra system,

$$f'(x) = \frac{12x^3 - 9x^2 + 2x + 5}{(6x - 1)^2};$$

$$f''(x) = \frac{2(36x^3 - 18x^2 + 3x - 31)}{(6x-1)^3}; \text{ and}$$

$$f'''(x) = \frac{1110}{(6x-1)^4}.$$

51. CAS Let $f(x) = \dfrac{x+2}{x-1}$. Use a computer algebra system to compute the $f^{(k)}(x)$ for $1 \le k \le 4$. Can you find a general formula for $f^{(k)}(x)$?

SOLUTION Let $f(x) = \dfrac{x+2}{x-1}$. Using a computer algebra system,

$$f'(x) = -\frac{3}{(x-1)^2} = (-1)^1 \frac{3 \cdot 1}{(x-1)^{1+1}};$$

$$f''(x) = \frac{6}{(x-1)^3} = (-1)^2 \frac{3 \cdot 2 \cdot 1}{(x-1)^{2+1}};$$

$$f'''(x) = -\frac{18}{(x-1)^4} = (-1)^3 \frac{3 \cdot 3!}{(x-1)^{3+1}}; \text{ and}$$

$$f^{(4)}(x) = \frac{72}{(x-1)^5} = (-1)^4 \frac{3 \cdot 4!}{(x-1)^{4+1}}.$$

From the pattern observed above, we conjecture

$$f^{(k)}(x) = (-1)^k \frac{3 \cdot k!}{(x-1)^{k+1}}.$$

Further Insights and Challenges

52. Find the 100th derivative of

$$p(x) = (x + x^5 + x^7)^{10}(1 + x^2)^{11}(x^3 + x^5 + x^7)$$

SOLUTION This is a polynomial of degree $70 + 22 + 7 = 99$, so its 100th derivative is zero.

53. What is $p^{(99)}(x)$ for $p(x)$ as in Exercise 52?

SOLUTION First note that for any integer $n \le 98$,

$$\frac{d^{99}}{dx^{99}} x^n = 0.$$

Now, if we expand $p(x)$, we find

$$p(x) = x^{99} + \text{ terms of degree at most 98;}$$

therefore,

$$\frac{d^{99}}{dx^{99}} p(x) = \frac{d^{99}}{dx^{99}}(x^{99} + \text{ terms of degree at most 98}) = \frac{d^{99}}{dx^{99}} x^{99}$$

Using logic similar to that used to compute the derivative in Example (3), we compute:

$$\frac{d^{99}}{dx^{99}}(x^{99}) = 99 \times 98 \times \ldots 1,$$

so that $\frac{d^{99}}{dx^{99}} p(x) = 99!$.

54. Use the Product Rule twice to find a formula for $(fg)''$ in terms of f and g and their first and second derivatives.

SOLUTION Let $h = fg$. Then $h' = fg' + gf' = f'g + fg'$ and

$$h'' = f'g' + gf'' + fg'' + g'f' = f''g + 2f'g' + fg''.$$

55. Use the Product Rule to find a formula for $(fg)'''$ and compare your result with the expansion of $(a+b)^3$. Then try to guess the general formula for $(fg)^{(n)}$.

SOLUTION Continuing from Exercise 54, we have

$$h''' = f''g' + gf''' + 2(f'g'' + g'f'') + fg''' + g''f' = f'''g + 3f''g' + 3f'g'' + fg'''$$

The binomial theorem gives

$$(a+b)^3 = a^3 + 3a^2b + 3ab^2 + b^3 = a^3b^0 + 3a^2b^1 + 3a^1b^2 + a^0b^3$$

and more generally

$$(a+b)^n = \sum_{k=0}^{n} \binom{n}{k} a^{n-k} b^k,$$

where the binomial coefficients are given by

$$\binom{n}{k} = \frac{k(k-1)\cdots(k-n+1)}{n!}.$$

Accordingly, the general formula for $(fg)^{(n)}$ is given by

$$(fg)^{(n)} = \sum_{k=0}^{n} \binom{n}{k} f^{(n-k)} g^{(k)},$$

where $p^{(k)}$ is the kth derivative of p (or p itself when $k = 0$).

56. Compute

$$\Delta f(x) = \lim_{h \to 0} \frac{f(x+h) + f(x-h) - 2f(x)}{h^2}$$

for the following functions:

(a) $f(x) = x$ **(b)** $f(x) = x^2$ **(c)** $f(x) = x^3$

Based on these examples, what do you think the limit Δf represents?

SOLUTION For $f(x) = x$, we have

$$f(x+h) + f(x-h) - 2f(x) = (x+h) + (x-h) - 2x = 0.$$

Hence, $\Delta(x) = 0$. For $f(x) = x^2$,

$$\begin{aligned} f(x+h) + f(x-h) - 2f(x) &= (x+h)^2 + (x-h)^2 - 2x^2 \\ &= x^2 + 2xh + h^2 + x^2 - 2xh + h^2 - 2x^2 = 2h^2, \end{aligned}$$

so $\Delta(x^2) = 2$. Working in a similar fashion, we find $\Delta(x^3) = 6x$. One can prove that for twice differentiable functions, $\Delta f = f''$. It is an interesting fact of more advanced mathematics that there are functions f for which Δf exists at all points, but the function is not differentiable.

3.6 Trigonometric Functions

Preliminary Questions

1. Determine the sign ($+$ or $-$) that yields the correct formula for the following:

(a) $\dfrac{d}{dx}(\sin x + \cos x) = \pm \sin x \pm \cos x$

(b) $\dfrac{d}{dx} \sec x = \pm \sec x \tan x$

(c) $\dfrac{d}{dx} \cot x = \pm \csc^2 x$

SOLUTION The correct formulas are

(a) $\dfrac{d}{dx}(\sin x + \cos x) = -\sin x + \cos x$

(b) $\dfrac{d}{dx}\sec x = \sec x \tan x$

(c) $\dfrac{d}{dx}\cot x = -\csc^2 x$

2. Which of the following functions can be differentiated using the rules we have covered so far?

(a) $y = 3\cos x \cot x$ **(b)** $y = \cos(x^2)$ **(c)** $y = e^x \sin x$

SOLUTION

(a) $3\cos x \cot x$ is a product of functions whose derivatives are known. This function can therefore be differentiated using the Product Rule.

(b) $\cos(x^2)$ is a composition of the functions $\cos x$ and x^2. We have not yet discussed how to differentiate composite functions.

(c) $x^2 \cos x$ is a product of functions whose derivatives are known. This function can therefore be differentiated using the Product Rule.

3. Compute $\frac{d}{dx}(\sin^2 x + \cos^2 x)$ without using the derivative formulas for $\sin x$ and $\cos x$.

SOLUTION Recall that $\sin^2 x + \cos^2 x = 1$ for all x. Thus,

$$\frac{d}{dx}(\sin^2 x + \cos^2 x) = \frac{d}{dx}1 = 0.$$

4. How is the addition formula used in deriving the formula $(\sin x)' = \cos x$?

SOLUTION The difference quotient for the function $\sin x$ involves the expression $\sin(x+h)$. The addition formula for the sine function is used to expand this expression as $\sin(x+h) = \sin x \cos h + \sin h \cos x$.

Exercises

In Exercises 1–4, find an equation of the tangent line at the point indicated.

1. $y = \sin x, \quad x = \frac{\pi}{4}$

SOLUTION Let $f(x) = \sin x$. Then $f'(x) = \cos x$ and the equation of the tangent line is

$$y = f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}\left(x - \frac{\pi}{4}\right) + \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{2}x + \frac{\sqrt{2}}{2}\left(1 - \frac{\pi}{4}\right).$$

2. $y = \cos x, \quad x = \frac{\pi}{3}$

SOLUTION Let $f(x) = \cos x$. Then $f'(x) = -\sin x$ and the equation of the tangent line is

$$y = f'\left(\frac{\pi}{3}\right)\left(x - \frac{\pi}{3}\right) + f\left(\frac{\pi}{3}\right) = -\frac{\sqrt{3}}{2}\left(x - \frac{\pi}{3}\right) + \frac{1}{2} = -\frac{\sqrt{3}}{2}x + \frac{1}{2} + \frac{\pi\sqrt{3}}{6}.$$

3. $y = \tan x, \quad x = \frac{\pi}{4}$

SOLUTION Let $f(x) = \tan x$. Then $f'(x) = \sec^2 x$ and the equation of the tangent line is

$$y = f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = 2\left(x - \frac{\pi}{4}\right) + 1 = 2x + 1 - \frac{\pi}{2}.$$

4. $y = \sec x, \quad x = \frac{\pi}{6}$

SOLUTION Let $f(x) = \sec x$. Then $f'(x) = \sec x \tan x$ and the equation of the tangent line is

$$y = f'\left(\frac{\pi}{6}\right)\left(x - \frac{\pi}{6}\right) + f\left(\frac{\pi}{6}\right) = \frac{2}{3}\left(x - \frac{\pi}{6}\right) + \frac{2}{\sqrt{3}} = \frac{2}{3}x + \frac{2\sqrt{3}}{3} + \frac{\pi}{9}.$$

In Exercises 5–24, compute the derivative.

5. $f(x) = \sin x \cos x$

SOLUTION Let $f(x) = \sin x \cos x$. Then

$$f'(x) = \sin x(-\sin x) + \cos x(\cos x) = -\sin^2 x + \cos^2 x.$$

6. $f(x) = x^2 \cos x$

SOLUTION Let $f(x) = x^2 \cos x$. Then

$$f'(x) = x^2 (-\sin x) + (\cos x)(2x) = 2x \cos x - x^2 \sin x.$$

7. $f(x) = \sin^2 x$

SOLUTION Let $f(x) = \sin^2 x = \sin x \sin x$. Then

$$f'(x) = \sin x(\cos x) + \sin x(\cos x) = 2 \sin x \cos x.$$

8. $f(x) = 9 \sec x + 12 \cot x$

SOLUTION Let $f(x) = 9 \sec x + 12 \cot x$. Then $f'(x) = 9 \sec x \tan x - 12 \csc^2 x$.

9. $H(t) = \sin t \sec^2 t$

SOLUTION Let $H(t) = \sin t \sec^2 t$. Then

$$\begin{aligned} H'(t) &= \sin t \frac{d}{dt}(\sec t \cdot \sec t) + \sec^2 t(\cos t) \\ &= \sin t(\sec t \sec t \tan t + \sec t \sec t \tan t) + \sec t \\ &= 2 \sin t \sec^2 t \tan t + \sec t. \end{aligned}$$

10. $h(t) = 9 \csc t + t \cot t$

SOLUTION Let $h(t) = 9 \csc t + t \cot t$. Then

$$h'(t) = 9(-\csc t \cot t) + t(-\csc^2 t) + \cot t = \cot t - 9 \csc t \cot t - t \csc^2 t.$$

11. $f(\theta) = \tan\theta \sec\theta$

SOLUTION Let $f(\theta) = \tan\theta \sec\theta$. Then

$$f'(\theta) = \tan\theta \sec\theta \tan\theta + \sec\theta \sec^2\theta = \sec\theta \tan^2\theta + \sec^3\theta = \left(\tan^2\theta + \sec^2\theta\right)\sec\theta.$$

12. $k(\theta) = \theta^2 \sin^2\theta$

SOLUTION Let $k(\theta) = \theta^2 \sin^2\theta$. Then

$$k'(\theta) = \theta^2 (2 \sin\theta \cos\theta) + 2\theta \sin^2\theta = 2\theta^2 \sin\theta \cos\theta + 2\theta \sin^2\theta.$$

Here we used the result from Exercise 7.

13. $f(x) = (2x^4 - 4x^{-1}) \sec x$

SOLUTION Let $f(x) = (2x^4 - 4x^{-1}) \sec x$. Then

$$f'(x) = (2x^4 - 4x^{-1}) \sec x \tan x + \sec x(8x^3 + 4x^{-2}).$$

14. $f(z) = z \tan z$

SOLUTION Let $f(z) = z \tan z$. Then $f'(z) = z(\sec^2 z) + \tan z$.

15. $y = \dfrac{\sec\theta}{\theta}$

SOLUTION Let $y = \dfrac{\sec\theta}{\theta}$. Then

$$y' = \frac{\theta \sec\theta \tan\theta - \sec\theta}{\theta^2}.$$

16. $G(z) = \dfrac{1}{\tan z - \cot z}$

SOLUTION Let $G(z) = \dfrac{1}{\tan z - \cot z}$. Then

$$G'(z) = \frac{(\tan z - \cot z)(0) - 1(\sec^2 z + \csc^2 z)}{(\tan z - \cot z)^2} = -\frac{\sec^2 z + \csc^2 z}{(\tan z - \cot z)^2}.$$

17. $R(y) = \dfrac{3\cos y - 4}{\sin y}$

SOLUTION Let $R(y) = \dfrac{3\cos y - 4}{\sin y}$. Then

$$R'(y) = \frac{\sin y(-3\sin y) - (3\cos y - 4)(\cos y)}{\sin^2 y} = \frac{4\cos y - 3(\sin^2 y + \cos^2 y)}{\sin^2 y} = \frac{4\cos y - 3}{\sin^2 y}.$$

18. $f(x) = \dfrac{x}{\sin x + 2}$

SOLUTION Let $f(x) = \dfrac{x}{2 + \sin x}$. Then

$$f'(x) = \frac{(2 + \sin x)(1) - x\cos x}{(2 + \sin x)^2} = \frac{2 + \sin x - x\cos x}{(2 + \sin x)^2}.$$

19. $f(x) = \dfrac{1 + \tan x}{1 - \tan x}$

SOLUTION Let $f(x) = \dfrac{1 + \tan x}{1 - \tan x}$. Then

$$f'(x) = \frac{(1 - \tan x)\sec^2 x - (1 + \tan x)\left(-\sec^2 x\right)}{(1 - \tan x)^2} = \frac{2\sec^2 x}{(1 - \tan x)^2}.$$

20. $f(\theta) = \theta \tan\theta \sec\theta$

SOLUTION Let $f(\theta) = \theta\tan\theta\sec\theta$. Then

$$\begin{aligned} f'(\theta) &= \theta\frac{d}{d\theta}(\tan\theta\sec\theta) + \tan\theta\sec\theta \\ &= \theta(\tan\theta\sec\theta\tan\theta + \sec\theta\sec^2\theta) + \tan\theta\sec\theta \\ &= \theta\tan^2\theta\sec\theta + \theta\sec^3\theta + \tan\theta\sec\theta. \end{aligned}$$

21. $f(x) = e^x \sin x$

SOLUTION Let $f(x) = e^x\sin x$. Then $f'(x) = e^x\cos x + \sin x e^x = e^x(\cos x + \sin x)$.

22. $h(t) = e^t \csc t$

SOLUTION Let $h(t) = e^t\csc t$. Then $h'(t) = e^t(-\csc t\cot t) + \csc t e^t = e^t\csc t(1 - \cot t)$.

23. $f(\theta) = e^\theta(5\sin\theta - 4\tan\theta)$

SOLUTION Let $f(\theta) = e^\theta(5\sin\theta - 4\tan\theta)$. Then

$$\begin{aligned} f'(\theta) &= e^\theta(5\cos\theta - 4\sec^2\theta) + e^\theta(5\sin\theta - 4\tan\theta) \\ &= e^\theta(5\sin\theta + 5\cos\theta - 4\tan\theta - 4\sec^2\theta). \end{aligned}$$

24. $f(x) = xe^x\cos x$

SOLUTION Let $f(x) = xe^x\cos x$. Then

$$\begin{aligned} f'(x) &= x\frac{d}{dx}(e^x\cos x) + e^x\cos x = x(e^x(-\sin x) + \cos x e^x) + e^x\cos x \\ &= e^x(x\cos x - x\sin x + \cos x). \end{aligned}$$

In Exercises 25–34, find an equation of the tangent line at the point specified.

25. $y = x^3 + \cos x, \quad x = 0$

SOLUTION Let $f(x) = x^3 + \cos x$. Then $f'(x) = 3x^2 - \sin x$ and $f'(0) = 0$. The tangent line at $x = 0$ is

$$y = f'(0)(x - 0) + f(0) = 0(x) + 1 = 1.$$

26. $y = \tan\theta, \quad \theta = \frac{\pi}{6}$

SOLUTION Let $f(\theta) = \tan\theta$. Then $f'(\theta) = \sec^2\theta$ and $f'(\frac{\pi}{6}) = \frac{4}{3}$. The tangent line at $x = \frac{\pi}{6}$ is

$$y = f'\left(\frac{\pi}{6}\right)\left(\theta - \frac{\pi}{6}\right) + f\left(\frac{\pi}{6}\right) = \frac{4}{3}\left(\theta - \frac{\pi}{6}\right) + \frac{\sqrt{3}}{3} = \frac{4}{3}\theta + \frac{\sqrt{3}}{3} - \frac{2\pi}{9}.$$

27. $y = \sin x + 3\cos x, \quad x = 0$

SOLUTION Let $f(x) = \sin x + 3\cos x$. Then $f'(x) = \cos x - 3\sin x$ and $f'(0) = 1$. The tangent line at $x = 0$ is

$$y = f'(0)(x - 0) + f(0) = x + 3.$$

28. $y = \dfrac{\sin t}{1 + \cos t}, \quad t = \frac{\pi}{3}$

SOLUTION Let $f(t) = \frac{\sin t}{1+\cos t}$. Then

$$f'(t) = \frac{(1 + \cos t)(\cos t) - \sin t(-\sin t)}{(1 + \cos t)^2} = \frac{1 + \cos t}{(1 + \cos t)^2} = \frac{1}{1 + \cos t},$$

and

$$f'\left(\frac{\pi}{3}\right) = \frac{1}{1 + 1/2} = \frac{2}{3}.$$

The tangent line at $x = \frac{\pi}{3}$ is

$$y = f'\left(\frac{\pi}{3}\right)\left(x - \frac{\pi}{3}\right) + f\left(\frac{\pi}{3}\right) = \frac{2}{3}\left(x - \frac{\pi}{3}\right) + \frac{\sqrt{3}}{3} = \frac{2}{3}x + \frac{\sqrt{3}}{3} - \frac{2\pi}{9}.$$

29. $y = 2(\sin\theta + \cos\theta), \quad \theta = \frac{\pi}{3}$

SOLUTION Let $f(\theta) = 2(\sin\theta + \cos\theta)$. Then $f'(\theta) = 2(\cos\theta - \sin\theta)$ and $f'(\frac{\pi}{3}) = 1 - \sqrt{3}$. The tangent line at $x = \frac{\pi}{3}$ is

$$y = f'\left(\frac{\pi}{3}\right)\left(x - \frac{\pi}{3}\right) + f\left(\frac{\pi}{3}\right) = (1 - \sqrt{3})\left(x - \frac{\pi}{3}\right) + 1 + \sqrt{3}.$$

30. $y = \csc x - \cot x, \quad x = \frac{\pi}{4}$

SOLUTION Let $f(x) = \csc x - \cot x$. Then

$$f'(x) = \csc^2 x - \csc x \cot x$$

and

$$f'\left(\frac{\pi}{4}\right) = 2 - \sqrt{2} \cdot 1 = 2 - \sqrt{2}.$$

Hence the tangent line is

$$\begin{aligned} y &= f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = \left(2 - \sqrt{2}\right)\left(x - \frac{\pi}{4}\right) + \left(\sqrt{2} - 1\right) \\ &= \left(2 - \sqrt{2}\right)x + \sqrt{2} - 1 + \frac{\pi}{4}\left(\sqrt{2} - 2\right). \end{aligned}$$

31. $y = e^x \cos x, \quad x = 0$

SOLUTION Let $f(x) = e^x \cos x$. Then

$$f'(x) = e^x(-\sin x) + e^x \cos x = e^x(\cos x - \sin x),$$

and $f'(0) = e^0(\cos 0 - \sin 0) = 1$. Thus, the equation of the tangent line is

$$y = f'(0)(x - 0) + f(0) = x + 1.$$

32. $y = e^x \cos^2 x, \quad x = \frac{\pi}{4}$

SOLUTION Let $f(x) = e^x \cos^2 x$. Then

$$f'(x) = e^x \frac{d}{dx}(\cos x \cdot \cos x) + e^x \cos^2 x = e^x(\cos x(-\sin x) + \cos x(-\sin x)) + e^x \cos^2 x$$
$$= e^x(\cos^2 x - 2\sin x \cos x),$$

and

$$f'\left(\frac{\pi}{4}\right) = e^{\pi/4}\left(\frac{1}{2} - 1\right) = -\frac{1}{2}e^{\pi/4}.$$

The tangent line at $x = \frac{\pi}{4}$ is

$$y = f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = -\frac{1}{2}e^{\pi/4}\left(x - \frac{\pi}{4}\right) + \frac{1}{2}e^{\pi/4}.$$

33. $y = e^t(1 - \cos t), \quad t = \frac{\pi}{2}$

SOLUTION Let $f(t) = e^t(1 - \cos t)$. Then

$$f'(t) = e^t \sin t + e^t(1 - \cos t) = e^t(1 + \sin t - \cos t),$$

and $f'(\frac{\pi}{2}) = 2e^{\pi/2}$. The tangent line at $x = \frac{\pi}{2}$ is

$$y = f'\left(\frac{\pi}{2}\right)\left(t - \frac{\pi}{2}\right) + f\left(\frac{\pi}{2}\right) = 2e^{\pi/2}\left(t - \frac{\pi}{2}\right) + e^{\pi/2}.$$

34. $y = e^\theta \sec\theta, \quad \theta = \frac{\pi}{4}$

SOLUTION Let $f(\theta) = e^\theta \sec\theta$. Then

$$f'(\theta) = e^\theta \sec\theta \tan\theta + e^\theta \sec\theta = e^\theta \sec\theta(\tan\theta + 1),$$

and

$$f'\left(\frac{\pi}{4}\right) = e^{\pi/4} \sec\frac{\pi}{4}\left(\tan\frac{\pi}{4} + 1\right) = 2\sqrt{2}e^{\pi/4}.$$

Thus, the equation of the tangent line is

$$y = f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = 2\sqrt{2}e^{\pi/4}\left(x - \frac{\pi}{4}\right) + \sqrt{2}e^{\pi/4}.$$

In Exercises 35–37, use Theorem 1 to verify the formula.

35. $\frac{d}{dx}\cot x = -\csc^2 x$

SOLUTION $\cot x = \frac{\cos x}{\sin x}$. Using the quotient rule and the derivative formulas, we compute:

$$\frac{d}{dx}\cot x = \frac{d}{dx}\frac{\cos x}{\sin x} = \frac{\sin x(-\sin x) - \cos x(\cos x)}{\sin^2 x} = \frac{-(\sin^2 x + \cos^2 x)}{\sin^2 x} = \frac{-1}{\sin^2 x} = -\csc^2 x.$$

36. $\frac{d}{dx}\sec x = \sec x \tan x$

SOLUTION Since $\sec x = \frac{1}{\cos x}$, we can apply the quotient rule and the known derivatives to get:

$$\frac{d}{dx}\sec x = \frac{d}{dx}\frac{1}{\cos x} = \frac{\cos x(0) - 1(-\sin x)}{\cos^2 x} = \frac{\sin x}{\cos^2 x} = \frac{\sin x}{\cos x}\frac{1}{\cos x} = \tan x \sec x.$$

37. $\frac{d}{dx}\csc x = -\csc x \cot x$

SOLUTION Since $\csc x = \frac{1}{\sin x}$, we can apply the quotient rule and the two known derivatives to get:

$$\frac{d}{dx}\csc x = \frac{d}{dx}\frac{1}{\sin x} = \frac{\sin x(0) - 1(\cos x)}{\sin^2 x} = \frac{-\cos x}{\sin^2 x} = -\frac{\cos x}{\sin x}\frac{1}{\sin x} = -\cot x \csc x.$$

38. Show that both $y = \sin x$ and $y = \cos x$ satisfy $y'' = -y$.

SOLUTION Let $y = \sin x$. Then $y' = \cos x$ and $y'' = -\sin x = -y$. Similarly, if we let $y = \cos x$, then $y' = -\sin x$ and $y'' = -\cos x = -y$.

In Exercises 39–42, calculate the higher derivative.

39. $f''(\theta), \quad f(\theta) = \theta \sin\theta$

SOLUTION Let $f(\theta) = \theta \sin\theta$. Then

$$f'(\theta) = \theta\cos\theta + \sin\theta$$
$$f''(\theta) = \theta(-\sin\theta) + \cos\theta + \cos\theta = -\theta\sin\theta + 2\cos\theta.$$

40. $\dfrac{d^2}{dt^2}\cos^2 t$

SOLUTION

$$\frac{d}{dt}\cos^2 t = \frac{d}{dt}(\cos t \cdot \cos t) = \cos t(-\sin t) + \cos t(-\sin t) = -2\sin t\cos t$$
$$\frac{d^2}{dt^2}\cos^2 t = \frac{d}{dt}(-2\sin t\cos t) = -2(\sin t(-\sin t) + \cos t(\cos t)) = -2(\cos^2 t - \sin^2 t).$$

41. $y'', \quad y''', \quad y = \tan x$

SOLUTION Let $y = \tan x$. Then $y' = \sec^2 x$ and by the Chain Rule,

$$y'' == \frac{d}{dx}\sec^2 x = 2(\sec x)(\sec x\tan x) = 2\sec^2 x\tan x$$
$$y''' = 2\sec^2 x(\sec^2 x) + (2\sec^2 x\tan x)\tan x = 2\sec^4 + 4\sec^4 x\tan^2 x$$

42. $y'', \quad y''', \quad y = e^t \sin t$

SOLUTION Let $y = e^t \sin t$. Then

$$y' = e^t\cos t + e^t\sin t = e^t(\cos t + \sin t)$$
$$y'' = e^t(-\sin t + \cos t) + e^t(\cos t + \sin t) = 2e^t\cos t$$
$$y''' = 2e^t(-\sin t) + 2e^t\cos t = 2e^t(\cos t - \sin t).$$

43. Calculate the first five derivatives of $f(x) = \cos x$. Then determine $f^{(8)}$ and $f^{(37)}$.

SOLUTION Let $f(x) = \cos x$.

- Then $f'(x) = -\sin x$, $f''(x) = -\cos x$, $f'''(x) = \sin x$, $f^{(4)}(x) = \cos x$, and $f^{(5)}(x) = -\sin x$.
- Accordingly, the successive derivatives of f cycle among

  $$\{-\sin x, -\cos x, \sin x, \cos x\}$$

  in that order. Since 8 is a multiple of 4, we have $f^{(8)}(x) = \cos x$.
- Since 36 is a multiple of 4, we have $f^{(36)}(x) = \cos x$. Therefore, $f^{(37)}(x) = -\sin x$.

44. Find $y^{(157)}$, where $y = \sin x$.

SOLUTION Let $f(x) = \sin x$. Then the successive derivatives of f cycle among

$$\{\cos x, -\sin x, -\cos x, \sin x\}$$

in that order. Since 156 is a multiple of 4, we have $f^{(156)}(x) = \sin x$. Therefore, $f^{(157)}(x) = \cos x$.

45. Find the values of x between 0 and 2π where the tangent line to the graph of $y = \sin x\cos x$ is horizontal.

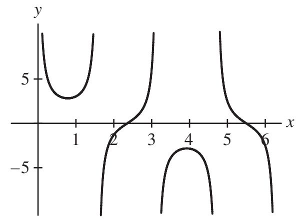
SOLUTION Let $y = \sin x\cos x$. Then

$$y' = (\sin x)(-\sin x) + (\cos x)(\cos x) = \cos^2 x - \sin^2 x.$$

When $y' = 0$, we have $\sin x = \pm\cos x$. In the interval $[0, 2\pi]$, this occurs when $x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$.

46. GU Plot the graph $f(\theta) = \sec\theta + \csc\theta$ over $[0, 2\pi]$ and determine the number of solutions to $f'(\theta) = 0$ in this interval graphically. Then compute $f'(\theta)$ and find the solutions.

SOLUTION The graph of $f(\theta) = \sec\theta + \csc\theta$ over $[0, 2\pi]$ is given below. From the graph, it appears that there are two locations where the tangent line would be horizontal; that is, there appear to be two solutions to $f'(\theta) = 0$. Now $f'(\theta) = \sec\theta\tan\theta - \csc\theta\cot\theta$. Setting $\sec\theta\tan\theta - \csc\theta\cot\theta = 0$ and then multiplying by $\sin\theta\tan\theta$ and rearranging terms yields $\tan^3\theta = 1$. Thus, on the interval $[0, 2\pi]$, there are two solution of $f'(\theta) = 0$: $\theta = \frac{\pi}{4}$ and $\theta = \frac{5\pi}{4}$.



47. GU Let $g(t) = t - \sin t$.

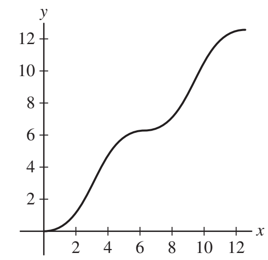
(a) Plot the graph of g with a graphing utility for $0 \le t \le 4\pi$.

(b) Show that the slope of the tangent line is nonnegative. Verify this on your graph.

(c) For which values of t in the given range is the tangent line horizontal?

SOLUTION Let $g(t) = t - \sin t$.

(a) Here is a graph of g over the interval $[0, 4\pi]$.



(b) Since $g'(t) = 1 - \cos t \ge 0$ for all t, the slope of the tangent line to g is always nonnegative.

(c) In the interval $[0, 4\pi]$, the tangent line is horizontal when $t = 0, 2\pi, 4\pi$.

48. CAS Let $f(x) = (\sin x)/x$ for $x \neq 0$ and $f(0) = 1$.

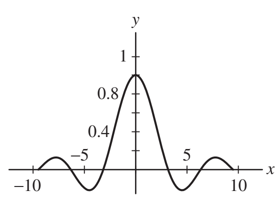
(a) Plot $f(x)$ on $[-3\pi, 3\pi]$.

(b) Show that $f'(c) = 0$ if $c = \tan c$. Use the numerical root finder on a computer algebra system to find a good approximation to the smallest *positive* value c_0 such that $f'(c_0) = 0$.

(c) Verify that the horizontal line $y = f(c_0)$ is tangent to the graph of $y = f(x)$ at $x = c_0$ by plotting them on the same set of axes.

SOLUTION

(a) Here is the graph of $f(x)$ over $[-3\pi, 3\pi]$.



(b) Let $f(x) = \dfrac{\sin x}{x}$. Then

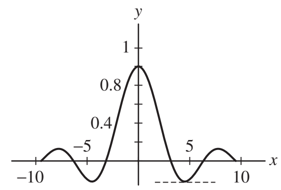
$$f'(x) = \frac{x\cos x - \sin x}{x^2}.$$

To have $f'(c) = 0$, it follows that $c\cos c - \sin c = 0$, or

$$\tan c = c.$$

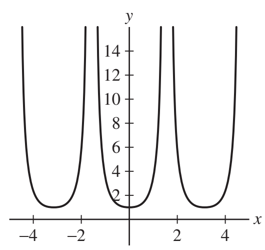
Using a computer algebra system, we find that the smallest positive value c_0 such that $f'(c_0) = 0$ is $c_0 = 4.493409$.

(c) The horizontal line $y = f(c_0) = -0.217234$ and the function $y = f(x)$ are both plotted below. The horizontal line is clearly tangent to the graph of $f(x)$.



49. Show that no tangent line to the graph of $f(x) = \tan x$ has zero slope. What is the least slope of a tangent line? Justify by sketching the graph of $(\tan x)'$.

SOLUTION Let $f(x) = \tan x$. Then $f'(x) = \sec^2 x = \frac{1}{\cos^2 x}$. Note that $f'(x) = \frac{1}{\cos^2 x}$ has numerator 1; the equation $f'(x) = 0$ therefore has no solution. Because the maximum value of $\cos^2 x$ is 1, the minimum value of $f'(x) = \frac{1}{\cos^2 x}$ is 1. Hence, the least slope for a tangent line to $\tan x$ is 1. Here is a graph of f'.



50. The height at time t (in seconds) of a mass, oscillating at the end of a spring, is $s(t) = 300 + 40 \sin t$ cm. Find the velocity and acceleration at $t = \frac{\pi}{3}$ s.

SOLUTION Let $s(t) = 300 + 40 \sin t$ be the height. Then the velocity is

$$v(t) = s'(t) = 40 \cos t$$

and the acceleration is

$$a(t) = v'(t) = -40 \sin t.$$

At $t = \frac{\pi}{3}$, the velocity is $v\left(\frac{\pi}{3}\right) = 20$ cm/sec and the acceleration is $a\left(\frac{\pi}{3}\right) = -20\sqrt{3}$ cm/sec^2.

51. The horizontal range R of a projectile launched from ground level at an angle θ and initial velocity v_0 m/s is $R = (v_0^2/9.8) \sin\theta \cos\theta$. Calculate $dR/d\theta$. If $\theta = 7\pi/24$, will the range increase or decrease if the angle is increased slightly? Base your answer on the sign of the derivative.

SOLUTION Let $R(\theta) = (v_0^2/9.8) \sin\theta \cos\theta$.

$$\frac{dR}{d\theta} = R'(\theta) = (v_0^2/9.8)(-\sin^2\theta + \cos^2\theta).$$

If $\theta = 7\pi/24$, $\frac{\pi}{4} < \theta < \frac{\pi}{2}$, so $|\sin\theta| > |\cos\theta|$, and $dR/d\theta < 0$ (numerically, $dR/d\theta = -0.0264101 v_0^2$). At this point, increasing the angle will *decrease* the range.

52. Show that if $\frac{\pi}{2} < \theta < \pi$, then the distance along the x-axis between θ and the point where the tangent line intersects the x-axis is equal to $|\tan\theta|$ (Figure 4).

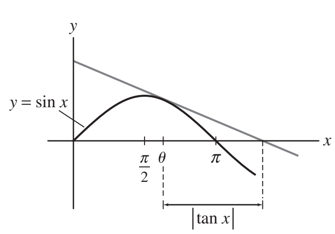


FIGURE 4

SOLUTION Let $f(x) = \sin x$. Since $f'(x) = \cos x$, this means that the tangent line at $(\theta, \sin\theta)$ is $y = \cos\theta(x - \theta) + \sin\theta$. When $y = 0$, $x = \theta - \tan\theta$. The distance from x to θ is then

$$|\theta - (\theta - \tan\theta)| = |\tan\theta|.$$

Further Insights and Challenges

53. Use the limit definition of the derivative and the addition law for the cosine function to prove that $(\cos x)' = -\sin x$.

SOLUTION Let $f(x) = \cos x$. Then

$$f'(x) = \lim_{h\to 0} \frac{\cos(x+h) - \cos x}{h} = \lim_{h\to 0} \frac{\cos x \cos h - \sin x \sin h - \cos x}{h}$$
$$= \lim_{h\to 0} \left((-\sin x) \frac{\sin h}{h} + (\cos x) \frac{\cos h - 1}{h} \right) = (-\sin x)\cdot 1 + (\cos x)\cdot 0 = -\sin x.$$

54. Use the addition formula for the tangent

$$\tan(x+h) = \frac{\tan x + \tan h}{1 + \tan x \tan h}$$

to compute $(\tan x)'$ directly as a limit of the difference quotients. You will also need to show that $\lim_{h\to 0} \frac{\tan h}{h} = 1$.

SOLUTION First note that

$$\lim_{h\to 0} \frac{\tan h}{h} = \lim_{h\to 0} \frac{\sin h}{h} \cdot \lim_{h\to 0} \frac{1}{\cos h} = 1(1) = 1.$$

Now, using the addition formula for tangent,

$$\frac{\tan(x+h) - \tan x}{h} = \frac{\frac{\tan x + \tan h}{1+\tan x \tan h} - \tan x}{h}$$
$$= \frac{\tan h(1 - \tan^2 x)}{h(1 + \tan x \tan h)} = \frac{\tan h}{h} \cdot \frac{\sec^2 x}{1 + \tan x \tan h}.$$

Therefore,

$$\frac{d}{dx} \tan x = \lim_{h\to 0} \frac{\tan h}{h} \cdot \frac{\sec^2 x}{1 + \tan x \tan h}$$
$$= \lim_{h\to 0} \frac{\tan h}{h} \cdot \lim_{h\to 0} \frac{\sec^2 x}{1 + \tan x \tan h}$$
$$= 1(\sec^2 x) = \sec^2 x.$$

55. Verify the following identity and use it to give another proof of the formula $(\sin x)' = \cos x$.

$$\sin(x+h) - \sin x = 2\cos\left(x + \tfrac{1}{2}h\right) \sin\left(\tfrac{1}{2}h\right)$$

Hint: Use the addition formula to prove that $\sin(a+b) - \sin(a-b) = 2\cos a \sin b$.

SOLUTION Recall that

$$\sin(a+b) = \sin a \cos b + \cos a \sin b$$

and

$$\sin(a-b) = \sin a \cos b - \cos a \sin b.$$

Subtracting the second identity from the first yields

$$\sin(a+b) - \sin(a-b) = 2\cos a \sin b.$$

If we now set $a = x + \frac{h}{2}$ and $b = \frac{h}{2}$, then the previous equation becomes

$$\sin(x+h) - \sin x = 2\cos\left(x + \frac{h}{2}\right) \sin\left(\frac{h}{2}\right).$$

Finally, we use the limit definition of the derivative of $\sin x$ to obtain

$$\frac{d}{dx}\sin x = \lim_{h\to 0} \frac{\sin(x+h) - \sin x}{h} = \lim_{h\to 0} \frac{2\cos\left(x + \frac{h}{2}\right)\sin\left(\frac{h}{2}\right)}{h}$$
$$= \lim_{h\to 0} \cos\left(x + \frac{h}{2}\right) \cdot \lim_{h\to 0} \frac{\sin\left(\frac{h}{2}\right)}{\left(\frac{h}{2}\right)} = \cos x \cdot 1 = \cos x.$$

In other words, $\frac{d}{dx}(\sin x) = \cos x$.

56. Show that a nonzero polynomial function $y = f(x)$ *cannot* satisfy the equation $y'' = -y$. Use this to prove that neither $\sin x$ nor $\cos x$ is a polynomial. Can you think of another way to reach this conclusion by considering limits as $x \to \infty$?

SOLUTION

- Let p be a nonzero polynomial of degree n and *assume* that p satisfies the differential equation $y'' + y = 0$. Then $p'' + p = 0$ for all x. There are exactly three cases.

  (a) If $n = 0$, then p is a constant polynomial and thus $p'' = 0$. Hence $0 = p'' + p = p$ or $p \equiv 0$ (i.e., p is equal to 0 for all x or p is identically 0). This is a contradiction, since p is a *non*zero polynomial.

  (b) If $n = 1$, then p is a linear polynomial and thus $p'' = 0$. Once again, we have $0 = p'' + p = p$ or $p \equiv 0$, a contradiction since p is a nonzero polynomial.

  (c) If $n \geq 2$, then p is at least a quadratic polynomial and thus p'' is a polynomial of degree $n - 2 \geq 0$. Thus $q = p'' + p$ is a polynomial of degree $n \geq 2$. By assumption, however, $p'' + p = 0$. Thus $q \equiv 0$, a polynomial of degree 0. This is a contradiction, since the degree of q is $n \geq 2$.

  CONCLUSION: In all cases, we have reached a contradiction. Therefore the *assumption* that p satisfies the differential equation $y'' + y = 0$ is *false*. Accordingly, a nonzero polynomial *cannot* satisfy the stated differential equation.

- Let $y = \sin x$. Then $y' = \cos x$ and $y'' = -\sin x$. Therefore, $y'' = -y$. Now, let $y = \cos x$. Then $y' = -\sin x$ and $y'' = -\cos x$. Therefore, $y'' = -y$. Because $\sin x$ and $\cos x$ are nonzero functions that satisfy $y'' = -y$, it follows that neither $\sin x$ nor $\cos x$ is a polynomial.

57. Let $f(x) = x \sin x$ and $g(x) = x \cos x$.

(a) Show that $f'(x) = g(x) + \sin x$ and $g'(x) = -f(x) + \cos x$.

(b) Verify that $f''(x) = -f(x) + 2\cos x$ and
$g''(x) = -g(x) - 2\sin x$.

(c) By further experimentation, try to find formulas for all higher derivatives of f and g. *Hint:* The kth derivative depends on whether $k = 4n, 4n + 1, 4n + 2$, or $4n + 3$.

SOLUTION Let $f(x) = x \sin x$ and $g(x) = x \cos x$.

(a) We examine first derivatives: $f'(x) = x \cos x + (\sin x) \cdot 1 = g(x) + \sin x$ and $g'(x) = (x)(-\sin x) + (\cos x) \cdot 1 = -f(x) + \cos x$; i.e., $f'(x) = g(x) + \sin x$ and $g'(x) = -f(x) + \cos x$.

(b) Now look at second derivatives: $f''(x) = g'(x) + \cos x = -f(x) + 2\cos x$ and $g''(x) = -f'(x) - \sin x = -g(x) - 2\sin x$; i.e., $f''(x) = -f(x) + 2\cos x$ and $g''(x) = -g(x) - 2\sin x$.

(c)
- The third derivatives are $f'''(x) = -f'(x) - 2\sin x = -g(x) - 3\sin x$ and $g'''(x) = -g'(x) - 2\cos x = f(x) - 3\cos x$; i.e., $f'''(x) = -g(x) - 3\sin x$ and $g'''(x) = f(x) - 3\cos x$.
- The fourth derivatives are $f^{(4)}(x) = -g'(x) - 3\cos x = f(x) - 4\cos x$ and $g^{(4)}(x) = f'(x) + 3\sin x = g(x) + 4\sin x$; i.e., $f^{(4)} = f(x) - 4\cos x$ and $g^{(4)}(x) = g(x) + 4\sin x$.
- We can now see the pattern for the derivatives, which are summarized in the following table. Here $n = 0, 1, 2, \ldots$

k	$4n$	$4n + 1$	$4n + 2$	$4n + 3$
$f^{(k)}(x)$	$f(x) - k\cos x$	$g(x) + k\sin x$	$-f(x) + k\cos x$	$-g(x) - k\sin x$
$g^{(k)}(x)$	$g(x) + k\sin x$	$-f(x) + k\cos x$	$-g(x) - k\sin x$	$f(x) - k\cos x$

58. Figure 5 shows the geometry behind the derivative formula $(\sin\theta)' = \cos\theta$. Segments $\overline{BA}$ and $\overline{BD}$ are parallel to the x- and y-axes. Let $\Delta \sin\theta = \sin(\theta + h) - \sin\theta$. Verify the following statements.

(a) $\Delta \sin\theta = BC$

(b) $\angle BDA = \theta$ *Hint:* $\overline{OA} \perp AD$.

(c) $BD = (\cos\theta)AD$

Now explain the following intuitive argument: If h is small, then $BC \approx BD$ and $AD \approx h$, so $\Delta \sin\theta \approx (\cos\theta)h$ and $(\sin\theta)' = \cos\theta$.

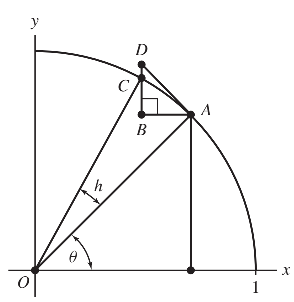

FIGURE 5

SOLUTION

(a) We note that $\sin(\theta + h)$ is the y-coordinate of the point C and $\sin\theta$ is the y-coordinate of the point A, and therefore also of the point B. Now, $\Delta \sin\theta = \sin(\theta + h) - \sin\theta$ can be interpreted as the difference between the y-coordinates of the points B and C; that is, $\Delta \sin\theta = BC$.

(b) From the figure, we note that $\angle OAB = \theta$, so $\angle BAD = \pi - \theta$ and $\angle BDA = \theta$.

(c) Using part (b), it follows that

$$\cos\theta = \frac{BD}{AD} \quad \text{or} \quad BD = (\cos\theta)AD.$$

For h "small," $BC \approx BD$ and AD is roughly the length of the arc subtended from A to C; that is, $AD \approx 1(h) = h$. Thus, using (a) and (c),

$$\Delta \sin\theta = BC \approx BD = (\cos\theta)AD \approx (\cos\theta)h.$$

In the limit as $h \to 0$,

$$\frac{\Delta \sin\theta}{h} \to (\sin\theta)',$$

so $(\sin\theta)' = \cos\theta$.

3.7 The Chain Rule

Preliminary Questions

1. Identify the outside and inside functions for each of these composite functions.

(a) $y = \sqrt{4x + 9x^2}$ **(b)** $y = \tan(x^2 + 1)$

(c) $y = \sec^5 x$ **(d)** $y = (1 + e^x)^4$

SOLUTION

(a) The outer function is $\sqrt{x}$, and the inner function is $4x + 9x^2$.

(b) The outer function is $\tan x$, and the inner function is $x^2 + 1$.

(c) The outer function is x^5, and the inner function is $\sec x$.

(d) The outer function is x^4, and the inner function is $1 + e^x$.

2. Which of the following can be differentiated easily *without* using the Chain Rule?

(a) $y = \tan(7x^2 + 2)$ **(b)** $y = \dfrac{x}{x+1}$

(c) $y = \sqrt{x} \cdot \sec x$ **(d)** $y = \sqrt{x \cos x}$

(e) $y = xe^x$ **(f)** $y = e^{\sin x}$

SOLUTION The function $\frac{x}{x+1}$ can be differentiated using the Quotient Rule, and the functions $\sqrt{x} \cdot \sec x$ and xe^x can be differentiated using the Product Rule. The functions $\tan(7x^2 + 2)$, $\sqrt{x \cos x}$ and $e^{\sin x}$ require the Chain Rule.

3. Which is the derivative of $f(5x)$?

(a) $5f'(x)$ **(b)** $5f'(5x)$ **(c)** $f'(5x)$

SOLUTION The correct answer is **(b)**: $5f'(5x)$.

4. Suppose that $f'(4) = g(4) = g'(4) = 1$. Do we have enough information to compute $F'(4)$, where $F(x) = f(g(x))$? If not, what is missing?

SOLUTION If $F(x) = f(g(x))$, then $F'(x) = f'(g(x))g'(x)$ and $F'(4) = f'(g(4))g'(4)$. Thus, we do not have enough information to compute $F'(4)$. We are missing the value of $f'(1)$.

Exercises

In Exercises 1–4, fill in a table of the following type:

$f(g(x))$	$f'(u)$	$f'(g(x))$	$g'(x)$	$(f \circ g)'$

1. $f(u) = u^{3/2}, \quad g(x) = x^4 + 1$

SOLUTION

$f(g(x))$	$f'(u)$	$f'(g(x))$	$g'(x)$	$(f \circ g)'$
$(x^4 + 1)^{3/2}$	$\frac{3}{2}u^{1/2}$	$\frac{3}{2}(x^4 + 1)^{1/2}$	$4x^3$	$6x^3(x^4 + 1)^{1/2}$

2. $f(u) = u^3, \quad g(x) = 3x + 5$

SOLUTION

$f(g(x))$	$f'(u)$	$f'(g(x))$	$g'(x)$	$(f \circ g)'$
$(3x+5)^3$	$3u^2$	$3(3x+5)^2$	3	$9(3x+5)^2$

3. $f(u) = \tan u, \quad g(x) = x^4$

SOLUTION

$f(g(x))$	$f'(u)$	$f'(g(x))$	$g'(x)$	$(f \circ g)'$
$\tan(x^4)$	$\sec^2 u$	$\sec^2(x^4)$	$4x^3$	$4x^3 \sec^2(x^4)$

4. $f(u) = u^4 + u, \quad g(x) = \cos x$

SOLUTION

$f(g(x))$	$f'(u)$	$f'(g(x))$	$g'(x)$	$(f \circ g)'$
$(\cos x)^4 + \cos x$	$4u^3 + 1$	$4(\cos x)^3 + 1$	$-\sin x$	$-4 \sin x \cos^3 x - \sin x$

In Exercises 5 and 6, write the function as a composite $f(g(x))$ and compute the derivative using the Chain Rule.

5. $y = (x + \sin x)^4$

SOLUTION Let $f(x) = x^4$, $g(x) = x + \sin x$, and $y = f(g(x)) = (x + \sin x)^4$. Then

$$\frac{dy}{dx} = f'(g(x))g'(x) = 4(x + \sin x)^3(1 + \cos x).$$

6. $y = \cos(x^3)$

SOLUTION Let $f(x) = \cos x$, $g(x) = x^3$, and $y = f(g(x)) = \cos(x^3)$. Then

$$\frac{dy}{dx} = f'(g(x))g'(x) = -3x^2 \sin(x^3).$$

7. Calculate $\frac{d}{dx} \cos u$ for the following choices of $u(x)$:

(a) $u = 9 - x^2$ **(b)** $u = x^{-1}$ **(c)** $u = \tan x$

SOLUTION

(a) $\cos(u(x)) = \cos(9 - x^2)$.

$$\frac{d}{dx}\cos(u(x)) = -\sin(u(x))u'(x) = -\sin(9 - x^2)(-2x) = 2x \sin(9 - x^2).$$

(b) $\cos(u(x)) = \cos(x^{-1})$.

$$\frac{d}{dx}\cos(u(x)) = -\sin(u(x))u'(x) = -\sin(x^{-1})\left(-\frac{1}{x^2}\right) = \frac{\sin(x^{-1})}{x^2}.$$

(c) $\cos(u(x)) = \cos(\tan x)$.

$$\frac{d}{dx}\cos(u(x)) = -\sin(u(x))u'(x) = -\sin(\tan x)(\sec^2 x) = -\sec^2 x \sin(\tan x).$$

8. Calculate $\frac{d}{dx} f(x^2 + 1)$ for the following choices of $f(u)$:

(a) $f(u) = \sin u$ **(b)** $f(u) = 3u^{3/2}$ **(c)** $f(u) = u^2 - u$

SOLUTION

(a) Let $\sin(u) = \sin(x^2 + 1)$. Then

$$\frac{d}{dx}\sin(x^2 + 1) = \cos(x^2 + 1) \cdot \frac{d}{dx}(x^2 + 1) = \cos(x^2 + 1)2x = 2x \cos(x^2 + 1).$$

(b) Let $3u^{3/2} = 3(x^2+1)^{3/2}$. Then

$$\frac{d}{dx}3(x^2+1)^{3/2} = 3\cdot\frac{3}{2}(x^2+1)^{1/2}\frac{d}{dx}(x^2+1) = \frac{9}{2}(x^2+1)^{1/2}(2x) = 9x(x^2+1)^{1/2}.$$

(c) Let $u^2 - u = (x^2+1)^2 - (x^2+1)$. Then

$$\frac{d}{dx}\left((x^2+1)^2-(x^2+1)\right) = [2(x^2+1)-1]\frac{d}{dx}(x^2+1) = [2(x^2+1)-1](2x) = 4x^3+2x.$$

9. Compute $\frac{df}{dx}$ if $\frac{df}{du} = 2$ and $\frac{du}{dx} = 6$.

SOLUTION Assuming f is a function of u, which is in turn a function of x,

$$\frac{df}{dx} = \frac{df}{du}\cdot\frac{du}{dx} = 2(6) = 12.$$

10. Compute $\left.\frac{df}{dx}\right|_{x=2}$ if $f(u) = u^2$, $u(2) = -5$, and $u'(2) = -5$.

SOLUTION Because $f(u) = u^2$, it follows that $f'(u) = 2u$. Therefore,

$$\left.\frac{df}{dx}\right|_{x=2} = f'(u(2))u'(2) = 2u(2)u'(2) = 2(-5)(-5) = 50.$$

In Exercises 11–22, use the General Power Rule or the Shifting and Scaling Rule to compute the derivative.

11. $y = (x^4+5)^3$

SOLUTION Using the General Power Rule,

$$\frac{d}{dx}(x^4+5)^3 = 3(x^4+5)^2\frac{d}{dx}(x^4+5) = 3(x^4+5)^2(4x^3) = 12x^3(x^4+5)^2.$$

12. $y = (8x^4+5)^3$

SOLUTION Using the General Power Rule,

$$\frac{d}{dx}(8x^4+5)^3 = 3(8x^4+5)^2\frac{d}{dx}(8x^4+5) = 3(8x^4+5)^2(32x^3) = 96x^3(8x^4+5)^2.$$

13. $y = \sqrt{7x-3}$

SOLUTION Using the Shifting and Scaling Rule

$$\frac{d}{dx}\sqrt{7x-3} = \frac{d}{dx}(7x-3)^{1/2} = \frac{1}{2}(7x-3)^{-1/2}(7) = \frac{7}{2\sqrt{7x-3}}.$$

14. $y = (4-2x-3x^2)^5$

SOLUTION Using the General Power Rule,

$$\begin{aligned}\frac{d}{dx}(4-2x-3x^2)^5 &= 5(4-2x-3x^2)^4\frac{d}{dx}(4-2x-3x^2) = 5(4-2x-3x^2)^4(-2-6x)\\ &= -10(1+3x)(4-2x-3x^2)^4.\end{aligned}$$

15. $y = (x^2+9x)^{-2}$

SOLUTION Using the General Power Rule,

$$\frac{d}{dx}(x^2+9x)^{-2} = -2(x^2+9x)^{-3}\frac{d}{dx}(x^2+9x) = -2(x^2+9x)^{-3}(2x+9).$$

16. $y = (x^3+3x+9)^{-4/3}$

SOLUTION Using the General Power Rule,

$$\begin{aligned}\frac{d}{dx}(x^3+3x+9)^{-4/3} &= -\frac{4}{3}(x^3+3x+9)^{-7/3}\frac{d}{dx}(x^3+3x+9) = -\frac{4}{3}(x^3+3x+9)^{-7/3}(3x^2+3)\\ &= -4(x^2+1)(x^3+3x+9)^{-7/3}.\end{aligned}$$

17. $y = \cos^4 \theta$

SOLUTION Using the General Power Rule,

$$\frac{d}{d\theta} \cos^4 \theta = 4 \cos^3 \theta \frac{d}{d\theta} \cos \theta = -4 \cos^3 \theta \sin \theta.$$

18. $y = \cos(9\theta + 41)$

SOLUTION Using the Shifting and Scaling Rule

$$\frac{d}{d\theta} \cos(9\theta + 41) = -9 \sin(9\theta + 41).$$

19. $y = (2 \cos \theta + 5 \sin \theta)^9$

SOLUTION Using the General Power Rule,

$$\frac{d}{d\theta}(2 \cos \theta + 5 \sin \theta)^9 = 9(2 \cos \theta + 5 \sin \theta)^8 \frac{d}{d\theta}(2 \cos \theta + 5 \sin \theta) = 9(2 \cos \theta + 5 \sin \theta)^8 (5 \cos \theta - 2 \sin \theta).$$

20. $y = \sqrt{9 + x + \sin x}$

SOLUTION Using the General Power Rule,

$$\frac{d}{dx}\sqrt{9 + x + \sin x} = \frac{1}{2}(9 + x + \sin x)^{-1/2} \frac{d}{dx}(9 + x + \sin x) = \frac{1 + \cos x}{2\sqrt{9 + x + \sin x}}.$$

21. $y = e^{x-12}$

SOLUTION Using the Shifting and Scaling Rule,

$$\frac{d}{dx} e^{x-12} = (1)e^{x-12} = e^{x-12}.$$

22. $y = e^{8x+9}$

SOLUTION Using the Shifting and Scaling Rule,

$$\frac{d}{dx} e^{8x+9} = 8e^{8x+9}.$$

In Exercises 23–26, compute the derivative of $f \circ g$.

23. $f(u) = \sin u, \quad g(x) = 2x + 1$

SOLUTION Let $h(x) = f(g(x)) = \sin(2x + 1)$. Then, applying the shifting and scaling rule, $h'(x) = 2 \cos(2x + 1)$. Alternately,

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = \cos(2x + 1) \cdot 2 = 2 \cos(2x + 1).$$

24. $f(u) = 2u + 1, \quad g(x) = \sin x$

SOLUTION Let $h(x) = f(g(x)) = 2(\sin x) + 1$. Then $h'(x) = 2 \cos x$. Alternately,

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = 2 \cos x.$$

25. $f(u) = e^u, \quad g(x) = x + x^{-1}$

SOLUTION Let $h(x) = f(g(x)) = e^{x+x^{-1}}$. Then

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = e^{x+x^{-1}} \left(1 - x^{-2}\right).$$

26. $f(u) = \dfrac{u}{u-1}, \quad g(x) = \csc x$

SOLUTION Let $h(x) = f(g(x))$. Then, applying the quotient rule:

$$h'(x) = \frac{(\csc x - 1)(-\csc x \cot x) - (\csc x)(-\csc x \cot x)}{(\csc x - 1)^2} = \frac{\csc x \cot x}{(\csc x - 1)^2}.$$

Alternately,

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = -\frac{1}{(\csc x - 1)^2}(-\csc x \cot x) = \frac{\csc x \cot x}{(\csc x - 1)^2},$$

where we have used the quotient rule to calculate $f'(u) = -\frac{1}{(u-1)^2}$.

In Exercises 27 and 28, find the derivatives of $f(g(x))$ and $g(f(x))$.

27. $f(u) = \cos u, \quad u = g(x) = x^2 + 1$

SOLUTION

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = -\sin(x^2 + 1)(2x) = -2x \sin(x^2 + 1).$$

$$\frac{d}{dx} g(f(x)) = g'(f(x))f'(x) = 2(\cos x)(-\sin x) = -2 \sin x \cos x.$$

28. $f(u) = u^3, \quad u = g(x) = \dfrac{1}{x+1}$

SOLUTION The derivative of $\frac{1}{x+1}$ is taken using the shifting and scaling rule.

$$\frac{d}{dx} f(g(x)) = f'(g(x))g'(x) = 3\left(\frac{1}{x+1}\right)^2 \left(-\frac{1}{(x+1)^2}\right) = -\frac{3}{(x+1)^4}.$$

$$\frac{d}{dx} g(f(x)) = g'(f(x))f'(x) = -\frac{1}{(x^3+1)^2}(3x^2) = -\frac{3x^2}{(x^3+1)^2}.$$

In Exercises 29–42, use the Chain Rule to find the derivative.

29. $y = \sin(x^2)$

SOLUTION Let $y = \sin\left(x^2\right)$. Then $y' = \cos\left(x^2\right) \cdot 2x = 2x \cos\left(x^2\right)$.

30. $y = \sin^2 x$

SOLUTION Let $y = \sin^2 x = (\sin x)^2$. Then $y' = 2 \sin x (\cos x)$.

31. $y = \sqrt{t^2 + 9}$

SOLUTION Let $y = \sqrt{t^2 + 9} = (t^2 + 9)^{1/2}$. Then

$$y' = \frac{1}{2}(t^2 + 9)^{-1/2}(2t) = \frac{t}{\sqrt{t^2 + 9}}.$$

32. $y = (t^2 + 3t + 1)^{-5/2}$

SOLUTION Let $y = \left(t^2 + 3t + 1\right)^{-5/2}$. Then

$$y' = -\frac{5}{2}\left(t^2 + 3t + 1\right)^{-7/2}(2t + 3) = -\frac{5\,(2t + 3)}{2\left(t^2 + 3t + 1\right)^{7/2}}.$$

33. $y = (x^4 - x^3 - 1)^{2/3}$

SOLUTION Let $y = \left(x^4 - x^3 - 1\right)^{2/3}$. Then

$$y' = \frac{2}{3}\left(x^4 - x^3 - 1\right)^{-1/3}\left(4x^3 - 3x^2\right).$$

34. $y = (\sqrt{x+1} - 1)^{3/2}$

SOLUTION Let $y = \left((x+1)^{1/2} - 1\right)^{3/2}$. Here, we note that calculating the derivative of the inside function, $\sqrt{x+1} - 1$, requires the chain rule (in the form of the scaling and shifting rule). After two applications of the chain rule, we have

$$y' = \frac{3}{2}\left((x+1)^{1/2} - 1\right)^{1/2} \cdot \left(\frac{1}{2}(x+1)^{-1/2} \cdot 1\right) = \frac{3\sqrt{\sqrt{x+1} - 1}}{4\sqrt{x+1}}.$$

35. $y = \left(\frac{x+1}{x-1}\right)^4$

SOLUTION Let $y = \left(\frac{x+1}{x-1}\right)^4$. Then

$$y' = 4\left(\frac{x+1}{x-1}\right)^3 \cdot \frac{(x-1)\cdot 1 - (x+1)\cdot 1}{(x-1)^2} = -\frac{8(x+1)^3}{(x-1)^5} = \frac{8(1+x)^3}{(1-x)^5}.$$

36. $y = \cos^3(12\theta)$

SOLUTION After two applications of the chain rule,

$$y' = 3\cos^2(12\theta)(-\sin(12\theta))(12) = -36\cos^2(12\theta)\sin(12\theta).$$

37. $y = \sec\frac{1}{x}$

SOLUTION Let $f(x) = \sec\left(x^{-1}\right)$. Then

$$f'(x) = \sec\left(x^{-1}\right)\tan\left(x^{-1}\right) \cdot \left(-x^{-2}\right) = -\frac{\sec(1/x)\tan(1/x)}{x^2}.$$

38. $y = \tan(\theta^2 - 4\theta)$

SOLUTION Let $y = \tan(\theta^2 - 4\theta)$. Then

$$y' = \sec^2(\theta^2 - 4\theta) \cdot (2\theta - 4) = (2\theta - 4)\sec^2(\theta^2 - 4\theta).$$

39. $y = \tan(\theta + \cos\theta)$

SOLUTION Let $y = \tan(\theta + \cos\theta)$. Then

$$y' = \sec^2(\theta + \cos\theta) \cdot (1 - \sin\theta) = (1 - \sin\theta)\sec^2(\theta + \cos\theta).$$

40. $y = e^{2x^2}$

SOLUTION Let $y = e^{2x^2}$. Then

$$y' = e^{2x^2}(4x) = 4xe^{2x^2}.$$

41. $y = e^{2-9t^2}$

SOLUTION Let $y = e^{2-9t^2}$. Then

$$y' = e^{2-9t^2}(-18t) = -18te^{2-9t^2}.$$

42. $y = \cos^3(e^{4\theta})$

SOLUTION Let $y = \cos^3(e^{4\theta})$. After two applications of the chain rule, we have

$$y' = 3\cos^2(e^{4\theta})(-\sin(e^{4\theta}))(4e^{4\theta}) = -12e^{4\theta}\cos^2(e^{4\theta})\sin(e^{4\theta}).$$

In Exercises 43–72, find the derivative using the appropriate rule or combination of rules.

43. $y = \tan(x^2 + 4x)$

SOLUTION Let $y = \tan(x^2 + 4x)$. By the chain rule,

$$y' = \sec^2(x^2 + 4x) \cdot (2x + 4) = (2x + 4)\sec^2(x^2 + 4x).$$

44. $y = \sin(x^2 + 4x)$

SOLUTION Let $y = \sin(x^2 + 4x)$. By the chain rule,

$$\frac{dy}{dx} = (2x + 4)\cos(x^2 + 4x).$$

45. $y = x\cos(1 - 3x)$

SOLUTION Let $y = x\cos(1 - 3x)$. Applying the product rule and then the scaling and shifting rule,

$$y' = x(-\sin(1 - 3x)) \cdot (-3) + \cos(1 - 3x) \cdot 1 = 3x\sin(1 - 3x) + \cos(1 - 3x).$$

46. $y = \sin(x^2)\cos(x^2)$

SOLUTION We start by using a trig identity to rewrite

$$y = \sin(x^2)\cos(x^2) = \frac{1}{2}\sin(2x^2).$$

Then, by the chain rule,

$$y' = \frac{1}{2}\cos(2x^2) \cdot 4x = 2x\cos(2x^2).$$

47. $y = (4t + 9)^{1/2}$

SOLUTION Let $y = (4t + 9)^{1/2}$. By the shifting and scaling rule,

$$\frac{dy}{dt} = 4\left(\frac{1}{2}\right)(4t + 9)^{-1/2} = 2(4t + 9)^{-1/2}.$$

48. $y = (z + 1)^4(2z - 1)^3$

SOLUTION Let $y = (z + 1)^4(2z - 1)^3$. Applying the product rule and the general power rule,

$$\begin{aligned}\frac{dy}{dz} &= (z + 1)^4(3(2z - 1)^2)(2) + (2z - 1)^3(4(z + 1)^3)(1) = (z + 1)^3(2z - 1)^2(6(z + 1) + 4(2z - 1)) \\ &= (z + 1)^3(2z - 1)^2(14z + 2).\end{aligned}$$

49. $y = (x^3 + \cos x)^{-4}$

SOLUTION Let $y = (x^3 + \cos x)^{-4}$. By the general power rule,

$$y' = -4(x^3 + \cos x)^{-5}(3x^2 - \sin x) = 4(\sin x - 3x^2)(x^3 + \cos x)^{-5}.$$

50. $y = \sin(\cos(\sin x))$

SOLUTION Let $y = \sin(\cos(\sin x))$. Applying the chain rule twice,

$$y' = \cos(\cos(\sin x)) \cdot (-\sin(\sin x)) \cdot \cos x = -\cos x\sin(\sin x)\cos(\cos(\sin x)).$$

51. $y = \sqrt{\sin x\cos x}$

SOLUTION We start by using a trig identity to rewrite

$$y = \sqrt{\sin x\cos x} = \sqrt{\frac{1}{2}\sin 2x} = \frac{1}{\sqrt{2}}(\sin 2x)^{1/2}.$$

Then, after two applications of the chain rule,

$$y' = \frac{1}{\sqrt{2}} \cdot \frac{1}{2}(\sin 2x)^{-1/2} \cdot \cos 2x \cdot 2 = \frac{\cos 2x}{\sqrt{2\sin 2x}}.$$

52. $y = (9 - (5 - 2x^4)^7)^3$

SOLUTION Let $y = (9 - (5 - 2x^4)^7)^3$. Applying the chain rule twice, we find

$$y' = 3(9 - (5 - 2x^4)^7)^2(-7(5 - 2x^4)^6)(-8x^3) = 168x^3(5 - 2x^4)^6(9 - (5 - 2x^4)^7)^2.$$

53. $y = (\cos 6x + \sin x^2)^{1/2}$

SOLUTION Let $y = (\cos 6x + \sin(x^2))^{1/2}$. Applying the general power rule followed by both the scaling and shifting rule and the chain rule,

$$y' = \frac{1}{2}\left(\cos 6x + \sin(x^2)\right)^{-1/2}\left(-\sin 6x \cdot 6 + \cos(x^2) \cdot 2x\right) = \frac{x\cos(x^2) - 3\sin 6x}{\sqrt{\cos 6x + \sin(x^2)}}.$$

54. $y = \dfrac{(x+1)^{1/2}}{x+2}$

SOLUTION Let $y = \frac{(x+1)^{1/2}}{x+2}$. Applying the quotient rule and the shifting and scaling rule, we get

$$\frac{dy}{dx} = \frac{(x+2)\frac{1}{2}(x+1)^{-1/2} - (x+1)^{1/2}}{(x+2)^2} = \frac{1}{2\sqrt{x+1}}\frac{(x+2) - 2(x+1)}{(x+2)^2} = -\frac{1}{2\sqrt{x+1}}\frac{x}{(x+2)^2}.$$

55. $y = \tan^3 x + \tan(x^3)$

SOLUTION Let $y = \tan^3 x + \tan(x^3) = (\tan x)^3 + \tan(x^3)$. Applying the general power rule to the first term and the chain rule to the second term,

$$y' = 3(\tan x)^2 \sec^2 x + \sec^2(x^3) \cdot 3x^2 = 3\left(x^2 \sec^2(x^3) + \sec^2 x \tan^2 x\right).$$

56. $y = \sqrt{4 - 3\cos x}$

SOLUTION Let $y = (4 - 3\cos x)^{1/2}$. By the general power rule,

$$y' = \frac{1}{2}(4 - 3\cos x)^{-1/2} \cdot 3\sin x = \frac{3\sin x}{2\sqrt{4 - 3\cos x}}.$$

57. $y = \sqrt{\dfrac{z+1}{z-1}}$

SOLUTION Let $y = \left(\dfrac{z+1}{z-1}\right)^{1/2}$. Applying the general power rule followed by the quotient rule,

$$\frac{dy}{dz} = \frac{1}{2}\left(\frac{z+1}{z-1}\right)^{-1/2} \cdot \frac{(z-1)\cdot 1 - (z+1)\cdot 1}{(z-1)^2} = \frac{-1}{\sqrt{z+1}\,(z-1)^{3/2}}.$$

58. $y = (\cos^3 x + 3\cos x + 7)^9$

SOLUTION Let $y = \left(\cos^3 x + 3\cos x + 7\right)^9$. Applying the general power rule followed by the sum rule, with the first term requiring the general power rule,

$$\begin{aligned}\frac{dy}{dx} &= 9\left(\cos^3 x + 3\cos x + 7\right)^8\left(3\cos^2 x \cdot (-\sin x) - 3\sin x\right)\\ &= -27\sin x\left(\cos^3 x + 3\cos x + 7\right)^8\left(1 + \cos^2 x\right).\end{aligned}$$

59. $y = \dfrac{\cos(1+x)}{1+\cos x}$

SOLUTION Let

$$y = \frac{\cos(1+x)}{1+\cos x}.$$

Then, applying the quotient rule and the shifting and scaling rule,

$$\begin{aligned}\frac{dy}{dx} &= \frac{-(1+\cos x)\sin(1+x) + \cos(1+x)\sin x}{(1+\cos x)^2} = \frac{\cos(1+x)\sin x - \cos x\sin(1+x) - \sin(1+x)}{(1+\cos x)^2}\\ &= \frac{\sin(-1) - \sin(1+x)}{(1+\cos x)^2}.\end{aligned}$$

The last line follows from the identity

$$\sin(A - B) = \sin A \cos B - \cos A \sin B$$

with $A = x$ and $B = 1 + x$.

60. $y = \sec(\sqrt{t^2 - 9})$

SOLUTION Let $y = \sec\left(\sqrt{t^2 - 9}\right)$. Applying the chain rule followed by the general power rule,

$$\frac{dy}{dt} = \sec\left(\sqrt{t^2 - 9}\right)\tan\left(\sqrt{t^2 - 9}\right) \cdot \frac{1}{2}\left(t^2 - 9\right)^{-1/2} \cdot 2t = \frac{t\sec\left(\sqrt{t^2 - 9}\right)\tan\left(\sqrt{t^2 - 9}\right)}{\sqrt{t^2 - 9}}.$$

61. $y = \cot^7(x^5)$

SOLUTION Let $y = \cot^7\left(x^5\right)$. Applying the general power rule followed by the chain rule,

$$\frac{dy}{dx} = 7\cot^6\left(x^5\right) \cdot \left(-\csc^2\left(x^5\right)\right) \cdot 5x^4 = -35x^4\cot^6\left(x^5\right)\csc^2\left(x^5\right).$$

62. $y = \dfrac{\cos(1/x)}{1 + x^2}$

SOLUTION Let $y = \frac{\cos(1/x)}{1+x^2} = \frac{\cos(x^{-1})}{1+x^2}$. Then, applying the quotient rule and the chain rule, we get:

$$\frac{dy}{dx} = \frac{(1 + x^2)(x^{-2}\sin(x^{-1})) - \cos(x^{-1})(2x)}{(1 + x^2)^2} = \frac{\sin(x^{-1}) - 2x\cos(x^{-1}) + x^{-2}\sin(x^{-1})}{(1 + x^2)^2}.$$

63. $y = \left(1 + \cot^5(x^4 + 1)\right)^9$

SOLUTION Let $y = \left(1 + \cot^5\left(x^4 + 1\right)\right)^9$. Applying the general power rule, the chain rule, and the general power rule in succession,

$$\begin{aligned}\frac{dy}{dx} &= 9\left(1 + \cot^5\left(x^4 + 1\right)\right)^8 \cdot 5\cot^4\left(x^4 + 1\right) \cdot \left(-\csc^2\left(x^4 + 1\right)\right) \cdot 4x^3 \\ &= -180x^3\cot^4\left(x^4 + 1\right)\csc^2\left(x^4 + 1\right)\left(1 + \cot^5\left(x^4 + 1\right)\right)^8.\end{aligned}$$

64. $y = 4e^{-x} + 7e^{-2x}$

SOLUTION Let $y = 4e^{-x} + 7e^{-2x}$. Using the chain rule twice, once for each exponential function, we obtain

$$\frac{dy}{dx} = -4e^{-x} - 14e^{-2x}.$$

65. $y = (2e^{3x} + 3e^{-2x})^4$

SOLUTION Let $y = (2e^{3x} + 3e^{-2x})^4$. Applying the general power rule followed by two applications of the chain rule, one for each exponential function, we find

$$\frac{dy}{dx} = 4(2e^{3x} + 3e^{-2x})^3(6e^{3x} - 6e^{-2x}) = 24(2e^{3x} + 3e^{-2x})^3(e^{3x} - e^{-2x}).$$

66. $y = \cos(te^{-2t})$

SOLUTION Let $y = \cos(te^{-2t})$. Applying the chain rule and the product rule, we have

$$\frac{dy}{dt} = -\sin(te^{-2t})\left(-2te^{-2t} + e^{-2t}\right) = e^{-2t}(2t - 1)\sin(te^{-2t}).$$

67. $y = e^{(x^2+2x+3)^2}$

SOLUTION Let $y = e^{(x^2+2x+3)^2}$. By the chain rule and the general power rule, we obtain

$$\frac{dy}{dx} = e^{(x^2+2x+3)^2} \cdot 2(x^2 + 2x + 3)(2x + 2) = 4(x + 1)(x^2 + 2x + 3)e^{(x^2+2x+3)^2}.$$

68. $y = e^{e^x}$

SOLUTION Let $y = e^{e^x}$. Applying the chain rule, we have

$$\frac{dy}{dx} = e^{e^x} e^x.$$

69. $y = \sqrt{1 + \sqrt{1 + \sqrt{x}}}$

SOLUTION Let $y = \left(1 + \left(1 + x^{1/2}\right)^{1/2}\right)^{1/2}$. Applying the general power rule twice,

$$\frac{dy}{dx} = \frac{1}{2}\left(1 + \left(1 + x^{1/2}\right)^{1/2}\right)^{-1/2} \cdot \frac{1}{2}\left(1 + x^{1/2}\right)^{-1/2} \cdot \frac{1}{2}x^{-1/2} = \frac{1}{8\sqrt{x}\sqrt{1+\sqrt{x}}\sqrt{1+\sqrt{1+\sqrt{x}}}}.$$

70. $y = \sqrt{\sqrt{x+1} + 1}$

SOLUTION Let $y = \left(1 + (x+1)^{1/2}\right)^{1/2}$. Applying the general power rule twice,

$$\frac{dy}{dx} = \frac{1}{2}\left(1 + (x+1)^{1/2}\right)^{-1/2} \cdot \frac{1}{2}(x+1)^{-1/2} \cdot 1 = \frac{1}{4\sqrt{x+1}\sqrt{1+\sqrt{x+1}}}.$$

71. $y = (kx + b)^{-1/3}$; k and b any constants

SOLUTION Let $y = (kx + b)^{-1/3}$, where b and k are constants. By the scaling and shifting rule,

$$y' = -\frac{1}{3}(kx + b)^{-4/3} \cdot k = -\frac{k}{3}(kx + b)^{-4/3}.$$

72. $y = \dfrac{1}{\sqrt{kt^4 + b}}$; k, b constants, not both zero

SOLUTION Let $y = \left(kt^4 + b\right)^{-1/2}$, where b and k are constants. By the chain rule,

$$y' = -\frac{1}{2}\left(kt^4 + b\right)^{-3/2} \cdot 4kt^3 = -\frac{2kt^3}{\left(kt^4 + b\right)^{3/2}}.$$

In Exercises 73–76, compute the higher derivative.

73. $\dfrac{d^2}{dx^2}\sin(x^2)$

SOLUTION Let $f(x) = \sin\left(x^2\right)$. Then, by the chain rule, $f'(x) = 2x\cos\left(x^2\right)$ and, by the product rule and the chain rule,

$$f''(x) = 2x\left(-\sin\left(x^2\right) \cdot 2x\right) + 2\cos\left(x^2\right) = 2\cos\left(x^2\right) - 4x^2\sin\left(x^2\right).$$

74. $\dfrac{d^2}{dx^2}(x^2 + 9)^5$

SOLUTION Let $f(x) = (x^2 + 9)^5$. Then, by the general power rule,

$$f'(x) = 5(x^2 + 9)^4 \cdot 2x = 10x(x^2 + 9)^4$$

and, by the product rule and the general power rule,

$$f''(x) = 10x \cdot 4(x^2 + 9)^3 \cdot 2x + 10(x^2 + 9)^4 = 80x^2(x^2 + 9)^3 + 10(x^2 + 9)^4.$$

75. $\dfrac{d^3}{dx^3}(9-x)^8$

SOLUTION Let $f(x) = (9-x)^8$. Then, by repeated use of the scaling and shifting rule,

$$f'(x) = 8(9-x)^7 \cdot (-1) = -8(9-x)^7$$
$$f''(x) = -56(9-x)^6 \cdot (-1) = 56(9-x)^6,$$
$$f'''(x) = 336(9-x)^5 \cdot (-1) = -336(9-x)^5.$$

76. $\dfrac{d^3}{dx^3}\sin(2x)$

SOLUTION Let $f(x) = \sin(2x)$. Then, by repeated use of the scaling and shifting rule,

$$f'(x) = 2\cos(2x)$$
$$f''(x) = -4\sin(2x)$$
$$f'''(x) = -8\cos(2x).$$

77. The average molecular velocity v of a gas in a certain container is given by $v = 29\sqrt{T}$ m/s, where T is the temperature in kelvins. The temperature is related to the pressure (in atmospheres) by $T = 200P$. Find $\left.\dfrac{dv}{dP}\right|_{P=1.5}$.

SOLUTION First note that when $P = 1.5$ atmospheres, $T = 200(1.5) = 300$K. Thus,

$$\left.\frac{dv}{dP}\right|_{P=1.5} = \left.\frac{dv}{dT}\right|_{T=300} \cdot \left.\frac{dT}{dP}\right|_{P=1.5} = \frac{29}{2\sqrt{300}} \cdot 200 = \frac{290\sqrt{3}}{3} \frac{\text{m}}{\text{s} \cdot \text{atmospheres}}.$$

Alternately, substituting $T = 200P$ into the equation for v gives $v = 290\sqrt{2P}$. Therefore,

$$\frac{dv}{dP} = \frac{290\sqrt{2}}{2\sqrt{P}} = \frac{290}{\sqrt{2P}},$$

so

$$\left.\frac{dv}{dP}\right|_{P=1.5} = \frac{290}{\sqrt{3}} = \frac{290\sqrt{3}}{3} \frac{\text{m}}{\text{s} \cdot \text{atmospheres}}.$$

78. The power P in a circuit is $P = Ri^2$, where R is the resistance and i is the current. Find dP/dt at $t = \frac{1}{3}$ if $R = 1000\ \Omega$ and i varies according to $i = \sin(4\pi t)$ (time in seconds).

SOLUTION $\left.\dfrac{d}{dt}\left(Ri^2\right)\right|_{t=1/3} = 2Ri\left.\dfrac{di}{dt}\right|_{t=2} = 2(1000)4\pi\sin(4\pi t)\cos(4\pi t)|_{t=1/3} = 2000\pi\sqrt{3}.$

79. An expanding sphere has radius $r = 0.4t$ cm at time t (in seconds). Let V be the sphere's volume. Find dV/dt when (a) $r = 3$ and (b) $t = 3$.

SOLUTION Let $r = 0.4t$, where t is in seconds (s) and r is in centimeters (cm). With $V = \frac{4}{3}\pi r^3$, we have

$$\frac{dV}{dr} = 4\pi r^2.$$

Thus

$$\frac{dV}{dt} = \frac{dV}{dr}\frac{dr}{dt} = 4\pi r^2 \cdot (0.4) = 1.6\pi r^2.$$

(a) When $r = 3$, $\dfrac{dV}{dt} = 1.6\pi(3)^2 \approx 45.24$ cm/s.

(b) When $t = 3$, we have $r = 1.2$. Hence $\dfrac{dV}{dt} = 1.6\pi(1.2)^2 \approx 7.24$ cm/s.

80. A 2005 study by the Fisheries Research Services in Aberdeen, Scotland, suggests that the average length of the species *Clupea harengus* (Atlantic herring) as a function of age t (in years) can be modeled by $L(t) = 32(1 - e^{-0.37t})$ cm for $0 \le t \le 13$. See Figure 2.

(a) How fast is the length changing at age $t = 6$ years?

(b) At what age is the length changing at a rate of 5 cm/yr?

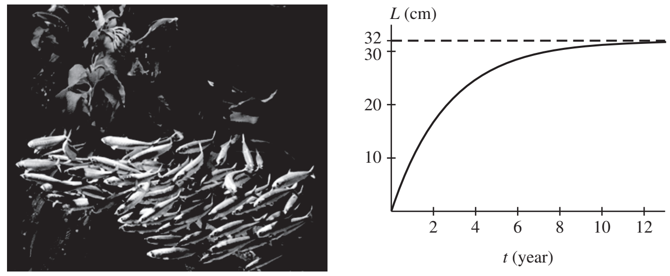

FIGURE 2 Average length of the species *Clupea harengus*

SOLUTION Let $L(t) = 32(1 - e^{-0.37t})$. Then

$$L'(t) = 32(0.37)e^{-0.37t} = 11.84e^{-0.37t}.$$

(a) At age $t = 6$,

$$L'(t) = 11.84e^{-0.37(6)} = 11.84e^{-2.22} \approx 1.29 \text{ cm/yr}.$$

(b) The length will be changing at a rate of 5 cm/yr when

$$11.84e^{-0.37t} = 5.$$

Solving for t yields

$$t = -\frac{1}{0.37}\ln\frac{5}{11.84} \approx 2.33 \text{ years}.$$

81. A 1999 study by Starkey and Scarnecchia developed the following model for the average weight (in kilograms) at age t (in years) of channel catfish in the Lower Yellowstone River (Figure 3):

$$W(t) = (3.46293 - 3.32173e^{-0.03456t})^{3.4026}$$

Find the rate at which weight is changing at age $t = 10$.

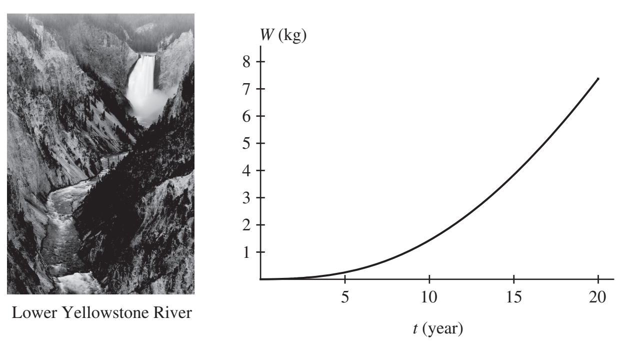

FIGURE 3 Average weight of channel catfish at age t

SOLUTION Let $W(t) = (3.46293 - 3.32173e^{-0.03456t})^{3.4026}$. Then

$$\begin{aligned} W'(t) &= 3.4026(3.46293 - 3.32173e^{-0.03456t})^{2.4026}(3.32173)(0.03456)e^{-0.03456t} \\ &= 0.3906(3.46293 - 3.32173e^{-0.03456t})^{2.4026}e^{-0.03456t}. \end{aligned}$$

At age $t = 10$,

$$W'(10) = 0.3906(1.1118)^{2.4026}(0.7078) \approx 0.3566 \text{ kg/yr}.$$

82. The functions in Exercises 80 and 81 are examples of the **von Bertalanffy growth function**

$$M(t) = \left(a + (b - a)e^{kmt}\right)^{1/m} \qquad (m \neq 0)$$

introduced in the 1930s by Austrian-born biologist Karl Ludwig von Bertalanffy. Calculate $M'(0)$ in terms of the constants a, b, k and m.

SOLUTION Let

$$M(t) = \left(a + (b-a)e^{kmt}\right)^{1/m} \qquad (m \neq 0).$$

Then

$$M'(t) = \frac{1}{m}(a + (b-a)e^{kmt})^{1/m-1} km(b-a)e^{kmt} = k(b-a)e^{kmt}(a + (b-a)e^{kmt})^{1/m-1},$$

and

$$M'(0) = k(b-a)e^{0}(a + (b-a)e^{0})^{1/m-1} = k(b-a)b^{1/m-1}.$$

83. With notation as in Example 7, calculate

(a) $\left.\dfrac{d}{d\theta} \underline{\sin}\,\theta\right|_{\theta=60^\circ}$ **(b)** $\left.\dfrac{d}{d\theta}\left(\theta + \underline{\tan}\,\theta\right)\right|_{\theta=45^\circ}$

SOLUTION

(a) $\left.\dfrac{d}{d\theta} \underline{\sin}\,\theta\right|_{\theta=60^\circ} = \left.\dfrac{d}{d\theta} \sin\left(\dfrac{\pi}{180}\theta\right)\right|_{\theta=60^\circ} = \left(\dfrac{\pi}{180}\right)\cos\left(\dfrac{\pi}{180}(60)\right) = \dfrac{\pi}{180}\dfrac{1}{2} = \dfrac{\pi}{360}.$

(b) $\left.\dfrac{d}{d\theta}\left(\theta + \underline{\tan}\,\theta\right)\right|_{\theta=45^\circ} = \left.\dfrac{d}{d\theta}\left(\theta + \tan\left(\dfrac{\pi}{180}\theta\right)\right)\right|_{\theta=45^\circ} = 1 + \dfrac{\pi}{180}\sec^2\left(\dfrac{\pi}{4}\right) = 1 + \dfrac{\pi}{90}.$

84. Assume that

$$f(0) = 2, \quad f'(0) = 3, \quad h(0) = -1, \quad h'(0) = 7$$

Calculate the derivatives of the following functions at $x = 0$:

(a) $(f(x))^3$ **(b)** $f(7x)$ **(c)** $f(4x)h(5x)$

SOLUTION

(a) Let $g(x) = (f(x))^3$. Then

$$g'(0) = 3(f(0))^2(f'(0)) = 12(3) = 36.$$

(b) Let $g(x) = f(7x)$. Then

$$g'(0) = 7f'(7(0)) = 21.$$

(c) Let $F(x) = f(4x)h(5x)$. Then $F'(x) = 4f'(4x)h(5x) + 5f(4x)h'(5x)$ and

$$F'(0) = 4(3)(-1) + 5(2)(7) = 58.$$

85. Compute the derivative of $h(\sin x)$ at $x = \frac{\pi}{6}$, assuming that $h'(0.5) = 10$.

SOLUTION Let $u = \sin x$ and suppose that $h'(0.5) = 10$. Then

$$\frac{d}{dx}(h(u)) = \frac{dh}{du}\frac{du}{dx} = \frac{dh}{du}\cos x.$$

When $x = \frac{\pi}{6}$, we have $u = .5$. Accordingly, the derivative of $h(\sin x)$ at $x = \frac{\pi}{6}$ is $10\cos\left(\frac{\pi}{6}\right) = 5\sqrt{3}$.

86. Let $F(x) = f(g(x))$, where the graphs of f and g are shown in Figure 4. Estimate $g'(2)$ and $f'(g(2))$ and compute $F'(2)$.

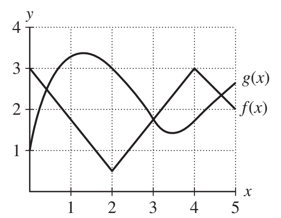

FIGURE 4

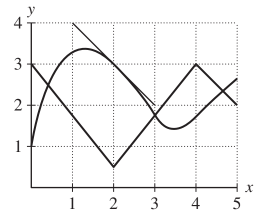
SOLUTION After sketching an approximate tangent line to g at $x = 2$ (see the figure below), we estimate $g'(2) = -1$. It appears from the graph that $g(2) = 3$ and $f'(3) = \frac{5}{4}$ (since between $x = 2$ and $x = 4$ the graph of f appears to be linear with slope $\frac{5}{4}$). Thus,

$$F'(2) = f'(g(2))g'(2) = \frac{5}{4}(-1) = -1.25.$$



In Exercises 87–90, use the table of values to calculate the derivative of the function at the given point.

x	1	4	6
$f(x)$	4	0	6
$f'(x)$	5	7	4
$g(x)$	4	1	6
$g'(x)$	5	$\frac{1}{2}$	3

87. $f(g(x)), \quad x = 6$

SOLUTION $\left.\frac{d}{dx} f(g(x))\right|_{x=6} = f'(g(6))g'(6) = f'(6)g'(6) = 4 \times 3 = 12.$

88. $e^{f(x)}, \quad x = 4$

SOLUTION $\left.\frac{d}{dx} e^{f(x)}\right|_{x=4} = e^{f(4)} f'(4) = e^0(7) = 7.$

89. $g(\sqrt{x}), \quad x = 16$

SOLUTION $\left.\frac{d}{dx} g(\sqrt{x})\right|_{x=16} = g'(4)\left(\frac{1}{2}\right)(1/\sqrt{16}) = \left(\frac{1}{2}\right)\left(\frac{1}{2}\right)\left(\frac{1}{4}\right) = \frac{1}{16}.$

90. $f(2x + g(x)), \quad x = 1$

SOLUTION $\left.\frac{d}{dx} f(2x + g(x))\right|_{x=1} = f'(2(1) + g(1))(2 + g'(1)) = f'(2 + 4)(7) = 4(7) = 28.$

91. The price (in dollars) of a computer component is $P = 2C - 18C^{-1}$, where C is the manufacturer's cost to produce it. Assume that cost at time t (in years) is $C = 9 + 3t^{-1}$. Determine the rate of change of price with respect to time at $t = 3$.

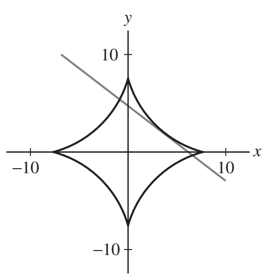
SOLUTION $\frac{dC}{dt} = -3t^{-2}$. $C(3) = 10$ and $C'(3) = -\frac{1}{3}$, so we compute:

$$\left.\frac{dP}{dt}\right|_{t=3} = 2C'(3) + \frac{18}{(C(3))^2} C'(3) = -\frac{2}{3} + \frac{18}{100}\left(-\frac{1}{3}\right) = -0.727 \ \frac{\text{dollars}}{\text{year}}.$$

92. $\boxed{\text{GU}}$ Plot the "astroid" $y = (4 - x^{2/3})^{3/2}$ for $0 \le x \le 8$. Show that the part of every tangent line in the first quadrant has a constant length 8.

SOLUTION

- Here is a graph of the astroid.



- Let $f(x) = (4 - x^{2/3})^{3/2}$. Then

$$f'(x) = \frac{3}{2}(4 - x^{2/3})^{1/2}\left(-\frac{2}{3}x^{-1/3}\right) = -\frac{\sqrt{4 - x^{2/3}}}{x^{1/3}},$$

and the tangent line to f at $x = a$ is

$$y = -\frac{\sqrt{4 - a^{2/3}}}{a^{1/3}}(x - a) + \left(4 - a^{2/3}\right)^{3/2}.$$

The y-intercept of this line is the point $P = \left(0, 4\sqrt{4 - a^{2/3}}\right)$, its x-intercept is the point $Q = \left(4a^{1/3}, 0\right)$, and the distance between P and Q is 8.

93. According to the U.S. standard atmospheric model, developed by the National Oceanic and Atmospheric Administration for use in aircraft and rocket design, atmospheric temperature T (in degrees Celsius), pressure P (kPa $= 1{,}000$ pascals), and altitude h (in meters) are related by these formulas (valid in the troposphere $h \le 11{,}000$):

$$T = 15.04 - 0.000649h, \qquad P = 101.29 + \left(\frac{T + 273.1}{288.08}\right)^{5.256}$$

Use the Chain Rule to calculate dP/dh. Then estimate the change in P (in pascals, Pa) per additional meter of altitude when $h = 3{,}000$.

SOLUTION

$$\frac{dP}{dT} = 5.256\left(\frac{T + 273.1}{288.08}\right)^{4.256}\left(\frac{1}{288.08}\right) = 6.21519 \times 10^{-13}\,(273.1 + T)^{4.256}$$

and $\frac{dT}{dh} = -0.000649°\text{C/m}$. $\frac{dP}{dh} = \frac{dP}{dT}\frac{dT}{dh}$, so

$$\frac{dP}{dh} = \left(6.21519 \times 10^{-13}\,(273.1 + T)^{4.256}\right)(-0.000649) = -4.03366 \times 10^{-16}\,(288.14 - 0.000649\,h)^{4.256}.$$

When $h = 3000$,

$$\frac{dP}{dh} = -4.03366 \times 10^{-16}(286.193)^{4.256} = -1.15 \times 10^{-5}\ \text{kPa/m};$$

therefore, for each additional meter of altitude,

$$\Delta P \approx -1.15 \times 10^{-5}\ \text{kPa} = -1.15 \times 10^{-2}\ \text{Pa}.$$

94. Climate scientists use the **Stefan-Boltzmann Law** $R = \sigma T^4$ to estimate the change in the earth's average temperature T (in kelvins) caused by a change in the radiation R (in joules per square meter per second) that the earth receives from the sun. Here $\sigma = 5.67 \times 10^{-8}\ \text{Js}^{-1}\text{m}^{-2}\text{K}^{-4}$. Calculate dR/dt, assuming that $T = 283$ and $\frac{dT}{dt} = 0.05$ K/yr. What are the units of the derivative?

SOLUTION By the Chain Rule,

$$\frac{dR}{dt} = \frac{dR}{dT} \cdot \frac{dT}{dt} = 4\sigma T^3 \frac{dT}{dt}.$$

Assuming $T = 283$ K and $\frac{dT}{dt} = 0.05$ K/yr, it follows that

$$\frac{dR}{dt} = 4\sigma(283^3)(0.05) \approx 0.257\ \text{Js}^{-1}\text{m}^{-2}/\text{yr}$$

95. In the setting of Exercise 94, calculate the yearly rate of change of T if $T = 283$ K and R increases at a rate of 0.5 $\text{Js}^{-1}\text{m}^{-2}$ per year.

SOLUTION By the Chain Rule,

$$\frac{dR}{dt} = \frac{dR}{dT} \cdot \frac{dT}{dt} = 4\sigma T^3 \frac{dT}{dt}.$$

Assuming $T = 283$ K and $\frac{dR}{dt} = 0.5\ \text{Js}^{-1}\text{m}^{-2}$ per year, it follows that author:

$$0.5 = 4\sigma(283)^3\frac{dT}{dt} \Rightarrow \frac{dT}{dt} = \frac{0.5}{4\sigma(283)^3} \approx 0.0973\ \text{kelvins/yr}$$

96. CAS Use a computer algebra system to compute $f^{(k)}(x)$ for $k = 1, 2, 3$ for the following functions:

(a) $f(x) = \cot(x^2)$ **(b)** $f(x) = \sqrt{x^3 + 1}$

SOLUTION

(a) Let $f(x) = \cot(x^2)$. Using a computer algebra system,

$$f'(x) = -2x\csc^2(x^2);$$
$$f''(x) = 2\csc^2(x^2)(4x^2\cot(x^2) - 1); \text{ and}$$
$$f'''(x) = -8x\csc^2(x^2)\left(6x^2\cot^2(x^2) - 3\cot(x^2) + 2x^2\right).$$

(b) Let $f(x) = \sqrt{x^3 + 1}$. Using a computer algebra system,

$$f'(x) = \frac{3x^2}{2\sqrt{x^3+1}};$$
$$f''(x) = \frac{3x(x^3+4)}{4(x^3+1)^{3/2}}; \text{ and}$$
$$f'''(x) = -\frac{3(x^6+20x^3-8)}{8(x^3+1)^{5/2}}.$$

97. Use the Chain Rule to express the second derivative of $f \circ g$ in terms of the first and second derivatives of f and g.

SOLUTION Let $h(x) = f(g(x))$. Then

$$h'(x) = f'(g(x))g'(x)$$

and

$$h''(x) = f'(g(x))g''(x) + g'(x)f''(g(x))g'(x) = f'(g(x))g''(x) + f''(g(x))\left(g'(x)\right)^2.$$

98. Compute the second derivative of $\sin(g(x))$ at $x = 2$, assuming that $g(2) = \frac{\pi}{4}$, $g'(2) = 5$, and $g''(2) = 3$.

SOLUTION Let $f(x) = \sin(g(x))$. Then $f'(x) = \cos(g(x))g'(x)$ and

$$f''(x) = \cos(g(x))g''(x) + g'(x)(-\sin(g(x)))g'(x) = \cos(g(x))g''(x) - (g'(x))^2\sin(g(x)).$$

Therefore,

$$f''(2) = g''(2)\cos(g(2)) - \left(g'(2)\right)^2\sin(g(2)) = 3\cos\left(\tfrac{\pi}{4}\right) - (5)^2\sin\left(\tfrac{\pi}{4}\right) = -22\cdot\frac{\sqrt{2}}{2} = -11\sqrt{2}$$

Further Insights and Challenges

99. Show that if f, g, and h are differentiable, then

$$[f(g(h(x)))]' = f'(g(h(x)))g'(h(x))h'(x)$$

SOLUTION Let f, g, and h be differentiable. Let $u = h(x)$, $v = g(u)$, and $w = f(v)$. Then

$$\frac{dw}{dx} = \frac{df}{dv}\frac{dv}{dx} = \frac{df}{dv}\frac{dg}{du}\frac{du}{dx} = f'(g(h(x))g'(h(x))h'(x)$$

100. Show that differentiation reverses parity: If f is even, then f' is odd, and if f is odd, then f' is even. *Hint:* Differentiate $f(-x)$.

SOLUTION A function is *even* if $f(-x) = f(x)$ and *odd* if $f(-x) = -f(x)$. By the chain rule, $\frac{d}{dx}f(-x) = -f'(-x)$. Now suppose that f is even. Then $f(-x) = f(x)$ and

$$\frac{d}{dx}f(-x) = \frac{d}{dx}f(x) = f'(x).$$

Hence, when f is even, $-f'(-x) = f'(x)$ or $f'(-x) = -f'(x)$ and f' is odd. On the other hand, suppose f is odd. Then $f(-x) = -f(x)$ and

$$\frac{d}{dx}f(-x) = -\frac{d}{dx}f(x) = -f'(x).$$

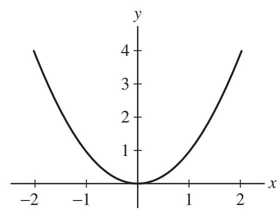
Hence, when f is odd, $-f'(-x) = -f'(x)$ or $f'(-x) = f'(x)$ and f' is even.

101. (a) Sketch a graph of any even function $f(x)$ and explain graphically why $f'(x)$ is odd.

(b) Suppose that $f'(x)$ is even. Is $f(x)$ necessarily odd? *Hint:* Check whether this is true for linear functions.

SOLUTION

(a) The graph of an even function is symmetric with respect to the y-axis. Accordingly, its image in the left half-plane is a mirror reflection of that in the right half-plane through the y-axis. If at $x = a \geq 0$, the slope of f exists and is equal to m, then by reflection its slope at $x = -a \leq 0$ is $-m$. That is, $f'(-a) = -f'(a)$. *Note:* This means that if $f'(0)$ exists, then it equals 0.



(b) Suppose that f' is even. Then f is not necessarily odd. Let $f(x) = 4x + 7$. Then $f'(x) = 4$, an even function. But f is not odd. For example, $f(2) = 15$, $f(-2) = -1$, but $f(-2) \neq -f(2)$.

102. Power Rule for Fractional Exponents Let $f(u) = u^q$ and $g(x) = x^{p/q}$. Assume that $g(x)$ is differentiable.

(a) Show that $f(g(x)) = x^p$ (recall the laws of exponents).

(b) Apply the Chain Rule and the Power Rule for whole-number exponents to show that $f'(g(x))\,g'(x) = px^{p-1}$.

(c) Then derive the Power Rule for $x^{p/q}$.

SOLUTION

(a) Let $f(u) = u^q$ and $g(x) = x^{p/q}$, where q is a positive integer and p is an integer. Then

$$f(g(x)) = f\left(x^{p/q}\right) = \left(x^{p/q}\right)^q = x^p.$$

(b) Differentiating both sides of the final expression in part (a), applying the chain rule on the left and the power rule for whole number exponents on the right, it follows that

$$f'(g(x))g'(x) = px^{p-1}.$$

(c) Thus

$$g'(x) = \frac{px^{p-1}}{f'(g(x))} = \frac{px^{p-1}}{q\left(x^{p/q}\right)^{q-1}} = \frac{px^{p-1}}{qx^{p-p/q}} = \frac{p}{q}x^{p/q-1}.$$

103. Prove that for all whole numbers $n \geq 1$,

$$\frac{d^n}{dx^n}\sin x = \sin\left(x + \frac{n\pi}{2}\right)$$

Hint: Use the identity $\cos x = \sin\left(x + \frac{\pi}{2}\right)$.

SOLUTION We will proceed by induction on n. For $n = 1$, we find

$$\frac{d}{dx}\sin x = \cos x = \sin\left(x + \frac{\pi}{2}\right),$$

as required. Now, suppose that for some positive integer k,

$$\frac{d^k}{dx^k}\sin x = \sin\left(x + \frac{k\pi}{2}\right).$$

Then

$$\begin{aligned}\frac{d^{k+1}}{dx^{k+1}}\sin x &= \frac{d}{dx}\sin\left(x + \frac{k\pi}{2}\right)\\ &= \cos\left(x + \frac{k\pi}{2}\right) = \sin\left(x + \frac{(k+1)\pi}{2}\right).\end{aligned}$$

104. A Discontinuous Derivative Use the limit definition to show that $g'(0)$ exists but $g'(0) \neq \lim_{x\to 0} g'(x)$, where

$$g(x) = \begin{cases} x^2 \sin \dfrac{1}{x} & x \neq 0 \\ 0 & x = 0 \end{cases}$$

SOLUTION Using the limit definition,

$$g'(0) = \lim_{h\to 0} \frac{g(0+h) - g(0)}{h} = \lim_{h\to 0} \frac{h^2 \sin\left(\frac{1}{h}\right) - 0}{h} = \lim_{h\to 0} h \sin\left(\frac{1}{h}\right) = 0,$$

where we have used the squeeze theorem in the last step. Now, for $x \neq 0$,

$$g'(x) = x^2\left(-\frac{1}{x^2}\right)\cos\left(\frac{1}{x}\right) + 2x\sin\left(\frac{1}{x}\right) = 2x\sin\left(\frac{1}{x}\right) - \cos\left(\frac{1}{x}\right).$$

Although the first term in g' has a limit of 0 as $x \to 0$ (by the squeeze theorem), the limit as $x \to 0$ of the second term does not exist. Hence, $\lim_{x\to 0} g'(x)$ does not exist, so $g'(0) \neq \lim_{x\to 0} g'(x)$.

105. Chain Rule This exercise proves the Chain Rule without the special assumption made in the text. For any number b, define a new function

$$F(u) = \frac{f(u) - f(b)}{u - b} \quad \text{for all } u \neq b$$

(a) Show that if we define $F(b) = f'(b)$, then $F(u)$ is continuous at $u = b$.

(b) Take $b = g(a)$. Show that if $x \neq a$, then for all u,

$$\frac{f(u) - f(g(a))}{x - a} = F(u)\frac{u - g(a)}{x - a} \tag{2}$$

Note that both sides are zero if $u = g(a)$.

(c) Substitute $u = g(x)$ in Eq. (2) to obtain

$$\frac{f(g(x)) - f(g(a))}{x - a} = F(g(x))\,\frac{g(x) - g(a)}{x - a}$$

Derive the Chain Rule by computing the limit of both sides as $x \to a$.

SOLUTION For any differentiable function f and any number b, define

$$F(u) = \frac{f(u) - f(b)}{u - b}$$

for all $u \neq b$.

(a) Define $F(b) = f'(b)$. Then

$$\lim_{u\to b} F(u) = \lim_{u\to b} \frac{f(u) - f(b)}{u - b} = f'(b) = F(b),$$

i.e., $\lim_{u\to b} F(u) = F(b)$. Therefore, F is continuous at $u = b$.

(b) Let g be a differentiable function and take $b = g(a)$. Let x be a number distinct from a. If we substitute $u = g(a)$ into Eq. (2), both sides evaluate to 0, so equality is satisfied. On the other hand, if $u \neq g(a)$, then

$$\frac{f(u) - f(g(a))}{x - a} = \frac{f(u) - f(g(a))}{u - g(a)}\,\frac{u - g(a)}{x - a} = \frac{f(u) - f(b)}{u - b}\,\frac{u - g(a)}{x - a} = F(u)\,\frac{u - g(a)}{x - a}.$$

(c) Hence for all u, we have

$$\frac{f(u) - f(g(a))}{x - a} = F(u)\,\frac{u - g(a)}{x - a}.$$

(d) Substituting $u = g(x)$ in Eq. (2), we have

$$\frac{f(g(x)) - f(g(a))}{x - a} = F(g(x))\,\frac{g(x) - g(a)}{x - a}.$$

Letting $x \to a$ gives

$$\lim_{x\to a} \frac{f(g(x)) - f(g(a))}{x-a} = \lim_{x\to a} \left(F(g(x)) \frac{g(x)-g(a)}{x-a} \right) = F(g(a))g'(a) = F(b)g'(a) = f'(b)g'(a)$$
$$= f'(g(a))g'(a)$$

Therefore $(f \circ g)'(a) = f'(g(a))g'(a)$, which is the Chain Rule.

3.8 Derivatives of Inverse Functions

Preliminary Questions

1. What is the slope of the line obtained by reflecting the line $y = \frac{x}{2}$ through the line $y = x$?

SOLUTION The line obtained by reflecting the line $y = x/2$ through the line $y = x$ has slope 2.

2. Suppose that $P = (2, 4)$ lies on the graph of $f(x)$ and that the slope of the tangent line through P is $m = 3$. Assuming that $f^{-1}(x)$ exists, what is the slope of the tangent line to the graph of $f^{-1}(x)$ at the point $Q = (4, 2)$?

SOLUTION The tangent line to the graph of $f^{-1}(x)$ at the point $Q = (4, 2)$ has slope $\frac{1}{3}$.

3. Which inverse trigonometric function $g(x)$ has the derivative $g'(x) = \dfrac{1}{x^2+1}$?

SOLUTION $g(x) = \tan^{-1} x$ has the derivative $g'(x) = \dfrac{1}{x^2+1}$.

4. What does the following identity tell us about the derivatives of $\sin^{-1} x$ and $\cos^{-1} x$?

$$\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}$$

SOLUTION Angles whose sine and cosine are x are complementary.

Exercises

1. Find the inverse $g(x)$ of $f(x) = \sqrt{x^2+9}$ with domain $x \ge 0$ and calculate $g'(x)$ in two ways: using Theorem 1 and by direct calculation.

SOLUTION To find a formula for $g(x) = f^{-1}(x)$, solve $y = \sqrt{x^2+9}$ for x. This yields $x = \pm\sqrt{y^2-9}$. Because the domain of f was restricted to $x \ge 0$, we must choose the positive sign in front of the radical. Thus

$$g(x) = f^{-1}(x) = \sqrt{x^2-9}.$$

Because $x^2 + 9 \ge 9$ for all x, it follows that $f(x) \ge 3$ for all x. Thus, the domain of $g(x) = f^{-1}(x)$ is $x \ge 3$. The range of g is the restricted domain of f: $y \ge 0$.

By Theorem 1,

$$g'(x) = \frac{1}{f'(g(x))}.$$

With

$$f'(x) = \frac{x}{\sqrt{x^2+9}},$$

it follows that

$$f'(g(x)) = \frac{\sqrt{x^2-9}}{\sqrt{(\sqrt{x^2-9})^2+9}} = \frac{\sqrt{x^2-9}}{\sqrt{x^2}} = \frac{\sqrt{x^2-9}}{x}$$

since the domain of g is $x \ge 3$. Thus,

$$g'(x) = \frac{1}{f'(g(x))} = \frac{x}{\sqrt{x^2-9}}.$$

This agrees with the answer we obtain by differentiating directly:

$$g'(x) = \frac{2x}{2\sqrt{x^2-9}} = \frac{x}{\sqrt{x^2-9}}.$$

2. Let $g(x)$ be the inverse of $f(x) = x^3 + 1$. Find a formula for $g(x)$ and calculate $g'(x)$ in two ways: using Theorem 1 and then by direct calculation.

SOLUTION To find $g(x)$, we solve $y = x^3 + 1$ for x:

$$y - 1 = x^3$$
$$x = (y-1)^{1/3}$$

Therefore, the inverse is $g(x) = (x-1)^{1/3}$.

We have $f'(x) = 3x^2$. According to Theorem 1,

$$g'(x) = \frac{1}{f'(g(x))} = \frac{1}{3g(x)^2} = \frac{1}{3(x-1)^{2/3}} = \frac{1}{3}(x-1)^{-2/3}$$

This agrees with the answer we obtain by differentiating directly:

$$\frac{d}{dx}(x-1)^{1/3} = \tfrac{1}{3}(x-1)^{-2/3}.$$

In Exercises 3–8, use Theorem 1 to calculate $g'(x)$, where $g(x)$ is the inverse of $f(x)$.

3. $f(x) = 7x + 6$

SOLUTION Let $f(x) = 7x + 6$ then $f'(x) = 7$. Solving $y = 7x + 6$ for x and switching variables, we obtain the inverse $g(x) = (x-6)/7$. Thus,

$$g'(x) = \frac{1}{f'(g(x))} = \frac{1}{7}.$$

4. $f(x) = \sqrt{3-x}$

SOLUTION Let $f(x) = (3-x)^{1/2}$. Then

$$f'(x) = \frac{1}{2}(3-x)^{-1/2}(-1) = \frac{-1}{2(3-x)^{1/2}}.$$

Solving $y = \sqrt{3-x}$ for x and switching variables, we obtain the inverse $g(x) = 3 - x^2$. Thus,

$$g'(x) = 1\Bigg/\frac{-1}{2(3-3+x^2)^{1/2}} = -2x,$$

where we have used the fact that the domain of g is $x \ge 0$ to write $\sqrt{x^2} = x$.

5. $f(x) = x^{-5}$

SOLUTION Let $f(x) = x^{-5}$, then $f'(x) = -5x^{-6}$. Solving $y = x^{-5}$ for x and switching variables, we obtain the inverse $g(x) = x^{-1/5}$. Thus,

$$g'(x) = \frac{1}{-5(x^{-1/5})^{-6}} = -\frac{1}{5}x^{-6/5}.$$

6. $f(x) = 4x^3 - 1$

SOLUTION Let $f(x) = 4x^3 - 1$, then $f'(x) = 12x^2$. Solving $y = 4x^3 - 1$ for x and switching variables, we obtain the inverse $g(x) = (\frac{x+1}{4})^{1/3}$. Thus,

$$g'(x) = \frac{1}{12}\left(\frac{x+1}{4}\right)^{-2/3}$$

7. $f(x) = \dfrac{x}{x+1}$

SOLUTION Let $f(x) = \frac{x}{x+1}$, then

$$f'(x) = \frac{(x+1) - x}{(x+1)^2} = \frac{1}{(x+1)^2}.$$

Solving $y = \frac{x}{x+1}$ for x and switching variables, we obtain the inverse $g(x) = \frac{x}{1-x}$. Thus

$$g'(x) = 1\Bigg/\frac{1}{(x/(1-x)+1)^2} = \frac{1}{(1-x)^2}.$$

8. $f(x) = 2 + x^{-1}$

SOLUTION Let $f(x) = 2 + x^{-1}$, then $f'(x) = -1/x^2$. Solving $y = 2 + x^{-1}$ for x and switching variables, we obtain the inverse $g(x) = 1/(x-2)$. Thus,

$$g'(x) = 1 \Big/ \frac{-1}{1/(x-2)^2} = -\frac{1}{(x-2)^2}.$$

9. Let $g(x)$ be the inverse of $f(x) = x^3 + 2x + 4$. Calculate $g(7)$ [without finding a formula for $g(x)$], and then calculate $g'(7)$.

SOLUTION Let $g(x)$ be the inverse of $f(x) = x^3 + 2x + 4$. Because

$$f(1) = 1^3 + 2(1) + 4 = 7,$$

it follows that $g(7) = 1$. Moreover, $f'(x) = 3x^2 + 2$, and

$$g'(7) = \frac{1}{f'(g(7))} = \frac{1}{f'(1)} = \frac{1}{5}.$$

10. Find $g'\left(-\frac{1}{2}\right)$, where $g(x)$ is the inverse of $f(x) = \dfrac{x^3}{x^2+1}$.

SOLUTION Let $g(x)$ be the inverse of $f(x) = \dfrac{x^3}{x^2+1}$. Because

$$f(-1) = \frac{(-1)^3}{(-1)^2+1} = -\frac{1}{2},$$

it follows that $g(-\frac{1}{2}) = -1$. Moreover,

$$f'(x) = \frac{(x^2+1)(3x^2) - x^3(2x)}{(x^2+1)^2} = \frac{x^4+3x^2}{(x^2+1)^2},$$

and

$$g'\left(-\frac{1}{2}\right) = \frac{1}{f'(g(-\frac{1}{2}))} = \frac{1}{f'(-1)} = 1.$$

In Exercises 11–16, calculate $g(b)$ and $g'(b)$, where g is the inverse of f (in the given domain, if indicated).

11. $f(x) = x + \cos x, \quad b = 1$

SOLUTION $f(0) = 1$, so $g(1) = 0$. $f'(x) = 1 - \sin x$ so $f'(g(1)) = f'(0) = 1 - \sin 0 = 1$. Thus, $g'(1) = 1/1 = 1$.

12. $f(x) = 4x^3 - 2x, \quad b = -2$

SOLUTION $f(-1) = -2$, so $g(-2) = -1$. $f'(x) = 12x^2 - 2$ so $f'(g(-2)) = f'(-1) = 12 - 2 = 10$. Thus, $g'(-2) = 1/10$.

13. $f(x) = \sqrt{x^2+6x}$ for $x \ge 0, \quad b = 4$

SOLUTION To determine $g(4)$, we solve $f(x) = \sqrt{x^2+6x} = 4$ for x. This yields:

$$\begin{aligned} x^2 + 6x &= 16 \\ x^2 + 6x - 16 &= 0 \\ (x+8)(x-2) &= 0 \end{aligned}$$

or $x = -8, 2$. Because the domain of f has been restricted to $x \ge 0$, we have $g(4) = 2$. With

$$f'(x) = \frac{x+3}{\sqrt{x^2+6x}},$$

it then follows that

$$g'(4) = \frac{1}{f'(g(4))} = \frac{1}{f'(2)} = \frac{4}{5}.$$

14. $f(x) = \sqrt{x^2 + 6x}$ for $x \le -6$, $\quad b = 4$

SOLUTION To determine $g(4)$, we solve $f(x) = \sqrt{x^2 + 6x} = 4$ for x. This yields:

$$x^2 + 6x = 16$$
$$x^2 + 6x - 16 = 0$$
$$(x+8)(x-2) = 0$$

or $x = -8, 2$. Because the domain of f has been restricted to $x \le -6$, we have $g(4) = -8$. With

$$f'(x) = \frac{x+3}{\sqrt{x^2+6x}},$$

it then follows that

$$g'(4) = \frac{1}{f'(g(4))} = \frac{1}{f'(-8)} = -\frac{4}{5}.$$

15. $f(x) = \dfrac{1}{x+1}$, $\quad b = \dfrac{1}{4}$

SOLUTION $f(3) = 1/4$, so $g(1/4) = 3$. $f'(x) = \frac{-1}{(x+1)^2}$ so $f'(g(1/4)) = f'(3) = \frac{-1}{(3+1)^2} = -1/16$. Thus, $g'(1/4) = -16$.

16. $f(x) = e^x$, $\quad b = e$

SOLUTION $f(1) = e$ so $g(e) = 1$. $f'(x) = e^x$ so $f'(g(e)) = f'(1) = e$. Thus, $g'(x) = 1/e$.

17. Let $f(x) = x^n$ and $g(x) = x^{1/n}$. Compute $g'(x)$ using Theorem 1 and check your answer using the Power Rule.

SOLUTION Note that $g(x) = f^{-1}(x)$. Therefore,

$$g'(x) = \frac{1}{f'(g(x))} = \frac{1}{n(g(x))^{n-1}} = \frac{1}{n(x^{1/n})^{n-1}} = \frac{1}{n(x^{1-1/n})} = \frac{x^{1/n-1}}{n} = \frac{1}{n}(x^{1/n-1})$$

which agrees with the Power Rule.

18. Show that $f(x) = \dfrac{1}{1+x}$ and $g(x) = \dfrac{1-x}{x}$ are inverses. Then compute $g'(x)$ directly and verify that $g'(x) = 1/f'(g(x))$.

SOLUTION Let $f(x) = \dfrac{1}{1+x}$ and $g(x) = \dfrac{1-x}{x}$. Then

$$f(g(x)) = \frac{1}{1 + \frac{1-x}{x}} = \frac{x}{x+1-x} = x,$$

and

$$g(f(x)) = \frac{1 - \frac{1}{1+x}}{\frac{1}{1+x}} = \frac{1+x-1}{1} = x;$$

consequently, f and g are inverses. Rewriting $g(x) = x^{-1} - 1$, we see that $g'(x) = -x^{-2}$. Moreover, $f'(x) = -(1+x)^{-2}$, so

$$f'(g(x)) = -\left(1 + \frac{1-x}{x}\right)^{-2} = -(x^{-1})^{-2} = -x^2,$$

and

$$\frac{1}{f'(g(x))} = -x^{-2} = g'(x).$$

In Exercises 19–22, compute the derivative at the point indicated without using a calculator.

19. $y = \sin^{-1} x$, $\quad x = \frac{3}{5}$

SOLUTION Let $y = \sin^{-1} x$. Then $y' = \frac{1}{\sqrt{1-x^2}}$ and

$$y'\left(\frac{3}{5}\right) = \frac{1}{\sqrt{1 - 9/25}} = \frac{1}{4/5} = \frac{5}{4}.$$

20. $y = \tan^{-1} x, \quad x = \frac{1}{2}$

SOLUTION Let $y = \tan^{-1} x$. Then $y' = \frac{1}{x^2+1}$ and

$$y'\left(\frac{1}{2}\right) = \frac{1}{\frac{1}{4}+1} = \frac{4}{5}.$$

21. $y = \sec^{-1} x, \quad x = 4$

SOLUTION Let $y = \sec^{-1} x$. Then $y' = \frac{1}{|x|\sqrt{x^2-1}}$ and

$$y'(4) = \frac{1}{4\sqrt{15}}.$$

22. $y = \arccos(4x), \quad x = \frac{1}{5}$

SOLUTION Let $y = \cos^{-1}(4x)$. Then $y' = \frac{-4}{\sqrt{1-16x^2}}$ and

$$y'\left(\frac{1}{5}\right) = \frac{-4}{\sqrt{1-\frac{16}{25}}} = \frac{-4}{\frac{3}{5}} = -\frac{20}{3}.$$

In Exercises 23–36, find the derivative.

23. $y = \sin^{-1}(7x)$

SOLUTION $\displaystyle \frac{d}{dx}\sin^{-1}(7x) = \frac{1}{\sqrt{1-(7x)^2}} \cdot \frac{d}{dx}7x = \frac{7}{\sqrt{1-(7x)^2}}.$

24. $y = \arctan\left(\frac{x}{3}\right)$

SOLUTION $\displaystyle \frac{d}{dx}\tan^{-1}\left(\frac{x}{3}\right) = \frac{1}{(x/3)^2+1} \cdot \frac{d}{dx}\left(\frac{x}{3}\right) = \frac{1}{3} \cdot \frac{1}{\left(\frac{x}{3}\right)^2+1} = \frac{1}{(x^2/3)+3}.$

25. $y = \cos^{-1}(x^2)$

SOLUTION $\displaystyle \frac{d}{dx}\cos^{-1}(x^2) = \frac{-1}{\sqrt{1-x^4}} \cdot \frac{d}{dx}x^2 = \frac{-2x}{\sqrt{1-x^4}}.$

26. $y = \sec^{-1}(t+1)$

SOLUTION $\displaystyle \frac{d}{dt}\sec^{-1}(t+1) = \frac{1}{|t+1|\sqrt{(t+1)^2-1}} = \frac{1}{|t+1|\sqrt{t^2+2t}}.$

27. $y = x\tan^{-1} x$

SOLUTION $\displaystyle \frac{d}{dx}x\tan^{-1} x = x\left(\frac{1}{1+x^2}\right) + \tan^{-1} x.$

28. $y = e^{\cos^{-1} x}$

SOLUTION $\displaystyle \frac{d}{dx}e^{\cos^{-1} x} = e^{\cos^{-1} x}\frac{d}{dx}\cos^{-1} x = \frac{-e^{\cos^{-1} x}}{\sqrt{1-x^2}}.$

29. $y = \arcsin(e^x)$

SOLUTION $\displaystyle \frac{d}{dx}\sin^{-1}(e^x) = \frac{1}{\sqrt{1-e^{2x}}} \cdot \frac{d}{dx}e^x = \frac{e^x}{\sqrt{1-e^{2x}}}.$

30. $y = \csc^{-1}(x^{-1})$

SOLUTION $\displaystyle \frac{d}{dx}\csc^{-1}(x^{-1}) = \frac{-1}{|1/x|\sqrt{1/x^2-1}}\left(\frac{-1}{x^2}\right) = \frac{1}{x^2|1/x|\sqrt{1/x^2-1}} = \frac{1}{\sqrt{1-x^2}}.$

31. $y = \sqrt{1-t^2} + \sin^{-1} t$

SOLUTION $\displaystyle \frac{d}{dt}\left(\sqrt{1-t^2} + \sin^{-1} t\right) = \frac{1}{2}(1-t^2)^{-1/2}(-2t) + \frac{1}{\sqrt{1-t^2}} = \frac{-t}{\sqrt{1-t^2}} + \frac{1}{\sqrt{1-t^2}} = \frac{1-t}{\sqrt{1-t^2}}.$

32. $y = \tan^{-1}\left(\dfrac{1+t}{1-t}\right)$

SOLUTION $\dfrac{d}{dx}\tan^{-1}\left(\dfrac{1+t}{1-t}\right) = \dfrac{1}{\left(\frac{1+t}{1-t}\right)^2+1}\cdot\left(\dfrac{(1-t)-(1+t)(-1)}{(1-t)^2}\right) = \dfrac{2}{(1+t)^2+(1-t)^2} = \dfrac{1}{t^2+1}.$

33. $y = (\tan^{-1} x)^3$

SOLUTION $\dfrac{d}{dx}\left((\tan^{-1} x)^3\right) = 3(\tan^{-1} x)^2 \dfrac{d}{dx}\tan^{-1} x = \dfrac{3(\tan^{-1} x)^2}{x^2+1}.$

34. $y = \dfrac{\cos^{-1} x}{\sin^{-1} x}$

SOLUTION $\dfrac{d}{dx}\left(\dfrac{\cos^{-1} x}{\sin^{-1} x}\right) = \dfrac{\sin^{-1} x\left(\frac{-1}{\sqrt{1-x^2}}\right) - \cos^{-1} x\left(\frac{1}{\sqrt{1-x^2}}\right)}{(\sin^{-1} x)^2} = -\dfrac{\pi}{2\sqrt{1-x^2}(\sin^{-1} x)^2}.$

35. $y = \cos^{-1} t^{-1} - \sec^{-1} t$

SOLUTION

$$\frac{d}{dx}(\cos^{-1} t^{-1} - \sec^{-1} t) = \frac{-1}{\sqrt{1-(1/t)^2}}\left(\frac{-1}{t^2}\right) - \frac{1}{|t|\sqrt{t^2-1}}$$
$$= \frac{1}{\sqrt{t^4-t^2}} - \frac{1}{|t|\sqrt{t^2-1}} = \frac{1}{|t|\sqrt{t^2-1}} - \frac{1}{|t|\sqrt{t^2-1}} = 0.$$

Alternately, let $t = \sec\theta$. Then $t^{-1} = \cos\theta$ and $\cos^{-1} t^{-1} - \sec^{-1} t = \theta - \theta = 0$. Consequently,

$$\frac{d}{dx}(\cos^{-1} t^{-1} - \sec^{-1} t) = 0.$$

36. $y = \cos^{-1}(x + \sin^{-1} x)$

SOLUTION $\dfrac{d}{dx}\cos^{-1}(x+\sin^{-1} x) = \dfrac{-1}{\sqrt{1-(x+\sin^{-1} x)^2}}\left(1+\dfrac{1}{\sqrt{1-x^2}}\right).$

37. Use Figure 5 to prove that $(\cos^{-1} x)' = -\dfrac{1}{\sqrt{1-x^2}}$.

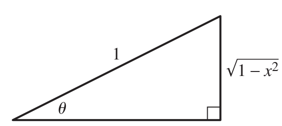


FIGURE 5 Right triangle with $\theta = \cos^{-1} x$.

SOLUTION Let $\theta = \cos^{-1} x$. Then $\cos\theta = x$ and

$$-\sin\theta\frac{d\theta}{dx} = 1 \quad\text{or}\quad \frac{d\theta}{dx} = -\frac{1}{\sin\theta} = -\frac{1}{\sin(\cos^{-1} x)}.$$

From Figure 5, we see that $\sin(\cos^{-1} x) = \sin\theta = \sqrt{1-x^2}$; hence,

$$\frac{d}{dx}\cos^{-1} x = \frac{1}{-\sin(\cos^{-1} x)} = -\frac{1}{\sqrt{1-x^2}}.$$

38. Show that $(\tan^{-1} x)' = \cos^2(\tan^{-1} x)$ and then use Figure 6 to prove that $(\tan^{-1} x)' = (x^2+1)^{-1}$.

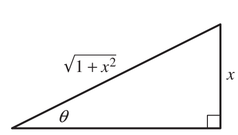

FIGURE 6 Right triangle with $\theta = \tan^{-1} x$.

SOLUTION Let $\theta = \tan^{-1} x$. Then $x = \tan\theta$ and

$$1 = \sec^2\theta \frac{d\theta}{dx} \quad \text{or} \quad \frac{d\theta}{dx} = \frac{1}{\sec^2\theta} = \cos^2\theta = \cos^2(\tan^{-1} x).$$

From Figure 6, $\cos\theta = \frac{1}{\sqrt{1+x^2}}$, thus $\cos^2\theta = \frac{1}{1+x^2}$ and

$$\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}.$$

39. Let $\theta = \sec^{-1} x$. Show that $\tan\theta = \sqrt{x^2-1}$ if $x \ge 1$ and that $\tan\theta = -\sqrt{x^2-1}$ if $x \le -1$. *Hint:* $\tan\theta \ge 0$ on $\left(0, \frac{\pi}{2}\right)$ and $\tan\theta \le 0$ on $\left(\frac{\pi}{2}, \pi\right)$.

SOLUTION In general, $1 + \tan^2\theta = \sec^2\theta$, so $\tan\theta = \pm\sqrt{\sec^2\theta - 1}$. With $\theta = \sec^{-1} x$, it follows that $\sec\theta = x$, so $\tan\theta = \pm\sqrt{x^2-1}$. Finally, if $x \ge 1$ then $\theta = \sec^{-1} x \in [0, \pi/2)$ so $\tan\theta$ is positive; on the other hand, if $x \le 1$ then $\theta = \sec^{-1} x \in (-\pi/2, 0]$ so $\tan\theta$ is negative.

40. Use Exercise 39 to verify the formula

$$(\sec^{-1} x)' = \frac{1}{|x|\sqrt{x^2-1}}$$

SOLUTION Let $\theta = \sec^{-1} x$. Then $\sec\theta = x$ and

$$\sec\theta\tan\theta \frac{d\theta}{dx} = 1 \quad \text{or} \quad \frac{d\theta}{dx} = \frac{1}{\sec\theta\tan\theta} = \frac{1}{x\tan(\sec^{-1} x)}.$$

By Exercise 39, $\tan(\sec^{-1} x) = \sqrt{x^2-1}$ for $x > 1$ and $\tan(\sec^{-1} x) = -\sqrt{x^2-1}$ for $x < -1$. Hence,

$$\frac{d}{dx}\sec^{-1} x = \frac{1}{|x|\sqrt{x^2-1}}.$$

Further Insights and Challenges

41. Let $g(x)$ be the inverse of $f(x)$. Show that if $f'(x) = f(x)$, then $g'(x) = x^{-1}$. We will apply this in the next section to show that the inverse of $f(x) = e^x$ (the natural logarithm) has the derivative $f'(x) = x^{-1}$.

SOLUTION

$$g'(x) = \frac{1}{f'(g(x))} = \frac{1}{f'(f^{-1}(x))} = \frac{1}{f(f^{-1}(x))} = \frac{1}{x}.$$

3.9 Derivatives of General Exponential and Logarithmic Functions

Preliminary Questions

1. What is the slope of the tangent line to $y = 4^x$ at $x = 0$?

SOLUTION The slope of the tangent line to $y = 4^x$ at $x = 0$ is

$$\frac{d}{dx}4^x\bigg|_{x=0} = 4^x \ln 4\bigg|_{x=0} = \ln 4.$$

2. What is the rate of change of $y = \ln x$ at $x = 10$?

SOLUTION The rate of change of $y = \ln x$ at $x = 10$ is

$$\frac{d}{dx}\ln x\bigg|_{x=10} = \frac{1}{x}\bigg|_{x=10} = \frac{1}{10}.$$

3. What is $b > 0$ if the tangent line to $y = b^x$ at $x = 0$ has slope 2?

SOLUTION The tangent line to $y = b^x$ at $x = 0$ has slope

$$\frac{d}{dx}b^x\bigg|_{x=0} = b^x \ln b\bigg|_{x=0} = \ln b.$$

This slope will be equal to 2 when

$$\ln b = 2 \quad \text{or} \quad b = e^2.$$

4. What is b if $(\log_b x)' = \dfrac{1}{3x}$?

SOLUTION $(\log_b x)' = \left(\dfrac{\ln x}{\ln b}\right)' = \dfrac{1}{x \ln b}$. This derivative will equal $\frac{1}{3x}$ when

$$\ln b = 3 \quad \text{or} \quad b = e^3.$$

5. What are $y^{(100)}$ and $y^{(101)}$ for $y = \cosh x$?

SOLUTION Let $y = \cosh x$. Then $y' = \sinh x$, $y'' = \cosh x$, and this pattern repeats indefinitely. Thus, $y^{(100)} = \cosh x$ and $y^{(101)} = \sinh x$.

Exercises

In Exercises 1–20, find the derivative.

1. $y = x \ln x$

SOLUTION $\dfrac{d}{dx} x \ln x = \ln x + \dfrac{x}{x} = \ln x + 1.$

2. $y = t \ln t - t$

SOLUTION $\dfrac{d}{dt}(t \ln t - t) = t\left(\dfrac{1}{t}\right) + \ln t - 1 = \ln t.$

3. $y = (\ln x)^2$

SOLUTION $\dfrac{d}{dx}(\ln x)^2 = (2 \ln x)\,\dfrac{1}{x} = \dfrac{2}{x}\ln x.$

4. $y = \ln(x^5)$

SOLUTION $\dfrac{d}{dx}(\ln x^5) = \dfrac{1}{x^5}(5x^4) = \dfrac{5}{x}.$

5. $y = \ln(9x^2 - 8)$

SOLUTION $\dfrac{d}{dx}\ln(9x^2 - 8) = \dfrac{18x}{9x^2 - 8}.$

6. $y = \ln(t5^t)$

SOLUTION Using the rules for logarithms, we write

$$y = \ln(t5^t) = \ln t + \ln(5^t) = \ln t + t \ln 5.$$

Then,

$$\frac{d}{dt}\ln(t5^t) = \frac{1}{t} + \ln 5.$$

7. $y = \ln(\sin t + 1)$

SOLUTION $\dfrac{d}{dt}\ln(\sin t + 1) = \dfrac{\cos t}{\sin t + 1}.$

8. $y = x^2 \ln x$

SOLUTION $\dfrac{d}{dx} x^2 \ln x = 2x \ln x + \dfrac{x^2}{x} = 2x \ln x + x.$

9. $y = \dfrac{\ln x}{x}$

SOLUTION $\dfrac{d}{dx}\dfrac{\ln x}{x} = \dfrac{\frac{1}{x}(x) - \ln x}{x^2} = \dfrac{1 - \ln x}{x^2}.$

10. $y = e^{(\ln x)^2}$

SOLUTION $\dfrac{d}{dx} e^{(\ln x)^2} = e^{(\ln x)^2} \cdot 2 \cdot \dfrac{\ln x}{x}.$

11. $y = \ln(\ln x)$

SOLUTION $\dfrac{d}{dx}\ln(\ln x) = \dfrac{1}{x \ln x}.$

12. $y = \ln(\cot x)$

SOLUTION $\dfrac{d}{dx}\ln(\cot x) = \dfrac{1}{\cot x}(-\csc^2 x) = -\dfrac{1}{\sin x \cos x}.$

13. $y = \big(\ln(\ln x)\big)^3$

SOLUTION $\dfrac{d}{dx}(\ln(\ln x))^3 = 3(\ln(\ln x))^2\left(\dfrac{1}{\ln x}\right)\left(\dfrac{1}{x}\right) = \dfrac{3(\ln(\ln x))^2}{x\ln x}.$

14. $y = \ln\big((\ln x)^3\big)$

SOLUTION $\dfrac{d}{dx}\ln((\ln x)^3) = \dfrac{3(\ln x)^2}{x(\ln x)^3} = \dfrac{3}{x\ln x}.$

Alternately, because $\ln((\ln x)^3) = 3\ln(\ln x)$,

$$\frac{d}{dx}\ln((\ln x)^3) = 3\frac{d}{dx}\ln(\ln x) = 3\cdot\frac{1}{x\ln x}.$$

15. $y = \ln\big((x+1)(2x+9)\big)$

SOLUTION

$$\frac{d}{dx}\ln((x+1)(2x+9)) = \frac{1}{(x+1)(2x+9)}\cdot((x+1)2+(2x+9)) = \frac{4x+11}{(x+1)(2x+9)}.$$

Alternately, because $\ln((x+1)(2x+9)) = \ln(x+1)+\ln(2x+9)$,

$$\frac{d}{dx}\ln((x+1)(2x+9)) = \frac{1}{x+1}+\frac{2}{2x+9} = \frac{4x+11}{(x+1)(2x+9)}.$$

16. $y = \ln\left(\dfrac{x+1}{x^3+1}\right)$

SOLUTION

$$\frac{d}{dx}\ln\left(\frac{x+1}{x^3+1}\right) = \frac{d}{dx}\ln\left(\frac{1}{x^2-x+1}\right) = -\frac{d}{dx}\ln(x^2-x+1) = -\frac{2x-1}{x^2-x+1}.$$

17. $y = 11^x$

SOLUTION $\dfrac{d}{dx}11^x = \ln 11\cdot 11^x.$

18. $y = 7^{4x-x^2}$

SOLUTION $\dfrac{d}{dx}7^{4x-x^2} = \ln 7(4-2x)7^{4x-x^2}.$

19. $y = \dfrac{2^x-3^{-x}}{x}$

SOLUTION $\dfrac{d}{dx}\dfrac{2^x-3^{-x}}{x} = \dfrac{x(2^x\ln 2+3^{-x}\ln 3)-(2^x-3^{-x})}{x^2}.$

20. $y = 16^{\sin x}$

SOLUTION $\dfrac{d}{dx}16^{\sin x} = \ln 16(\cos x)16^{\sin x}.$

In Exercises 21–24, compute the derivative.

21. $f'(x)$, $f(x) = \log_2 x$

SOLUTION $f(x) = \log_2 x = \dfrac{\ln x}{\ln 2}$. Thus, $f'(x) = \dfrac{1}{x}\cdot\dfrac{1}{\ln 2}.$

22. $f'(3)$, $f(x) = \log_5 x$

SOLUTION $f(x) = \dfrac{\ln x}{\ln 5}$, so $f'(x) = \dfrac{1}{x\ln 5}$. Thus, $f'(3) = \dfrac{1}{3\ln 5}.$

23. $\dfrac{d}{dt}\log_3(\sin t)$

SOLUTION $\dfrac{d}{dt}\log_3(\sin t) = \dfrac{d}{dt}\left(\dfrac{\ln(\sin t)}{\ln 3}\right) = \dfrac{1}{\ln 3}\cdot\dfrac{1}{\sin t}\cdot\cos t = \dfrac{\cot t}{\ln 3}.$

24. $\dfrac{d}{dt}\log_{10}(t+2^t)$

SOLUTION $\dfrac{d}{dt}\log_{10}(t+2^t) = \dfrac{d}{dt}\left(\dfrac{\ln(t+2^t)}{\ln 10}\right) = \dfrac{1}{\ln 10}\cdot\dfrac{1+2^t\ln 2}{t+2^t}.$

In Exercises 25–36, find an equation of the tangent line at the point indicated.

25. $f(x) = 6^x, \quad x = 2$

SOLUTION Let $f(x) = 6^x$. Then $f(2) = 36$, $f'(x) = 6^x \ln 6$ and $f'(2) = 36\ln 6$. The equation of the tangent line is therefore $y = 36\ln 6(x-2)+36$.

26. $y = (\sqrt{2})^x, \quad x = 8$

SOLUTION Let $y = (\sqrt{2})^x$. Then $y(8) = 16$, $y'(x) = (\sqrt{2})^x \ln\sqrt{2}$ and $y'(8) = 16\ln\sqrt{2} = 8\ln 2$. The equation of the tangent line is therefore $y = 8\ln 2(x-8)+16$.

27. $s(t) = 3^{9t}, \quad t = 2$

SOLUTION Let $s(t) = 3^{9t}$. Then $s(2) = 3^{18}$, $s'(t) = 3^{9t}9\ln 3$, and $s'(2) = 3^{18}\cdot 9\ln 3 = 3^{20}\ln 3$. The equation of the tangent line is therefore $y = 3^{20}\ln 3(t-2)+3^{18}$.

28. $y = \pi^{5x-2}, \quad x = 1$

SOLUTION Let $y = \pi^{5x-2}$. Then $y(1) = \pi^3$, $y'(x) = \pi^{5x-2}5\ln\pi$, and $y'(1) = 5\pi^3\ln\pi$. The equation of the tangent line is therefore $y = 5\pi^3\ln\pi(x-1)+\pi^3$.

29. $f(x) = 5^{x^2-2x}, \quad x = 1$

SOLUTION Let $f(x) = 5^{x^2-2x}$. Then $f(1) = 5^{-1}$, $f'(x) = \ln 5\cdot 5^{x^2-2x}(2x-2)$, and $f'(1) = \ln 5(0) = 0$. Therefore, the equation of the tangent line is $y = 5^{-1}$.

30. $s(t) = \ln t, \quad t = 5$

SOLUTION Let $s(t) = \ln t$. Then $s(5) = \ln 5$. $s'(t) = 1/t$, so $s'(5) = 1/5$. Therefore the equation of the tangent line is $y = (1/5)(t-5)+\ln 5$.

31. $s(t) = \ln(8-4t), \quad t = 1$

SOLUTION Let $s(t) = \ln(8-4t)$. Then $s(1) = \ln(8-4) = \ln 4$. $s'(t) = \frac{-4}{8-4t}$, so $s'(1) = -4/4 = -1$. Therefore the equation of the tangent line is $y = -1(t-1)+\ln 4$.

32. $f(x) = \ln(x^2), \quad x = 4$

SOLUTION Let $f(x) = \ln x^2 = 2\ln x$. Then $f(4) = 2\ln 4$. $f'(x) = 2/x$, so $f'(4) = 1/2$. Therefore the equation of the tangent line is $y = (1/2)(x-4)+2\ln 4$.

33. $R(z) = \log_5(2z^2+7), \quad z = 3$

SOLUTION Let $R(z) = \log_5(2z^2+7)$. Then $R(3) = \log_5(25) = 2$,

$$R'(z) = \frac{4z}{(2z^2+7)\ln 5}, \quad \text{and} \quad R'(3) = \frac{12}{25\ln 5}.$$

The equation of the tangent line is therefore

$$y = \frac{12}{25\ln 5}(z-3)+2.$$

34. $y = \ln(\sin x), \quad x = \dfrac{\pi}{4}$

SOLUTION Let $f(x) = \ln\sin x$. Then $f(\pi/4) = \ln(\sqrt{2}/2)$. $f'(x) = \cos x/\sin x = \cot x$, so $f'(\pi/4) = 1$. Therefore the equation of the tangent line is $y = (x-\pi/4)+\ln(\sqrt{2}/2)$.

35. $f(w) = \log_2 w, \quad w = \frac{1}{8}$

SOLUTION Let $f(w) = \log_2 w$. Then

$$f\left(\frac{1}{8}\right) = \log_2\frac{1}{8} = \log_2 2^{-3} = -3,$$

$f'(w) = \frac{1}{w\ln 2}$, and

$$f'\left(\frac{1}{8}\right) = \frac{8}{\ln 2}.$$

The equation of the tangent line is therefore

$$y = \frac{8}{\ln 2}\left(w-\frac{1}{8}\right)-3.$$

36. $y = \log_2(1 + 4x^{-1})$, $\quad x = 4$

SOLUTION Let $y = \log_2(1 + 4x^{-1})$. Then $y(4) = \log_2(1 + 1) = 1$,

$$y'(x) = -\frac{4x^{-2}}{(1 + 4x^{-1})\ln 2}, \quad \text{and} \quad y'(4) = -\frac{1}{8\ln 2}.$$

The equation of the tangent line is therefore

$$y = -\frac{1}{8\ln 2}(x - 4) - 1.$$

In Exercises 37–44, find the derivative using logarithmic differentiation as in Example 5.

37. $y = (x + 5)(x + 9)$

SOLUTION Let $y = (x + 5)(x + 9)$. Then $\ln y = \ln((x + 5)(x + 9)) = \ln(x + 5) + \ln(x + 9)$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{1}{x + 5} + \frac{1}{x + 9}$$

or

$$y' = (x + 5)(x + 9)\left(\frac{1}{x + 5} + \frac{1}{x + 9}\right) = (x + 9) + (x + 5) = 2x + 14.$$

38. $y = (3x + 5)(4x + 9)$

SOLUTION Let $y = (3x + 5)(4x + 9)$. Then $\ln y = \ln((3x + 5)(4x + 9)) = \ln(3x + 5) + \ln(4x + 9)$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{3}{3x + 5} + \frac{4}{4x + 9}$$

or

$$y' = (3x + 5)(4x + 9)\left(\frac{3}{3x + 5} + \frac{4}{4x + 9}\right) = (12x + 27) + (12x + 20) = 24x + 47.$$

39. $y = (x - 1)(x - 12)(x + 7)$

SOLUTION Let $y = (x - 1)(x - 12)(x + 7)$. Then $\ln y = \ln(x - 1) + \ln(x - 12) + \ln(x + 7)$. By logarithmic differentiation,

$$\frac{y'}{y} = \frac{1}{x - 1} + \frac{1}{x - 12} + \frac{1}{x + 7}$$

or

$$y' = (x - 12)(x + 7) + (x - 1)(x + 7) + (x - 1)(x - 12) = 3x^2 - 12x + 79.$$

40. $y = \dfrac{x(x + 1)^3}{(3x - 1)^2}$

SOLUTION Let $y = \frac{x(x+1)^3}{(3x-1)^2}$. Then $\ln y = \ln x + 3\ln(x + 1) - 2\ln(3x - 1)$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{1}{x} + \frac{3}{x + 1} - \frac{6}{3x - 1},$$

so

$$y' = \frac{(x + 1)^3}{(3x - 1)^2} + \frac{3x(x + 1)^2}{(3x - 1)^2} - \frac{6x(x + 1)^3}{(3x - 1)^3}.$$

41. $y = \dfrac{x(x^2 + 1)}{\sqrt{x + 1}}$

SOLUTION Let $y = \frac{x(x^2+1)}{\sqrt{x+1}}$. Then $\ln y = \ln x + \ln(x^2 + 1) - \frac{1}{2}\ln(x + 1)$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{1}{x} + \frac{2x}{x^2 + 1} - \frac{1}{2(x + 1)},$$

so

$$y' = \frac{x(x^2 + 1)}{\sqrt{x + 1}}\left(\frac{1}{x} + \frac{2x}{x^2 + 1} - \frac{1}{2(x + 1)}\right).$$

42. $y = (2x+1)(4x^2)\sqrt{x-9}$

SOLUTION Let $y = (2x+1)(4x^2)\sqrt{x-9}$. Then

$$\ln y = \ln(2x+1) + \ln 4x^2 + \ln(x-9)^{1/2} = \ln(2x+1) + \ln 4 + 2\ln x + \frac{1}{2}\ln(x-9).$$

By logarithmic differentiation

$$\frac{y'}{y} = \frac{2}{2x+1} + \frac{2}{x} + \frac{1}{2(x-9)},$$

so

$$y' = (2x+1)(4x^2)\sqrt{x-9}\left(\frac{2}{2x+1} + \frac{2}{x} + \frac{1}{2(x-9)}\right).$$

43. $y = \sqrt{\dfrac{x(x+2)}{(2x+1)(3x+2)}}$

SOLUTION Let $y = \sqrt{\frac{x(x+2)}{(2x+1)(3x+2)}}$. Then $\ln y = \frac{1}{2}[\ln(x) + \ln(x+2) - \ln(2x+1) - \ln(3x+2)]$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{1}{2}\left(\frac{1}{x} + \frac{1}{x+2} - \frac{2}{2x+1} - \frac{3}{3x+2}\right),$$

so

$$y' = \frac{1}{2}\sqrt{\frac{x(x+2)}{(2x+1)(3x+2)}} \cdot \left(\frac{1}{x} + \frac{1}{x+2} - \frac{2}{2x+1} - \frac{3}{3x+2}\right).$$

44. $y = (x^3+1)(x^4+2)(x^5+3)^2$

SOLUTION Let $y = (x^3+1)(x^4+2)(x^5+3)^2$. Then $\ln y = \ln(x^3+1) + \ln(x^4+2) + 2\ln(x^5+3)$. By logarithmic differentiation

$$\frac{y'}{y} = \frac{3x^2}{x^3+1} + \frac{4x^3}{x^4+2} + \frac{10x^4}{x^5+3},$$

so

$$y' = (x^3+1)(x^4+2)(x^5+3)^2\left(\frac{3x^2}{x^3+1} + \frac{4x^3}{x^4+2} + \frac{10x^4}{x^5+3}\right).$$

In Exercises 45–50, find the derivative using either method of Example 6.

45. $f(x) = x^{3x}$

SOLUTION Method 1: $x^{3x} = e^{3x\ln x}$, so

$$\frac{d}{dx}x^{3x} = e^{3x\ln x}(3 + 3\ln x) = x^{3x}(3 + 3\ln x).$$

Method 2: Let $y = x^{3x}$. Then, $\ln y = 3x\ln x$. By logarithmic differentiation

$$\frac{y'}{y} = 3x \cdot \frac{1}{x} + 3\ln x,$$

so

$$y' = y(3 + 3\ln x) = x^{3x}(3 + 3\ln x).$$

46. $f(x) = x^{\cos x}$

SOLUTION Method 1: $x^{\cos x} = e^{\cos x \ln x}$, so

$$\frac{d}{dx}x^{\cos x} = e^{\cos x \ln x}\left(\frac{\cos x}{x} - \sin x \ln x\right) = x^{\cos x}\left(\frac{\cos x}{x} - \sin x \ln x\right).$$

Method 2: Let $y = x^{\cos x}$. Then $\ln y = \cos x \ln x$. By logarithmic differentiation

$$\frac{y'}{y} = \cos x \frac{1}{x} + \ln x(-\sin x),$$

so

$$y' = y\left(\frac{\cos x}{x} - \sin x \ln x\right) = x^{\cos x}\left(\frac{\cos x}{x} - \sin x \ln x\right).$$

47. $f(x) = x^{e^x}$

SOLUTION Method 1: $x^{e^x} = e^{e^x \ln x}$, so

$$\frac{d}{dx}x^{e^x} = e^{e^x \ln x}\left(\frac{e^x}{x} + e^x \ln x\right) = x^{e^x}\left(\frac{e^x}{x} + e^x \ln x\right).$$

Method 2: Let $y = x^{e^x}$. Then $\ln y = e^x \ln x$. By logarithmic differentiation

$$\frac{y'}{y} = e^x \cdot \frac{1}{x} + e^x \ln x,$$

so

$$y' = y\left(\frac{e^x}{x} + e^x \ln x\right) = x^{e^x}\left(\frac{e^x}{x} + e^x \ln x\right).$$

48. $f(x) = x^{x^2}$

SOLUTION Method 1: $x^{x^2} = e^{x^2 \ln x}$, so

$$\frac{d}{dx}x^{x^2} = e^{x^2 \ln x}(x + 2x \ln x) = x^{x^2}(x + 2x \ln x) = x^{x^2+1}(1 + 2\ln x).$$

Method 2: Let $y = x^{x^2}$. Then $\ln y = x^2 \ln x$. By logarithmic differentiation

$$\frac{y'}{y} = x + 2x \ln x,$$

so

$$y' = x^{x^2}(x + 2x \ln x) = x^{x^2+1}(1 + 2\ln x).$$

49. $f(x) = x^{3^x}$

SOLUTION Method 1: $x^{3^x} = e^{3^x \ln x}$, so

$$\frac{d}{dx}x^{3^x} = e^{3^x \ln x}\left(\frac{3^x}{x} + (\ln x)(\ln 3)3^x\right) = x^{3^x}\left(\frac{3^x}{x} + (\ln x)(\ln 3)3^x\right).$$

Method 2: Let $y = x^{3^x}$. Then $\ln y = 3^x \ln x$. By logarithmic differentiation

$$\frac{y'}{y} = 3^x \frac{1}{x} + (\ln x)(\ln 3)3^x,$$

so

$$y' = x^{3^x}\left(\frac{3^x}{x} + (\ln x)(\ln 3)3^x\right).$$

50. $f(x) = e^{x^x}$

SOLUTION Method 1:

$$\frac{d}{dx}e^{x^x} = e^{x^x}\frac{d}{dx}x^x = e^{x^x} \cdot x^x(1 + \ln x),$$

by Example 6 from the text.

Method 2: Let $y = e^{x^x}$. Then $\ln y = x^x \ln e = x^x$. By logarithmic differentiation and Example 6

$$\frac{y'}{y} = x^x(1 + \ln x), \quad \text{so} \quad y' = e^{x^x}(x^x)(1 + \ln x).$$

In Exercises 51–74, calculate the derivative.

51. $y = \sinh(9x)$

SOLUTION $\frac{d}{dx}\sinh(9x) = 9\cosh(9x)$.

52. $y = \sinh(x^2)$

SOLUTION $\frac{d}{dx}\sinh(x^2) = 2x\cosh(x^2)$.

53. $y = \cosh^2(9 - 3t)$

SOLUTION $\frac{d}{dt}\cosh^2(9 - 3t) = 2\cosh(9 - 3t) \cdot (-3\sinh(9 - 3t)) = -6\cosh(9 - 3t)\sinh(9 - 3t)$.

54. $y = \tanh(t^2 + 1)$

SOLUTION $\frac{d}{dt}\tanh(t^2 + 1) = 2t\,\mathrm{sech}^2(t^2 + 1)$.

55. $y = \sqrt{\cosh x + 1}$

SOLUTION $\frac{d}{dx}\sqrt{\cosh x + 1} = \frac{1}{2}(\cosh x + 1)^{-1/2}\sinh x$.

56. $y = \sinh x \tanh x$

SOLUTION $\frac{d}{dx}\sinh x \tanh x = \cosh x \tanh x + \sinh x\,\mathrm{sech}^2 x = \sinh x + \tanh x\,\mathrm{sech}\, x$.

57. $y = \frac{\coth t}{1 + \tanh t}$

SOLUTION $\frac{d}{dt}\frac{\coth t}{1 + \tanh t} = \frac{-\mathrm{csch}^2 t(1 + \tanh t) - \coth t(\mathrm{sech}^2 t)}{(1 + \tanh t)^2} = \frac{1 + \cosh t}{(1 + \cosh t)^2} = \frac{1}{1 + \cosh t}$.

58. $y = (\ln(\cosh x))^5$

SOLUTION $\frac{d}{dx}(\ln(\cosh x))^5 = 5(\ln\cosh x)^4\frac{\sinh x}{\cosh x} = 5(\ln\cosh x)^4\tanh x$.

59. $y = \sinh(\ln x)$

SOLUTION $\frac{d}{dx}\sinh(\ln x) = \frac{\cosh(\ln x)}{x}$.

60. $y = e^{\coth x}$

SOLUTION $\frac{d}{dx}e^{\coth x} = -\mathrm{csch}^2 x \cdot e^{\coth x}$.

61. $y = \tanh(e^x)$

SOLUTION $\frac{d}{dx}\tanh(e^x) = e^x\,\mathrm{sech}^2(e^x)$.

62. $y = \sinh(\cosh^3 x)$

SOLUTION $\frac{d}{dx}\sinh(\cosh^3 x) = \cosh(\cosh^3 x)(3\cosh^2 x\sinh x)$.

63. $y = \mathrm{sech}(\sqrt{x})$

SOLUTION $\frac{d}{dx}\mathrm{sech}(\sqrt{x}) = -\frac{1}{2}x^{-1/2}\,\mathrm{sech}\sqrt{x}\tanh\sqrt{x}$.

64. $y = \ln(\coth x)$

SOLUTION $\frac{d}{dx}\ln(\coth x) = \frac{-\mathrm{csch}^2 x}{\coth x} = \frac{-1}{\sinh^2 x(\frac{\cosh x}{\sinh x})} = \frac{-1}{\sinh x\cosh x}$.

65. $y = \operatorname{sech} x \coth x$

SOLUTION $\dfrac{d}{dx} \operatorname{sech} x \coth x = \dfrac{d}{dx} \operatorname{csch} x = -\operatorname{csch} x \coth x$.

66. $y = x^{\sinh x}$

SOLUTION

$$\frac{d}{dx} x^{\sinh x} = \frac{d}{dx} e^{\ln x \sinh x} = \left(\cosh x \ln x + \frac{\sinh x}{x}\right) e^{\sinh x \ln x} = x^{\sinh x}\left(\cosh x \ln x + \frac{\sinh x}{x}\right).$$

67. $y = \cosh^{-1}(3x)$

SOLUTION $\dfrac{d}{dx} \cosh^{-1}(3x) = \dfrac{3}{\sqrt{9x^2 - 1}}$.

68. $y = \tanh^{-1}(e^x + x^2)$

SOLUTION $\dfrac{d}{dx} \tanh^{-1}(e^x + x^2) = \dfrac{e^x + 2x}{1 - (e^x + x^2)^2}$.

69. $y = (\sinh^{-1}(x^2))^3$

SOLUTION $\dfrac{d}{dx} (\sinh^{-1}(x^2))^3 = 3(\sinh^{-1}(x^2))^2 \dfrac{2x}{\sqrt{x^4 + 1}}$.

70. $y = (\operatorname{csch}^{-1} 3x)^4$

SOLUTION $\dfrac{d}{dx} (\operatorname{csch}^{-1} 3x)^4 = 4(\operatorname{csch}^{-1} 3x)^3 \left(\dfrac{-1}{|3x|\sqrt{1 + 9x^2}}\right)(3) = \dfrac{-4(\operatorname{csch}^{-1} 3x)^3}{|x|\sqrt{1 + 9x^2}}$.

71. $y = e^{\cosh^{-1} x}$

SOLUTION $\dfrac{d}{dx} e^{\cosh^{-1} x} = e^{\cosh^{-1} x}\left(\dfrac{1}{\sqrt{x^2 - 1}}\right)$.

72. $y = \sinh^{-1}(\sqrt{x^2 + 1})$

SOLUTION $\dfrac{d}{dx} \sinh^{-1}(\sqrt{x^2 + 1}) = \dfrac{1}{\sqrt{x^2 + 1 + 1}} \left(\dfrac{1}{2\sqrt{x^2 + 1}}\right)(2x) = \dfrac{x}{\sqrt{x^2 + 2} \cdot \sqrt{x^2 + 1}}$.

73. $y = \tanh^{-1}(\ln t)$

SOLUTION $\dfrac{d}{dt} \tanh^{-1}(\ln t) = \dfrac{1}{t(1 - (\ln t)^2)}$.

74. $y = \ln(\tanh^{-1} x)$

SOLUTION $\dfrac{d}{dx} \ln(\tanh^{-1} x) = \dfrac{1}{\tanh^{-1} x}\left(\dfrac{1}{1 - x^2}\right)$.

In Exercises 75–77, prove the formula.

75. $\dfrac{d}{dx}(\coth x) = -\operatorname{csch}^2 x$

SOLUTION $\dfrac{d}{dx} \coth x = \dfrac{d}{dx} \dfrac{\cosh x}{\sinh x} = \dfrac{\sinh^2 x - \cosh^2 x}{\sinh^2 x} = \dfrac{-1}{\sinh^2 x} = -\operatorname{csch}^2 x$.

76. $\dfrac{d}{dt} \sinh^{-1} t = \dfrac{1}{\sqrt{t^2 + 1}}$

SOLUTION Let $x = \sinh^{-1} t$. Then $t = \sinh x$ and

$$1 = \cosh x \frac{dx}{dt} \quad \text{or} \quad \frac{dx}{dt} = \frac{1}{\cosh x}.$$

Thus,

$$\frac{d}{dt} \sinh^{-1} t = \frac{1}{\cosh x},$$

where $\sinh x = t$. Working from the identity $\cosh^2 x - \sinh^2 x = 1$, we find $\cosh x = \pm\sqrt{\sinh^2 x + 1}$. Because the hyperbolic cosine is always positive, we know to choose the positive square root. Hence, $\cosh x = \sqrt{\sinh^2 x + 1} = \sqrt{t^2 + 1}$, and

$$\frac{d}{dt} \sinh^{-1} t = \frac{1}{\cosh x} = \frac{1}{\sqrt{t^2 + 1}}.$$

77. $\dfrac{d}{dt}\cosh^{-1} t = \dfrac{1}{\sqrt{t^2-1}}$ for $t > 1$

SOLUTION Let $x = \cosh^{-1} t$. Then $x \geq 0$, $t = \cosh x$ and

$$1 = \sinh x \frac{dx}{dt} \quad \text{or} \quad \frac{dx}{dt} = \frac{1}{\sinh x}.$$

Thus, for $t > 1$,

$$\frac{d}{dt}\cosh^{-1} t = \frac{1}{\sinh x},$$

where $\cosh x = t$. Working from the identity $\cosh^2 x - \sinh^2 x = 1$, we find $\sinh x = \pm\sqrt{\cosh^2 x - 1}$. Because $\sinh w \geq 0$ for $w \geq 0$, we know to choose the positive square root. Hence, $\sinh x = \sqrt{\cosh^2 x - 1} = \sqrt{t^2-1}$, and

$$\frac{d}{dt}\cosh^{-1} t = \frac{1}{\sinh x} = \frac{1}{\sqrt{t^2-1}}.$$

78. Use the formula $(\ln f(x))' = f'(x)/f(x)$ to show that $\ln x$ and $\ln(2x)$ have the same derivative. Is there a simpler explanation of this result?

SOLUTION Observe

$$(\ln x)' = \frac{1}{x} \quad \text{and} \quad (\ln 2x)' = \frac{2}{2x} = \frac{1}{x}.$$

As an alternative explanation, note that $\ln(2x) = \ln 2 + \ln x$. Hence, $\ln x$ and $\ln(2x)$ differ by a constant, which implies the two functions have the same derivative.

79. According to one simplified model, the purchasing power of a dollar in the year $2000 + t$ is equal to $P(t) = 0.68(1.04)^{-t}$ (in 1983 dollars). Calculate the predicted rate of decline in purchasing power (in cents per year) in the year 2020.

SOLUTION First, note that

$$P'(t) = -0.68(1.04)^{-t}\ln 1.04;$$

thus, the rate of change in the year 2020 is

$$P'(20) = -0.68(1.04)^{-20}\ln 1.04 = -0.0122.$$

That is, the rate of decline is 1.22 cents per year.

80. The energy E (in joules) radiated as seismic waves by an earthquake of Richter magnitude M satisfies $\log_{10} E = 4.8 + 1.5M$.

(a) Show that when M increases by 1, the energy increases by a factor of approximately 31.5.

(b) Calculate dE/dM.

SOLUTION Solving $\log_{10} E = 4.8 + 1.5M$ for E yields

$$E = 10^{4.8+1.5M}.$$

(a) We find

$$E(M+1) = 10^{4.8+1.5(M+1)} = 10^{1.5}10^{4.8+1.5M} \approx 31.6E(M).$$

(b)

$$\frac{dE}{dM} = (1.5\ln 10)10^{4.8+1.5M}.$$

81. Show that for any constants M, k, and a, the function

$$y(t) = \frac{1}{2}M\left(1 + \tanh\left(\frac{k(t-a)}{2}\right)\right)$$

satisfies the **logistic equation**: $\dfrac{y'}{y} = k\left(1 - \dfrac{y}{M}\right)$.

SOLUTION Let

$$y(t) = \frac{1}{2}M\left(1 + \tanh\left(\frac{k(t-a)}{2}\right)\right).$$

Then

$$1 - \frac{y(t)}{M} = \frac{1}{2}\left(1 - \tanh\left(\frac{k(t-a)}{2}\right)\right),$$

and

$$\begin{aligned} ky(t)\left(1 - \frac{y(t)}{M}\right) &= \frac{1}{4}Mk\left(1 - \tanh^2\left(\frac{k(t-a)}{2}\right)\right) \\ &= \frac{1}{4}Mk\,\mathrm{sech}^2\left(\frac{k(t-a)}{2}\right). \end{aligned}$$

Finally,

$$y'(t) = \frac{1}{4}Mk\,\mathrm{sech}^2\left(\frac{k(t-a)}{2}\right) = ky(t)\left(1 - \frac{y(t)}{M}\right).$$

82. Show that $V(x) = 2\ln(\tanh(x/2))$ satisfies the **Poisson-Boltzmann** equation $V''(x) = \sinh(V(x))$, which is used to describe electrostatic forces in certain molecules.

SOLUTION Let $V(x) = 2\ln(\tanh(x/2))$. Then

$$V'(x) = 2\frac{1}{\tanh(x/2)} \cdot \frac{1}{2}\,\mathrm{sech}^2(x/2) = \frac{1}{\sinh(x/2)\cosh(x/2)}$$

and

$$V''(x) = -\frac{1}{2}\frac{\sinh^2(x/2) + \cosh^2(x/2)}{\sinh^2(x/2)\cosh^2(x/2)} = -\frac{1}{2}\left(\mathrm{sech}^2(x/2) + \mathrm{csch}^2(x/2)\right).$$

On the other hand,

$$\begin{aligned} \sinh(V(x)) &= \frac{e^{2\ln(\tanh(x/2))} - e^{-2\ln(\tanh(x/2))}}{2} \\ &= \frac{\tanh^2(x/2) - \coth^2(x/2)}{2} \\ &= \frac{(1 - \mathrm{sech}^2(x/2)) - (1 + \mathrm{csch}^2(x/2))}{2} = -\frac{1}{2}\left(\mathrm{sech}^2(x/2) + \mathrm{csch}^2(x/2)\right). \end{aligned}$$

Thus, $V''(x) = \sinh(V(x))$.

83. The Palermo Technical Impact Hazard Scale P is used to quantify the risk associated with the impact of an asteroid colliding with the earth:

$$P = \log_{10}\left(\frac{p_i E^{0.8}}{0.03T}\right)$$

where p_i is the probability of impact, T is the number of years until impact, and E is the energy of impact (in megatons of TNT). The risk is greater than a random event of similar magnitude if $P > 0$.

(a) Calculate dP/dT, assuming that $p_i = 2 \times 10^{-5}$ and $E = 2$ megatons.

(b) Use the derivative to estimate the change in P if T increases from 8 to 9 years.

SOLUTION
(a) Observe that

$$P = \log_{10}\left(\frac{p_i E^{0.8}}{0.03T}\right) = \log_{10}\left(\frac{p_i E^{0.8}}{0.03}\right) - \log_{10} T,$$

so

$$\frac{dP}{dT} = -\frac{1}{T \ln 10}.$$

(b) If T increases to 9 years from 8 years, then

$$\Delta P \approx \left.\frac{dP}{dT}\right|_{T=8} \cdot \Delta T = -\frac{1}{(8 \text{ yr}) \ln 10} \cdot (1 \text{ yr}) = -0.054$$

Further Insights and Challenges

84. **(a)** Show that if f and g are differentiable, then

$$\frac{d}{dx} \ln(f(x)g(x)) = \frac{f'(x)}{f(x)} + \frac{g'(x)}{g(x)} \qquad \boxed{4}$$

(b) Give a new proof of the Product Rule by observing that the left-hand side of Eq. (4) is equal to $\dfrac{(f(x)g(x))'}{f(x)g(x)}$.

SOLUTION
(a) $\dfrac{d}{dx} \ln f(x)g(x) = \dfrac{d}{dx}(\ln f(x) + \ln g(x)) = \dfrac{f'(x)}{f(x)} + \dfrac{g'(x)}{g(x)}$.
(b) By part (a),

$$\frac{d}{dx} \ln f(x)g(x) = \frac{f'(x)}{f(x)} + \frac{g'(x)}{g(x)} = \frac{f'(x)g(x) + f(x)g'(x)}{f(x)g(x)}.$$

Alternately,

$$\frac{d}{dx} \ln f(x)g(x) = \frac{(f(x)g(x))'}{f(x)g(x)}.$$

Thus,

$$\frac{(f(x)g(x))'}{f(x)g(x)} = \frac{f'(x)g(x) + f(x)g'(x)}{f(x)g(x)},$$

or

$$(f(x)g(x))' = f'(x)g(x) + f(x)g'(x).$$

85. Use the formula $\log_b x = \dfrac{\log_a x}{\log_a b}$ for $a, b > 0$ to verify the formula

$$\frac{d}{dx} \log_b x = \frac{1}{(\ln b)x}$$

SOLUTION $\dfrac{d}{dx} \log_b x = \dfrac{d}{dx} \dfrac{\ln x}{\ln b} = \dfrac{1}{(\ln b)x}$.

3.10 Implicit Differentiation

Preliminary Questions

1. Which differentiation rule is used to show $\dfrac{d}{dx} \sin y = \cos y \dfrac{dy}{dx}$?

SOLUTION The chain rule is used to show that $\frac{d}{dx} \sin y = \cos y \frac{dy}{dx}$.

2. One of (a)–(c) is incorrect. Find and correct the mistake.

(a) $\dfrac{d}{dy} \sin(y^2) = 2y \cos(y^2)$ **(b)** $\dfrac{d}{dx} \sin(x^2) = 2x \cos(x^2)$ **(c)** $\dfrac{d}{dx} \sin(y^2) = 2y \cos(y^2)$

SOLUTION

(a) This is correct. Note that the differentiation is with respect to the variable y.
(b) This is correct. Note that the differentiation is with respect to the variable x.
(c) This is incorrect. Because the differentiation is with respect to the variable x, the chain rule is needed to obtain

$$\frac{d}{dx}\sin(y^2) = 2y\cos(y^2)\frac{dy}{dx}.$$

3. On an exam, Jason was asked to differentiate the equation

$$x^2 + 2xy + y^3 = 7$$

Find the errors in Jason's answer: $2x + 2xy' + 3y^2 = 0$

SOLUTION There are two mistakes in Jason's answer. First, Jason should have applied the product rule to the second term to obtain

$$\frac{d}{dx}(2xy) = 2x\frac{dy}{dx} + 2y.$$

Second, he should have applied the general power rule to the third term to obtain

$$\frac{d}{dx}y^3 = 3y^2\frac{dy}{dx}.$$

4. Which of (a) or (b) is equal to $\frac{d}{dx}(x\sin t)$?

(a) $(x\cos t)\frac{dt}{dx}$ **(b)** $(x\cos t)\frac{dt}{dx} + \sin t$

SOLUTION Using the product rule and the chain rule we see that

$$\frac{d}{dx}(x\sin t) = x\cos t\frac{dt}{dx} + \sin t,$$

so the correct answer is **(b)**.

Exercises

1. Show that if you differentiate both sides of $x^2 + 2y^3 = 6$, the result is $2x + 6y^2\frac{dy}{dx} = 0$. Then solve for dy/dx and evaluate it at the point $(2, 1)$.

SOLUTION

$$\begin{aligned}
\frac{d}{dx}(x^2 + 2y^3) &= \frac{d}{dx}6\\
2x + 6y^2\frac{dy}{dx} &= 0\\
2x + 6y^2\frac{dy}{dx} &= 0\\
6y^2\frac{dy}{dx} &= -2x\\
\frac{dy}{dx} &= \frac{-2x}{6y^2}.
\end{aligned}$$

At $(2, 1)$, $\frac{dy}{dx} = \frac{-4}{6} = -\frac{2}{3}$.

2. Show that if you differentiate both sides of $xy + 4x + 2y = 1$, the result is $(x+2)\frac{dy}{dx} + y + 4 = 0$. Then solve for dy/dx and evaluate it at the point $(1, -1)$.

SOLUTION Applying the product rule

$$\begin{aligned}
\frac{d}{dx}(xy + 4x + 2y) &= \frac{d}{dx}1\\
x\frac{dy}{dx} + y + 4 + 2\frac{dy}{dx} &= 0\\
(x+2)\frac{dy}{dx} &= -(y+4)\\
\frac{dy}{dx} &= -\frac{y+4}{x+2}.
\end{aligned}$$

At $(1, -1)$, $dy/dx = -3/3 = -1$.

In Exercises 3–8, differentiate the expression with respect to x, assuming that $y = f(x)$.

3. x^2y^3

SOLUTION Assuming that y depends on x, then

$$\frac{d}{dx}\left(x^2y^3\right) = x^2 \cdot 3y^2y' + y^3 \cdot 2x = 3x^2y^2y' + 2xy^3.$$

4. $\dfrac{x^3}{y^2}$

SOLUTION Assuming that y depends on x, then

$$\frac{d}{dx}\left(\frac{x^3}{y^2}\right) = \frac{y^2(3x^2) - x^3 2yy'}{y^4} = \frac{3x^2}{y^2} - \frac{2x^3y'}{y^3}.$$

5. $(x^2 + y^2)^{3/2}$

SOLUTION Assuming that y depends on x, then

$$\frac{d}{dx}\left(\left(x^2 + y^2\right)^{3/2}\right) = \frac{3}{2}\left(x^2 + y^2\right)^{1/2}\left(2x + 2yy'\right) = 3\left(x + yy'\right)\sqrt{x^2 + y^2}.$$

6. $\tan(xy)$

SOLUTION Assuming that y depends on x, then $\dfrac{d}{dx}(\tan(xy)) = \left(xy' + y\right)\sec^2(xy)$.

7. $\dfrac{y}{y+1}$

SOLUTION Assuming that y depends on x, then $\dfrac{d}{dx}\dfrac{y}{y+1} = \dfrac{(y+1)y' - yy'}{(y+1)^2} = \dfrac{y'}{(y+1)^2}$.

8. $e^{y/t}$

SOLUTION Assuming that y depends on t, then

$$\frac{d}{dt}e^{y/t} = e^{y/t}\left(\frac{ty' - y}{t^2}\right).$$

In Exercises 9–26, calculate the derivative with respect to x.

9. $3y^3 + x^2 = 5$

SOLUTION Let $3y^3 + x^2 = 5$. Then $9y^2y' + 2x = 0$, and $y' = -\dfrac{2x}{9y^2}$.

10. $y^4 - 2y = 4x^3 + x$

SOLUTION Let $y^4 - 2y = 4x^3 + x$. Then

$$\begin{aligned}
\frac{d}{dx}(y^4 - 2y) &= \frac{d}{dx}(4x^3 + x)\\
4y^3y' - 2y' &= 12x^2 + 1\\
y'(4y^3 - 2) &= 12x^2 + 1\\
y' &= \frac{12x^2 + 1}{4y^3 - 2}
\end{aligned}$$

11. $x^2y + 2x^3y = x + y$

SOLUTION Let $x^2y + 2x^3y = x + y$. Then

$$\begin{aligned}
x^2y' + 2xy + 2x^3y' + 6x^2y &= 1 + y'\\
x^2y' + 2x^3y' - y' &= 1 - 2xy - 6x^2y\\
y' &= \frac{1 - 2xy - 6x^2y}{x^2 + 2x^3 - 1}.
\end{aligned}$$

12. $xy^2 + x^2y^5 - x^3 = 3$

SOLUTION Let $xy^2 + x^2y^5 - x^3 = 3$. Then

$$\begin{aligned} 2xyy' + y^2 + 5x^2y^4y' + 2xy^5 - 3x^2 &= 0 \\ (2xy + 5x^2y^4)y' &= 3x^2 - y^2 - 2xy^5 \\ y' &= \frac{3x^2 - y^2 - 2xy^5}{2xy + 5x^2y^4} \end{aligned}$$

13. $x^3R^5 = 1$

SOLUTION Let $x^3R^5 = 1$. Then $x^3 \cdot 5R^4R' + R^5 \cdot 3x^2 = 0$, and $R' = -\frac{3x^2R^5}{5x^3R^4} = -\frac{3R}{5x}$.

14. $x^4 + z^4 = 1$

SOLUTION Let $x^4 + z^4 = 1$. Then $4x^3 + 4z^3z' = 0$, and $z' = -x^3/z^3$.

15. $\frac{y}{x} + \frac{x}{y} = 2y$

SOLUTION Let

$$\frac{y}{x} + \frac{x}{y} = 2y.$$

Then

$$\begin{aligned} \frac{xy' - y}{x^2} + \frac{y - xy'}{y^2} &= 2y' \\ \left(\frac{1}{x} - \frac{x}{y^2} - 2\right)y' &= \frac{y}{x^2} - \frac{1}{y} \\ \frac{y^2 - x^2 - 2xy^2}{xy^2}y' &= \frac{y^2 - x^2}{x^2y} \\ y' &= \frac{y(y^2 - x^2)}{x(y^2 - x^2 - 2xy^2)}. \end{aligned}$$

16. $\sqrt{x+s} = \frac{1}{x} + \frac{1}{s}$

SOLUTION Let $(x+s)^{1/2} = x^{-1} + s^{-1}$. Then

$$\frac{1}{2}(x+s)^{-1/2}\left(1 + s'\right) = -x^{-2} - s^{-2}s'.$$

Multiplying by $2x^2s^2\sqrt{x+s}$ and then solving for s' gives

$$\begin{aligned} x^2s^2\left(1 + s'\right) &= -2s^2\sqrt{x+s} - 2x^2s'\sqrt{x+s} \\ x^2s^2s' + 2x^2s'\sqrt{x+s} &= -2s^2\sqrt{x+s} - x^2s^2 \\ x^2\left(s^2 + 2\sqrt{x+s}\right)s' &= -s^2\left(x^2 + 2\sqrt{x+s}\right) \\ s' &= -\frac{s^2\left(x^2 + 2\sqrt{x+s}\right)}{x^2\left(s^2 + 2\sqrt{x+s}\right)}. \end{aligned}$$

17. $y^{-2/3} + x^{3/2} = 1$

SOLUTION Let $y^{-2/3} + x^{3/2} = 1$. Then

$$-\frac{2}{3}y^{-5/3}y' + \frac{3}{2}x^{1/2} = 0 \quad \text{or} \quad y' = \frac{9}{4}x^{1/2}y^{5/3}.$$

18. $x^{1/2} + y^{2/3} = -4y$

SOLUTION Let $x^{1/2} + y^{2/3} = y^{-4}$. Then $\frac{1}{2}x^{-1/2} + \frac{2}{3}y^{-1/3}y' = -4y^{-5}y'$, and

$$y' = -\frac{\frac{1}{2}x^{-1/2}}{\frac{2}{3}y^{-1/3} + 4y^{-5}}.$$

19. $y + \frac{1}{y} = x^2 + x$

SOLUTION Let $y + \frac{1}{y} = x^2 + x$. Then

$$y' - \frac{1}{y^2} y' = 2x + 1 \quad \text{or} \quad y' = \frac{2x+1}{1 - y^{-2}} = \frac{(2x+1)y^2}{y^2 - 1}.$$

20. $\sin(xt) = t$

SOLUTION In what follows, $t' = \frac{dt}{dx}$. Applying the chain rule and the product rule, we get:

$$\begin{aligned}
\frac{d}{dx}\sin(xt) &= \frac{d}{dx}t \\
\cos(xt)(xt' + t) &= t' \\
x\cos(xt)t' + t\cos(xt) &= t' \\
x\cos(xt)t' - t' &= -t\cos(xt) \\
t'(x\cos(xt) - 1) &= -t\cos(xt) \\
t' &= \frac{-t\cos(xt)}{x\cos(xt) - 1}.
\end{aligned}$$

21. $\sin(x + y) = x + \cos y$

SOLUTION Let $\sin(x + y) = x + \cos y$. Then

$$\begin{aligned}
(1 + y')\cos(x + y) &= 1 - y'\sin y \\
\cos(x + y) + y'\cos(x + y) &= 1 - y'\sin y \\
(\cos(x + y) + \sin y)\, y' &= 1 - \cos(x + y) \\
y' &= \frac{1 - \cos(x + y)}{\cos(x + y) + \sin y}.
\end{aligned}$$

22. $\tan(x^2 y) = (x + y)^3$

SOLUTION Let $\tan\left(x^2 y\right) = (x + y)^3$. Then

$$\begin{aligned}
\sec^2(x^2 y) \cdot (x^2 y' + 2xy) &= 3(x + y)^2(1 + y') \\
x^2\sec^2(x^2 y)y' + 2xy\sec^2(x^2 y) &= 3(x + y)^2 + 3(x + y)^2 y' \\
\left(x^2\sec^2(x^2 y) - 3(x + y)^2\right) y' &= 3(x + y)^2 - 2xy\sec^2(x^2 y) \\
y' &= \frac{3(x + y)^2 - 2xy\sec^2\left(x^2 y\right)}{x^2\sec^2\left(x^2 y\right) - 3(x + y)^2}.
\end{aligned}$$

23. $xe^y = 2xy + y^3$

SOLUTION Let $xe^y = 2xy + y^3$. Then $xy'e^y + e^y = 2xy' + 2y + 3y^2 y'$, whence

$$y' = \frac{e^y - 2y}{2x + 3y^2 - xe^y}.$$

24. $e^{xy} = \sin(y^2)$

SOLUTION Let $e^{xy} = \sin(y^2)$. Then $e^{xy}\left(xy' + y\right) = 2y\cos(y^2)y'$, whence

$$y' = \frac{ye^{xy}}{2y\cos(y^2) - xe^{xy}}.$$

25. $\ln x + \ln y = x - y$

SOLUTION Let $\ln x + \ln y = x - y$. Then

$$\frac{1}{x} + \frac{y'}{y} = 1 - y' \quad \text{or} \quad y' = \frac{1 - \frac{1}{x}}{1 + \frac{1}{y}} = \frac{xy - y}{xy + x}.$$

26. $\ln(x^2 + y^2) = x + 4$

SOLUTION Let $\ln(x^2 + y^2) = x + 4$. Then

$$\frac{2x + 2yy'}{x^2 + y^2} = 1 \quad \text{or} \quad y' = \frac{x^2 + y^2 - 2x}{2y}.$$

27. Show that $x + yx^{-1} = 1$ and $y = x - x^2$ define the same curve (except that $(0, 0)$ is not a solution of the first equation) and that implicit differentiation yields $y' = yx^{-1} - x$ and $y' = 1 - 2x$. Explain why these formulas produce the same values for the derivative.

SOLUTION Multiply the first equation by x and then isolate the y term to obtain

$$x^2 + y = x \quad \Rightarrow \quad y = x - x^2.$$

Implicit differentiation applied to the first equation yields

$$1 - yx^{-2} + x^{-1}y' = 0 \quad \text{or} \quad y' = yx^{-1} - x.$$

From the first equation, we find $yx^{-1} = 1 - x$; upon substituting this expression into the previous derivative, we find

$$y' = 1 - x - x = 1 - 2x,$$

which is the derivative of the second equation.

28. Use the method of Example 4 to compute $\left.\frac{dy}{dx}\right|_P$ at $P = (2, 1)$ on the curve $y^2x^3 + y^3x^4 - 10x + y = 5$.

SOLUTION Implicit differentiation yields

$$3x^2y^2 + 2x^3yy' + 4x^3y^3 + 3x^4y^2y' - 10 + y' = 0 \quad \text{or} \quad y' = \frac{10 - 3x^2y^2 - 4x^3y^3}{2x^3y + 3x^4y^2 + 1}.$$

Thus, at $P = (2, 1)$,

$$\left.\frac{dy}{dx}\right|_P = \frac{10 - 3(2)^2(1)^2 - 4(2)^3(1)^3}{2(2)^3(1) + 3(2)^4(1)^2 + 1} = -\frac{34}{65}.$$

In Exercises 29 and 30, find dy/dx at the given point.

29. $(x + 2)^2 - 6(2y + 3)^2 = 3, \quad (1, -1)$

SOLUTION By the scaling and shifting rule,

$$2(x + 2) - 24(2y + 3)y' = 0.$$

If $x = 1$ and $y = -1$, then

$$2(3) - 24(1)y' = 0.$$

so that $24y' = 6$, or $y' = \frac{1}{4}$.

30. $\sin^2(3y) = x + y, \quad \left(\frac{2-\pi}{4}, \frac{\pi}{4}\right)$

SOLUTION Taking the derivative of both sides of $\sin^2(3y) = x + y$ yields

$$2\sin(3y)\cos(3y)(3y') = 1 + y'.$$

If $x = \frac{2-\pi}{4}$ and $y = \frac{\pi}{4}$, we get

$$6\sin\left(\frac{3\pi}{4}\right)\cos\left(\frac{3\pi}{4}\right)y' = 1 + y'.$$

Using

$$\sin\left(\frac{3\pi}{4}\right) = \frac{\sqrt{2}}{2} \quad \text{and} \quad \cos\left(\frac{3\pi}{4}\right) = -\frac{\sqrt{2}}{2}$$

we find

$$\begin{aligned} -6\left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{2}}{2}\right)y' &= 1 + y' \\ -3y' &= 1 + y' \\ y' &= -\frac{1}{4}. \end{aligned}$$

In Exercises 31–38, find an equation of the tangent line at the given point.

31. $xy + x^2y^2 = 5, \quad (2, 1)$

SOLUTION Taking the derivative of both sides of $xy + x^2y^2 = 5$ yields

$$xy' + y + 2xy^2 + 2x^2yy' = 0.$$

Substituting $x = 2$, $y = 1$, we find

$$2y' + 1 + 4 + 8y' = 0 \quad \text{or} \quad y' = -\frac{1}{2}.$$

Hence, the equation of the tangent line at $(2, 1)$ is $y - 1 = -\frac{1}{2}(x - 2)$ or $y = -\frac{1}{2}x + 2$.

32. $x^{2/3} + y^{2/3} = 2, \quad (1, 1)$

SOLUTION Taking the derivative of both sides of $x^{2/3} + y^{2/3} = 2$ yields

$$\frac{2}{3}x^{-1/3} + \frac{2}{3}y^{-1/3}y' = 0.$$

Substituting $x = 1$, $y = 1$ yields $\frac{2}{3} + \frac{2}{3}y' = 0$, so that $1 + y' = 0$, or $y' = -1$. Hence, the equation of the tangent line at $(1, 1)$ is $y - 1 = -(x - 1)$, or $y = 2 - x$.

33. $x^2 + \sin y = xy^2 + 1, \quad (1, 0)$

SOLUTION Taking the derivative of both sides of $x^2 + \sin y = xy^2 + 1$ yields

$$2x + \cos y y' = y^2 + 2xyy'.$$

Substituting $x = 1$, $y = 0$, we find

$$2 + y' = 0 \quad \text{or} \quad y' = -2.$$

Hence, the equation of the tangent line is $y - 0 = -2(x - 1)$ or $y = -2x + 2$.

34. $\sin(x - y) = x\cos\left(y + \frac{\pi}{4}\right), \quad \left(\frac{\pi}{4}, \frac{\pi}{4}\right)$

SOLUTION Taking the derivative of both sides of $\sin(x - y) = x\cos\left(y + \frac{\pi}{4}\right)$ yields

$$\cos(x - y)(1 - y') = \cos\left(y + \frac{\pi}{4}\right) - x\sin\left(y + \frac{\pi}{4}\right)y'.$$

Substituting $x = \frac{\pi}{4}$, $y = \frac{\pi}{4}$, we find

$$1(1 - y') = 0 - \frac{\pi}{4}y' \quad \text{or} \quad y' = \frac{4}{4 + \pi}.$$

Hence, the equation of the tangent line is

$$y - \frac{\pi}{4} = \frac{4}{4+\pi}\left(x - \frac{\pi}{4}\right).$$

35. $2x^{1/2} + 4y^{-1/2} = xy, \quad (1, 4)$

SOLUTION Taking the derivative of both sides of $2x^{1/2} + 4y^{-1/2} = xy$ yields

$$x^{-1/2} - 2y^{-3/2}y' = xy' + y.$$

Substituting $x = 1$, $y = 4$, we find

$$1 - 2\left(\frac{1}{8}\right)y' = y' + 4 \quad \text{or} \quad y' = -\frac{12}{5}.$$

Hence, the equation of the tangent line is $y - 4 = -\frac{12}{5}(x - 1)$ or $y = -\frac{12}{5}x + \frac{32}{5}$.

36. $x^2e^y + ye^x = 4, \quad (2, 0)$

SOLUTION Taking the derivative of both sides of $x^2e^y + ye^x = 4$ yields

$$x^2e^yy' + 2xe^y + ye^x + e^xy' = 0.$$

Substituting $x = 2$, $y = 0$, we find

$$4y' + 4 + 0 + e^2y' = 0 \quad \text{or} \quad y' = -\frac{4}{4+e^2}.$$

Hence, the equation of the tangent line is

$$y = -\frac{4}{4+e^2}(x - 2).$$

37. $e^{2x-y} = \dfrac{x^2}{y}, \quad (2, 4)$

SOLUTION taking the derivative of both sides of $e^{2x-y} = \dfrac{x^2}{y}$ yields

$$e^{2x-y}(2 - y') = \frac{2xy - x^2y'}{y^2}.$$

Substituting $x = 2$, $y = 4$, we find

$$e^0(2 - y') = \frac{16 - 4y'}{16} \quad \text{or} \quad y' = \frac{4}{3}.$$

Hence, the equation of the tangent line is $y - 4 = \frac{4}{3}(x - 2)$ or $y = \frac{4}{3}x + \frac{4}{3}$.

38. $y^2e^{x^2-16} - xy^{-1} = 2, \quad (4, 2)$

SOLUTION Taking the derivative of both sides of $y^2e^{x^2-16} - xy^{-1} = 2$ yields

$$2xy^2e^{x^2-16} + 2yy'e^{x^2-16} + xy^{-2}y' - y^{-1} = 0.$$

Substituting $x = 4$, $y = 2$, we find

$$32e^0 + 4y'e^0 + y' - \frac{1}{2} = 0 \quad \text{or} \quad y' = -\frac{63}{10}.$$

Hence, the equation of the tangent line is $y - 2 = -\frac{63}{10}(x - 4)$ or $y = -\frac{63}{10}x + \frac{136}{5}$.

39. Find the points on the graph of $y^2 = x^3 - 3x + 1$ (Figure 6) where the tangent line is horizontal.

(a) First show that $2yy' = 3x^2 - 3$, where $y' = dy/dx$.

(b) Do not solve for y'. Rather, set $y' = 0$ and solve for x. This yields two values of x where the slope may be zero.

(c) Show that the positive value of x does not correspond to a point on the graph.

(d) The negative value corresponds to the two points on the graph where the tangent line is horizontal. Find their coordinates.

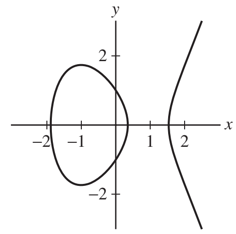

FIGURE 6 Graph of $y^2 = x^3 - 3x + 1$.

SOLUTION

(a) Applying implicit differentiation to $y^2 = x^3 - 3x + 1$, we have

$$2y\frac{dy}{dx} = 3x^2 - 3.$$

(b) Setting $y' = 0$ we have $0 = 3x^2 - 3$, so $x = 1$ or $x = -1$.

(c) If we return to the equation $y^2 = x^3 - 3x + 1$ and substitute $x = 1$, we obtain the equation $y^2 = -1$, which has no real solutions.

(d) Substituting $x = -1$ into $y^2 = x^3 - 3x + 1$ yields

$$y^2 = (-1)^3 - 3(-1) + 1 = -1 + 3 + 1 = 3,$$

so $y = \sqrt{3}$ or $-\sqrt{3}$. The tangent is horizontal at the points $(-1, \sqrt{3})$ and $(-1, -\sqrt{3})$.

40. Show, by differentiating the equation, that if the tangent line at a point (x, y) on the curve $x^2y - 2x + 8y = 2$ is horizontal, then $xy = 1$. Then substitute $y = x^{-1}$ in $x^2y - 2x + 8y = 2$ to show that the tangent line is horizontal at the points $\left(2, \frac{1}{2}\right)$ and $\left(-4, -\frac{1}{4}\right)$.

SOLUTION Taking the derivative on both sides of the equation $x^2y - 2x + 8y = 2$ yields

$$x^2y' + 2xy - 2 + 8y' = 0 \quad \text{or} \quad y' = \frac{2(1 - xy)}{x^2 + 8}.$$

Thus, if the tangent line to the given curve is horizontal, it must be that $1 - xy = 0$, or $xy = 1$. Substituting $y = x^{-1}$ into $x^2y - 2x + 8y = 2$ then yields

$$x - 2x + \frac{8}{x} = 2 \quad \text{or} \quad x^2 + 2x - 8 = (x + 4)(x - 2) = 0.$$

Hence, the given curve has a horizontal tangent line when $x = 2$ and when $x = -4$. The corresponding points on the curve are thus $\left(2, \frac{1}{2}\right)$ and $\left(-4, -\frac{1}{4}\right)$.

41. Find all points on the graph of $3x^2 + 4y^2 + 3xy = 24$ where the tangent line is horizontal (Figure 7).

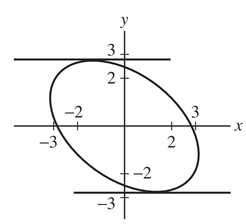

FIGURE 7 Graph of $3x^2 + 4y^2 + 3xy = 24$.

SOLUTION Differentiating the equation $3x^2 + 4y^2 + 3xy = 24$ implicitly yields

$$6x + 8yy' + 3xy' + 3y = 0,$$

so

$$y' = -\frac{6x + 3y}{8y + 3x}.$$

Setting $y' = 0$ leads to $6x + 3y = 0$, or $y = -2x$. Substituting $y = -2x$ into the equation $3x^2 + 4y^2 + 3xy = 24$ yields

$$3x^2 + 4(-2x)^2 + 3x(-2x) = 24,$$

or $13x^2 = 24$. Thus, $x = \pm 2\sqrt{78}/13$, and the coordinates of the two points on the graph of $3x^2 + 4y^2 + 3xy = 24$ where the tangent line is horizontal are

$$\left(\frac{2\sqrt{78}}{13}, -\frac{4\sqrt{78}}{13}\right) \qquad \text{and} \qquad \left(-\frac{2\sqrt{78}}{13}, \frac{4\sqrt{78}}{13}\right).$$

42. Show that no point on the graph of $x^2 - 3xy + y^2 = 1$ has a horizontal tangent line.

SOLUTION Let the implicit curve $x^2 - 3xy + y^2 = 1$ be given. Then

$$2x - 3xy' - 3y + 2yy' = 0,$$

so

$$y' = \frac{2x - 3y}{3x - 2y}.$$

Setting $y' = 0$ leads to $y = \frac{2}{3}x$. Substituting $y = \frac{2}{3}x$ into the equation of the implicit curve gives

$$x^2 - 3x\left(\frac{2}{3}x\right) + \left(\frac{2}{3}x\right)^2 = 1,$$

or $-\frac{5}{9}x^2 = 1$, which has *no* real solutions. Accordingly, there are *no* points on the implicit curve where the tangent line has slope zero.

43. Figure 1 shows the graph of $y^4 + xy = x^3 - x + 2$. Find dy/dx at the two points on the graph with x-coordinate 0 and find an equation of the tangent line at $(1, 1)$.

SOLUTION Consider the equation $y^4 + xy = x^3 - x + 2$. Then $4y^3y' + xy' + y = 3x^2 - 1$, and

$$y' = \frac{3x^2 - y - 1}{x + 4y^3}.$$

- Substituting $x = 0$ into $y^4 + xy = x^3 - x + 2$ gives $y^4 = 2$, which has two real solutions, $y = \pm 2^{1/4}$. When $y = 2^{1/4}$, we have

  $$y' = \frac{-2^{1/4} - 1}{4\left(2^{3/4}\right)} = -\frac{\sqrt{2} + \sqrt[4]{2}}{8} \approx -.3254.$$

  When $y = -2^{1/4}$, we have

  $$y' = \frac{2^{1/4} - 1}{-4\left(2^{3/4}\right)} = -\frac{\sqrt{2} - \sqrt[4]{2}}{8} \approx -.02813.$$

- At the point $(1, 1)$, we have $y' = \frac{1}{5}$. At this point the tangent line is $y - 1 = \frac{1}{5}(x - 1)$ or $y = \frac{1}{5}x + \frac{4}{5}$.

44. Folium of Descartes The curve $x^3 + y^3 = 3xy$ (Figure 8) was first discussed in 1638 by the French philosopher-mathematician René Descartes, who called it the folium (meaning "leaf"). Descartes's scientific colleague Gilles de Roberval called it the jasmine flower. Both men believed incorrectly that the leaf shape in the first quadrant was repeated in each quadrant, giving the appearance of petals of a flower. Find an equation of the tangent line at the point $\left(\frac{2}{3}, \frac{4}{3}\right)$.

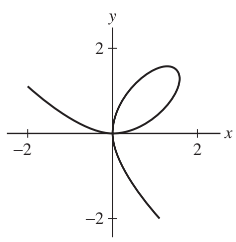

FIGURE 8 Folium of Descartes: $x^3 + y^3 = 3xy$.

SOLUTION Let $x^3 + y^3 = 3xy$. Then $3x^2 + 3y^2y' = 3xy' + 3y$, and $y' = \dfrac{x^2 - y}{x - y^2}$. At the point $\left(\frac{2}{3}, \frac{4}{3}\right)$, we have

$$y' = \frac{\frac{4}{9} - \frac{4}{3}}{\frac{2}{3} - \frac{16}{9}} = \frac{-\frac{8}{9}}{-\frac{10}{9}} = \frac{4}{5}.$$

The tangent line at P is thus $y - \frac{4}{3} = \frac{4}{5}\left(x - \frac{2}{3}\right)$ or $y = \frac{4}{5}x + \frac{4}{5}$.

45. Find a point on the folium $x^3 + y^3 = 3xy$ other than the origin at which the tangent line is horizontal.

SOLUTION Using implicit differentiation, we find

$$\frac{d}{dx}\left(x^3 + y^3\right) = \frac{d}{dx}(3xy)$$
$$3x^2 + 3y^2 y' = 3(xy' + y)$$

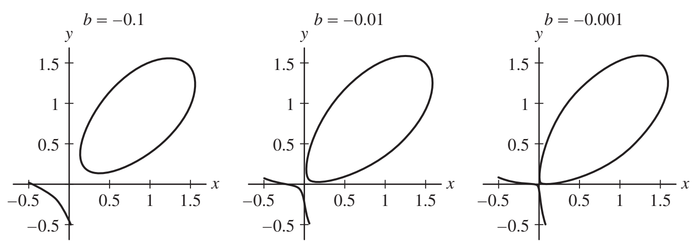
Setting $y' = 0$ in this equation yields $3x^2 = 3y$ or $y = x^2$. If we substitute this expression into the original equation $x^3 + y^3 = 3xy$, we obtain:

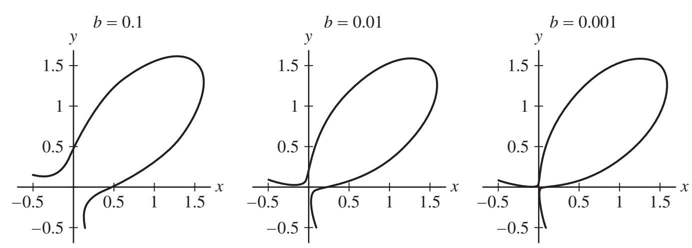
$$x^3 + x^6 = 3x(x^2) = 3x^3 \qquad \text{or} \qquad x^3(x^3 - 2) = 0.$$

One solution of this equation is $x = 0$ and the other is $x = 2^{1/3}$. Thus, the two points on the folium $x^3 + y^3 = 3xy$ at which the tangent line is horizontal are $(0, 0)$ and $(2^{1/3}, 2^{2/3})$.

46. GU Plot $x^3 + y^3 = 3xy + b$ for several values of b and describe how the graph changes as $b \to 0$. Then compute dy/dx at the point $(b^{1/3}, 0)$. How does this value change as $b \to \infty$? Do your plots confirm this conclusion?

SOLUTION Consider the first row of figures below. When $b < 0$, the graph of $x^3 + y^3 = 3xy + b$ consists of two pieces. As $b \to 0-$, the two pieces move closer to intersecting at the origin. From the second row of figures, we see that the graph of $x^3 + y^3 = 3xy + b$ when $b > 0$ consists of a single piece that has a "loop" in the first quadrant. As $b \to 0+$, the loop comes closer to "pinching off" at the origin.





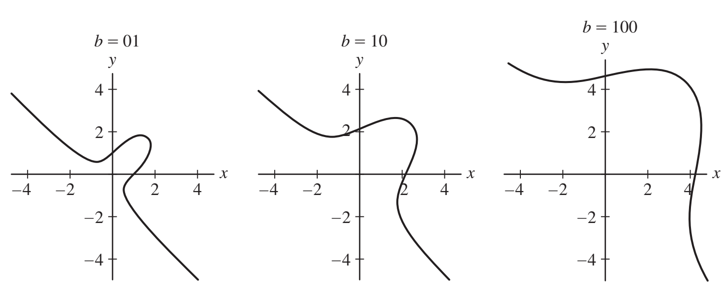
Differentiating the equation $x^3 + y^3 = 3xy + b$ with respect to x yields $3x^2 + 3y^2 y' = 3xy' + 3y$, so

$$y' = \frac{y - x^2}{y^2 - x}.$$

At $(b^{1/3}, 0)$, we have

$$y' = \frac{0 - x^2}{0^2 - x} = x = \sqrt[3]{b}.$$

Consequently, as $b \to \infty$, $y' \to \infty$ at the point on the graph where $y = 0$. This conclusion is supported by the figures shown below, which correspond to $b = 1$, $b = 10$, and $b = 100$.



47. Find the x-coordinates of the points where the tangent line is horizontal on the *trident curve* $xy = x^3 - 5x^2 + 2x - 1$, so named by Isaac Newton in his treatise on curves published in 1710 (Figure 9).
Hint: $2x^3 - 5x^2 + 1 = (2x - 1)(x^2 - 2x - 1)$.

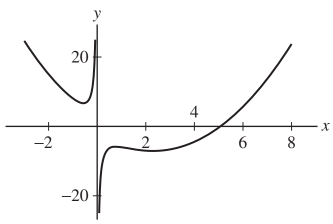


FIGURE 9 Trident curve: $xy = x^3 - 5x^2 + 2x - 1$.

SOLUTION Take the derivative of the equation of a trident curve:

$$xy = x^3 - 5x^2 + 2x - 1$$

to obtain

$$xy' + y = 3x^2 - 10x + 2.$$

Setting $y' = 0$ gives $y = 3x^2 - 10x + 2$. Substituting this into the equation of the trident, we have

$$xy = x(3x^2 - 10x + 2) = x^3 - 5x^2 + 2x - 1$$

or

$$3x^3 - 10x^2 + 2x = x^3 - 5x^2 + 2x - 1$$

Collecting like terms and setting to zero, we have

$$0 = 2x^3 - 5x^2 + 1 = (2x - 1)(x^2 - 2x - 1).$$

Hence, $x = \frac{1}{2}, 1 \pm \sqrt{2}$.

48. Find an equation of the tangent line at each of the four points on the curve $(x^2 + y^2 - 4x)^2 = 2(x^2 + y^2)$ where $x = 1$. This curve (Figure 10) is an example of a *limaçon of Pascal*, named after the father of the French philosopher Blaise Pascal, who first described it in 1650.

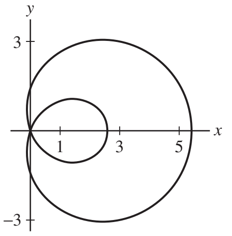

FIGURE 10 Limaçon: $(x^2 + y^2 - 4x)^2 = 2(x^2 + y^2)$.

SOLUTION Plugging $x = 1$ into the equation for the limaçon and solving for y, we find that the points on the curve where $x = 1$ are: $(1, 1)$, $(1, -1)$, $(1, \sqrt{7})$, $(1, -\sqrt{7})$. Using implicit differentiation, we obtain

$$2(x^2 + y^2 - 4x)(2x + 2yy' - 4) = 2(2x + 2yy').$$

We plug in $x = 1$ and get

$$2(1 + y^2 - 4)(2 + 2yy' - 4) = 2(2 + 2yy')$$

or

$$(2y^2 - 6)(2yy' - 2) = 4 + 4yy'.$$

After collecting like terms and solving for y', we have

$$y' = \frac{-2 + y^2}{y^3 - 4y}.$$

At the point (1, 1) the slope of the tangent is $\frac{1}{3}$ and the tangent line is

$$y - 1 = \frac{1}{3}(x-1) \quad \text{or} \quad y = \frac{1}{3}x + \frac{2}{3}.$$

At the point (1, −1) the slope of the tangent is $-\frac{1}{3}$ and the tangent line is

$$y + 1 = -\frac{1}{3}(x-1) \quad \text{or} \quad y = -\frac{1}{3}x - \frac{2}{3}.$$

At the point $(1, \sqrt{7})$ the slope of the tangent is $5/3\sqrt{7}$ and the tangent line is

$$y - \sqrt{7} = \frac{5}{3\sqrt{7}}(x-1) \quad \text{or} \quad y = \frac{5}{3\sqrt{7}}x + \sqrt{7} - \frac{5}{3\sqrt{7}}.$$

At the point $(1, -\sqrt{7})$ the slope of the tangent is $-5/3\sqrt{7}$ and the tangent line is

$$y + \sqrt{7} = -\frac{5}{3\sqrt{7}}(x-1) \quad \text{or} \quad y = -\frac{5}{3\sqrt{7}}x + \frac{5}{3\sqrt{7}} - \sqrt{7}.$$

49. Find the derivative at the points where $x = 1$ on the folium $(x^2 + y^2)^2 = \frac{25}{4}xy^2$. See Figure 11.

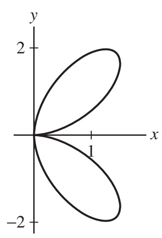

FIGURE 11 Folium curve: $(x^2 + y^2)^2 = \dfrac{25}{4}xy^2$

SOLUTION First, find the points $(1, y)$ on the curve. Setting $x = 1$ in the equation $(x^2 + y^2)^2 = \frac{25}{4}xy^2$ yields

$$\begin{aligned}
(1 + y^2)^2 &= \frac{25}{4}y^2 \\
y^4 + 2y^2 + 1 &= \frac{25}{4}y^2 \\
4y^4 + 8y^2 + 4 &= 25y^2 \\
4y^4 - 17y^2 + 4 &= 0 \\
(4y^2 - 1)(y^2 - 4) &= 0 \\
y^2 &= \frac{1}{4} \text{ or } y^2 = 4
\end{aligned}$$

Hence $y = \pm\frac{1}{2}$ or $y = \pm 2$. Taking $\frac{d}{dx}$ of both sides of the original equation yields

$$\begin{aligned}
2(x^2 + y^2)(2x + 2yy') &= \frac{25}{4}y^2 + \frac{25}{2}xyy' \\
4(x^2 + y^2)x + 4(x^2 + y^2)yy' &= \frac{25}{4}y^2 + \frac{25}{2}xyy' \\
(4(x^2 + y^2) - \frac{25}{2}x)yy' &= \frac{25}{4}y^2 - 4(x^2 + y^2)x \\
y' &= \frac{\frac{25}{4}y^2 - 4(x^2 + y^2)x}{y(4(x^2 + y^2) - \frac{25}{2}x)}
\end{aligned}$$

- At (1, 2), $x^2 + y^2 = 5$, and

$$y' = \frac{\frac{25}{4}2^2 - 4(5)(1)}{2(4(5) - \frac{25}{2}(1))} = \frac{1}{3}.$$

- At $(1, -2)$, $x^2 + y^2 = 5$ as well, and

$$y' = \frac{\frac{25}{4}(-2)^2 - 4(5)(1)}{-2(4(5) - \frac{25}{2}(1))} = -\frac{1}{3}.$$

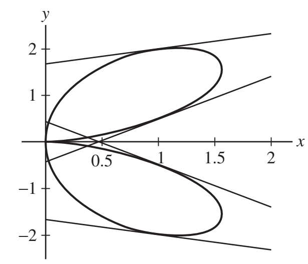
- At $(1, \frac{1}{2})$, $x^2 + y^2 = \frac{5}{4}$, and

$$y' = \frac{\frac{25}{4}\left(\frac{1}{2}\right)^2 - 4\left(\frac{5}{4}\right)(1)}{\frac{1}{2}\left(4\left(\frac{5}{4}\right) - \frac{25}{2}(1)\right)} = \frac{11}{12}.$$

- At $(1, -\frac{1}{2})$, $x^2 + y^2 = \frac{5}{4}$, and

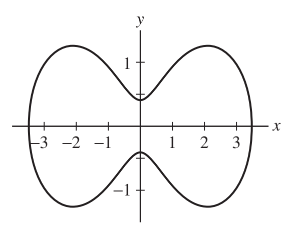
$$y' = \frac{\frac{25}{4}\left(-\frac{1}{2}\right)^2 - 4\left(\frac{5}{4}\right)(1)}{-\frac{1}{2}\left(4\left(\frac{5}{4}\right) - \frac{25}{2}(1)\right)} = -\frac{11}{12}.$$

The folium and its tangent lines are plotted below:



50. CAS Plot $(x^2 + y^2)^2 = 12(x^2 - y^2) + 2$ for $-4 \le x \le 4$, $4 \le y \le 4$ using a computer algebra system. How many horizontal tangent lines does the curve appear to have? Find the points where these occur.

SOLUTION A plot of the curve $(x^2 + y^2)^2 = 12(x^2 - y^2) + 2$ is shown below. From this plot, it appears that the curve has a horizontal tangent line at six different locations.



Differentiating the equation $(x^2 + y^2)^2 = 12(x^2 - y^2) + 2$ with respect to x yields

$$2(x^2 + y^2)(2x + 2yy') = 12(2x - 2yy'),$$

so

$$y' = \frac{x(6 - x^2 - y^2)}{y(x^2 + y^2 + 6)}.$$

Thus, horizontal tangent lines occur when $x = 0$ and when $x^2 + y^2 = 6$. Substituting $x = 0$ into the equation for the curve leaves $y^4 + 12y^2 - 2 = 0$, from which it follows that $y^2 = \sqrt{38} - 6$ or $y = \pm\sqrt{\sqrt{38} - 6}$. Substituting $x^2 + y^2 = 6$ into the equation for the curve leaves $x^2 - y^2 = \frac{17}{6}$. From here, it follows that

$$x = \pm\frac{\sqrt{159}}{6} \qquad \text{and} \qquad y = \pm\frac{\sqrt{57}}{6}.$$

The six points at which horizontal tangent lines occur are therefore

$$\left(0, \sqrt{\sqrt{38} - 6}\right), \left(0, -\sqrt{\sqrt{38} - 6}\right)$$

$$\left(\frac{\sqrt{159}}{6}, \frac{\sqrt{57}}{6}\right), \left(\frac{\sqrt{159}}{6}, -\frac{\sqrt{57}}{6}\right), \left(-\frac{\sqrt{159}}{6}, \frac{\sqrt{57}}{6}\right), \left(-\frac{\sqrt{159}}{6}, -\frac{\sqrt{57}}{6}\right)$$

Exercises 51–53: If the derivative dx/dy (instead of $dy/dx = 0$) exists at a point and $dx/dy = 0$, then the tangent line at that point is vertical.

51. Calculate dx/dy for the equation $y^4 + 1 = y^2 + x^2$ and find the points on the graph where the tangent line is vertical.

SOLUTION Let $y^4 + 1 = y^2 + x^2$. Differentiating this equation with respect to y yields

$$4y^3 = 2y + 2x\frac{dx}{dy},$$

so

$$\frac{dx}{dy} = \frac{4y^3 - 2y}{2x} = \frac{y(2y^2 - 1)}{x}.$$

Thus, $\frac{dx}{dy} = 0$ when $y = 0$ and when $y = \pm\frac{\sqrt{2}}{2}$. Substituting $y = 0$ into the equation $y^4 + 1 = y^2 + x^2$ gives $1 = x^2$, so $x = \pm 1$. Substituting $y = \pm\frac{\sqrt{2}}{2}$, gives $x^2 = 3/4$, so $x = \pm\frac{\sqrt{3}}{2}$. Thus, there are six points on the graph of $y^4 + 1 = y^2 + x^2$ where the tangent line is vertical:

$$(1, 0), (-1, 0), \left(\frac{\sqrt{3}}{2}, \frac{\sqrt{2}}{2}\right), \left(-\frac{\sqrt{3}}{2}, \frac{\sqrt{2}}{2}\right), \left(\frac{\sqrt{3}}{2}, -\frac{\sqrt{2}}{2}\right), \left(-\frac{\sqrt{3}}{2}, -\frac{\sqrt{2}}{2}\right).$$

52. Show that the tangent lines at $x = 1 \pm \sqrt{2}$ to the *conchoid* with equation $(x - 1)^2(x^2 + y^2) = 2x^2$ are vertical (Figure 12).

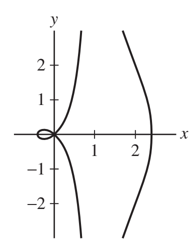


FIGURE 12 Conchoid: $(x - 1)^2(x^2 + y^2) = 2x^2$.

SOLUTION Consider the equation of a conchoid:

$$(x - 1)^2 \left(x^2 + y^2\right) = 2x^2.$$

Taking the derivative of both sides of this equation gives

$$(x - 1)^2 \left(2x\frac{dx}{dy} + 2y\right) + \left(x^2 + y^2\right) \cdot 2\,(x - 1)\,\frac{dx}{dy} = 4x\frac{dx}{dy},$$

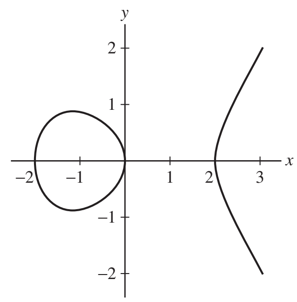
so that

$$\frac{dx}{dy} = \frac{(x - 1)^2\, y}{2x + (1 - x)\left(x^2 + y^2\right) - x\,(x - 1)^2}.$$

Setting $dx/dy = 0$ yields $x = 1$ or $y = 0$. We can't have $x = 1$, lest $0 = 2$ in the conchoid's equation. Plugging $y = 0$ into the equation gives $(x - 1)^2\, x^2 = 2x^2$ or $x^2\left((x - 1)^2 - 2\right) = 0$, which implies $x = 0$ (a double root) or $x = 1 \pm \sqrt{2}$. [Plugging $x = 0$ into the conchoid's equation gives $y^2 = 0$ or $y = 0$. At $(x, y) = (0, 0)$ the expression for dx/dy is undefined $(0/0)$. Via an alternative parametric analysis, the slopes of the tangent lines at the origin turn out to be $\pm\sqrt{3}$.] Accordingly, the tangent lines to the conchoid are vertical at $(x, y) = (1 \pm \sqrt{2}, 0)$.

53. CAS Use a computer algebra system to plot $y^2 = x^3 - 4x$ for $-4 \le x \le 4$, $4 \le y \le 4$. Show that if $dx/dy = 0$, then $y = 0$. Conclude that the tangent line is vertical at the points where the curve intersects the x-axis. Does your plot confirm this conclusion?

SOLUTION A plot of the curve $y^2 = x^3 - 4x$ is shown below.



Differentiating the equation $y^2 = x^3 - 4x$ with respect to y yields

$$2y = 3x^2 \frac{dx}{dy} - 4\frac{dx}{dy},$$

or

$$\frac{dx}{dy} = \frac{2y}{3x^2 - 4}.$$

From here, it follows that $\frac{dx}{dy} = 0$ when $y = 0$, so the tangent line to this curve is vertical at the points where the curve intersects the x-axis. This conclusion is confirmed by the plot of the curve shown above.

54. Show that for all points P on the graph in Figure 13, the segments $\overline{OP}$ and $\overline{PR}$ have equal length.

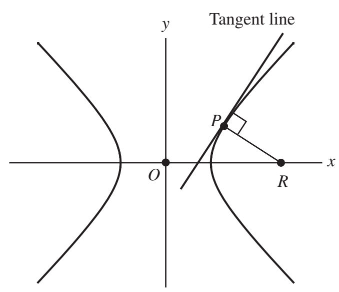


FIGURE 13 Graph of $x^2 - y^2 = a^2$.

SOLUTION Because of the symmetry of the graph, we may restrict attention to any point P in the first quadrant. Suppose P has coordinates $(p, \sqrt{p^2 - a^2})$. Taking the derivative of both sides of the equation $x^2 - y^2 = a^2$ yields $2x - 2yy' = 0$, or $y' = x/y$. It follows that the slope of the line tangent to the graph at P has slope

$$\frac{p}{\sqrt{p^2 - a^2}}$$

and the slope of the normal line is

$$-\frac{\sqrt{p^2 - a^2}}{p}.$$

Thus, the equation of the normal line is

$$y - \sqrt{p^2 - a^2} = -\frac{\sqrt{p^2 - a^2}}{p}(x - p),$$

and the coordinates of the point R are $(2p, 0)$. Finally, the length of the line segment $\overline{OP}$ is

$$\sqrt{p^2 + p^2 - a^2} = \sqrt{2p^2 - a^2},$$

while the length of the segment $\overline{PR}$ is

$$\sqrt{(2p - p)^2 + p^2 - a^2} = \sqrt{2p^2 - a^2}.$$

In Exercises 55–58, use implicit differentiation to calculate higher derivatives.

55. Consider the equation $y^3 - \frac{3}{2}x^2 = 1$.

(a) Show that $y' = x/y^2$ and differentiate again to show that

$$y'' = \frac{y^2 - 2xyy'}{y^4}$$

(b) Express y'' in terms of x and y using part (a).

SOLUTION

(a) Let $y^3 - \frac{3}{2}x^2 = 1$. Then $3y^2y' - 3x = 0$, and $y' = x/y^2$. Therefore,

$$y'' = \frac{y^2 \cdot 1 - x \cdot 2yy'}{y^4} = \frac{y^2 - 2xyy'}{y^4}.$$

(b) Substituting the expression for y' into the result for y'' gives

$$y'' = \frac{y^2 - 2xy\left(x/y^2\right)}{y^4} = \frac{y^3 - 2x^2}{y^5}.$$

56. Use the method of the previous exercise to show that $y'' = -y^{-3}$ on the circle $x^2 + y^2 = 1$.

SOLUTION Let $x^2 + y^2 = 1$. Then $2x + 2yy' = 0$, and $y' = -\frac{x}{y}$. Thus

$$y'' = -\frac{y \cdot 1 - xy'}{y^2} = -\frac{y - x\left(-\frac{x}{y}\right)}{y^2} = -\frac{y^2 + x^2}{y^3} = -\frac{1}{y^3} = -y^{-3}.$$

57. Calculate y'' at the point $(1, 1)$ on the curve $xy^2 + y - 2 = 0$ by the following steps:

(a) Find y' by implicit differentiation and calculate y' at the point $(1, 1)$.

(b) Differentiate the expression for y' found in (a). Then compute y'' at $(1, 1)$ by substituting $x = 1$, $y = 1$, and the value of y' found in (a).

SOLUTION Let $xy^2 + y - 2 = 0$.

(a) Then $x \cdot 2yy' + y^2 \cdot 1 + y' = 0$, and $y' = -\frac{y^2}{2xy + 1}$. At $(x, y) = (1, 1)$, we have $y' = -\frac{1}{3}$.

(b) Therefore,

$$y'' = -\frac{(2xy + 1)\left(2yy'\right) - y^2\left(2xy' + 2y\right)}{(2xy + 1)^2} = -\frac{(3)\left(-\frac{2}{3}\right) - (1)\left(-\frac{2}{3} + 2\right)}{3^2} = -\frac{-6 + 2 - 6}{27} = \frac{10}{27}$$

given that $(x, y) = (1, 1)$ and $y' = -\frac{1}{3}$.

58. Use the method of the previous exercise to compute y'' at the point $(1, 1)$ on the curve $x^3 + y^3 = 3x + y - 2$.

SOLUTION Let $x^3 + y^3 = 3x + y - 2$. Then $3x^2 + 3y^2y' = 3 + y'$, and $y' = \frac{3(1 - x^2)}{3y^2 - 1}$. At $(x, y) = (1, 1)$, we find

$$y' = \frac{3(1 - 1)}{3(1) - 1} = 0.$$

Similarly,

$$y'' = \frac{\left(3y^2 - 1\right)(-6x) - \left(3 - 3x^2\right)\left(6yy'\right)}{\left(3y^2 - 1\right)^2} = -3$$

when $(x, y) = (1, 1)$ and $y' = 0$.

In Exercises 59–61, x and y are functions of a variable t and use implicit differentiation to relate dy/dt and dx/dt.

59. Differentiate $xy = 1$ with respect to t and derive the relation $\dfrac{dy}{dt} = -\dfrac{y}{x}\dfrac{dx}{dt}$.

SOLUTION Let $xy = 1$. Then $x\dfrac{dy}{dt} + y\dfrac{dx}{dt} = 0$, and $\dfrac{dy}{dt} = -\dfrac{y}{x}\dfrac{dx}{dt}$.

60. Differentiate $x^3 + 3xy^2 = 1$ with respect to t and express dy/dt in terms of dx/dt, as in Exercise 59.

SOLUTION Let $x^3 + 3xy^2 = 1$. Then

$$3x^2\frac{dx}{dt} + 6xy\frac{dy}{dt} + 3y^2\frac{dx}{dt} = 0,$$

and

$$\frac{dy}{dt} = -\frac{x^2 + y^2}{2xy}\frac{dx}{dt}.$$

61. Calculate dy/dt in terms of dx/dt.

(a) $x^3 - y^3 = 1$

(b) $y^4 + 2xy + x^2 = 0$

SOLUTION

(a) Taking the derivative of both sides of the equation $x^3 - y^3 = 1$ with respect to t yields

$$3x^2\frac{dx}{dt} - 3y^2\frac{dy}{dt} = 0 \quad \text{or} \quad \frac{dy}{dt} = \frac{x^2}{y^2}\frac{dx}{dt}.$$

(b) Taking the derivative of both sides of the equation $y^4 + 2xy + x^2 = 0$ with respect to t yields

$$4y^3\frac{dy}{dt} + 2x\frac{dy}{dt} + 2y\frac{dx}{dt} + 2x\frac{dx}{dt} = 0,$$

or

$$\frac{dy}{dt} = -\frac{x + y}{2y^3 + x}\frac{dx}{dt}.$$

62. The volume V and pressure P of gas in a piston (which vary in time t) satisfy $PV^{3/2} = C$, where C is a constant. Prove that

$$\frac{dP/dt}{dV/dt} = -\frac{3}{2}\frac{P}{V}$$

The ratio of the derivatives is negative. Could you have predicted this from the relation $PV^{3/2} = C$?

SOLUTION Let $PV^{3/2} = C$, where C is a constant. Then

$$P \cdot \frac{3}{2}V^{1/2}\frac{dV}{dt} + V^{3/2}\frac{dP}{dt} = 0, \quad \text{so} \quad \frac{dP/dt}{dV/dt} = -\frac{3}{2}\frac{P}{V}.$$

If P is increasing (respectively, decreasing), then $V = (C/P)^{2/3}$ is decreasing (respectively, increasing). Hence the ratio of the derivatives ($+/-$ or $-/+$) is negative.

Further Insights and Challenges

63. Show that if P lies on the intersection of the two curves $x^2 - y^2 = c$ and $xy = d$ (c, d constants), then the tangents to the curves at P are perpendicular.

SOLUTION Let $C1$ be the curve described by $x^2 - y^2 = c$, and let $C2$ be the curve described by $xy = d$. Suppose that $P = (x_0, y_0)$ lies on the intersection of the two curves $x^2 - y^2 = c$ and $xy = d$. Since $x^2 - y^2 = c$, the chain rule gives us $2x - 2yy' = 0$, so that $y' = \frac{2x}{2y} = \frac{x}{y}$. The slope to the tangent line to $C1$ is $\frac{x_0}{y_0}$. On the curve $C2$, since $xy = d$, the product rule yields that $xy' + y = 0$, so that $y' = -\frac{y}{x}$. Therefore the slope to the tangent line to $C2$ is $-\frac{y_0}{x_0}$. The two slopes are negative reciprocals of one another, hence the tangents to the two curves are perpendicular.

64. The *lemniscate curve* $(x^2 + y^2)^2 = 4(x^2 - y^2)$ was discovered by Jacob Bernoulli in 1694, who noted that it is "shaped like a figure 8, or a knot, or the bow of a ribbon." Find the coordinates of the four points at which the tangent line is horizontal (Figure 14).

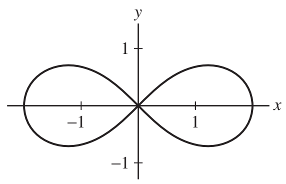

FIGURE 14 Lemniscate curve: $(x^2 + y^2)^2 = 4(x^2 - y^2)$.

SOLUTION Consider the equation of a lemniscate curve: $\left(x^2+y^2\right)^2 = 4\left(x^2-y^2\right)$. Taking the derivative of both sides of this equation, we have

$$2\left(x^2+y^2\right)\left(2x+2yy'\right) = 4\left(2x-2yy'\right).$$

Therefore,

$$y' = \frac{8x - 4x\left(x^2+y^2\right)}{8y+4y\left(x^2+y^2\right)} = -\frac{\left(x^2+y^2-2\right)x}{\left(x^2+y^2+2\right)y}.$$

If $y'=0$, then either $x=0$ or $x^2+y^2=2$.

- If $x=0$ in the lemniscate curve, then $y^4=-4y^2$ or $y^2\left(y^2+4\right)=0$. If y is real, then $y=0$. The formula for y' in (a) is not defined at the origin (0/0). An alternative parametric analysis shows that the slopes of the tangent lines to the curve at the origin are ± 1.
- If $x^2+y^2=2$ or $y^2=2-x^2$, then plugging this into the lemniscate equation gives $4=4\left(2x^2-2\right)$ which yields $x=\pm\sqrt{\frac{3}{2}}=\pm\frac{\sqrt{6}}{2}$. Thus $y=\pm\sqrt{\frac{1}{2}}=\pm\frac{\sqrt{2}}{2}$. Accordingly, the four points at which the tangent lines to the lemniscate curve are horizontal are $\left(-\frac{\sqrt{6}}{2},-\frac{\sqrt{2}}{2}\right)$, $\left(-\frac{\sqrt{6}}{2},\frac{\sqrt{2}}{2}\right)$, $\left(\frac{\sqrt{6}}{2},-\frac{\sqrt{2}}{2}\right)$, and $\left(\frac{\sqrt{6}}{2},\frac{\sqrt{2}}{2}\right)$.

65. Divide the curve in Figure 15 into five branches, each of which is the graph of a function. Sketch the branches.

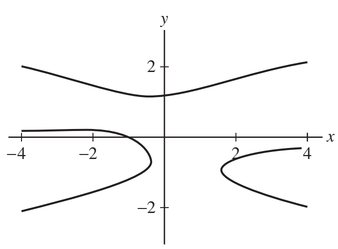

FIGURE 15 Graph of $y^5 - y = x^2y + x + 1$.

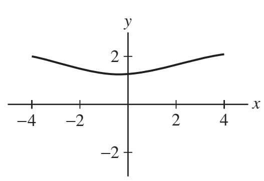
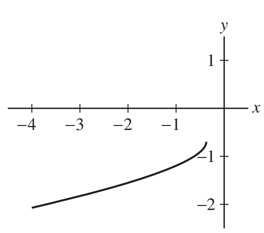
SOLUTION The branches are:

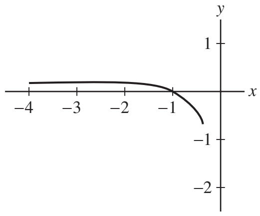
- Upper branch:



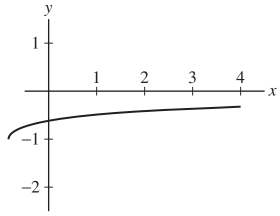
- Lower part of lower left curve:



- Upper part of lower left curve:



- Upper part of lower right curve:



- Lower part of lower right curve:

Preliminary Questions

1. Assign variables and restate the following problem in terms of known and unknown derivatives (but do not solve it): How fast is the volume of a cube increasing if its side increases at a rate of 0.5 cm/s?

SOLUTION Let s and V denote the length of the side and the corresponding volume of a cube, respectively. Determine $\frac{dV}{dt}$ if $\frac{ds}{dt} = 0.5$ cm/s.

2. What is the relation between dV/dt and dr/dt if $V = \left(\frac{4}{3}\right)\pi r^3$?

SOLUTION Applying the general power rule, we find $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$. Therefore, the ratio is $4\pi r^2$.

In Questions 3 and 4, water pours into a cylindrical glass of radius 4 cm. Let V and h denote the volume and water level respectively, at time t.

3. Restate this question in terms of dV/dt and dh/dt: How fast is the water level rising if water pours in at a rate of 2 cm^3/min?

SOLUTION Determine $\frac{dh}{dt}$ if $\frac{dV}{dt} = 2$ cm^3/min.

4. Restate this question in terms of dV/dt and dh/dt: At what rate is water pouring in if the water level rises at a rate of 1 cm/min?

SOLUTION Determine $\frac{dV}{dt}$ if $\frac{dh}{dt} = 1$ cm/min.

Exercises

In Exercises 1 and 2, consider a rectangular bathtub whose base is 18 ft^2.

1. How fast is the water level rising if water is filling the tub at a rate of 0.7 ft^3/min?

SOLUTION Let h be the height of the water in the tub and V be the volume of the water. Then $V = 18h$ and $\frac{dV}{dt} = 18\frac{dh}{dt}$. Thus

$$\frac{dh}{dt} = \frac{1}{18}\frac{dV}{dt} = \frac{1}{18}(0.7) \approx 0.039 \text{ ft/min}.$$

2. At what rate is water pouring into the tub if the water level rises at a rate of 0.8 ft/min?

SOLUTION Let h be the height of the water in the tub and V its volume. Then $V = 18h$ and

$$\frac{dV}{dt} = 18\frac{dh}{dt} = 18\,(0.8) = 14.4\ \text{ft}^3/\text{min}.$$

3. The radius of a circular oil slick expands at a rate of 2 m/min.
(a) How fast is the area of the oil slick increasing when the radius is 25 m?
(b) If the radius is 0 at time $t = 0$, how fast is the area increasing after 3 min?

SOLUTION Let r be the radius of the oil slick and A its area.
(a) Then $A = \pi r^2$ and $\frac{dA}{dt} = 2\pi r\frac{dr}{dt}$. Substituting $r = 25$ and $\frac{dr}{dt} = 2$, we find

$$\frac{dA}{dt} = 2\pi\,(25)\,(2) = 100\pi \approx 314.16\ \text{m}^2/\text{min}.$$

(b) Since $\frac{dr}{dt} = 2$ and $r(0) = 0$, it follows that $r(t) = 2t$. Thus, $r(3) = 6$ and

$$\frac{dA}{dt} = 2\pi\,(6)\,(2) = 24\pi \approx 75.40\ \text{m}^2/\text{min}.$$

4. At what rate is the diagonal of a cube increasing if its edges are increasing at a rate of 2 cm/s?

SOLUTION Let s be the length of an edge of the cube and q the length of its diagonal. Two applications of the Pythagorean Theorem (or the distance formula) yield $q = \sqrt{3}s$. Thus $\frac{dq}{dt} = \sqrt{3}\frac{ds}{dt}$. Using $\frac{ds}{dt} = 2$,

$$\frac{dq}{dt} = \sqrt{3} \times 2 = 2\sqrt{3} \approx 3.46\ \text{cm/s}.$$

In Exercises 5–8, assume that the radius r of a sphere is expanding at a rate of 30 cm/min. *The volume of a sphere is $V = \frac{4}{3}\pi r^3$ and its surface area is $4\pi r^2$. Determine the given rate.*

5. Volume with respect to time when $r = 15$ cm.

SOLUTION As the radius is expanding at 30 centimeters per minute, we know that $\frac{dr}{dt} = 30$ cm/min. Taking $\frac{d}{dt}$ of the equation $V = \frac{4}{3}\pi r^3$ yields

$$\frac{dV}{dt} = \frac{4}{3}\pi\left(3r^2\frac{dr}{dt}\right) = 4\pi r^2\frac{dr}{dt}.$$

Substituting $r = 15$ and $\frac{dr}{dt} = 30$ yields

$$\frac{dV}{dt} = 4\pi(15)^2(30) = 27000\pi\ \text{cm}^3/\text{min}.$$

6. Volume with respect to time at $t = 2$ min, assuming that $r = 0$ at $t = 0$.

SOLUTION Taking $\frac{d}{dt}$ of the equation $V = \frac{4}{3}\pi r^3$ yields $\frac{dV}{dt} = 4\pi r^2\frac{dr}{dt}$. Since $\frac{dr}{dt} = 30$ and $r(0) = 0$, it follows that $r(t) = 30t$. From this, $r(2) = 60$, so

$$\frac{dV}{dt} = 4\pi(60^2)(30) = 432000\pi\ \text{cm}^3/\text{min}.$$

7. Surface area with respect to time when $r = 40$ cm.

SOLUTION Taking the derivative of both sides of $A = 4\pi r^2$ with respect to t yields $\frac{dA}{dt} = 8\pi r\frac{dr}{dt}$. $\frac{dr}{dt} = 30$, so

$$\frac{dA}{dt} = 8\pi(40)(30) = 9600\pi\ \text{cm}^2/\text{min}.$$

8. Surface area with respect to time at $t = 2$ min, assuming that $r = 10$ at $t = 0$.

SOLUTION Taking $\frac{d}{dt}$ of both sides of $A = 4\pi r^2$ yields $\frac{dA}{dt} = 8\pi r\frac{dr}{dt}$. Since $r = 10$ at $t = 0$ and $\frac{dr}{dt} = 30$, $r = 30t + 10$. Hence, at $t = 2$,

$$\frac{dA}{dt} = 8\pi(30 \cdot 2 + 10)(30) = 16800\pi\ \text{cm}^2/\text{min}.$$

In Exercises 9–12, refer to a 5-meter ladder sliding down a wall, as in Figures 1 and 2. The variable h is the height of the ladder's top at time t, and x is the distance from the wall to the ladder's bottom.

9. Assume the bottom slides away from the wall at a rate of 0.8 m/s. Find the velocity of the top of the ladder at $t = 2$ s if the bottom is 1.5 m from the wall at $t = 0$ s.

SOLUTION Let x denote the distance from the base of the ladder to the wall, and h denote the height of the top of the ladder from the floor. The ladder is 5 m long, so $h^2 + x^2 = 5^2$. At any time t, $x = 1.5 + 0.8t$. Therefore, at time $t = 2$, the base is $x = 1.5 + 0.8(2) = 3.1$ m from the wall. Furthermore, we have

$$2h\frac{dh}{dt} + 2x\frac{dx}{dt} = 0 \quad \text{so} \quad \frac{dh}{dt} = -\frac{x}{h}\frac{dx}{dt}.$$

Substituting $x = 3.1$, $h = \sqrt{5^2 - 3.1^2}$ and $\frac{dx}{dt} = 0.8$, we obtain

$$\frac{dh}{dt} = -\frac{3.1}{\sqrt{5^2 - 3.1^2}}(0.8) \approx -0.632 \text{ m/s}.$$

10. Suppose that the top is sliding down the wall at a rate of 1.2 m/s. Calculate dx/dt when $h = 3$ m.

SOLUTION Let h be the height of the ladder's top and x the distance from the wall of the ladder's bottom. Then $h^2 + x^2 = 5^2$. Thus $2h\frac{dh}{dt} + 2x\frac{dx}{dt} = 0$, and $\frac{dx}{dt} = -\frac{h}{x}\frac{dh}{dt}$. With $h = 3$, $x = \sqrt{5^2 - 3^2} = 4$, and $\frac{dh}{dt} = -1.2$, we find

$$\frac{dx}{dt} = -\frac{3}{4}(-1.2) = 0.9 \text{ m/s}.$$

11. Suppose that $h(0) = 4$ and the top slides down the wall at a rate of 1.2 m/s. Calculate x and dx/dt at $t = 2$ s.

SOLUTION Let h and x be the height of the ladder's top and the distance from the wall of the ladder's bottom, respectively. After 2 seconds, $h = 4 + 2(-1.2) = 1.6$ m. Since $h^2 + x^2 = 5^2$,

$$x = \sqrt{5^2 - 1.6^2} = 4.737 \text{ m}.$$

Furthermore, we have $2h\frac{dh}{dt} + 2x\frac{dx}{dt} = 0$, so that $\frac{dx}{dt} = -\frac{h}{x}\frac{dh}{dt}$. Substituting $h = 1.6$, $x = 4.737$, and $\frac{dh}{dt} = -1.2$, we find

$$\frac{dx}{dt} = -\frac{1.6}{4.737}(-1.2) \approx 0.405 \text{ m/s}.$$

12. What is the relation between h and x at the moment when the top and bottom of the ladder move at the same speed?

SOLUTION Let h and x be the height of the ladder's top and the distance from the wall of the ladder's bottom, respectively. When the top and the bottom of the ladder are moving at the same *speed* (say $s > 0$), their *velocities* satisfy $\frac{dh}{dt} = -\frac{dx}{dt} = -s$. Since $h^2 + x^2 = 16^2$, we have $2h\frac{dh}{dt} + 2x\frac{dx}{dt} = 0$ or $-hs + xs = 0$. This implies $h = x$.

13. A conical tank has height 3 m and radius 2 m at the top. Water flows in at a rate of 2 m^3/min. How fast is the water level rising when it is 2 m?

SOLUTION Consider the cone of water in the tank at a certain instant. Let r be the radius of its (inverted) base, h its height, and V its volume. By similar triangles, $\frac{r}{h} = \frac{2}{3}$ or $r = \frac{2}{3}h$ and thus $V = \frac{1}{3}\pi r^2 h = \frac{4}{27}\pi h^3$. Therefore,

$$\frac{dV}{dt} = \tfrac{4}{9}\pi h^2 \frac{dh}{dt},$$

and

$$\frac{dh}{dt} = \frac{9}{4\pi h^2}\frac{dV}{dt}.$$

Substituting $h = 2$ and $\frac{dV}{dt} = 2$ yields

$$\frac{dh}{dt} = \frac{9}{4\pi\,(2)^2} \times 2 = \frac{9}{8\pi} \approx -0.36 \text{ m/min}.$$

14. Follow the same set-up as Exercise 13, but assume that the water level is rising at a rate of 0.3 m/min when it is 2 m. At what rate is water flowing in?

SOLUTION Consider the cone of water in the tank at a certain instant. Let r be the radius of its (inverted) base, h its height, and V its volume. By similar triangles, $\frac{r}{h} = \frac{2}{3}$ or $r = \frac{2}{3}h$ and thus $V = \frac{1}{3}\pi r^2 h = \frac{4}{27}\pi h^3$. Accordingly,

$$\frac{dV}{dt} = \frac{4}{9}\pi h^2 \frac{dh}{dt}.$$

Substituting $h = 2$ and $\frac{dh}{dt} = 0.3$ yields

$$\frac{dV}{dt} = \frac{4}{9}\pi\,(2)^2\,(0.3) \approx 1.68\ \text{m}^3/\text{min}.$$

15. The radius r and height h of a circular cone change at a rate of 2 cm/s. How fast is the volume of the cone increasing when $r = 10$ and $h = 20$?

SOLUTION Let r be the radius, h be the height, and V be the volume of a right circular cone. Then $V = \frac{1}{3}\pi r^2 h$, and

$$\frac{dV}{dt} = \frac{1}{3}\pi\left(r^2\frac{dh}{dt} + 2hr\frac{dr}{dt}\right).$$

When $r = 10$, $h = 20$, and $\frac{dr}{dt} = \frac{dh}{dt} = 2$, we find

$$\frac{dV}{dt} = \frac{\pi}{3}\left(10^2 \cdot 2 + 2 \cdot 20 \cdot 10 \cdot 2\right) = \frac{1000\pi}{3} \approx 1047.20\ \text{cm}^3/\text{s}.$$

16. A road perpendicular to a highway leads to a farmhouse located 2 km away (Figure 8). An automobile travels past the farmhouse at a speed of 80 km/h. How fast is the distance between the automobile and the farmhouse increasing when the automobile is 6 km past the intersection of the highway and the road?

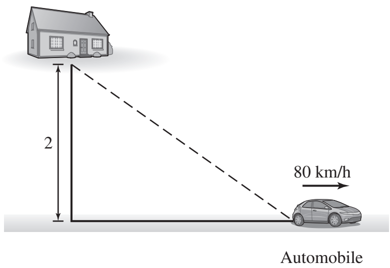

FIGURE 8

SOLUTION Let l denote the distance between the automobile and the farmhouse, and let s denote the distance past the intersection of the highway and the road. Then $l^2 = 2^2 + s^2$. Taking the derivative of both sides of this equation yields $2l\frac{dl}{dt} = 2s\frac{ds}{dt}$, so

$$\frac{dl}{dt} = \frac{s}{l}\frac{ds}{dt}.$$

When the auto is 6 km past the intersection, we have

$$\frac{dl}{dt} = \frac{6 \cdot 80}{\sqrt{2^2 + 6^2}} = \frac{480}{\sqrt{40}} = 24\sqrt{10} \approx 75.89\ \text{km/h}.$$

17. A man of height 1.8 meters walks away from a 5-meter lamppost at a speed of 1.2 m/s (Figure 9). Find the rate at which his shadow is increasing in length.

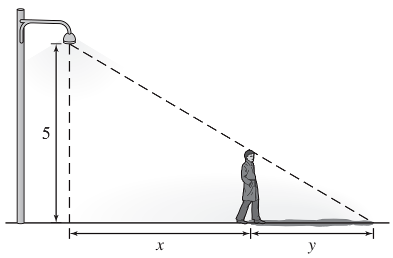

FIGURE 9

SOLUTION Since the man is moving at a rate of 1.2 m/s, his distance from the light post at any given time is $x = 1.2t$. Knowing the man is 1.8 meters tall and that the length of his shadow is denoted by y, we set up a proportion of similar triangles from the diagram:

$$\frac{y}{1.8} = \frac{1.2t + y}{5}.$$

Clearing fractions and solving for y yields

$$y = 0.675t.$$

Thus, $dy/dt = 0.675$ meters per second is the rate at which the length of the shadow is increasing.

18. As Claudia walks away from a 264-cm lamppost, the tip of her shadow moves twice as fast as she does. What is Claudia's height?

SOLUTION Let L be the distance from the base of the lamppost to the tip of Claudia's shadow, let x denote the distance from the base of the lamppost to Claudia's feet, and let h denote Claudia's height. The right triangle with legs $L - x$ and h (formed by Claudia and her shadow) and the right triangle with legs L and 264 (formed by the lamppost and the total distance L) are similar. By similarity

$$\frac{L - x}{h} = L264.$$

h is constant, so taking the derivative of both sides of this equation yields

$$\frac{dL/dt - dx/dt}{h} = \frac{dL/dt}{264}.$$

The problem states that $\frac{dL}{dt} = 2\frac{dx}{dt}$, so

$$264\left(2\frac{dx}{dt} - \frac{dx}{dt}\right) = 2h\frac{dx}{dt} \quad \text{or} \quad 264 = 2h.$$

Hence, $h = 132$ cm.

19. At a given moment, a plane passes directly above a radar station at an altitude of 6 km.

(a) The plane's speed is 800 km/h. How fast is the distance between the plane and the station changing half an hour later?

(b) How fast is the distance between the plane and the station changing when the plane passes directly above the station?

SOLUTION Let x be the distance of the plane from the station along the ground and h the distance through the air.

(a) By the Pythagorean Theorem, we have

$$h^2 = x^2 + 6^2 = x^2 + 36.$$

Thus $2h\frac{dh}{dt} = 2x\frac{dx}{dt}$, and $\frac{dh}{dt} = \frac{x}{h}\frac{dx}{dt}$. After an half hour, $x = \frac{1}{2} \times 800 = 400$ kilometers. With $x = 400$, $h = \sqrt{400^2 + 36}$, and $\frac{dx}{dt} = 800$,

$$\frac{dh}{dt} = \frac{400}{\sqrt{400^2 + 36}} \times 800 \approx 799.91 \text{ km/h}.$$

(b) When the plane is directly above the station, $x = 0$, so the distance between the plane and the station is not changing, for at this instant we have

$$\frac{dh}{dt} = \frac{0}{6} \times 800 = 0 \text{ km/h}.$$

20. In the setting of Exercise 19, let θ be the angle that the line through the radar station and the plane makes with the horizontal. How fast is θ changing 12 min after the plane passes over the radar station?

SOLUTION Let the distance x and angle θ be defined as in the figure below. Then

$$\tan\theta = \frac{6}{x} \qquad \text{and} \qquad \sec^2\theta\frac{d\theta}{dt} = -\frac{6}{x^2}\frac{dx}{dt}.$$

Because the plane is traveling at 800 km/h, 12 minutes after the plane passes over the radar station,

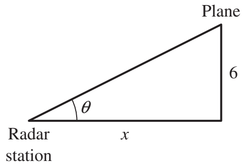
$$x = 160 \qquad \text{and} \qquad \tan\theta = \frac{3}{80}.$$

Furthermore,

$$\sec^2\theta = 1 + \tan^2\theta = 1 + \frac{3^2}{80^2}.$$

Finally,

$$\frac{d\theta}{dt} = -\frac{6}{160^2}\frac{1}{1+\frac{3^2}{80^2}}800 = -\frac{1200}{6409} = -0.187 \text{ rad/hour.}$$



21. A hot air balloon rising vertically is tracked by an observer located 4 km from the lift-off point. At a certain moment, the angle between the observer's line of sight and the horizontal is $\frac{\pi}{5}$, and it is changing at a rate of 0.2 rad/min. How fast is the balloon rising at this moment?

SOLUTION Let y be the height of the balloon (in miles) and θ the angle between the line-of-sight and the horizontal. Via trigonometry, we have $\tan\theta = \dfrac{y}{4}$. Therefore,

$$\sec^2\theta \cdot \frac{d\theta}{dt} = \frac{1}{4}\frac{dy}{dt},$$

and

$$\frac{dy}{dt} = 4\frac{d\theta}{dt}\sec^2\theta.$$

Using $\frac{d\theta}{dt} = 0.2$ and $\theta = \frac{\pi}{5}$ yields

$$\frac{dy}{dt} = 4\,(0.2)\,\frac{1}{\cos^2(\pi/5)} \approx 1.22 \text{ km/min.}$$

22. A laser pointer is placed on a platform that rotates at a rate of 20 revolutions per minute. The beam hits a wall 8 m away, producing a dot of light that moves horizontally along the wall. Let θ be the angle between the beam and the line through the searchlight perpendicular to the wall (Figure 10). How fast is this dot moving when $\theta = \frac{\pi}{6}$?

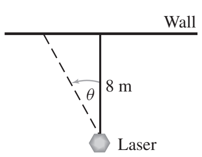


FIGURE 10

SOLUTION Let y be the distance between the dot of light and the point of intersection of the wall and the line through the searchlight perpendicular to the wall. Let θ be the angle between the beam of light and the line. Using trigonometry, we have $\tan\theta = \frac{y}{8}$. Therefore,

$$\sec^2\theta \cdot \frac{d\theta}{dt} = \frac{1}{8}\frac{dy}{dt},$$

and

$$\frac{dy}{dt} = 8\frac{d\theta}{dt}\sec^2\theta.$$

With $\theta = \frac{\pi}{6}$ and $\frac{d\theta}{dt} = 40\pi$, we find

$$\frac{dy}{dt} = 8\,(40\pi)\,\frac{1}{\cos^2(\pi/6)} = \frac{1280}{3}\pi \approx 1340.4 \text{ m/min.}$$

23. A rocket travels vertically at a speed of 1200 km/h. The rocket is tracked through a telescope by an observer located 16 km from the launching pad. Find the rate at which the angle between the telescope and the ground is increasing 3 min after lift-off.

SOLUTION Let y be the height of the rocket and θ the angle between the telescope and the ground. Using trigonometry, we have $\tan\theta = \frac{y}{16}$. Therefore,

$$\sec^2\theta \cdot \frac{d\theta}{dt} = \frac{1}{16}\frac{dy}{dt},$$

and

$$\frac{d\theta}{dt} = \frac{\cos^2\theta}{16}\frac{dy}{dt}.$$

After the rocket has traveled for 3 minutes (or $\frac{1}{20}$ hour), its height is $\frac{1}{20} \times 1200 = 60$ km. At this instant, $\tan\theta = 60/16 = 15/4$ and thus

$$\cos\theta = \frac{4}{\sqrt{15^2+4^2}} = \frac{4}{\sqrt{241}}.$$

Finally,

$$\frac{d\theta}{dt} = \frac{16/241}{16}(1200) = \frac{1200}{241} \approx 4.98 \text{ rad/hr}.$$

24. Using a telescope, you track a rocket that was launched 4 km away, recording the angle θ between the telescope and the ground at half-second intervals. Estimate the velocity of the rocket if $\theta(10) = 0.205$ and $\theta(10.5) = 0.225$.

SOLUTION Let h be the height of the vertically ascending rocket. Using trigonometry, $\tan\theta = \frac{h}{4}$, so

$$\frac{dh}{dt} = 4\sec^2\theta \cdot \frac{d\theta}{dt}.$$

We are given $\theta(10) = 0.205$, and we can estimate

$$\left.\frac{d\theta}{dt}\right|_{t=10} \approx \frac{\theta(10.5) - \theta(10)}{0.5} = 0.04.$$

Thus,

$$\frac{dh}{dt} = 4\sec^2(0.205)\cdot(0.04) \approx 0.166 \text{ km/s},$$

or roughly 600 km/h.

25. A police car traveling south toward Sioux Falls at 160 km/h pursues a truck traveling east away from Sioux Falls, Iowa, at 140 km/h (Figure 11). At time $t = 0$, the police car is 20 km north and the truck is 30 km east of Sioux Falls. Calculate the rate at which the distance between the vehicles is changing:

(a) At time $t = 0$

(b) 5 minutes later

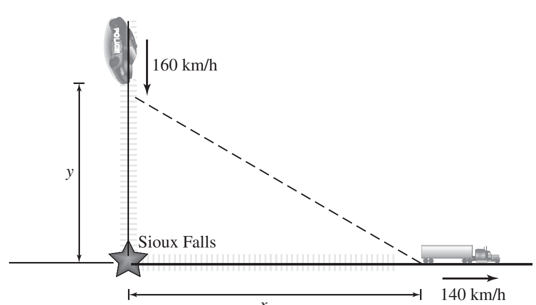

FIGURE 11

SOLUTION Let y denote the distance the police car is north of Sioux Falls and x the distance the truck is east of Sioux Falls. Then $y = 20 - 160t$ and $x = 30 + 140t$. If ℓ denotes the distance between the police car and the truck, then

$$\ell^2 = x^2 + y^2 = (30 + 140t)^2 + (20 - 160t)^2$$

and

$$\ell\frac{d\ell}{dt} = 140(30 + 140t) - 160(20 - 160t) = 1000 + 45200t.$$

(a) At $t = 0$, $\ell = \sqrt{30^2 + 20^2} = 10\sqrt{13}$, so

$$\frac{d\ell}{dt} = \frac{1000}{10\sqrt{13}} = \frac{100\sqrt{13}}{13} \approx 27.735 \text{ km/h}.$$

(b) At $t = 5$ minutes $= \frac{1}{12}$ hour,

$$\ell = \sqrt{\left(30 + 140 \cdot \frac{1}{12}\right)^2 + \left(20 - 160 \cdot \frac{1}{12}\right)^2} \approx 42.197 \text{ km},$$

and

$$\frac{d\ell}{dt} = \frac{1000 + 45200 \cdot \frac{1}{12}}{42.197} \approx 112.962 \text{ km/h}.$$

26. A car travels down a highway at 25 m/s. An observer stands 150 m from the highway.

(a) How fast is the distance from the observer to the car increasing when the car passes in front of the observer? Explain your answer without making any calculations.

(b) How fast is the distance increasing 20 s later?

SOLUTION Let x be the distance (in feet) along the road that the car has traveled and h be the distance (in feet) between the car and the observer.

(a) Before the car passes the observer, we have $dh/dt < 0$; after it passes, we have $dh/dt > 0$. So at the instant it passes we have $dh/dt = 0$, given that dh/dt varies continuously since the car travels at a constant velocity.

(b) By the Pythagorean Theorem, we have $h^2 = x^2 + 150^2$. Thus

$$2h\frac{dh}{dt} = 2x\frac{dx}{dt},$$

and

$$\frac{dh}{dt} = \frac{x}{h}\frac{dx}{dt}.$$

The car travels at 25 m/s, so after 20 seconds, $x = 25(20) = 500$ meters. Therefore,

$$\frac{dh}{dt} = \frac{500}{\sqrt{500^2 + 125^2}}(25) \approx 24.25 \text{ m/s}.$$

27. In the setting of Example 5, at a certain moment, the tractor's speed is 3 m/s and the bale is rising at 2 m/s. How far is the tractor from the bale at this moment?

SOLUTION From Example 5, we have the equation

$$\frac{x\frac{dx}{dt}}{\sqrt{x^2 + 4.5^2}} = \frac{dh}{dt},$$

where x denote the distance from the tractor to the bale and h denotes the height of the bale. Given

$$\frac{dx}{dt} = 3 \quad \text{and} \quad \frac{dh}{dt} = 2,$$

it follows that

$$\frac{3x}{\sqrt{4.5^2 + x^2}} = 2,$$

which yields $x = \sqrt{16.2} \approx 4.025$ m.

28. Placido pulls a rope attached to a wagon through a pulley at a rate of q m/s. With dimensions as in Figure 12:

(a) Find a formula for the speed of the wagon in terms of q and the variable x in the figure.

(b) Find the speed of the wagon when $x = 0.6$ if $q = 0.5$ m/s.

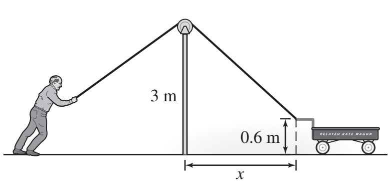

FIGURE 12

SOLUTION Let h be the distance from the pulley to the loop on the wagon. Using the Pythagorean Theorem, we have $h^2 = x^2 + (3 - 0.6)^2 = x^2 + 2.4^2$.

(a) Thus $2h\frac{dh}{dt} = 2x\frac{dx}{dt}$, and $\frac{dx}{dt} = \frac{h}{x}\frac{dh}{dt}$. Given $dh/dt = q$, it follows that

$$\frac{dx}{dt} = \frac{\sqrt{x^2 + 2.4^2}}{x}q.$$

(b) As Placido pulls the rope at the rate of $q = 0.5$ m/s and $x = 0.6$

$$\frac{dx}{dt} = \frac{\sqrt{0.6^2 + 2.4^2}}{0.6}(0.5) \approx 2.06 \text{ m/s}.$$

29. Julian is jogging around a circular track of radius 50 m. In a coordinate system with origin at the center of the track, Julian's x-coordinate is changing at a rate of -1.25 m/s when his coordinates are (40, 30). Find dy/dt at this moment.

SOLUTION We have $x^2 + y^2 = 50^2$, so

$$2x\frac{dx}{dt} + 2y\frac{dy}{dt} = 0 \quad \text{or} \quad \frac{dy}{dt} = -\frac{x}{y}\frac{dx}{dt}.$$

Given $x = 40$, $y = 30$ and $dx/dt = -1.25$, we find

$$\frac{dy}{dt} = -\frac{40}{30}(-1.25) = \frac{5}{3} \text{ m/s}.$$

30. A particle moves counterclockwise around the ellipse with equation $9x^2 + 16y^2 = 25$ (Figure 13).

(a) In which of the four quadrants is $dx/dt > 0$? Explain.

(b) Find a relation between dx/dt and dy/dt.

(c) At what rate is the x-coordinate changing when the particle passes the point (1, 1) if its y-coordinate is increasing at a rate of 6 m/s?

(d) Find dy/dt when the particle is at the top and bottom of the ellipse.

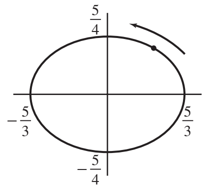

FIGURE 13

SOLUTION A particle moves counterclockwise around the ellipse with equation $9x^2 + 16y^2 = 25$.

(a) The derivative dx/dt is positive in quadrants 3 and 4 since the particle is moving to the right.

(b) From $9x^2 + 16y^2 = 25$ we have $18x\frac{dx}{dt} + 32y\frac{dy}{dt} = 0$.

(c) From (b), we have $\frac{dx}{dt} = -\frac{16y}{9x}\frac{dy}{dt}$. With $x = y = 1$ and $\frac{dy}{dt} = 6$,

$$\frac{dx}{dt} = -\frac{16 \cdot 1}{9 \cdot 1}(6) = -\frac{32}{3} \text{ m/s}.$$

(d) From (b), we have $\frac{dy}{dt} = -\frac{9x}{16y}\frac{dx}{dt}$. When $(x, y) = \left(0, \pm\frac{5}{4}\right)$, it follows that $\frac{dy}{dt} = 0$.

In Exercises 31 and 32, assume that the pressure P (in kilopascals) and volume V (in cubic centimeters) of an expanding gas are related by $PV^b = C$, where b and C are constants (this holds in an adiabatic *expansion, without heat gain or loss).*

31. Find dP/dt if $b = 1.2$, $P = 8$ kPa, $V = 100$ cm^2, and $dV/dt = 20$ cm^3/min.

SOLUTION Let $PV^b = C$. Then

$$PbV^{b-1}\frac{dV}{dt} + V^b\frac{dP}{dt} = 0,$$

and

$$\frac{dP}{dt} = -\frac{Pb}{V}\frac{dV}{dt}.$$

Substituting $b = 1.2$, $P = 8$, $V = 100$, and $\frac{dV}{dt} = 20$, we find

$$\frac{dP}{dt} = -\frac{(8)(1.2)}{100}(20) = -1.92 \text{ kPa/min}.$$

32. Find b if $P = 25$ kPa, $dP/dt = 12$ kPa/min, $V = 100$ cm^2, and $dV/dt = 20$ cm^3/min.

SOLUTION Let $PV^b = C$. Then

$$PbV^{b-1}\frac{dV}{dt} + V^b\frac{dP}{dt} = 0,$$

and

$$b = -\frac{V}{P}\,\frac{dP/dt}{dV/dt}.$$

With $P = 25$, $V = 100$, $\frac{dP}{dt} = 12$, and $\frac{dV}{dt} = 20$, we have

$$b = -\frac{100}{25} \times \frac{12}{20} = -\frac{12}{5}.$$

(*Note:* If instead we have $\frac{dP}{dt} = -12$ kPa/min, then $b = \frac{12}{5}$.)

33. The base x of the right triangle in Figure 14 increases at a rate of 5 cm/s, while the height remains constant at $h = 20$. How fast is the angle θ changing when $x = 20$?

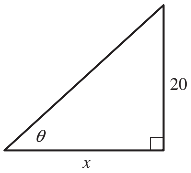

FIGURE 14

SOLUTION We have $\cot\theta = \dfrac{x}{20}$, from which

$$-\csc^2\theta \cdot \frac{d\theta}{dt} = \frac{1}{20}\,\frac{dx}{dt}$$

and thus

$$\frac{d\theta}{dt} = -\frac{\sin^2\theta}{20}\,\frac{dx}{dt}.$$

We are given $\frac{dx}{dt} = 5$ and when $x = h = 20$, $\theta = \frac{\pi}{4}$. Hence,

$$\frac{d\theta}{dt} = -\frac{\sin^2\left(\frac{\pi}{4}\right)}{20}(5) = -\frac{1}{8}\text{ rad/s}.$$

34. Two parallel paths 15 m apart run east-west through the woods. Brooke jogs east on one path at 10 km/h, while Jamail walks west on the other path at 6 km/h. If they pass each other at time $t = 0$, how far apart are they 3 s later, and how fast is the distance between them changing at that moment?

SOLUTION Brooke jogs at 10 km/h $= \frac{25}{9}$ m/s and Jamail walks at 6 km/h $= \frac{5}{3}$ m/s. At time zero, consider Brooke to be at the origin $(0, 0)$ and (without loss of generality) Jamail to be at $(0, 15)$; i.e., due north of Brooke. Then at time t, the position of Brooke is $\left(\frac{25}{9}t, 0\right)$ and that of Jamail is $\left(-\frac{5}{3}t, 15\right)$. The distance between them is

$$L = \sqrt{\left(\frac{25}{9}t + \frac{5}{3}t\right)^2 + (15)^2} = \left(\left(\frac{40}{9}t\right)^2 + 15^2\right)^{1/2}.$$

- When $t = 3$ seconds, the distance between them is

$$L = \sqrt{\left(\frac{40}{3}\right)^2 + 15^2} = \frac{5}{3}\sqrt{145} \approx 20.07\text{ m}.$$

- The distance between them is changing at the rate

$$\frac{dL}{dt} = \frac{1}{2}\left(\left(\frac{40}{9}t\right)^2 + 15^2\right)^{-1/2}\left(2\left(\frac{40}{9}t\right)\frac{40}{9}\right).$$

When $t = 3$, we then have

$$\frac{dL}{dt} = \frac{\frac{1}{9}(40)^2}{\sqrt{40^2 + 45^2}} \approx 2.95\text{ m/s}$$

35. A particle travels along a curve $y = f(x)$ as in Figure 15. Let $L(t)$ be the particle's distance from the origin.

(a) Show that $\dfrac{dL}{dt} = \left(\dfrac{x + f(x)f'(x)}{\sqrt{x^2 + f(x)^2}}\right)\dfrac{dx}{dt}$ if the particle's location at time t is $P = (x, f(x))$.

(b) Calculate $L'(t)$ when $x = 1$ and $x = 2$ if $f(x) = \sqrt{3x^2 - 8x + 9}$ and $dx/dt = 4$.

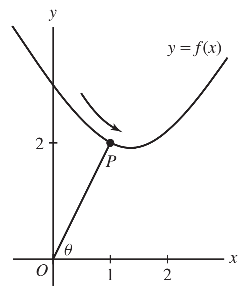

FIGURE 15

SOLUTION

(a) If the particle's location at time t is $P = (x, f(x))$, then

$$L(t) = \sqrt{x^2 + f(x)^2}.$$

Thus,

$$\frac{dL}{dt} = \frac{1}{2}(x^2 + f(x)^2)^{-1/2}\left(2x\frac{dx}{dt} + 2f(x)f'(x)\frac{dx}{dt}\right) = \left(\frac{x + f(x)f'(x)}{\sqrt{x^2 + f(x)^2}}\right)\frac{dx}{dt}.$$

(b) Given $f(x) = \sqrt{3x^2 - 8x + 9}$, it follows that

$$f'(x) = \frac{3x - 4}{\sqrt{3x^2 - 8x + 9}}.$$

Let's start with $x = 1$. Then $f(1) = 2$, $f'(1) = -\frac{1}{2}$ and

$$\frac{dL}{dt} = \left(\frac{1 - 1}{\sqrt{1^2 + 2^2}}\right)(4) = 0.$$

With $x = 2$, $f(2) = \sqrt{5}$, $f'(2) = 2/\sqrt{5}$ and

$$\frac{dL}{dt} = \frac{2 + 2}{\sqrt{2^2 + \sqrt{5}^2}}(4) = \frac{16}{3}.$$

36. Let θ be the angle in Figure 15, where $P = (x, f(x))$. In the setting of the previous exercise, show that

$$\frac{d\theta}{dt} = \left(\frac{xf'(x) - f(x)}{x^2 + f(x)^2}\right)\frac{dx}{dt}$$

Hint: Differentiate $\tan\theta = f(x)/x$ and observe that $\cos\theta = x/\sqrt{x^2 + f(x)^2}$.

SOLUTION If the particle's location at time t is $P = (x, f(x))$, then $\tan\theta = f(x)/x$ and

$$\sec^2\theta\frac{d\theta}{dx} = \frac{xf'(x) - f(x)}{x^2}.$$

Now

$$\cos\theta = \frac{x}{\sqrt{x^2 + f(x)^2}} \quad \text{so} \quad \sec^2\theta = \frac{x^2 + f(x)^2}{x^2}.$$

Finally,

$$\frac{d\theta}{dx} = \frac{xf'(x) - f(x)}{x^2 + f(x)^2}.$$

Exercises 37 and 38 refer to the baseball diamond (a square of side 90 ft*) in Figure 16.*

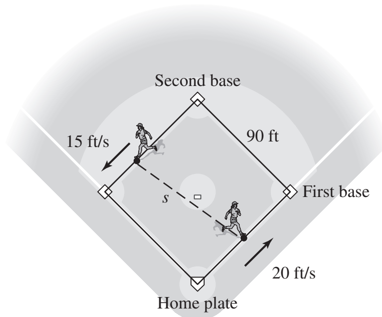

FIGURE 16

37. A baseball player runs from home plate toward first base at 20 ft/s. How fast is the player's distance from second base changing when the player is halfway to first base?

SOLUTION Let x be the distance of the player from home plate and h the player's distance from second base. Using the Pythagorean theorem, we have $h^2 = 90^2 + (90 - x)^2$. Therefore,

$$2h\frac{dh}{dt} = 2\,(90 - x)\left(-\frac{dx}{dt}\right),$$

and

$$\frac{dh}{dt} = -\frac{90 - x}{h}\frac{dx}{dt}.$$

We are given $\frac{dx}{dt} = 20$. When the player is halfway to first base, $x = 45$ and $h = \sqrt{90^2 + 45^2}$, so

$$\frac{dh}{dt} = -\frac{45}{\sqrt{90^2 + 45^2}}\,(20) = -4\sqrt{5} \approx -8.94 \text{ ft/s}.$$

38. Player 1 runs to first base at a speed of 20 ft/s while Player 2 runs from second base to third base at a speed of 15 ft/s. Let s be the distance between the two players. How fast is s changing when Player 1 is 30 ft from home plate and Player 2 is 60 ft from second base?

SOLUTION Let x denote the distance from home plate to Player 1 and y denote the distance from second base to Player 2, both distances measured along the base path. Then

$$s(t) = \sqrt{(90 - x - y)^2 + 90^2},$$

and

$$\frac{ds}{dt} = -\frac{90 - x - y}{\sqrt{(90 - x - y)^2 + 90^2}}\left(\frac{dx}{dt} + \frac{dy}{dt}\right).$$

With $x = 30$ and $y = 60$, it follows that

$$\frac{ds}{dt} = 0.$$

39. The conical watering pail in Figure 17 has a grid of holes. Water flows out through the holes at a rate of kA m^3/min, where k is a constant and A is the surface area of the part of the cone in contact with the water. This surface area is $A = \pi r\sqrt{h^2 + r^2}$ and the volume is $V = \frac{1}{3}\pi r^2 h$. Calculate the rate dh/dt at which the water level changes at $h = 0.3$ m, assuming that $k = 0.25$ m.

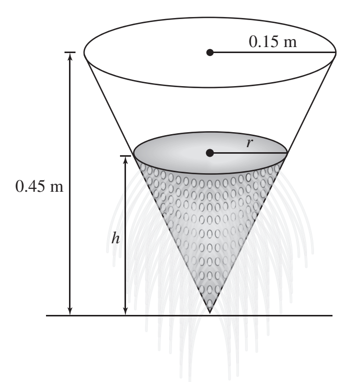

FIGURE 17

SOLUTION By similar triangles, we have

$$\frac{r}{h} = \frac{0.15}{0.45} = \frac{1}{3} \quad \text{so} \quad r = \frac{1}{3}h.$$

Substituting this expression for r into the formula for V yields

$$V = \frac{1}{3}\pi\left(\frac{1}{3}h\right)^2 h = \frac{1}{27}\pi h^3.$$

From here and the problem statement, it follows that

$$\frac{dV}{dt} = \frac{1}{9}\pi h^2 \frac{dh}{dt} = -kA = -0.25\pi r\sqrt{h^2 + r^2}.$$

Solving for dh/dt gives

$$\frac{dh}{dt} = -\frac{9}{4}\frac{r}{h^2}\sqrt{h^2 + r^2}.$$

When $h = 0.3$, $r = 0.1$ and

$$\frac{dh}{dt} = -\frac{9}{4}\frac{0.1}{0.3^2}\sqrt{0.3^2 + 0.1^2} = -0.79 \text{ m/min}.$$

Further Insights and Challenges

40. A bowl contains water that evaporates at a rate proportional to the surface area of water exposed to the air (Figure 18). Let $A(h)$ be the cross-sectional area of the bowl at height h.

(a) Explain why $V(h + \Delta h) - V(h) \approx A(h)\Delta h$ if Δh is small.

(b) Use (a) to argue that $\dfrac{dV}{dh} = A(h)$.

(c) Show that the water level h decreases at a constant rate.

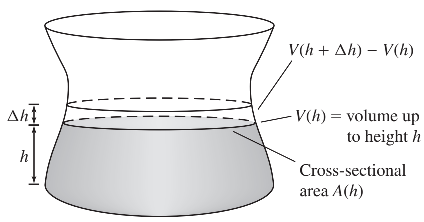

FIGURE 18

SOLUTION

(a) Consider a thin horizontal slice of the water in the cup of thickness Δh at height h. Assuming the cross-sectional area of the cup is roughly constant across this slice, it follows that

$$V(h + \Delta h) - V(h) \approx A(h)\Delta h.$$

(b) If we take the expression from part (a), divide by Δh and pass to the limit as $\Delta h \to 0$, we find

$$\frac{dV}{dh} = A(h).$$

(c) If we take the expression from part (b) and multiply by dh/dt, recognizing that

$$\frac{dV}{dt} = \frac{dV}{dh} \cdot \frac{dh}{dt},$$

we find that

$$\frac{dV}{dt} = A(h)\frac{dh}{dt}.$$

We are told that the water in the bowl evaporates at a rate proportional to the surface area exposed to the air; translated into mathematics, this means

$$\frac{dV}{dt} = -kA(h),$$

where k is a positive constant of proportionality. Combining the last two equations yields

$$\frac{dh}{dt} = -k;$$

that is, the water level decreases at a constant rate.

41. A roller coaster has the shape of the graph in Figure 19. Show that when the roller coaster passes the point $(x, f(x))$, the vertical velocity of the roller coaster is equal to $f'(x)$ times its horizontal velocity.

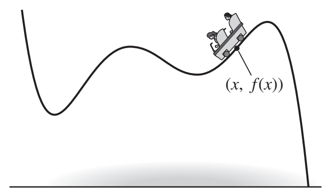

FIGURE 19 Graph of $f(x)$ as a roller coaster track.

SOLUTION Let the equation $y = f(x)$ describe the shape of the roller coaster track. Taking $\frac{d}{dt}$ of both sides of this equation yields $\frac{dy}{dt} = f'(x)\frac{dx}{dt}$. In other words, the vertical velocity of a car moving along the track, $\frac{dy}{dt}$, is equal to $f'(x)$ times the horizontal velocity, $\frac{dx}{dt}$.

42. Two trains leave a station at $t = 0$ and travel with constant velocity v along straight tracks that make an angle θ.

(a) Show that the trains are separating from each other at a rate $v\sqrt{2 - 2\cos\theta}$.

(b) What does this formula give for $\theta = \pi$?

SOLUTION Choose a coordinate system such that

- the origin is the point of departure of the trains;
- the first train travels along the positive x-axis;
- the second train travels along the ray emanating from the origin at an angle of $\theta > 0$.

(a) At time t, the position of the first train is $(vt, 0)$, while that of the second is $(vt\cos\theta, vt\sin\theta)$. The distance between the trains is

$$L = \sqrt{(vt\,(1 - \cos\theta))^2 + (vt\sin\theta)^2} = vt\sqrt{2 - 2\cos\theta}.$$

Thus $dL/dt = v\sqrt{2 - 2\cos\theta}$.

(b) When $\theta = \pi$, we have $dL/dt = 2v$. This is obviously correct since at this angle the trains travel in opposite directions at the same constant speed, having started from the same point.

43. As the wheel of radius r cm in Figure 20 rotates, the rod of length L attached at point P drives a piston back and forth in a straight line. Let x be the distance from the origin to point Q at the end of the rod, as shown in the figure.

(a) Use the Pythagorean Theorem to show that

$$L^2 = (x - r\cos\theta)^2 + r^2\sin^2\theta \qquad \boxed{6}$$

(b) Differentiate Eq. (6) with respect to t to prove that

$$2(x - r\cos\theta)\left(\frac{dx}{dt} + r\sin\theta\frac{d\theta}{dt}\right) + 2r^2\sin\theta\cos\theta\frac{d\theta}{dt} = 0$$

(c) Calculate the speed of the piston when $\theta = \frac{\pi}{2}$, assuming that $r = 10$ cm, $L = 30$ cm, and the wheel rotates at 4 revolutions per minute.

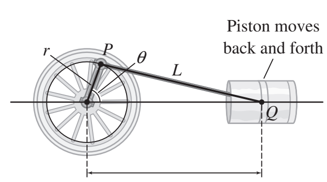

FIGURE 20

SOLUTION From the diagram, the coordinates of P are $(r\cos\theta, r\sin\theta)$ and those of Q are $(x, 0)$.

(a) The distance formula gives

$$L = \sqrt{(x - r\cos\theta)^2 + (-r\sin\theta)^2}.$$

Thus,

$$L^2 = (x - r\cos\theta)^2 + r^2\sin^2\theta.$$

Note that L (the length of the fixed rod) and r (the radius of the wheel) are constants.

(b) From (a) we have

$$0 = 2\,(x - r\cos\theta)\left(\frac{dx}{dt} + r\sin\theta\frac{d\theta}{dt}\right) + 2r^2\sin\theta\cos\theta\frac{d\theta}{dt}.$$

(c) Solving for dx/dt in (b) gives

$$\frac{dx}{dt} = \frac{r^2\sin\theta\cos\theta\frac{d\theta}{dt}}{r\cos\theta - x} - r\sin\theta\frac{d\theta}{dt} = \frac{rx\sin\theta\frac{d\theta}{dt}}{r\cos\theta - x}.$$

With $\theta = \frac{\pi}{2}$, $r = 10$, $L = 30$, and $\frac{d\theta}{dt} = 8\pi$,

$$\frac{dx}{dt} = \frac{(10)\,(x)\left(\sin\frac{\pi}{2}\right)(8\pi)}{(10)\,(0) - x} = -80\pi \approx -251.33 \text{ cm/min}$$

44. A spectator seated 300 m away from the center of a circular track of radius 100 m watches an athlete run laps at a speed of 5 m/s. How fast is the distance between the spectator and athlete changing when the runner is approaching the spectator and the distance between them is 250 m? *Hint:* The diagram for this problem is similar to Figure 20, with $r = 100$ and $x = 300$.

SOLUTION From the diagram, the coordinates of P are $(r\cos\theta, r\sin\theta)$ and those of Q are $(x, 0)$.

- The distance formula gives

$$L = \sqrt{(x - r\cos\theta)^2 + (-r\sin\theta)^2}.$$

Thus,

$$L^2 = (x - r\cos\theta)^2 + r^2\sin^2\theta.$$

Note that x (the distance of the spectator from the center of the track) and r (the radius of the track) are constants.

- Differentiating with respect to t gives

$$2L\frac{dL}{dt} = 2\,(x - r\cos\theta)\,r\sin\theta\frac{d\theta}{dt} + 2r^2\sin\theta\cos\theta\frac{d\theta}{dt}.$$

Thus,

$$\frac{dL}{dt} = \frac{rx}{L}\sin\theta\frac{d\theta}{dt}.$$

- Recall the relation between arc length s and angle θ, namely $s = r\theta$. Thus $\dfrac{d\theta}{dt} = \dfrac{1}{r}\dfrac{ds}{dt}$. Given $r = 100$ and $\frac{ds}{dt} = -5$, we have

$$\frac{d\theta}{dt} = \frac{1}{100}\,(-5) = -\frac{1}{20}\text{ rad/s}.$$

(*Note:* In this scenario, the runner traverses the track in a *clockwise* fashion and approaches the spectator from Quadrant 1.)

- Next, the Law of Cosines gives $L^2 = r^2 + x^2 - 2rx\cos\theta$, so

$$\cos\theta = \frac{r^2 + x^2 - L^2}{2rx} = \frac{100^2 + 300^2 - 250^2}{2\,(100)\,(300)} = \frac{5}{8}.$$

Accordingly,

$$\sin\theta = \sqrt{1 - \left(\frac{5}{8}\right)^2} = \frac{\sqrt{39}}{8}.$$

- Finally

$$\frac{dL}{dt} = \frac{(300)\,(100)}{250}\left(\frac{\sqrt{39}}{8}\right)\left(-\frac{1}{20}\right) = -\frac{3\sqrt{39}}{4} \approx -4.68 \text{ m/s}.$$

45. A cylindrical tank of radius R and length L lying horizontally as in Figure 21 is filled with oil to height h.

(a) Show that the volume $V(h)$ of oil in the tank is

$$V(h) = L\left(R^2\cos^{-1}\left(1-\frac{h}{R}\right) - (R-h)\sqrt{2hR-h^2}\right)$$

(b) Show that $\frac{dV}{dh} = 2L\sqrt{h(2R-h)}$.

(c) Suppose that $R = 1.5$ m and $L = 10$ m and that the tank is filled at a constant rate of 0.6 m^3/min. How fast is the height h increasing when $h = 0.5$?

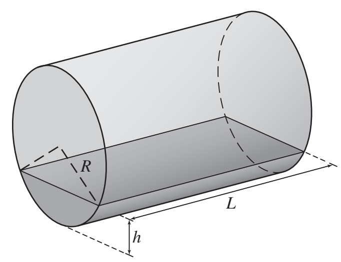

FIGURE 21 Oil in the tank has level h.

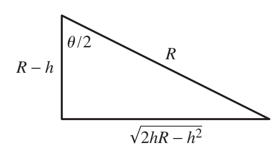
SOLUTION

(a) From Figure 21, we see that the volume of oil in the tank, $V(h)$, is equal to L times $A(h)$, the area of that portion of the circular cross section occupied by the oil. Now,

$$A(h) = \text{area of sector} - \text{area of triangle} = \frac{R^2\theta}{2} - \frac{R^2\sin\theta}{2},$$

where θ is the central angle of the sector. Referring to the diagram below,

$$\cos\frac{\theta}{2} = \frac{R-h}{R} \quad \text{and} \quad \sin\frac{\theta}{2} = \frac{\sqrt{2hR-h^2}}{R}.$$



Thus,

$$\theta = 2\cos^{-1}\left(1-\frac{h}{R}\right),$$

$$\sin\theta = 2\sin\frac{\theta}{2}\cos\frac{\theta}{2} = 2\frac{(R-h)\sqrt{2hR-h^2}}{R^2},$$

and

$$V(h) = L\left(R^2\cos^{-1}\left(1-\frac{h}{R}\right) - (R-h)\sqrt{2hR-h^2}\right).$$

(b) Recalling that $\frac{d}{dx}\cos^{-1}u = -\frac{1}{\sqrt{1-x^2}}\frac{du}{dx}$,

$$\frac{dV}{dh} = L\left(\frac{d}{dh}\left(R^2\cos^{-1}\left(1-\frac{h}{R}\right)\right) - \frac{d}{dh}\left((R-h)\sqrt{2hR-h^2}\right)\right)$$

$$= L\left(-R\frac{-1}{\sqrt{1-(1-(h/R))^2}} + \sqrt{2hR-h^2} - \frac{(R-h)^2}{\sqrt{2hR-h^2}}\right)$$

$$= L\left(\frac{R^2}{\sqrt{2hR-h^2}} + \sqrt{2hR-h^2} - \frac{R^2-2Rh+h^2}{\sqrt{2hR-h^2}}\right)$$

$$= L\left(\frac{R^2+(2hR-h^2)-(R^2-2Rh+h^2)}{\sqrt{2hR-h^2}}\right)$$

$$= L\left(\frac{4hR-2h^2}{\sqrt{2hR-h^2}}\right) = L\left(\frac{2(2hR-h^2)}{\sqrt{2hR-h^2}}\right) = 2L\sqrt{2hR-h^2}.$$

(c) $\frac{dV}{dt} = \frac{dV}{dh}\frac{dh}{dt}$, so $\frac{dh}{dt} = \frac{1}{dV/dh}\frac{dV}{dt}$. From part (b) with $R = 1.5$, $L = 10$ and $h = 0.5$,

$$\frac{dV}{dh} = 2(10)\sqrt{2(0.5)(1.5)-0.5^2} = 10\sqrt{5}\ \text{m}^2.$$

Thus,

$$\frac{dh}{dt} = \frac{1}{10\sqrt{5}}(0.6) = \frac{3\sqrt{5}}{2500} \approx 0.0027\ \text{m/min}.$$

CHAPTER REVIEW EXERCISES

In Exercises 1–4, refer to the function $f(x)$ whose graph is shown in Figure 1.

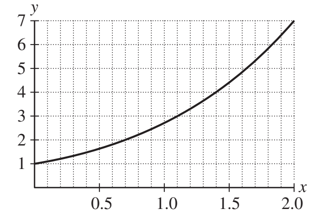


FIGURE 1

1. Compute the average rate of change of $f(x)$ over [0, 2]. What is the graphical interpretation of this average rate?

SOLUTION The average rate of change of $f(x)$ over [0, 2] is

$$\frac{f(2)-f(0)}{2-0} = \frac{7-1}{2-0} = 3.$$

Graphically, this average rate of change represents the slope of the secant line through the points (2, 7) and (0, 1) on the graph of $f(x)$.

2. For which value of h is $\frac{f(0.7+h)-f(0.7)}{h}$ equal to the slope of the secant line between the points where $x = 0.7$ and $x = 1.1$?

SOLUTION Because $1.1 = 0.7 + 0.4$, the difference quotient

$$\frac{f(0.7+h)-f(0.7)}{h}$$

is equal to the slope of the secant line between the points where $x = 0.7$ and $x = 1.1$ for $h = 0.4$.

3. Estimate $\frac{f(0.7+h)-f(0.7)}{h}$ for $h = 0.3$. Is this number larger or smaller than $f'(0.7)$?

SOLUTION For $h = 0.3$,

$$\frac{f(0.7+h)-f(0.7)}{h} = \frac{f(1)-f(0.7)}{0.3} \approx \frac{2.8-2}{0.3} = \frac{8}{3}.$$

Because the curve is concave up, the slope of the secant line is larger than the slope of the tangent line, so the value of the difference quotient should be larger than the value of the derivative.

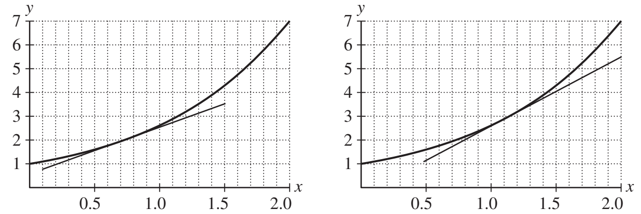
4. Estimate $f'(0.7)$ and $f'(1.1)$.

SOLUTION The tangent line sketched in the graph below at the left appears to pass through the points (0.2, 1) and (1.5, 3.5). Thus,

$$f'(0.7) \approx \frac{3.5-1}{1.5-0.2} = \frac{2.5}{1.3} = 1.923.$$

The tangent line sketched in the graph below at the right appears to pass through the points (0.8, 2) and (2, 5.5). Thus,

$$f'(1.1) \approx \frac{5.5-2}{2-0.8} = \frac{3.5}{1.2} = 2.917.$$



In Exercises 5–8, compute $f'(a)$ using the limit definition and find an equation of the tangent line to the graph of $f(x)$ at $x = a$.

5. $f(x) = x^2 - x, \quad a = 1$

SOLUTION Let $f(x) = x^2 - x$ and $a = 1$. Then

$$f'(a) = \lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{(1+h)^2 - (1+h) - (1^2 - 1)}{h}$$
$$= \lim_{h\to 0} \frac{1 + 2h + h^2 - 1 - h}{h} = \lim_{h\to 0}(1+h) = 1$$

and the equation of the tangent line to the graph of $f(x)$ at $x = a$ is

$$y = f'(a)(x-a) + f(a) = 1(x-1) + 0 = x - 1.$$

6. $f(x) = 5 - 3x, \quad a = 2$

SOLUTION Let $f(x) = 5 - 3x$ and $a = 2$. Then

$$f'(a) = \lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{5 - 3(2+h) - (5-6)}{h} = \lim_{h\to 0} -3 = -3$$

and the equation of the tangent line to the graph of $f(x)$ at $x = a$ is

$$y = f'(a)(x-a) + f(a) = -3(x-2) - 1 = -3x + 5.$$

7. $f(x) = x^{-1}, \quad a = 4$

SOLUTION Let $f(x) = x^{-1}$ and $a = 4$. Then

$$f'(a) = \lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{\frac{1}{4+h} - \frac{1}{4}}{h} = \lim_{h\to 0} \frac{4 - (4+h)}{4h(4+h)}$$
$$= \lim_{h\to 0} \frac{-1}{4(4+h)} = -\frac{1}{4(4+0)} = -\frac{1}{16}$$

and the equation of the tangent line to the graph of $f(x)$ at $x = a$ is

$$y = f'(a)(x-a) + f(a) = -\frac{1}{16}(x-4) + \frac{1}{4} = -\frac{1}{16}x + \frac{1}{2}.$$

8. $f(x) = x^3, \quad a = -2$

SOLUTION Let $f(x) = x^3$ and $a = -2$. Then

$$f'(a) = \lim_{h\to 0} \frac{f(a+h) - f(a)}{h} = \lim_{h\to 0} \frac{(-2+h)^3 - (-2)^3}{h} = \lim_{h\to 0} \frac{-8 + 12h - 6h^2 + h^3 + 8}{h}$$
$$= \lim_{h\to 0}(12 - 6h + h^2) = 12 - 6(0) + 0^2 = 12$$

and the equation of the tangent line to the graph of $f(x)$ at $x = a$ is

$$y = f'(a)(x - a) + f(a) = 12(x + 2) - 8 = 12x + 16.$$

In Exercises 9–12, compute dy/dx using the limit definition.

9. $y = 4 - x^2$

SOLUTION Let $y = 4 - x^2$. Then

$$\frac{dy}{dx} = \lim_{h\to 0} \frac{4 - (x+h)^2 - (4 - x^2)}{h} = \lim_{h\to 0} \frac{4 - x^2 - 2xh - h^2 - 4 + x^2}{h} = \lim_{h\to 0}(-2x - h) = -2x - 0 = -2x.$$

10. $y = \sqrt{2x+1}$

SOLUTION Let $y = \sqrt{2x+1}$. Then

$$\frac{dy}{dx} = \lim_{h\to 0} \frac{\sqrt{2(x+h)+1} - \sqrt{2x+1}}{h} = \lim_{h\to 0} \frac{\sqrt{2x+2h+1} - \sqrt{2x+1}}{h} \cdot \frac{\sqrt{2x+2h+1} + \sqrt{2x+1}}{\sqrt{2x+2h+1} + \sqrt{2x+1}}$$
$$= \lim_{h\to 0} \frac{(2x+2h+1) - (2x+1)}{h(\sqrt{2x+2h+1} + \sqrt{2x+1})} = \lim_{h\to 0} \frac{2}{\sqrt{2x+2h+1} + \sqrt{2x+1}} = \frac{1}{\sqrt{2x+1}}.$$

11. $y = \dfrac{1}{2-x}$

SOLUTION Let $y = \dfrac{1}{2-x}$. Then

$$\frac{dy}{dx} = \lim_{h\to 0} \frac{\frac{1}{2-(x+h)} - \frac{1}{2-x}}{h} = \lim_{h\to 0} \frac{(2-x) - (2-x-h)}{h(2-x-h)(2-x)} = \lim_{h\to 0} \frac{1}{(2-x-h)(2-x)} = \frac{1}{(2-x)^2}.$$

12. $y = \dfrac{1}{(x-1)^2}$

SOLUTION Let $y = \dfrac{1}{(x-1)^2}$. Then

$$\frac{dy}{dx} = \lim_{h\to 0} \frac{\frac{1}{(x+h-1)^2} - \frac{1}{(x-1)^2}}{h} = \lim_{h\to 0} \frac{(x-1)^2 - (x+h-1)^2}{h(x+h-1)^2(x-1)^2}$$
$$= \lim_{h\to 0} \frac{x^2 - 2x + 1 - (x^2 + 2xh + h^2 - 2x - 2h + 1)}{h(x+h-1)^2(x-1)^2} = \lim_{h\to 0} \frac{-2x - h + 2}{(x+h-1)^2(x-1)^2}$$
$$= \frac{-2x+2}{(x-1)^4} = -\frac{2}{(x-1)^3}.$$

In Exercises 13–16, express the limit as a derivative.

13. $\displaystyle\lim_{h\to 0} \frac{\sqrt{1+h} - 1}{h}$

SOLUTION Let $f(x) = \sqrt{x}$. Then

$$\lim_{h\to 0} \frac{\sqrt{1+h} - 1}{h} = \lim_{h\to 0} \frac{f(1+h) - f(1)}{h} = f'(1).$$

14. $\displaystyle\lim_{x\to -1} \frac{x^3 + 1}{x + 1}$

SOLUTION Let $f(x) = x^3$. Then

$$\lim_{x\to -1} \frac{x^3+1}{x+1} = \lim_{x\to -1} \frac{f(x) - f(-1)}{x - (-1)} = f'(-1).$$

15. $\lim_{t\to\pi} \frac{\sin t \cos t}{t-\pi}$

SOLUTION Let $f(t) = \sin t \cos t$ and note that $f(\pi) = \sin\pi \cos\pi = 0$. Then

$$\lim_{t\to\pi} \frac{\sin t \cos t}{t-\pi} = \lim_{t\to\pi} \frac{f(t) - f(\pi)}{t-\pi} = f'(\pi).$$

16. $\lim_{\theta\to\pi} \frac{\cos\theta - \sin\theta + 1}{\theta-\pi}$

SOLUTION Let $f(\theta) = \cos\theta - \sin\theta$ and note that $f(\pi) = -1$. Then

$$\lim_{\theta\to\pi} \frac{\cos\theta - \sin\theta + 1}{\theta-\pi} = \lim_{\theta\to\pi} \frac{f(\theta) - f(\pi)}{\theta-\pi} = f'(\pi).$$

17. Find $f(4)$ and $f'(4)$ if the tangent line to the graph of $f(x)$ at $x = 4$ has equation $y = 3x - 14$.

SOLUTION The equation of the tangent line to the graph of $f(x)$ at $x = 4$ is $y = f'(4)(x-4) + f(4) = f'(4)x + (f(4) - 4f'(4))$. Matching this to $y = 3x - 14$, we see that $f'(4) = 3$ and $f(4) - 4(3) = -14$, so $f(4) = -2$.

18. Each graph in Figure 2 shows the graph of a function $f(x)$ and its derivative $f'(x)$. Determine which is the function and which is the derivative.

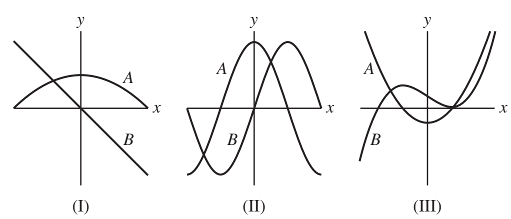


FIGURE 2 Graph of $f(x)$.

SOLUTION

- In (I), the graph labeled A is increasing when the graph labeled B is positive and is decreasing when the graph labeled B is negative. Therefore, the graph labeled A is the function $f(x)$ and the graph labeled B is the derivative $f'(x)$.
- In (II), the graph labeled B is increasing when the graph labeled A is positive and is decreasing when the graph labeled A is negative. Therefore, the graph labeled B is the function $f(x)$ and the graph labeled A is the derivative $f'(x)$.
- In (III), the graph labeled B has horizontal tangent lines at the locations the graph labeled A is zero. Therefore, the graph labeled B is the function $f(x)$ and the graph labeled A is the derivative $f'(x)$.

19. Is (A), (B), or (C) the graph of the derivative of the function $f(x)$ shown in Figure 3?

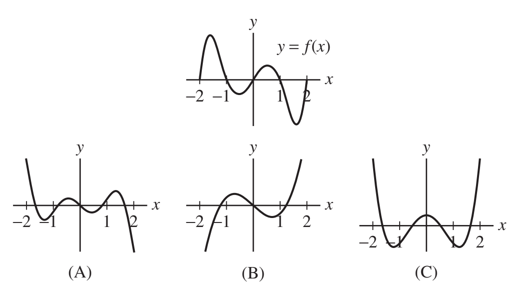

FIGURE 3

SOLUTION The graph of $f(x)$ has four horizontal tangent lines on $[-2, 2]$, so the graph of its derivative must have four x-intercepts on $[-2, 2]$. This eliminates (B). Moreover, $f(x)$ is increasing at both ends of the interval, so its derivative must be positive at both ends. This eliminates (A) and identifies (C) as the graph of $f'(x)$.

20. Let $N(t)$ be the percentage of a state population infected with a flu virus on week t of an epidemic. What percentage is likely to be infected in week 4 if $N(3) = 8$ and $N'(3) = 1.2$?

SOLUTION Because $N(4) - N(3) \approx N'(3)$, we estimate that

$$N(4) \approx N(3) + N'(3) = 8 + 1.2 = 9.2.$$

Thus, 9.2% of the population is likely infected in week 4.

21. A girl's height $h(t)$ (in centimeters) is measured at time t (in years) for $0 \le t \le 14$:

52, 75.1, 87.5, 96.7, 104.5, 111.8, 118.7, 125.2,
131.5, 137.5, 143.3, 149.2, 155.3, 160.8, 164.7

(a) What is the average growth rate over the 14-year period?

(b) Is the average growth rate larger over the first half or the second half of this period?

(c) Estimate $h'(t)$ (in centimeters per year) for $t = 3, 8$.

SOLUTION

(a) The average growth rate over the 14-year period is

$$\frac{164.7 - 52}{14} = 8.05 \text{ cm/year.}$$

(b) Over the first half of the 14-year period, the average growth rate is

$$\frac{125.2 - 52}{7} \approx 10.46 \text{ cm/year,}$$

which is larger than the average growth rate over the second half of the 14-year period:

$$\frac{164.7 - 125.2}{7} \approx 5.64 \text{ cm/year.}$$

(c) For $t = 3$,

$$h'(3) \approx \frac{h(4) - h(3)}{4 - 3} = \frac{104.5 - 96.7}{1} = 7.8 \text{ cm/year;}$$

for $t = 8$,

$$h'(8) \approx \frac{h(9) - h(8)}{9 - 8} = \frac{137.5 - 131.5}{1} = 6.0 \text{ cm/year.}$$

22. A planet's period P (number of days to complete one revolution around the sun) is approximately $0.199A^{3/2}$, where A is the average distance (in millions of kilometers) from the planet to the sun.

(a) Calculate P and dP/dA for Earth using the value $A = 150$.

(b) Estimate the increase in P if A is increased to 152.

SOLUTION

(a) Let $P = 0.199A^{3/2}$. Then $\frac{dP}{dA} = 0.2985A^{1/2}$. For $A = 150$,

$$P = 0.199(150)^{3/2} \approx 365.6 \text{ days; and}$$

$$\frac{dP}{dA} = 0.2985(150)^{1/2} \approx 3.656 \text{ days/millions of kilometers.}$$

(b) If A is increased to 150, then

$$P(152) - P(150) \approx \left.\frac{dP}{dA}\right|_{A=150} = 3.656 \text{ days.}$$

In Exercises 23 and 24, use the following table of values for the number $A(t)$ of automobiles (in millions) manufactured in the United States in year t.

t	1970	1971	1972	1973	1974	1975	1976
$A(t)$	6.55	8.58	8.83	9.67	7.32	6.72	8.50

23. What is the interpretation of $A'(t)$? Estimate $A'(1971)$. Does $A'(1974)$ appear to be positive or negative?

SOLUTION Because $A(t)$ measures the number of automobiles manufactured in the United States in year t, $A'(t)$ measures the rate of change in automobile production in the United States. For $t = 1971$,

$$A'(1971) \approx \frac{A(1972) - A(1971)}{1972 - 1971} = \frac{8.83 - 8.58}{1} = 0.25 \text{ million automobiles/year.}$$

Because $A(t)$ decreases from 1973 to 1974 and from 1974 to 1975, it appears that $A'(1974)$ would be negative.

24. Given the data, which of (A)–(C) in Figure 4 could be the graph of the derivative $A'(t)$? Explain.

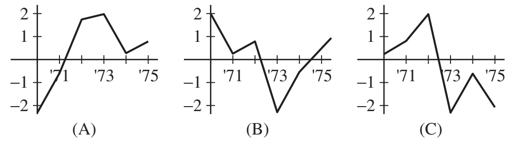

FIGURE 4

SOLUTION The values of $A(t)$ increase, then decrease and finally increase. Thus $A'(t)$ should transition from positive to negative and back to positive. This describes the graph in (B).

25. Which of the following is equal to $\frac{d}{dx}2^x$?

(a) 2^x **(b)** $(\ln 2)2^x$ **(c)** $x2^{x-1}$ **(d)** $\frac{1}{\ln 2}2^x$

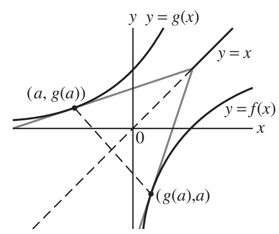
SOLUTION The derivative of $f(x) = 2^x$ is

$$\frac{d}{dx}2^x = 2^x \ln 2.$$

Hence, the correct answer is **(b)**.

26. Describe the graphical interpretation of the relation $g'(x) = 1/f'(g(x))$, where $f(x)$ and $g(x)$ are inverses of each other.

SOLUTION Suppose $f(x)$ and $g(x)$ are inverse functions. Consider a point on the graph of $y = f(x)$ – say (a, b) – and the point on the graph of $y = g(x)$ symmetric with respect to the line $y = x$ – that is, (b, a). The relation $g'(x) = 1/f'(g(x))$ indicates that the lines tangent to the two graphs at these symmetric points have slopes that are reciprocals of one another.



27. Show that if $f(x)$ is a function satisfying $f'(x) = f(x)^2$, then its inverse $g(x)$ satisfies $g'(x) = x^{-2}$.

SOLUTION

$$g'(x) = \frac{1}{f'(g(x))} = \frac{1}{f(g(x))^2} = \frac{1}{x^2} = x^{-2}.$$

28. Find $g'(8)$, where $g(x)$ is the inverse of a differentiable function $f(x)$ such that $f(-1) = 8$ and $f'(-1) = 12$.

SOLUTION The Theorem on the derivative of an inverse function states

$$g'(x) = \frac{1}{f'(g(x))}.$$

Setting $x = 8$, we obtain

$$g'(8) = \frac{1}{f'(g(8))}.$$

Because $f(-1) = 8$, it follows that $g(8) = -1$. Thus,

$$g'(8) = \frac{1}{f'(-1)} = \frac{1}{12}.$$

In Exercises 29–80, compute the derivative.

29. $y = 3x^5 - 7x^2 + 4$

SOLUTION Let $y = 3x^5 - 7x^2 + 4$. Then

$$\frac{dy}{dx} = 15x^4 - 14x.$$

30. $y = 4x^{-3/2}$

SOLUTION Let $y = 4x^{-3/2}$. Then

$$\frac{dy}{dx} = -6x^{-5/2}.$$

31. $y = t^{-7.3}$

SOLUTION Let $y = t^{-7.3}$. Then

$$\frac{dy}{dt} = -7.3t^{-8.3}.$$

32. $y = 4x^2 - x^{-2}$

SOLUTION Let $y = 4x^2 - x^{-2}$. Then

$$\frac{dy}{dx} = 8x + 2x^{-3}.$$

33. $y = \dfrac{x+1}{x^2+1}$

SOLUTION Let $y = \dfrac{x+1}{x^2+1}$. Then

$$\frac{dy}{dx} = \frac{(x^2+1)(1) - (x+1)(2x)}{(x^2+1)^2} = \frac{1 - 2x - x^2}{(x^2+1)^2}.$$

34. $y = \dfrac{3t-2}{4t-9}$

SOLUTION Let $y = \dfrac{3t-2}{4t-9}$. Then

$$\frac{dy}{dt} = \frac{(4t-9)(3) - (3t-2)(4)}{(4t-9)^2} = -\frac{19}{(4t-9)^2}.$$

35. $y = (x^4 - 9x)^6$

SOLUTION Let $y = (x^4 - 9x)^6$. Then

$$\frac{dy}{dx} = 6(x^4 - 9x)^5 \frac{d}{dx}(x^4 - 9x) = 6(4x^3 - 9)(x^4 - 9x)^5.$$

36. $y = (3t^2 + 20t^{-3})^6$

SOLUTION Let $y = (3t^2 + 20t^{-3})^6$. Then

$$\frac{dy}{dt} = 6(3t^2 + 20t^{-3})^5 \frac{d}{dt}(3t^2 + 20t^{-3}) = 6(6t - 60t^{-4})(3t^2 + 20t^{-3})^5.$$

37. $y = (2 + 9x^2)^{3/2}$

SOLUTION Let $y = (2 + 9x^2)^{3/2}$. Then

$$\frac{dy}{dx} = \frac{3}{2}(2 + 9x^2)^{1/2} \frac{d}{dx}(2 + 9x^2) = 27x(2 + 9x^2)^{1/2}.$$

38. $y = (x+1)^3(x+4)^4$

SOLUTION Let $y = (x+1)^3(x+4)^4$. Then

$$\begin{aligned}\frac{dy}{dx} &= 4(x+1)^3(x+4)^3 + 3(x+1)^2(x+4)^4 = (x+1)^2(x+4)^3(4x + 4 + 3x + 12)\\ &= (7x+16)(x+1)^2(x+4)^3.\end{aligned}$$

39. $y = \dfrac{z}{\sqrt{1-z}}$

SOLUTION Let $y = \dfrac{z}{\sqrt{1-z}}$. Then

$$\frac{dy}{dz} = \frac{\sqrt{1-z} - (-\frac{z}{2})\frac{1}{\sqrt{1-z}}}{1-z} = \frac{1 - z + \frac{z}{2}}{(1-z)^{3/2}} = \frac{2-z}{2(1-z)^{3/2}}.$$

40. $y = \left(1 + \frac{1}{x}\right)^3$

SOLUTION Let $y = \left(1 + \frac{1}{x}\right)^3$. Then

$$\frac{dy}{dx} = 3\left(1 + \frac{1}{x}\right)^2 \frac{d}{dx}\left(1 + \frac{1}{x}\right) = -\frac{3}{x^2}\left(1 + \frac{1}{x}\right)^2.$$

41. $y = \frac{x^4 + \sqrt{x}}{x^2}$

SOLUTION Let

$$y = \frac{x^4 + \sqrt{x}}{x^2} = x^2 + x^{-3/2}.$$

Then

$$\frac{dy}{dx} = 2x - \frac{3}{2}x^{-5/2}.$$

42. $y = \frac{1}{(1-x)\sqrt{2-x}}$

SOLUTION Let $y = \frac{1}{(1-x)\sqrt{2-x}} = \left((1-x)\sqrt{2-x}\right)^{-1}$. Then

$$\frac{dy}{dx} = -\left((1-x)\sqrt{2-x}\right)^{-2} \frac{d}{dx}\left((1-x)\sqrt{2-x}\right) = -\left((1-x)\sqrt{2-x}\right)^{-2}\left(-\frac{1-x}{2\sqrt{2-x}} - \sqrt{2-x}\right)$$
$$= \frac{5-3x}{2(1-x)^2(2-x)^{3/2}}.$$

43. $y = \sqrt{x + \sqrt{x + \sqrt{x}}}$

SOLUTION Let $y = \sqrt{x + \sqrt{x + \sqrt{x}}}$. Then

$$\frac{dy}{dx} = \frac{1}{2}\left(x + \sqrt{x + \sqrt{x}}\right)^{-1/2} \frac{d}{dx}\left(x + \sqrt{x + \sqrt{x}}\right)$$
$$= \frac{1}{2}\left(x + \sqrt{x + \sqrt{x}}\right)^{-1/2}\left(1 + \frac{1}{2}\left(x + \sqrt{x}\right)^{-1/2} \frac{d}{dx}\left(x + \sqrt{x}\right)\right)$$
$$= \frac{1}{2}\left(x + \sqrt{x + \sqrt{x}}\right)^{-1/2}\left(1 + \frac{1}{2}\left(x + \sqrt{x}\right)^{-1/2}\left(1 + \frac{1}{2}x^{-1/2}\right)\right).$$

44. $h(z) = \left(z + (z+1)^{1/2}\right)^{-3/2}$

SOLUTION

$$\frac{d}{dz}\left(z + (z+1)^{1/2}\right)^{-3/2} = -\frac{3}{2}\left(z + (z+1)^{1/2}\right)^{-5/2} \frac{d}{dz}\left(z + (z+1)^{1/2}\right)$$
$$= -\frac{3}{2}\left(z + (z+1)^{1/2}\right)^{-5/2}\left(1 + \frac{1}{2}(z+1)^{-1/2}\right).$$

45. $y = \tan(t^{-3})$

SOLUTION Let $y = \tan(t^{-3})$. Then

$$\frac{dy}{dt} = \sec^2(t^{-3})\frac{d}{dt}t^{-3} = -3t^{-4}\sec^2(t^{-3}).$$

46. $y = 4\cos(2 - 3x)$

SOLUTION Let $y = 4\cos(2 - 3x)$. Then

$$\frac{dy}{dx} = -4\sin(2 - 3x)\frac{d}{dx}(2 - 3x) = 12\sin(2 - 3x).$$

47. $y = \sin(2x)\cos^2 x$

SOLUTION Let $y = \sin(2x)\cos^2 x = 2\sin x\cos^3 x$. Then

$$\frac{dy}{dx} = -6\sin^2 x\cos^2 x + 2\cos^4 x.$$

48. $y = \sin\left(\frac{4}{\theta}\right)$

SOLUTION Let $y = \sin\left(\frac{4}{\theta}\right)$. Then

$$\frac{dy}{d\theta} = \cos\left(\frac{4}{\theta}\right)\frac{d}{d\theta}\left(\frac{4}{\theta}\right) = -\frac{4}{\theta^2}\cos\left(\frac{4}{\theta}\right).$$

49. $y = \dfrac{t}{1+\sec t}$

SOLUTION Let $y = \dfrac{t}{1+\sec t}$. Then

$$\frac{dy}{dt} = \frac{1+\sec t - t\sec t\tan t}{(1+\sec t)^2}.$$

50. $y = z\csc(9z+1)$

SOLUTION Let $y = z\csc(9z+1)$. Then

$$\frac{dy}{dz} = -9z\csc(9z+1)\cot(9z+1) + \csc(9z+1).$$

51. $y = \dfrac{8}{1+\cot\theta}$

SOLUTION Let $y = \dfrac{8}{1+\cot\theta} = 8(1+\cot\theta)^{-1}$. Then

$$\frac{dy}{d\theta} = -8(1+\cot\theta)^{-2}\frac{d}{d\theta}(1+\cot\theta) = \frac{8\csc^2\theta}{(1+\cot\theta)^2}.$$

52. $y = \tan(\cos x)$

SOLUTION Let $y = \tan(\cos x)$. Then

$$\frac{dy}{dx} = \sec^2(\cos x)\frac{d}{dx}\cos x = -\sin x\sec^2(\cos x).$$

53. $y = \tan(\sqrt{1+\csc\theta})$

SOLUTION

$$\begin{aligned}\frac{dy}{dx} &= \sec^2(\sqrt{1+\csc\theta})\frac{d}{dx}\sqrt{1+\csc\theta}\\ &= \sec^2(\sqrt{1+\csc\theta})\cdot\frac{1}{2}(1+\csc\theta)^{-1/2}\frac{d}{dx}(1+\csc\theta)\\ &= -\frac{\sec^2(\sqrt{1+\csc\theta})\csc\theta\cot\theta}{2(\sqrt{1+\csc\theta})}.\end{aligned}$$

54. $y = \cos(\cos(\cos(\theta)))$

SOLUTION Let $y = \cos(\cos(\cos(\theta)))$. Then

$$\begin{aligned}\frac{dy}{d\theta} &= -\sin(\cos(\cos(\theta)))\frac{d}{d\theta}\cos(\cos(\theta)) = \sin(\cos(\cos(\theta)))\sin(\cos(\theta))\frac{d}{d\theta}\cos(\theta)\\ &= -\sin(\cos(\cos(\theta)))\sin(\cos(\theta))\sin(\theta).\end{aligned}$$

55. $f(x) = 9e^{-4x}$

SOLUTION $\dfrac{d}{dx}9e^{-4x} = -36e^{-4x}$.

56. $f(x) = \dfrac{e^{-x}}{x}$

SOLUTION $\dfrac{d}{dx}\left(\dfrac{e^{-x}}{x}\right) = \dfrac{-xe^{-x} - e^{-x}}{x^2} = -\dfrac{e^{-x}(x+1)}{x^2}.$

57. $g(t) = e^{4t-t^2}$

SOLUTION $\dfrac{d}{dt}e^{4t-t^2} = (4-2t)e^{4t-t^2}.$

58. $g(t) = t^2 e^{1/t}$

SOLUTION $\dfrac{d}{dt}t^2e^{1/t} = 2te^{1/t} + t^2\left(-\dfrac{1}{t^2}\right)e^{1/t} = (2t-1)e^{1/t}.$

59. $f(x) = \ln(4x^2+1)$

SOLUTION $\dfrac{d}{dx}\ln(4x^2+1) = \dfrac{8x}{4x^2+1}.$

60. $f(x) = \ln(e^x - 4x)$

SOLUTION $\dfrac{d}{dx}\ln(e^x-4x) = \dfrac{e^x-4}{e^x-4x}.$

61. $G(s) = (\ln(s))^2$

SOLUTION $\dfrac{d}{ds}(\ln s)^2 = \dfrac{2\ln s}{s}.$

62. $G(s) = \ln(s^2)$

SOLUTION $\dfrac{d}{ds}\ln(s^2) = 2\dfrac{d}{ds}\ln s = \dfrac{2}{s}.$

63. $f(\theta) = \ln(\sin\theta)$

SOLUTION $\dfrac{d}{d\theta}\ln(\sin\theta) = \dfrac{\cos\theta}{\sin\theta} = \cot\theta.$

64. $f(\theta) = \sin(\ln\theta)$

SOLUTION $\dfrac{d}{d\theta}\sin(\ln\theta) = \dfrac{\cos(\ln\theta)}{\theta}.$

65. $h(z) = \sec(z + \ln z)$

SOLUTION $\dfrac{d}{dz}\sec(z+\ln z) = \sec(z+\ln z)\tan(z+\ln z)\left(1+\dfrac{1}{z}\right).$

66. $f(x) = e^{\sin^2 x}$

SOLUTION $\dfrac{d}{dx}e^{\sin^2 x} = 2\sin x\cos x e^{\sin^2 x} = \sin 2x e^{\sin^2 x}.$

67. $f(x) = 7^{-2x}$

SOLUTION $\dfrac{d}{dx}7^{-2x} = \big(-2\ln 7\big)\big(7^{-2x}\big).$

68. $h(y) = \dfrac{1+e^y}{1-e^y}$

SOLUTION $\dfrac{d}{dy}\left(\dfrac{1+e^y}{1-e^y}\right) = \dfrac{(1-e^y)e^y - (1+e^y)(-e^y)}{(1-e^y)^2} = \dfrac{e^y(1-e^y+1+e^y)}{(1-e^y)^2} = \dfrac{2e^y}{(1-e^y)^2}.$

69. $g(x) = \tan^{-1}(\ln x)$

SOLUTION $\dfrac{d}{dx}\tan^{-1}(\ln x) = \dfrac{1}{1+(\ln x)^2}\cdot\dfrac{1}{x}.$

70. $G(s) = \cos^{-1}(s^{-1})$

SOLUTION $\dfrac{d}{ds}\cos^{-1}(s^{-1}) = \dfrac{-1}{\sqrt{1-\left(\frac{1}{s}\right)^2}}\left(-\dfrac{1}{s^2}\right) = \dfrac{1}{\sqrt{s^4-s^2}}.$

71. $f(x) = \ln(\csc^{-1} x)$

SOLUTION $\dfrac{d}{dx}\ln(\csc^{-1} x) = -\dfrac{1}{|x|\sqrt{x^2-1}\csc^{-1} x}.$

72. $f(x) = e^{\sec^{-1} x}$

SOLUTION $\dfrac{d}{dx}e^{\sec^{-1} x} = \dfrac{1}{|x|\sqrt{x^2-1}}e^{\sec^{-1} x}.$

73. $R(s) = s^{\ln s}$

SOLUTION Rewrite

$$R(s) = \left(e^{\ln s}\right)^{\ln s} = e^{(\ln s)^2}.$$

Then

$$\frac{dR}{ds} = e^{(\ln s)^2}\cdot 2\ln s\cdot\frac{1}{s} = \frac{2\ln s}{s}s^{\ln s}.$$

Alternately, $R(s) = s^{\ln s}$ implies that $\ln R = \ln\left(s^{\ln s}\right) = (\ln s)^2$. Thus,

$$\frac{1}{R}\frac{dR}{ds} = 2\ln s\cdot\frac{1}{s} \quad\text{or}\quad \frac{dR}{ds} = \frac{2\ln s}{s}s^{\ln s}.$$

74. $f(x) = (\cos^2 x)^{\cos x}$

SOLUTION Rewrite

$$f(x) = \left(e^{\ln\cos^2 x}\right)^{\cos x} = e^{2\cos x\ln\cos x}.$$

Then

$$\begin{aligned}\frac{df}{dx} &= e^{2\cos x\ln\cos x}\left(2\cos x\cdot\frac{-\sin x}{\cos x} - 2\sin x\ln\cos x\right)\\ &= -2\sin x(\cos^2 x)^{\cos x}(1+\ln\cos x).\end{aligned}$$

Alternately, $f(x) = (\cos^2 x)^{\cos x}$ implies that $\ln f = \cos x\ln\cos^2 x = 2\cos x\ln\cos x$. Thus,

$$\begin{aligned}\frac{1}{f}\frac{df}{dx} &= 2\cos x\cdot\frac{-\sin x}{\cos x} - 2\sin x\ln\cos x\\ &= -2\sin x(1+\ln\cos x),\end{aligned}$$

and

$$\frac{df}{dx} = -2\sin x(\cos^2 x)^{\cos x}(1+\ln\cos x).$$

75. $G(t) = (\sin^2 t)^t$

SOLUTION Rewrite

$$G(t) = \left(e^{\ln\sin^2 t}\right)^t = e^{2t\ln\sin t}.$$

Then

$$\frac{dG}{dt} = e^{2t\ln\sin t}\left(2t\cdot\frac{\cos t}{\sin t} + 2\ln\sin t\right) = 2(\sin^2 t)^t(t\cot t + \ln\sin t).$$

Alternately, $G(t) = (\sin^2 t)^t$ implies that $\ln G = t \ln \sin^2 t = 2t \ln \sin t$. Thus,

$$\frac{1}{G}\frac{dG}{dt} = 2t \cdot \frac{\cos t}{\sin t} + 2 \ln \sin t,$$

and

$$\frac{dG}{dt} = 2(\sin^2 t)^t (t \cot t + \ln \sin t).$$

76. $h(t) = t^{(t^t)}$

SOLUTION Let $h(t) = t^{(t^t)}$. Then $\ln h = t^t \ln t$ and

$$\begin{aligned}\ln(\ln h) &= \ln(t^t \ln t) = \ln t^t + \ln(\ln t)\\ &= t \ln t + \ln(\ln t).\end{aligned}$$

Thus,

$$\frac{1}{h \ln h}\frac{dh}{dt} = t \cdot \frac{1}{t} + \ln t + \frac{1}{t \ln t} = 1 + \ln t + \frac{1}{t \ln t},$$

and

$$\frac{dh}{dt} = t^{(t^t)} t^t \ln t \left(1 + \ln t + \frac{1}{t \ln t}\right).$$

77. $g(t) = \sinh(t^2)$

SOLUTION $\dfrac{d}{dt}\sinh(t^2) = 2t\cosh(t^2)$.

78. $h(y) = y \tanh(4y)$

SOLUTION $\dfrac{d}{dy} y \tanh(4y) = \tanh(4y) + 4y \operatorname{sech}^2(4y)$.

79. $g(x) = \tanh^{-1}(e^x)$

SOLUTION $\dfrac{d}{dx}\tanh^{-1}(e^x) = \dfrac{1}{1-(e^x)^2}e^x = \dfrac{e^x}{1-e^{2x}}$.

80. $g(t) = \sqrt{t^2-1}\sinh^{-1} t$

SOLUTION $\dfrac{d}{dt}\sqrt{t^2-1}\sinh^{-1} t = \dfrac{t}{\sqrt{t^2-1}}\sinh^{-1} t + \sqrt{t^2-1} \cdot \dfrac{1}{\sqrt{t^2+1}} = \dfrac{t\sinh^{-1} t}{\sqrt{t^2-1}} + \sqrt{\dfrac{t^2-1}{t^2+1}}$.

81. For which values of α is $f(x) = |x|^\alpha$ differentiable at $x = 0$?

SOLUTION Let $f(x) = |x|^\alpha$. If $\alpha < 0$, then $f(x)$ is not continuous at $x = 0$ and therefore cannot be differentiable at $x = 0$. If $\alpha = 0$, then the function reduces to $f(x) = 1$, which is differentiable at $x = 0$. Now, suppose $\alpha > 0$ and consider the limit

$$\lim_{x\to 0}\frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0}\frac{|x|^\alpha}{x}.$$

If $0 < \alpha < 1$, then

$$\lim_{x\to 0-}\frac{|x|^\alpha}{x} = -\infty \qquad \text{while} \qquad \lim_{x\to 0+}\frac{|x|^\alpha}{x} = \infty$$

and $f'(0)$ does not exist. If $\alpha = 1$, then

$$\lim_{x\to 0-}\frac{|x|}{x} = -1 \qquad \text{while} \qquad \lim_{x\to 0+}\frac{|x|}{x} = 1$$

and $f'(0)$ again does not exist. Finally, if $\alpha > 1$, then

$$\lim_{x\to 0}\frac{|x|^\alpha}{x} = 0,$$

so $f'(0)$ does exist.

In summary, $f(x) = |x|^\alpha$ is differentiable at $x = 0$ when $\alpha = 0$ and when $\alpha > 1$.

82. Find $f'(2)$ if $f(g(x)) = e^{x^2}$, $g(1) = 2$, and $g'(1) = 4$.

SOLUTION We differentiate both sides of the equation $f(g(x)) = e^{x^2}$ to obtain,

$$f'(g(x))\, g'(x) = 2xe^{x^2}.$$

Setting $x = 1$ yields

$$f'(g(1))\, g'(1) = 2e.$$

Since $g(1) = 2$ and $g'(1) = 4$, we find

$$f'(2) \cdot 4 = 2e,$$

or

$$f'(2) = \frac{e}{2}.$$

In Exercises 83 and 84, let $f(x) = xe^{-x}$.

83. Show that $f(x)$ has an inverse on $[1, \infty)$. Let $g(x)$ be this inverse. Find the domain and range of $g(x)$ and compute $g'(2e^{-2})$.

SOLUTION Let $f(x) = xe^{-x}$. Then $f'(x) = e^{-x}(1 - x)$. On $[1, \infty)$, $f'(x) < 0$, so $f(x)$ is decreasing and therefore one-to-one. It follows that $f(x)$ has an inverse on $[1, \infty)$. Let $g(x)$ denote this inverse. Because $f(1) = e^{-1}$ and $f(x) \to 0$ as $x \to \infty$, the domain of $g(x)$ is $(0, e^{-1}]$, and the range is $[1, \infty)$.

To determine $g'(2e^{-2})$, we use the formula $g'(x) = 1/f'(g(x))$. Because $f(2) = 2e^{-2}$, it follows that $g(2e^{-2}) = 2$. Then,

$$g'(2e^{-2}) = \frac{1}{f'(g(2e^{-2}))} = \frac{1}{f'(2)} = \frac{1}{-e^{-2}} = -e^2.$$

84. Show that $f(x) = c$ has two solutions if $0 < c < e^{-1}$.

SOLUTION First note that $f(x) < 0$ for $x < 0$, so we only need to examine $(0, \infty)$ for solutions to $f(x) = c$ when $c > 0$. Next, because $f'(x) = e^{-x}(1 - x)$, f is decreasing on $(1, \infty)$ and increasing on $(0, 1)$. Therefore, f is one-to-one on each of these intervals, which guarantees that the equation $f(x) = c$ can have at most one solution on each of these intervals for any value of c.

Now, let $0 < c < e^{-1}$ and consider the interval $[1, \infty)$. Because

$$\lim_{x\to\infty} f(x) = \lim_{x\to\infty} \frac{x}{e^x} = 0,$$

it follows that there exists a $d \in (1, \infty)$ such that $f(d) < c$. With $f(1) = e^{-1} > c$, it follows from the Intermediate Value Theorem that the equation $f(x) = c$ has a solution on $[1, \infty)$. Next, consider the interval $[0, 1]$. With $f(0) = 0 < c$ and $f(1) = e^{-1} > c$, it follows from the Intermediate Value Theorem that the equation $f(x) = c$ has a solution on $[0, 1]$.

In summary, the equation $f(x) = c$ has exactly two solutions for any c between 0 and e^{-1}.

In Exercises 85–90, use the following table of values to calculate the derivative of the given function at $x = 2$.

x	$f(x)$	$g(x)$	$f'(x)$	$g'(x)$
2	5	4	−3	9
4	3	2	−2	3

85. $S(x) = 3f(x) - 2g(x)$

SOLUTION Let $S(x) = 3f(x) - 2g(x)$. Then $S'(x) = 3f'(x) - 2g'(x)$ and

$$S'(2) = 3f'(2) - 2g'(2) = 3(-3) - 2(9) = -27.$$

86. $H(x) = f(x)g(x)$

SOLUTION Let $H(x) = f(x)g(x)$. Then $H'(x) = f(x)g'(x) + f'(x)g(x)$ and

$$H'(2) = f(2)g'(2) + f'(2)g(2) = 5(9) + (-3)(4) = 33.$$

87. $R(x) = \dfrac{f(x)}{g(x)}$

SOLUTION Let $R(x) = f(x)/g(x)$. Then

$$R'(x) = \frac{g(x)f'(x) - f(x)g'(x)}{g(x)^2}$$

and

$$R'(2) = \frac{g(2)f'(2) - f(2)g'(2)}{g(2)^2} = \frac{4(-3) - 5(9)}{4^2} = -\frac{57}{16}.$$

88. $G(x) = f(g(x))$

SOLUTION Let $G(x) = f(g(x))$. Then $G'(x) = f'(g(x))g'(x)$ and

$$G'(2) = f'(g(2))g'(2) = f'(4)g'(2) = -2(9) = -18.$$

89. $F(x) = f(g(2x))$

SOLUTION Let $F(x) = f(g(2x))$. Then $F'(x) = 2f'(g(2x))g'(2x)$ and

$$F'(2) = 2f'(g(4))g'(4) = 2f'(2)g'(4) = 2(-3)(3) = -18.$$

90. $K(x) = f(x^2)$

SOLUTION Let $K(x) = f(x^2)$. Then $K'(x) = 2xf'(x^2)$ and

$$K'(2) = 2(2)f'(4) = 4(-2) = -8.$$

91. Find the points on the graph of $f(x) = x^3 - 3x^2 + x + 4$ where the tangent line has slope 10.

SOLUTION Let $f(x) = x^3 - 3x^2 + x + 4$. Then $f'(x) = 3x^2 - 6x + 1$. The tangent line to the graph of $f(x)$ will have slope 10 when $f'(x) = 10$. Solving the quadratic equation $3x^2 - 6x + 1 = 10$ yields $x = -1$ and $x = 3$. Thus, the points on the graph of $f(x)$ where the tangent line has slope 10 are $(-1, -1)$ and $(3, 7)$.

92. Find the points on the graph of $x^{2/3} + y^{2/3} = 1$ where the tangent line has slope 1.

SOLUTION Suppose $x^{2/3} + y^{2/3} = 1$. Differentiating with respect to x leads to

$$\frac{2}{3}x^{-1/3} + \frac{2}{3}y^{-1/3}\frac{dy}{dx} = 0,$$

or

$$\frac{dy}{dx} = -\left(\frac{x}{y}\right)^{-1/3} = -\left(\frac{y}{x}\right)^{1/3}.$$

Tangents to the curve therefore have slope 1 when $y = -x$. Substituting $y = -x$ into the equation for the curve yields $2x^{2/3} = 1$, so $x = \pm\frac{\sqrt{2}}{4}$. Thus, the points along the curve $x^{2/3} + y^{2/3} = 1$ where the tangent line has slope 1 are:

$$\left(\frac{\sqrt{2}}{4}, -\frac{\sqrt{2}}{4}\right) \quad \text{and} \quad \left(-\frac{\sqrt{2}}{4}, \frac{\sqrt{2}}{4}\right).$$

93. Find a such that the tangent lines $y = x^3 - 2x^2 + x + 1$ at $x = a$ and $x = a + 1$ are parallel.

SOLUTION Let $f(x) = x^3 - 2x^2 + x + 1$. Then $f'(x) = 3x^2 - 4x + 1$ and the slope of the tangent line at $x = a$ is $f'(a) = 3a^2 - 4a + 1$, while the slope of the tangent line at $x = a + 1$ is

$$f'(a + 1) = 3(a + 1)^2 - 4(a + 1) + 1 = 3(a^2 + 2a + 1) - 4a - 4 + 1 = 3a^2 + 2a.$$

In order for the tangent lines at $x = a$ and $x = a + 1$ to have the same slope, we must have $f'(a) = f'(a + 1)$, or

$$3a^2 - 4a + 1 = 3a^2 + 2a.$$

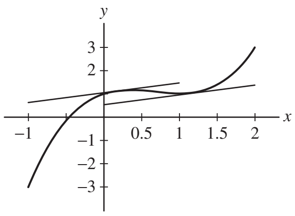
The only solution to this equation is $a = \frac{1}{6}$. The equation of the tangent line at $x = \frac{1}{6}$ is

$$y = f'\left(\frac{1}{6}\right)\left(x - \frac{1}{6}\right) + f\left(\frac{1}{6}\right) = \frac{5}{12}\left(x - \frac{1}{6}\right) + \frac{241}{216} = \frac{5}{12}x + \frac{113}{108},$$

and the equation of the tangent line at $x = \frac{7}{6}$ is

$$y = f'\left(\frac{7}{6}\right)\left(x - \frac{7}{6}\right) + f\left(\frac{7}{6}\right) = \frac{5}{12}\left(x - \frac{7}{6}\right) + \frac{223}{216} = \frac{5}{12}x + \frac{59}{108}.$$

The graphs of $f(x)$ and the two tangent lines appear below.



94. Use the table to compute the average rate of change of Candidate A's percentage of votes over the intervals from day 20 to day 15, day 15 to day 10, and day 10 to day 5. If this trend continues over the last 5 days before the election, will Candidate A win?

Days Before Election	**20**	**15**	**10**	**5**
Candidate A	44.8%	46.8%	48.3%	49.3%
Candidate B	55.2%	53.2%	51.7%	50.7%

SOLUTION The average rate of change of A's percentage for the period from day 20 to day 15 is

$$\frac{46.8 - 44.8}{5} = 0.4\%/\text{day}.$$

For the period from day 15 to day 10, the average rate of change is

$$\frac{48.3 - 46.8}{5} = 0.3\%/\text{day}.$$

Finally, for the period from day 10 to day 5, the average rate of change is

$$\frac{49.3 - 48.3}{5} = 0.2\%/\text{day}.$$

If this trend continues over the last five days before the election, the average rate of change will drop to 0.1 %/day, so A's percentage will increase another 0.5% to 49.8%. Accordingly, A will *not* win the election.

In Exercises 95–100, calculate y''.

95. $y = 12x^3 - 5x^2 + 3x$

SOLUTION Let $y = 12x^3 - 5x^2 + 3x$. Then

$$y' = 36x^2 - 10x + 3 \quad \text{and} \quad y'' = 72x - 10.$$

96. $y = x^{-2/5}$

SOLUTION Let $y = x^{-2/5}$. Then

$$y' = -\frac{2}{5}x^{-7/5} \quad \text{and} \quad y'' = \frac{14}{25}x^{-12/5}.$$

97. $y = \sqrt{2x + 3}$

SOLUTION Let $y = \sqrt{2x + 3} = (2x + 3)^{1/2}$. Then

$$y' = \frac{1}{2}(2x + 3)^{-1/2}\frac{d}{dx}(2x + 3) = (2x + 3)^{-1/2} \quad \text{and} \quad y'' = -\frac{1}{2}(2x + 3)^{-3/2}\frac{d}{dx}(2x + 3) = -(2x + 3)^{-3/2}.$$

98. $y = \dfrac{4x}{x + 1}$

SOLUTION Let $y = \dfrac{4x}{x + 1}$. Then

$$y' = \frac{(x + 1)(4) - 4x}{(x + 1)^2} = \frac{4}{(x + 1)^2} \quad \text{and} \quad y'' = -\frac{8}{(x + 1)^3}.$$

99. $y = \tan(x^2)$

SOLUTION Let $y = \tan(x^2)$. Then

$$y' = 2x\sec^2(x^2) \quad \text{and}$$
$$y'' = 2x\left(2\sec(x^2)\frac{d}{dx}\sec(x^2)\right) + 2\sec^2(x^2) = 8x^2\sec^2(x^2)\tan(x^2) + 2\sec^2(x^2).$$

100. $y = \sin^2(4x+9)$

SOLUTION Let $y = \sin^2(4x+9)$. Then

$$y' = 8\sin(4x+9)\cos(4x+9) = 4\sin(8x+18) \quad \text{and} \quad y'' = 32\cos(8x+18).$$

In Exercises 101–106, compute $\frac{dy}{dx}$.

101. $x^3 - y^3 = 4$

SOLUTION Consider the equation $x^3 - y^3 = 4$. Differentiating with respect to x yields

$$3x^2 - 3y^2\frac{dy}{dx} = 0.$$

Therefore,

$$\frac{dy}{dx} = \frac{x^2}{y^2}.$$

102. $4x^2 - 9y^2 = 36$

SOLUTION Consider the equation $4x^2 - 9y^2 = 36$. Differentiating with respect to x yields

$$8x - 18y\frac{dy}{dx} = 0.$$

Therefore,

$$\frac{dy}{dx} = \frac{4x}{9y}.$$

103. $y = xy^2 + 2x^2$

SOLUTION Consider the equation $y = xy^2 + 2x^2$. Differentiating with respect to x yields

$$\frac{dy}{dx} = 2xy\frac{dy}{dx} + y^2 + 4x.$$

Therefore,

$$\frac{dy}{dx} = \frac{y^2 + 4x}{1 - 2xy}.$$

104. $\frac{y}{x} = x + y$

SOLUTION Solving $\frac{y}{x} = x + y$ for y yields

$$y = \frac{x^2}{1-x}.$$

By the quotient rule,

$$\frac{dy}{dx} = \frac{(1-x)(2x) - x^2(-1)}{(1-x)^2} = \frac{2x - x^2}{(1-x)^2}.$$

105. $y = \sin(x+y)$

SOLUTION Consider the equation $y = \sin(x+y)$. Differentiating with respect to x yields

$$\frac{dy}{dx} = \cos(x+y)\left(1 + \frac{dy}{dx}\right).$$

Therefore,

$$\frac{dy}{dx} = \frac{\cos(x+y)}{1 - \cos(x+y)}.$$

106. $\tan(x + y) = xy$

SOLUTION Consider the equation $\tan(x + y) = xy$. Differentiating with respect to x yields

$$\sec^2(x + y)\left(1 + \frac{dy}{dx}\right) = x\frac{dy}{dx} + y.$$

Therefore,

$$\frac{dy}{dx} = \frac{y - \sec^2(x + y)}{\sec^2(x + y) - x}.$$

107. In Figure 5, label the graphs f, f', and f''.

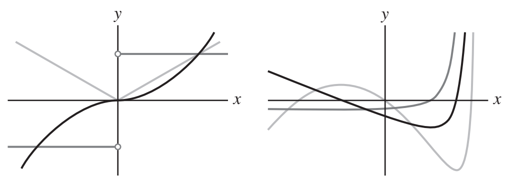


FIGURE 5

SOLUTION First consider the plot on the left. Observe that the green curve is nonnegative whereas the red curve is increasing, suggesting that the green curve is the derivative of the red curve. Moreover, the green curve is linear with negative slope for $x < 0$ and linear with positive slope for $x > 0$ while the blue curve is a negative constant for $x < 0$ and a positive constant for $x > 0$, suggesting the blue curve is the derivative of the green curve. Thus, the red, green and blue curves, respectively, are the graphs of f, f' and f''.

Now consider the plot on the right. Because the red curve is decreasing when the blue curve is negative and increasing when the blue curve is positive and the green curve is decreasing when the red curve is negative and increasing when the red curve is positive, it follows that the green, red and blue curves, respectively, are the graphs of f, f' and f''.

108. Let $f(x) = x^2 \sin(x^{-1})$ for $x \neq 0$ and $f(0) = 0$. Show that $f'(x)$ exists for all x (including $x = 0$) but that $f'(x)$ is not continuous at $x = 0$ (Figure 6).

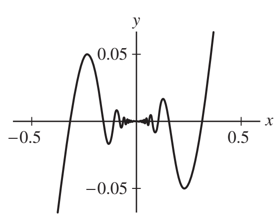

FIGURE 6 Graph of $f(x) = x^2 \sin(x^{-1})$.

SOLUTION Let $f(x) = x^2 \sin(x^{-1})$ for $x \neq 0$ and $f(0) = 0$. For $x \neq 0$, the product rule and the chain rule give

$$f'(x) = 2x \sin(x^{-1}) - x^2 \cos(x^{-1})(x^{-2}) = 2x \sin(x^{-1}) - \cos(x^{-1}),$$

which exists for all $x \neq 0$. At $x = 0$ we use the limit definition of the derivative:

$$f'(0) = \lim_{h\to 0} \frac{f(h) - f(0)}{h} = \lim_{h\to 0} \frac{1}{h}(h^2 \sin(h^{-1})) = \lim_{h\to 0} h \sin(h^{-1}) = 0,$$

by the Squeeze Theorem, since $-h \le h \sin \frac{1}{h} \le h$. Thus, $f'(x)$ exists for all x. However,

$$\lim_{x\to 0} f'(x) = \lim_{x\to 0} \left(2x \sin(x^{-1}) - \cos(x^{-1})\right)$$

does not exist, so $f'(x)$ is not continuous at $x = 0$.

In Exercises 109–114, use logarithmic differentiation to find the derivative.

109. $y = \dfrac{(x + 1)^3}{(4x - 2)^2}$

SOLUTION Let $y = \dfrac{(x + 1)^3}{(4x - 2)^2}$. Then

$$\ln y = \ln\left(\frac{(x + 1)^3}{(4x - 2)^2}\right) = \ln (x + 1)^3 - \ln (4x - 2)^2 = 3 \ln(x + 1) - 2 \ln(4x - 2).$$

By logarithmic differentiation,

$$\frac{y'}{y} = \frac{3}{x+1} - \frac{2}{4x-2} \cdot 4 = \frac{3}{x+1} - \frac{4}{2x-1},$$

so

$$y' = \frac{(x+1)^3}{(4x-2)^2}\left(\frac{3}{x+1} - \frac{4}{2x-1}\right).$$

110. $y = \dfrac{(x+1)(x+2)^2}{(x+3)(x+4)}$

SOLUTION Let $y = \dfrac{(x+1)(x+2)^2}{(x+3)(x+4)}$. Then

$$\begin{aligned}\ln y &= \ln\left((x+1)(x+2)^2\right) - \ln\left((x+3)(x+4)\right)\\ &= \ln(x+1) + 2\ln(x+2) - \ln(x+3) - \ln(x+4).\end{aligned}$$

By logarithmic differentiation,

$$\frac{y'}{y} = \frac{1}{x+1} + \frac{2}{x+2} - \frac{1}{x+3} - \frac{1}{x+4},$$

so

$$y' = \frac{(x+1)(x+2)^2}{(x+3)(x+4)}\left(\frac{1}{x+1} + \frac{2}{x+2} - \frac{1}{x+3} - \frac{1}{x+4}\right).$$

111. $y = e^{(x-1)^2}e^{(x-3)^2}$

SOLUTION Let $y = e^{(x-1)^2}e^{(x-3)^2}$. Then

$$\ln y = \ln\left(e^{(x-1)^2}e^{(x-3)^2}\right) = \ln\left(e^{(x-1)^2+(x-3)^2}\right) = (x-1)^2 + (x-3)^2.$$

By logarithmic differentiation,

$$\frac{y'}{y} = 2(x-1) + 2(x-3) = 4x - 8,$$

so

$$y' = 4e^{(x-1)^2}e^{(x-3)^2}(x-2).$$

112. $y = \dfrac{e^x \sin^{-1} x}{\ln x}$

SOLUTION Let $y = \dfrac{e^x \sin^{-1} x}{\ln x}$. Then

$$\begin{aligned}\ln y &= \ln\left(\frac{e^x \sin^{-1} x}{\ln x}\right) = \ln(e^x \sin^{-1} x) - \ln(\ln x)\\ &= \ln\left(e^x\right) + \ln(\sin^{-1} x) - \ln(\ln x) = x + \ln(\sin^{-1} x) - \ln(\ln x).\end{aligned}$$

By logarithmic differentiation,

$$\frac{y'}{y} = 1 + \frac{1}{\sin^{-1} x} \cdot \frac{1}{\sqrt{1-x^2}} - \frac{1}{\ln x} \cdot \frac{1}{x},$$

so

$$y' = \frac{e^x \sin^{-1} x}{\ln x}\left(1 + \frac{1}{\sqrt{1-x^2}\sin^{-1} x} - \frac{1}{x\ln x}\right).$$

113. $y = \dfrac{e^{3x}(x-2)^2}{(x+1)^2}$

SOLUTION Let $y = \dfrac{e^{3x}(x-2)^2}{(x+1)^2}$. Then

$$\begin{aligned}\ln y = \ln\left(\frac{e^{3x}(x-2)^2}{(x+1)^2}\right) &= \ln e^{3x} + \ln(x-2)^2 - \ln(x+1)^2\\ &= 3x + 2\ln(x-2) - 2\ln(x+1).\end{aligned}$$

By logarithmic differentiation,

$$\frac{y'}{y} = 3 + \frac{2}{x-2} - \frac{2}{x+1},$$

so

$$y = \frac{e^{3x}(x-2)^2}{(x+1)^2}\left(3 + \frac{2}{x-2} - \frac{2}{x+1}\right).$$

114. $y = x^{\sqrt{x}}(x^{\ln x})$

SOLUTION Let $y = x^{\sqrt{x}}(x^{\ln x})$. Then

$$\ln y = \sqrt{x}\ln x + (\ln x)^2$$

By logarithmic differentiation,

$$\frac{y'}{y} = \frac{1}{2\sqrt{x}}\ln x + \sqrt{x}\cdot\frac{1}{x} + 2(\ln x)\cdot\frac{1}{x} = \frac{\ln x}{2\sqrt{x}} + \frac{1}{\sqrt{x}} + \frac{2\ln x}{x},$$

so

$$y' = x^{\sqrt{x}}(x^{\ln x})\left(\frac{\ln x}{2\sqrt{x}} + \frac{1}{\sqrt{x}} + \frac{2\ln x}{x}\right).$$

*Exercises 115–117: Let q be the number of units of a product (cell phones, barrels of oil, etc.) that can be sold at the price p. The **price elasticity of demand** E is defined as the percentage rate of change of q with respect to p. In terms of derivatives,*

$$E = \frac{p}{q}\frac{dq}{dp} = \lim_{\Delta p\to 0}\frac{(100\Delta q)/q}{(100\Delta p)/p}$$

115. Show that the total revenue $R = pq$ satisfies $\dfrac{dR}{dp} = q(1+E)$.

SOLUTION Let $R = pq$. Then

$$\frac{dR}{dp} = p\frac{dq}{dp} + q = q\frac{p}{q}\frac{dq}{dp} + q = q(E+1).$$

116. A commercial bakery can sell q chocolate cakes per week at price \$$p$, where $q = 50p(10-p)$ for $5 < p < 10$.

(a) Show that $E(p) = \dfrac{2p-10}{p-10}$.

(b) Show, by computing $E(8)$, that if $p = \$8$, then a 1% increase in price reduces demand by approximately 3%.

SOLUTION

(a) Let $q = 50p(10-p) = 500p - 50p^2$. Then $q'(p) = 500 - 100p$ and

$$E(p) = \left(\frac{p}{q}\right)\frac{dq}{dp} = \frac{p}{50p(10-p)}(500-100p) = \frac{10-2p}{10-p} = \frac{2p-10}{p-10}.$$

(b) From part (a),

$$E(8) = \frac{2(8)-10}{8-10} = -3.$$

Thus, with the price set at \$8, a 1% increase in price results in a 3% decrease in demand.

117. The monthly demand (in thousands) for flights between Chicago and St. Louis at the price p is $q = 40 - 0.2p$. Calculate the price elasticity of demand when $p = \$150$ and estimate the percentage increase in number of additional passengers if the ticket price is lowered by 1%.

SOLUTION Let $q = 40 - 0.2p$. Then $q'(p) = -0.2$ and

$$E(p) = \left(\frac{p}{q}\right)\frac{dq}{dp} = \frac{0.2p}{0.2p - 40}.$$

For $p = 150$,

$$E(150) = \frac{0.2(150)}{0.2(150) - 40} = -3,$$

so a 1% decrease in price increases demand by 3%. The demand when $p = 150$ is $q = 40 - 0.2(150) = 10$, or 10000 passengers. Therefore, a 1% increase in demand translates to 300 additional passengers.

118. How fast does the water level rise in the tank in Figure 7 when the water level is $h = 4$ m and water pours in at 20 m^3/min?

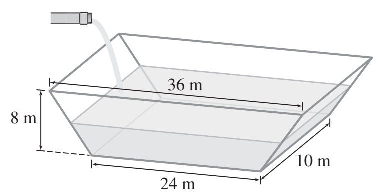

FIGURE 7

SOLUTION When the water level is at height h, the length of the upper surface of the water is $24 + \frac{3}{2}h$ and the volume of water in the trough is

$$V = \frac{1}{2}h\left(24 + 24 + \frac{3}{2}h\right)(10) = 240h + \frac{15}{2}h^2.$$

Therefore,

$$\frac{dV}{dt} = (240 + 15h)\frac{dh}{dt} = 20 \text{ m}^3/\text{min}.$$

When $h = 4$, we have

$$\frac{dh}{dt} = \frac{20}{240 + 15(4)} = \frac{1}{15} \text{ m/min}.$$

119. The minute hand of a clock is 8 cm long, and the hour hand is 5 cm long. How fast is the distance between the tips of the hands changing at 3 o'clock?

SOLUTION Let S be the distance between the tips of the two hands. By the law of cosines

$$S^2 = 8^2 + 5^2 - 2 \cdot 8 \cdot 5\cos(\theta),$$

where θ is the angle between the hands. Thus

$$2S\frac{dS}{dt} = 80\sin(\theta)\frac{d\theta}{dt}.$$

At three o'clock $\theta = \pi/2$, $S = \sqrt{89}$, and

$$\frac{d\theta}{dt} = \left(\frac{\pi}{360} - \frac{\pi}{30}\right) \text{ rad/min} = -\frac{11\pi}{360} \text{ rad/min},$$

so

$$\frac{dS}{dt} = \frac{1}{2\sqrt{89}}(80)(1)\frac{-11\pi}{360} \approx -0.407 \text{ cm/min}.$$

120. Chloe and Bao are in motorboats at the center of a lake. At time $t = 0$, Chloe begins traveling south at a speed of 50 km/h. One minute later, Bao takes off, heading east at a speed of 40 km/h. At what rate is the distance between them increasing at $t = 12$ min?

SOLUTION Take the center of the lake to be origin of our coordinate system. Because Chloe travels at 50 km/h = $\frac{5}{6}$ km/min due south, her position at time $t > 0$ is $(0, \frac{5}{6}t)$; because Bao travels at 40 km/h = $\frac{2}{3}$ km/min due east, her position at time $t > 1$ is $(\frac{2}{3}(t-1), 0)$. Thus, the distance between the two motorboats at time $t > 1$ is

$$s = \sqrt{\frac{4}{9}(t-1)^2 + \frac{25}{36}t^2} = \frac{1}{6}\sqrt{41t^2 - 32t + 16},$$

and

$$\frac{ds}{dt} = \frac{41t - 16}{6\sqrt{41t^2 - 32t + 16}}.$$

At $t = 12$, it follows that

$$\frac{ds}{dt} = \frac{476}{6\sqrt{5536}} \approx 1.066 \text{ km/min}.$$

121. A bead slides down the curve $xy = 10$. Find the bead's horizontal velocity at time $t = 2$ s if its height at time t seconds is $y = 400 - 16t^2$ cm.

SOLUTION Let $xy = 10$. Then $x = 10/y$ and

$$\frac{dx}{dt} = -\frac{10}{y^2}\frac{dy}{dt}.$$

If $y = 400 - 16t^2$, then $\frac{dy}{dt} = -32t$ and

$$\frac{dx}{dt} = -\frac{10}{(400 - 16t^2)^2}(-32t) = \frac{320t}{(400 - 16t^2)^2}.$$

Thus, at $t = 2$,

$$\frac{dx}{dt} = \frac{640}{(336)^2} \approx 0.00567 \text{ cm/s}.$$

122. In Figure 8, x is increasing at 2 cm/s, y is increasing at 3 cm/s, and θ is decreasing such that the area of the triangle has the constant value 4 cm^2.

(a) How fast is θ decreasing when $x = 4$, $y = 4$?

(b) How fast is the distance between P and Q changing when $x = 4$, $y = 4$?

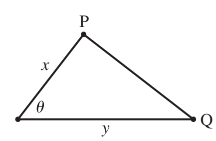

FIGURE 8

SOLUTION

(a) The area of the triangle is

$$A = \frac{1}{2}xy\sin\theta = 4.$$

Differentiating with respect to t, we obtain

$$\frac{dA}{dt} = \frac{1}{2}xy\cos\theta\frac{d\theta}{dt} + \frac{1}{2}y\sin\theta\frac{dx}{dt} + x\sin\theta\frac{dy}{dt} = 0.$$

When $x = y = 4$, we have $\frac{1}{2}(4)(4)\sin\theta = 4$, so $\sin\theta = \frac{1}{2}$. Thus, $\theta = \frac{\pi}{6}$ and

$$\frac{1}{2}(4)(4)\frac{\sqrt{3}}{2}\frac{d\theta}{dt} + \frac{1}{2}(4)\left(\frac{1}{2}\right)(2) + \frac{1}{2}(4)\left(\frac{1}{2}\right)(3) = 0.$$

Solving for $d\theta/dt$, we find

$$\frac{d\theta}{dt} = -\frac{5}{4\sqrt{3}} \approx -0.72 \text{ rad/s}.$$

(b) By the Law of Cosines, the distance D between P and Q satisfies

$$D^2 = x^2 + y^2 - 2xy\cos\theta,$$

so

$$2D\frac{dD}{dt} = 2x\frac{dx}{dt} + 2y\frac{dy}{dt} + 2xy\sin\theta\frac{d\theta}{dt} - 2x\cos\theta\frac{dy}{dt} - 2y\cos\theta\frac{dx}{dt}.$$

With $x = y = 4$ and $\theta = \frac{\pi}{6}$,

$$D = \sqrt{4^2 + 4^2 - 2(4)(4)\frac{\sqrt{3}}{2}} = 4\sqrt{2-\sqrt{3}}.$$

Therefore,

$$\frac{dD}{dt} = \frac{16 + 24 - \frac{20}{\sqrt{3}} - 12\sqrt{3} - 8\sqrt{3}}{8\sqrt{2-\sqrt{3}}} \approx -1.50 \text{ cm/s}.$$

123. A light moving at 0.8 m/s approaches a man standing 4 m from a wall (Figure 9). The light is 1 m above the ground. How fast is the tip P of the man's shadow moving when the light is 7 m from the wall?

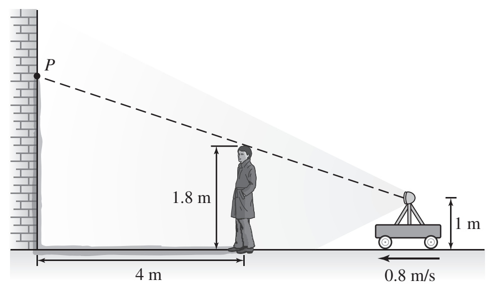

FIGURE 9

SOLUTION Let x denote the distance between the man and the light. Using similar triangles, we find

$$\frac{0.8}{x} = \frac{P-1}{4+x} \qquad \text{or} \qquad P = \frac{3.2}{x} + 1.8.$$

Therefore,

$$\frac{dP}{dt} = -\frac{3.2}{x^2}\frac{dx}{dt}.$$

When the light is 7 feet from the wall, $x = 3$. With $\frac{dx}{dt} = -0.8$, we have

$$\frac{dP}{dt} = -\frac{3.2}{3^2}(-0.8) = 0.284 \text{ m/s}.$$

4 APPLICATIONS OF THE DERIVATIVE

4.1 Linear Approximation and Applications

Preliminary Questions

1. True or False? The Linear Approximation says that the vertical change in the graph is approximately equal to the vertical change in the tangent line.

SOLUTION This statement is true. The linear approximation does say that the vertical change in the graph is approximately equal to the vertical change in the tangent line.

2. Estimate $g(1.2) - g(1)$ if $g'(1) = 4$.

SOLUTION Using the Linear Approximation,

$$g(1.2) - g(1) \approx g'(1)(1.2 - 1) = 4(0.2) = 0.8.$$

3. Estimate $f(2.1)$ if $f(2) = 1$ and $f'(2) = 3$.

SOLUTION Using the Linearization,

$$f(2.1) \approx f(2) + f'(2)(2.1 - 2) = 1 + 3(0.1) = 1.3$$

4. Complete the sentence: The Linear Approximation shows that up to a small error, the change in output Δf is directly proportional to ….

SOLUTION The Linear Approximation tells us that up to a small error, the change in output Δf is directly proportional to the change in input Δx when Δx is small.

Exercises

In Exercises 1–6, use Eq. (1) to estimate $\Delta f = f(3.02) - f(3)$.

1. $f(x) = x^2$

SOLUTION Let $f(x) = x^2$. Then $f'(x) = 2x$ and $\Delta f \approx f'(3)\Delta x = 6(0.02) = 0.12$.

2. $f(x) = x^4$

SOLUTION Let $f(x) = x^4$. Then $f'(x) = 4x^3$ and $\Delta f \approx f'(3)\Delta x = 4(27)(0.02) = 2.16$.

3. $f(x) = x^{-1}$

SOLUTION Let $f(x) = x^{-1}$. Then $f'(x) = -x^{-2}$ and $\Delta f \approx f'(3)\Delta x = -\frac{1}{9}(0.02) = -0.00222$.

4. $f(x) = \dfrac{1}{x+1}$

SOLUTION Let $f(x) = (x+1)^{-1}$. Then $f'(x) = -(x+1)^{-2}$ and $\Delta f \approx f'(3)\Delta x = -\frac{1}{16}(0.02) = -0.00125$.

5. $f(x) = \sqrt{x+6}$

SOLUTION Let $f(x) = \sqrt{x+6}$. Then $f'(x) = \frac{1}{2}(x+6)^{-1/2}$ and

$$\Delta f \approx f'(3)\Delta x = \frac{1}{2}9^{-1/2}(0.02) = 0.003333.$$

6. $f(x) = \tan \dfrac{\pi x}{3}$

SOLUTION Let $f(x) = \tan \frac{\pi x}{3}$. Then $f'(x) = \frac{\pi}{3}\sec^2 \frac{\pi x}{3}$ and

$$\Delta f \approx f'(3)\Delta x = \frac{\pi}{3}(0.02) = 0.020944.$$

7. The cube root of 27 is 3. How much larger is the cube root of 27.2? Estimate using the Linear Approximation.

SOLUTION Let $f(x) = x^{1/3}$, $a = 27$, and $\Delta x = 0.2$. Then $f'(x) = \frac{1}{3}x^{-2/3}$ and $f'(a) = f'(27) = \frac{1}{27}$. The Linear Approximation is

$$\Delta f \approx f'(a)\Delta x = \frac{1}{27}(0.2) = 0.0074074$$

8. Estimate $\ln(e^3 + 0.1) - \ln(e^3)$ using differentials.

SOLUTION Let $f(x) = \ln x$, $a = e^3$, and $\Delta x = 0.1$. Then $f'(x) = x^{-1}$ and $f'(a) = e^{-3}$. Thus,

$$\ln(e^3 + 0.1) - \ln(e^3) = \Delta f \approx f'(a)\Delta x = e^{-3}(0.1) = 0.00498.$$

In Exercises 9–12, use Eq. (1) to estimate Δf. Use a calculator to compute both the error and the percentage error.

9. $f(x) = \sqrt{1+x}, \quad a = 3, \quad \Delta x = 0.2$

SOLUTION Let $f(x) = (1+x)^{1/2}$, $a = 3$, and $\Delta x = 0.2$. Then $f'(x) = \frac{1}{2}(1+x)^{-1/2}$, $f'(a) = f'(3) = \frac{1}{4}$ and $\Delta f \approx f'(a)\Delta x = \frac{1}{4}(0.2) = 0.05$. The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(3.2) - f(3) = \sqrt{4.2} - 2 \approx 0.049390.$$

The error in the Linear Approximation is therefore $|0.049390 - 0.05| = 0.000610$; in percentage terms, the error is

$$\frac{0.000610}{0.049390} \times 100\% \approx 1.24\%.$$

10. $f(x) = 2x^2 - x, \quad a = 5, \quad \Delta x = -0.4$

SOLUTION Let $f(x) = 2x^2 - x$, $a = 5$ and $\Delta x = -0.4$. Then $f'(x) = 4x - 1$, $f'(a) = 19$ and $\Delta f \approx f'(a)\Delta x = 19(-0.4) = -7.6$. The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(4.6) - f(5) = 37.72 - 45 = -7.28.$$

The error in the Linear Approximation is therefore $|-7.28 - (-7.6)| = 0.32$; in percentage terms, the error is

$$\frac{0.32}{7.28} \times 100\% \approx 4.40\%.$$

11. $f(x) = \dfrac{1}{1+x^2}, \quad a = 3, \quad \Delta x = 0.5$

SOLUTION Let $f(x) = \frac{1}{1+x^2}$, $a = 3$, and $\Delta x = .5$. Then $f'(x) = -\frac{2x}{(1+x^2)^2}$, $f'(a) = f'(3) = -0.06$ and $\Delta f \approx f'(a)\Delta x = -0.06(0.5) = -0.03$. The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(3.5) - f(3) \approx -0.0245283.$$

The error in the Linear Approximation is therefore $|-0.0245283 - (-0.03)| = 0.0054717$; in percentage terms, the error is

$$\left|\frac{0.0054717}{-0.0245283}\right| \times 100\% \approx 22.31\%$$

12. $f(x) = \ln(x^2 + 1), \quad a = 1, \quad \Delta x = 0.1$

SOLUTION Let $f(x) = \ln(x^2 + 1)$, $a = 1$, and $\Delta x = 0.1$. Then $f'(x) = \frac{2x}{x^2+1}$, $f'(a) = f'(1) = 1$, and $\Delta f \approx f'(a)\Delta x = 1(0.1) = 0.1$. The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(1.1) - f(1) = 0.099845.$$

The error in the Linear Approximation is therefore $|0.099845 - 0.1| = 0.000155$; in percentage terms, the error is

$$\frac{0.000155}{0.099845} \times 100\% \approx 0.16\%.$$

In Exercises 13–16, estimate Δy using differentials [Eq. (3)].

13. $y = \cos x, \quad a = \frac{\pi}{6}, \quad dx = 0.014$

SOLUTION Let $f(x) = \cos x$. Then $f'(x) = -\sin x$ and

$$\Delta y \approx dy = f'(a)dx = -\sin\left(\frac{\pi}{6}\right)(0.014) = -0.007.$$

14. $y = \tan^2 x, \quad a = \frac{\pi}{4}, \quad dx = -0.02$

SOLUTION Let $f(x) = \tan^2 x$. Then $f'(x) = 2\tan x \sec^2 x$ and

$$\Delta y \approx dy = f'(a)dx = 2\tan\frac{\pi}{4}\sec^2\frac{\pi}{4}(-0.02) = -0.08.$$

15. $y = \dfrac{10 - x^2}{2 + x^2}, \quad a = 1, \quad dx = 0.01$

SOLUTION Let $f(x) = \dfrac{10 - x^2}{2 + x^2}$. Then

$$f'(x) = \frac{(2 + x^2)(-2x) - (10 - x^2)(2x)}{(2 + x^2)^2} = -\frac{24x}{(2 + x^2)^2}$$

and

$$\Delta y \approx dy = f'(a)dx = -\frac{24}{9}(0.01) = -0.026667.$$

16. $y = x^{1/3}e^{x-1}, \quad a = 1, \quad dx = 0.1$

SOLUTION Let $y = x^{1/3}e^{x-1}$, $a = 1$, and $dx = 0.1$. Then $y'(x) = \frac{1}{3}x^{-2/3}e^{x-1}(3x + 1)$, $y'(a) = y'(1) = \frac{4}{3}$, and $\Delta y \approx dy = y'(a)\,dx = \frac{4}{3}(0.1) = 0.133333$.

In Exercises 17–24, estimate using the Linear Approximation and find the error using a calculator.

17. $\sqrt{26} - \sqrt{25}$

SOLUTION Let $f(x) = \sqrt{x}$, $a = 25$, and $\Delta x = 1$. Then $f'(x) = \frac{1}{2}x^{-1/2}$ and $f'(a) = f'(25) = \frac{1}{10}$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = \frac{1}{10}(1) = 0.1$.
- The actual change is $\Delta f = f(a + \Delta x) - f(a) = f(26) - f(25) \approx 0.0990195$.
- The error in this estimate is $|0.0990195 - 0.1| = 0.000980486$.

18. $16.5^{1/4} - 16^{1/4}$

SOLUTION Let $f(x) = x^{1/4}$, $a = 16$, and $\Delta x = .5$. Then $f'(x) = \frac{1}{4}x^{-3/4}$ and $f'(a) = f'(16) = \frac{1}{32}$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = \frac{1}{32}(0.5) = 0.015625$.
- The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(16.5) - f(16) \approx 2.015445 - 2 = 0.015445$$

- The error in this estimate is $|0.015625 - 0.015445| \approx 0.00018$.

19. $\dfrac{1}{\sqrt{101}} - \dfrac{1}{10}$

SOLUTION Let $f(x) = \frac{1}{\sqrt{x}}$, $a = 100$, and $\Delta x = 1$. Then $f'(x) = \frac{d}{dx}(x^{-1/2}) = -\frac{1}{2}x^{-3/2}$ and $f'(a) = -\frac{1}{2}(\frac{1}{1000}) = -0.0005$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = -0.0005(1) = -0.0005$.
- The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = \frac{1}{\sqrt{101}} - \frac{1}{10} = -0.000496281.$$

- The error in this estimate is $|-0.0005 - (-0.000496281)| = 3.71902 \times 10^{-6}$.

20. $\dfrac{1}{\sqrt{98}} - \dfrac{1}{10}$

SOLUTION Let $f(x) = \frac{1}{\sqrt{x}}$, $a = 100$, and $\Delta x = -2$. Then $f'(x) = \frac{d}{dx}(x^{-1/2}) = -\frac{1}{2}x^{-3/2}$ and $f'(a) = -\frac{1}{2}(\frac{1}{1000}) = -0.0005$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = -0.0005(-2) = 0.001$.
- The actual change is $\Delta f = f(a + \Delta x) - f(a) = f(98) - f(100) = 0.00101525$.
- The error in this estimate is $|0.001 - 0.00101525| \approx 0.00001525$.

21. $9^{1/3} - 2$

SOLUTION Let $f(x) = x^{1/3}$, $a = 8$, and $\Delta x = 1$. Then $f'(x) = \frac{1}{3}x^{-2/3}$ and $f'(a) = f'(8) = \frac{1}{12}$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = \frac{1}{12}(1) = 0.083333$.
- The actual change is $\Delta f = f(a + \Delta x) - f(a) = f(9) - f(8) = 0.080084$.
- The error in this estimate is $|0.080084 - 0.083333| \approx 3.25 \times 10^{-3}$.

22. $\tan^{-1}(1.05) - \frac{\pi}{4}$

SOLUTION Let $f(x) = \tan^{-1} x$, $a = 1$, and $\Delta x = 0.05$. Then $f'(x) = (1 + x^2)^{-1}$ and $f'(a) = f'(1) = \frac{1}{2}$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = \frac{1}{2}(0.05) = 0.025$.
- The actual change is $\Delta f = f(a + \Delta x) - f(a) = f(1.05) - f(1) = 0.024385$.
- The error in this estimate is $|0.024385 - 0.025| \approx 6.15 \times 10^{-4}$.

23. $e^{-0.1} - 1$

SOLUTION Let $f(x) = e^x$, $a = 0$, and $\Delta x = -0.1$. Then $f'(x) = e^x$ and $f'(a) = f'(0) = 1$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = 1(-0.1) = -0.1$.
- The actual change is $\Delta f = f(a + \Delta x) - f(a) = f(-0.1) - f(0) = -0.095163$.
- The error in this estimate is $|-0.095163 - (-0.1)| \approx 4.84 \times 10^{-3}$.

24. $\ln(0.97)$

SOLUTION Let $f(x) = \ln x$, $a = 1$, and $\Delta x = -0.03$. Then $f'(x) = \frac{1}{x}$ and $f'(a) = f'(1) = 1$.

- The Linear Approximation is $\Delta f \approx f'(a)\Delta x = (1)(-0.03) = -0.03$, so $\ln(0.97) \approx \ln 1 - 0.03 = -0.03$.
- The actual change is

$$\Delta f = f(a + \Delta x) - f(a) = f(0.97) - f(1) \approx -0.030459 - 0 = -0.030459.$$

- The error is $|\Delta f - f'(a)\Delta x| \approx 0.000459$.

25. Estimate $f(4.03)$ for $f(x)$ as in Figure 8.

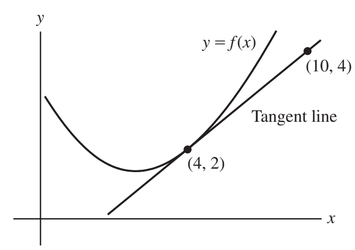

FIGURE 8

SOLUTION Using the Linear Approximation, $f(4.03) \approx f(4) + f'(4)(0.03)$. From the figure, we find that $f(4) = 2$ and

$$f'(4) = \frac{4 - 2}{10 - 4} = \frac{1}{3}.$$

Thus,

$$f(4.03) \approx 2 + \frac{1}{3}(0.03) = 2.01.$$

26. At a certain moment, an object in linear motion has velocity 100 m/s. Estimate the distance traveled over the next quarter-second, and explain how this is an application of the Linear Approximation.

SOLUTION Because the velocity is 100 m/s, we estimate the object will travel

$$\left(100\ \frac{\text{m}}{\text{s}}\right)\left(\frac{1}{4}\ \text{s}\right) = 25\ \text{m}$$

in the next quarter-second. Recall that velocity is the derivative of position, so we have just estimated the change in position, Δs, using the product $s'\Delta t$, which is just the Linear Approximation.

27. Which is larger: $\sqrt{2.1} - \sqrt{2}$ or $\sqrt{9.1} - \sqrt{9}$? Explain using the Linear Approximation.

SOLUTION Let $f(x) = \sqrt{x}$, and $\Delta x = 0.1$. Then $f'(x) = \frac{1}{2}x^{-1/2}$ and the Linear Approximation at $x = a$ gives

$$\Delta f = \sqrt{a + 0.1} - \sqrt{a} \approx f'(a)(0.1) = \frac{1}{2}a^{-1/2}(0.1) = \frac{0.05}{\sqrt{a}}$$

We see that Δf decreases as a increases. In particular

$$\sqrt{2.1} - \sqrt{2} \approx \frac{0.05}{\sqrt{2}} \qquad \text{is larger than} \qquad \sqrt{9.1} - \sqrt{9} \approx \frac{0.05}{3}$$

28. Estimate $\sin 61^\circ - \sin 60^\circ$ using the Linear Approximation. *Hint:* Express $\Delta\theta$ in radians.

SOLUTION Let $f(x) = \sin x$, $a = \frac{\pi}{3}$, and $\Delta x = \frac{\pi}{180}$. Then $f'(x) = \cos x$ and $f'(a) = f'(\frac{\pi}{3}) = \frac{1}{2}$. Finally, the Linear Approximation is

$$\Delta f \approx f'(a)\Delta x = \frac{1}{2}\left(\frac{\pi}{180}\right) = \frac{\pi}{360} \approx 0.008727$$

29. Box office revenue at a multiplex cinema in Paris is $R(p) = 3600p - 10p^3$ euros per showing when the ticket price is p euros. Calculate $R(p)$ for $p = 9$ and use the Linear Approximation to estimate ΔR if p is raised or lowered by 0.5 euros.

SOLUTION Let $R(p) = 3600p - 10p^3$. Then $R(9) = 3600(9) - 10(9)^3 = 25110$ euros. Moreover, $R'(p) = 3600 - 30p^2$, so by the Linear Approximation,

$$\Delta R \approx R'(9)\Delta p = 1170\Delta p.$$

If p is raised by 0.5 euros, then $\Delta R \approx 585$ euros; on the other hand, if p is lowered by 0.5 euros, then $\Delta R \approx -585$ euros.

30. The *stopping distance* for an automobile is $F(s) = 1.1s + 0.054s^2$ ft, where s is the speed in mph. Use the Linear Approximation to estimate the change in stopping distance per additional mph when $s = 35$ and when $s = 55$.

SOLUTION Let $F(s) = 1.1s + 0.054s^2$.

- The Linear Approximation at $s = 35$ mph is

$$\Delta F \approx F'(35)\Delta s = (1.1 + 0.108 \times 35)\Delta s = 4.88\Delta s \text{ ft}$$

  The change in stopping distance per additional mph for $s = 35$ mph is approximately 4.88 ft.
- The Linear Approximation at $s = 55$ mph is

$$\Delta F \approx F'(55)\Delta s = (1.1 + 0.108 \times 55)\Delta s = 7.04\Delta s \text{ ft}$$

  The change in stopping distance per additional mph for $s = 55$ mph is approximately 7.04 ft.

31. A thin silver wire has length $L = 18$ cm when the temperature is $T = 30^\circ$C. Estimate ΔL when T decreases to 25°C if the coefficient of thermal expansion is $k = 1.9 \times 10^{-5}{}^\circ\text{C}^{-1}$ (see Example 3).

SOLUTION We have

$$\frac{dL}{dT} = kL = (1.9 \times 10^{-5})(18) = 3.42 \times 10^{-4} \text{ cm}/^\circ\text{C}$$

The change in temperature is $\Delta T = -5^\circ$ C, so by the Linear Approximation, the change in length is approximately

$$\Delta L \approx 3.42 \times 10^{-4}\Delta T = (3.42 \times 10^{-4})(-5) = -0.00171 \text{ cm}$$

At $T = 25^\circ$ C, the length of the wire is approximately 17.99829 cm.

32. At a certain moment, the temperature in a snake cage satisfies $dT/dt = 0.008^\circ$C/s. Estimate the rise in temperature over the next 10 seconds.

SOLUTION Using the Linear Approximation, the rise in temperature over the next 10 seconds will be

$$\Delta T \approx \frac{dT}{dt}\Delta t = 0.008(10) = 0.08^\circ\text{C}.$$

33. The atmospheric pressure at altitude h (kilometers) for $11 \le h \le 25$ is approximately

$$P(h) = 128e^{-0.157h} \text{ kilopascals.}$$

(a) Estimate ΔP at $h = 20$ when $\Delta h = 0.5$.

(b) Compute the actual change, and compute the percentage error in the Linear Approximation.

SOLUTION

(a) Let $P(h) = 128e^{-0.157h}$. Then $P'(h) = -20.096e^{-0.157h}$. Using the Linear Approximation,

$$\Delta P \approx P'(h)\Delta h = P'(20)(0.5) = -0.434906 \text{ kilopascals.}$$

(b) The actual change in pressure is

$$P(20.5) - P(20) = -0.418274 \text{ kilopascals.}$$

The percentage error in the Linear Approximation is

$$\left|\frac{-0.434906 - (-0.418274)}{-0.418274}\right| \times 100\% \approx 3.98\%.$$

34. The resistance R of a copper wire at temperature $T = 20°\text{C}$ is $R = 15\ \Omega$. Estimate the resistance at $T = 22°\text{C}$, assuming that $dR/dT\big|_{T=20} = 0.06\ \Omega/°\text{C}$.

SOLUTION $\Delta T = 2°\text{C}$. The Linear Approximation gives us:

$$R(22) - R(20) \approx dR/dT\Big|_{T=20} \Delta T = 0.06\ \Omega/°\text{C}(2°\text{C}) = 0.12\ \Omega.$$

Therefore, $R(22) \approx 15\ \Omega + 0.12\ \Omega = 15.12\ \Omega$.

35. Newton's Law of Gravitation shows that if a person weighs w pounds on the surface of the earth, then his or her weight at distance x from the center of the earth is

$$W(x) = \frac{wR^2}{x^2} \qquad (\text{for } x \geq R)$$

where $R = 3960$ miles is the radius of the earth (Figure 9).

(a) Show that the weight lost at altitude h miles above the earth's surface is approximately $\Delta W \approx -(0.0005w)h$. *Hint:* Use the Linear Approximation with $dx = h$.

(b) Estimate the weight lost by a 200-lb football player flying in a jet at an altitude of 7 miles.

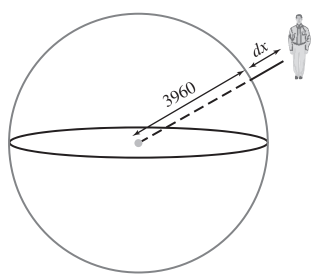

FIGURE 9 The distance to the center of the earth is $3960 + h$ miles.

SOLUTION

(a) Using the Linear Approximation

$$\Delta W \approx W'(R)\Delta x = -\frac{2wR^2}{R^3}h = -\frac{2wh}{R} \approx -0.0005wh.$$

(b) Substitute $w = 200$ and $h = 7$ into the result from part (a) to obtain

$$\Delta W \approx -0.0005(200)(7) = -0.7 \text{ pounds.}$$

36. Using Exercise 35(a), estimate the altitude at which a 130-lb pilot would weigh 129.5 lb.

SOLUTION From Exercise 35(a), the weight loss ΔW at altitude h (in miles) for a person weighing w at the surface of the earth is approximately

$$\Delta W \approx -0.0005wh$$

If $w = 130$ pounds, then $\Delta W \approx -0.065h$. Accordingly, the pilot loses approximately 0.065 pounds per mile of altitude gained. The pilot will weigh 129.5 pounds at the altitude h such that $-0.065h = -0.5$, or $h = 0.5/0.065 \approx 7.7$ miles.

37. A stone tossed vertically into the air with initial velocity v cm/s reaches a maximum height of $h = v^2/1960$ cm.

(a) Estimate Δh if $v = 700$ cm/s and $\Delta v = 1$ cm/s.

(b) Estimate Δh if $v = 1{,}000$ cm/s and $\Delta v = 1$ cm/s.

(c) In general, does a 1 cm/s increase in v lead to a greater change in h at low or high initial velocities? Explain.

SOLUTION A stone tossed vertically with initial velocity v cm/s attains a maximum height of $h(v) = v^2/1960$ cm. Thus, $h'(v) = v/980$.

(a) If $v = 700$ and $\Delta v = 1$, then $\Delta h \approx h'(v)\Delta v = \frac{1}{980}(700)(1) \approx 0.71$ cm.

(b) If $v = 1000$ and $\Delta v = 1$, then $\Delta h \approx h'(v)\Delta v = \frac{1}{980}(1000)(1) = 1.02$ cm.

(c) A one centimeter per second increase in initial velocity v increases the maximum height by approximately $v/980$ cm. Accordingly, there is a bigger effect at higher velocities.

38. The side s of a square carpet is measured at 6 m. Estimate the maximum error in the area A of the carpet if s is accurate to within 2 centimeters.

SOLUTION Let s be the length in meters of the side of the square carpet. Then $A(s) = s^2$ is the area of the carpet. With $a = 6$ and $\Delta s = 0.02$ (note that 1 cm equals 0.01 m), an estimate of the size of the error in the area is given by the Linear Approximation:

$$\Delta A \approx A'(6)\Delta s = 12\,(0.02) = 0.24 \text{ m}^2$$

In Exercises 39 and 40, use the following fact derived from Newton's Laws: An object released at an angle θ with initial velocity v ft/s *travels a horizontal distance*

$$s = \frac{1}{32}v^2 \sin 2\theta \text{ ft} \quad \text{(Figure 10)}$$

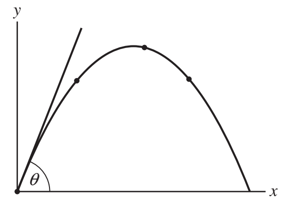

FIGURE 10 Trajectory of an object released at an angle θ.

39. A player located 18.1 ft from the basket launches a successful jump shot from a height of 10 ft (level with the rim of the basket), at an angle $\theta = 34^\circ$ and initial velocity $v = 25$ ft/s.)

(a) Show that $\Delta s \approx 0.255\Delta\theta$ ft for a small change of $\Delta\theta$.

(b) Is it likely that the shot would have been successful if the angle had been off by 2°?

SOLUTION Using Newton's laws and the given initial velocity of $v = 25$ ft/s, the shot travels $s = \frac{1}{32}v^2 \sin 2t = \frac{625}{32}\sin 2t$ ft, where t is in radians.

(a) If $\theta = 34^\circ$ (i.e., $t = \frac{17}{90}\pi$), then

$$\Delta s \approx s'(t)\Delta t = \frac{625}{16}\cos\left(\frac{17}{45}\pi\right)\Delta t = \frac{625}{16}\cos\left(\frac{17}{45}\pi\right)\Delta\theta \cdot \frac{\pi}{180} \approx 0.255\Delta\theta.$$

(b) If $\Delta\theta = 2^\circ$, this gives $\Delta s \approx 0.51$ ft, in which case the shot would not have been successful, having been off half a foot.

40. Estimate Δs if $\theta = 34^\circ$, $v = 25$ ft/s, and $\Delta v = 2$.

SOLUTION Using Newton's laws and the fixed angle of $\theta = 34^\circ = \frac{17}{90}\pi$, the shot travels

$$s = \frac{1}{32}v^2 \sin\frac{17}{45}\pi.$$

With $v = 25$ ft/s and $\Delta v = 2$ ft/s, we find

$$\Delta s \approx s'(v)\Delta v = \frac{1}{16}(25)\sin\frac{17\pi}{45} \cdot 2 = 2.897 \text{ ft}.$$

41. The radius of a spherical ball is measured at $r = 25$ cm. Estimate the maximum error in the volume and surface area if r is accurate to within 0.5 cm.

SOLUTION The volume and surface area of the sphere are given by $V = \frac{4}{3}\pi r^3$ and $S = 4\pi r^2$, respectively. If $r = 25$ and $\Delta r = \pm 0.5$, then

$$\Delta V \approx V'(25)\Delta r = 4\pi(25)^2(0.5) \approx 3927 \text{ cm}^3,$$

and

$$\Delta S \approx S'(25)\Delta r = 8\pi(25)(0.5) \approx 314.2 \text{ cm}^2.$$

42. The dosage D of diphenhydramine for a dog of body mass w kg is $D = 4.7w^{2/3}$ mg. Estimate the maximum allowable error in w for a cocker spaniel of mass $w = 10$ kg if the percentage error in D must be less than 3%.

SOLUTION We have $D = kw^{2/3}$ where $k = 4.7$. The Linear Approximation yields

$$\Delta D \approx \frac{2}{3}kw^{-1/3}\Delta w,$$

so

$$\frac{\Delta D}{D} \approx \frac{\frac{2}{3}kw^{-1/3}\Delta w}{kw^{2/3}} = \frac{2}{3} \cdot \frac{\Delta w}{w}$$

If the percentage error in D must be less than 3%, we estimate the maximum allowable error in w to be

$$\Delta w \approx \frac{3w}{2} \cdot \frac{\Delta D}{D} = \frac{3(10)}{2}(.03) = 0.45 \text{ kg}$$

43. The volume (in liters) and pressure P (in atmospheres) of a certain gas satisfy $PV = 24$. A measurement yields $V = 4$ with a possible error of ± 0.3 L. Compute P and estimate the maximum error in this computation.

SOLUTION Given $PV = 24$ and $V = 4$, it follows that $P = 6$ atmospheres. Solving $PV = 24$ for P yields $P = 24V^{-1}$. Thus, $P' = -24V^{-2}$ and

$$\Delta P \approx P'(4)\Delta V = -24(4)^{-2}(\pm 0.3) = \pm 0.45 \text{ atmospheres.}$$

44. In the notation of Exercise 43, assume that a measurement yields $V = 4$. Estimate the maximum allowable error in V if P must have an error of less than 0.2 atm.

SOLUTION From Exercise 43, with $V = 4$, we have

$$\Delta P \approx -\frac{3}{2}\Delta V \quad \text{or} \quad \Delta V = -\frac{2}{3}\Delta P.$$

If we require $|\Delta P| \le 0.2$, then we must have

$$|\Delta V| \le \frac{2}{3}(0.2) = 0.133333 \text{ L.}$$

In Exercises 45–54, find the linearization at $x = a$.

45. $f(x) = x^4, \quad a = 1$

SOLUTION Let $f(x) = x^4$. Then $f'(x) = 4x^3$. The linearization at $a = 1$ is

$$L(x) = f'(a)(x - a) + f(a) = 4(x - 1) + 1 = 4x - 3.$$

46. $f(x) = \dfrac{1}{x}, \quad a = 2$

SOLUTION Let $f(x) = \frac{1}{x} = x^{-1}$. Then $f'(x) = -x^{-2}$. The linearization at $a = 2$ is

$$L(x) = f'(a)(x - a) + f(a) = -\frac{1}{4}(x - 2) + \frac{1}{2} = -\frac{1}{4}x + 1.$$

47. $f(\theta) = \sin^2\theta, \quad a = \frac{\pi}{4}$

SOLUTION Let $f(\theta) = \sin^2\theta$. Then $f'(\theta) = 2\sin\theta\cos\theta = \sin 2\theta$. The linearization at $a = \frac{\pi}{4}$ is

$$L(\theta) = f'(a)(\theta - a) + f(a) = 1\left(\theta - \frac{\pi}{4}\right) + \frac{1}{2} = \theta - \frac{\pi}{4} + \frac{1}{2}.$$

48. $g(x) = \dfrac{x^2}{x - 3}, \quad a = 4$

SOLUTION Let $g(x) = \frac{x^2}{x-3}$. Then

$$g'(x) = \frac{(x - 3)(2x) - x^2}{(x - 3)^2} = \frac{x^2 - 6x}{(x - 3)^2}.$$

The linearization at $a = 4$ is

$$L(x) = g'(a)(x - a) + g(a) = -8(x - 4) + 16 = -8x + 48.$$

49. $y = (1+x)^{-1/2}$, $a = 0$

SOLUTION Let $f(x) = (1+x)^{-1/2}$. Then $f'(x) = -\frac{1}{2}(1+x)^{-3/2}$. The linearization at $a = 0$ is

$$L(x) = f'(a)(x-a) + f(a) = -\frac{1}{2}x + 1.$$

50. $y = (1+x)^{-1/2}$, $a = 3$

SOLUTION Let $f(x) = (1+x)^{-1/2}$. Then $f'(x) = -\frac{1}{2}(1+x)^{-3/2}$, $f(a) = 4^{-1/2} = \frac{1}{2}$, and $f'(a) = -\frac{1}{2}(4^{-3/2}) = -\frac{1}{16}$, so the linearization at $a = 3$ is

$$L(x) = f'(a)(x-a) + f(a) = -\frac{1}{16}(x-3) + \frac{1}{2} = -\frac{1}{16}x + \frac{11}{16}.$$

51. $y = (1+x^2)^{-1/2}$, $a = 0$

SOLUTION Let $f(x) = (1+x^2)^{-1/2}$. Then $f'(x) = -x(1+x^2)^{-3/2}$, $f(a) = 1$ and $f'(a) = 0$, so the linearization at a is

$$L(x) = f'(a)(x-a) + f(a) = 1.$$

52. $y = \tan^{-1} x$, $a = 1$

SOLUTION Let $f(x) = \tan^{-1} x$. Then

$$f'(x) = \frac{1}{1+x^2}, \quad f(a) = \frac{\pi}{4}, \text{ and } f'(a) = \frac{1}{2},$$

so the linearization of $f(x)$ at a is

$$L(x) = f'(a)(x-a) + f(a) = \frac{1}{2}(x-1) + \frac{\pi}{4}.$$

53. $y = e^{\sqrt{x}}$, $a = 1$

SOLUTION Let $f(x) = e^{\sqrt{x}}$. Then

$$f'(x) = \frac{1}{2\sqrt{x}}e^{\sqrt{x}}, \quad f(a) = e, \text{ and } f'(a) = \frac{1}{2}e,$$

so the linearization of $f(x)$ at a is

$$L(x) = f'(a)(x-a) + f(a) = \frac{1}{2}e(x-1) + e = \frac{1}{2}e(x+1).$$

54. $y = e^x \ln x$, $a = 1$

SOLUTION Let $f(x) = e^x \ln x$. Then

$$f'(x) = \frac{e^x}{x} + e^x \ln x, \quad f(a) = 0, \text{ and } f'(a) = e,$$

so the linearization of $f(x)$ at a is

$$L(x) = f'(a)(x-a) + f(a) = e(x-1).$$

55. What is $f(2)$ if the linearization of $f(x)$ at $a = 2$ is $L(x) = 2x + 4$?

SOLUTION $f(2) = L(2) = 2(2) + 4 = 8$.

56. Compute the linearization of $f(x) = 3x - 4$ at $a = 0$ and $a = 2$. Prove more generally that a linear function coincides with its linearization at $x = a$ for all a.

SOLUTION Let $f(x) = 3x - 4$. Then $f'(x) = 3$. With $a = 0$, $f(a) = -4$ and $f'(a) = 3$, so the linearization of $f(x)$ at $a = 0$ is

$$L(x) = -4 + 3(x-0) = 3x - 4 = f(x).$$

With $a = 2$, $f(a) = 2$ and $f'(a) = 3$, so the linearization of $f(x)$ at $a = 2$ is

$$L(x) = 2 + 3(x-2) = 2 + 3x - 6 = 3x - 4 = f(x).$$

More generally, let $g(x) = bx + c$ be any linear function. The linearization $L(x)$ of $g(x)$ at $x = a$ is

$$L(x) = g'(a)(x-a) + g(a) = b(x-a) + ba + c = bx + c = g(x);$$

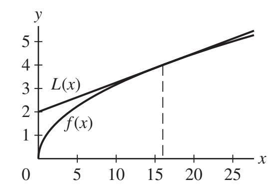
i.e., $L(x) = g(x)$.

57. Estimate $\sqrt{16.2}$ using the linearization $L(x)$ of $f(x) = \sqrt{x}$ at $a = 16$. Plot $f(x)$ and $L(x)$ on the same set of axes and determine whether the estimate is too large or too small.

SOLUTION Let $f(x) = x^{1/2}$, $a = 16$, and $\Delta x = 0.2$. Then $f'(x) = \frac{1}{2}x^{-1/2}$ and $f'(a) = f'(16) = \frac{1}{8}$. The linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = \frac{1}{8}(x-16) + 4 = \frac{1}{8}x + 2.$$

Thus, we have $\sqrt{16.2} \approx L(16.2) = 4.025$. Graphs of $f(x)$ and $L(x)$ are shown below. Because the graph of $L(x)$ lies above the graph of $f(x)$, we expect that the estimate from the Linear Approximation is too large.



58. $\boxed{\text{GU}}$ Estimate $1/\sqrt{15}$ using a suitable linearization of $f(x) = 1/\sqrt{x}$. Plot $f(x)$ and $L(x)$ on the same set of axes and determine whether the estimate is too large or too small. Use a calculator to compute the percentage error.

SOLUTION The nearest perfect square to 15 is 16. Let $f(x) = \frac{1}{\sqrt{x}}$ and $a = 16$. Then $f'(x) = -\frac{1}{2}x^{-3/2}$ and $f'(a) = f'(16) = -\frac{1}{128}$. The linearization is

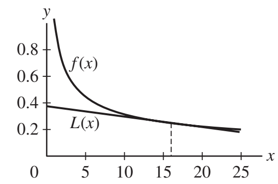
$$L(x) = f'(a)(x-a) + f(a) = -\frac{1}{128}(x-16) + \frac{1}{4}.$$

Then

$$\frac{1}{\sqrt{15}} \approx L(15) = -\frac{1}{128}(-1) + \frac{1}{4} = \frac{33}{128} = 0.257813.$$

Graphs of $f(x)$ and $L(x)$ are shown below. Because the graph of $L(x)$ lies below the graph of $f(x)$, we expect that the estimate from the Linear Approximation is too small. The percentage error in the estimate is

$$\left|\frac{\frac{1}{\sqrt{15}} - 0.257813}{\frac{1}{\sqrt{15}}}\right| \times 100\% \approx 0.15\%$$



In Exercises 59–67, approximate using linearization and use a calculator to compute the percentage error.

59. $\dfrac{1}{\sqrt{17}}$

SOLUTION Let $f(x) = x^{-1/2}$, $a = 16$, and $\Delta x = 1$. Then $f'(x) = -\frac{1}{2}x^{-3/2}$, $f'(a) = f'(16) = -\frac{1}{128}$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = -\frac{1}{128}(x-16) + \frac{1}{4} = -\frac{1}{128}x + \frac{3}{8}.$$

Thus, we have $\frac{1}{\sqrt{17}} \approx L(17) \approx 0.24219$. The percentage error in this estimate is

$$\left|\frac{\frac{1}{\sqrt{17}} - 0.24219}{\frac{1}{\sqrt{17}}}\right| \times 100\% \approx 0.14\%$$

60. $\dfrac{1}{101}$

SOLUTION Let $f(x) = x^{-1}$, $a = 100$ and $\Delta x = 1$. Then $f'(x) = -x^{-2}$, $f'(a) = f'(100) = -0.0001$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = -0.0001(x-100) + 0.01 = -0.0001x + 0.02.$$

Thus, we have

$$\frac{1}{101} \approx L(101) = -0.0001(101) + 0.02 = 0.0099.$$

The percentage error in this estimate is

$$\left|\frac{\frac{1}{101} - 0.0099}{\frac{1}{101}}\right| \times 100\% \approx 0.01\%$$

61. $\dfrac{1}{(10.03)^2}$

SOLUTION Let $f(x) = x^{-2}$, $a = 10$ and $\Delta x = 0.03$. Then $f'(x) = -2x^{-3}$, $f'(a) = f'(10) = -0.002$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = -0.002(x-10) + 0.01 = -0.002x + 0.03.$$

Thus, we have

$$\frac{1}{(10.03)^2} \approx L(10.03) = -0.002(10.03) + 0.03 = 0.00994.$$

The percentage error in this estimate is

$$\left|\frac{\frac{1}{(10.03)^2} - 0.00994}{\frac{1}{(10.03)^2}}\right| \times 100\% \approx 0.0027\%$$

62. $(17)^{1/4}$

SOLUTION Let $f(x) = x^{1/4}$, $a = 16$, and $\Delta x = 1$. Then $f'(x) = \frac{1}{4}x^{-3/4}$, $f'(a) = f'(16) = \frac{1}{32}$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = \frac{1}{32}(x-16) + 2 = \frac{1}{32}x + \frac{3}{2}.$$

Thus, we have $(17)^{1/4} \approx L(17) = 2.03125$. The percentage error in this estimate is

$$\left|\frac{(17)^{1/4} - 2.03125}{(17)^{1/4}}\right| \times 100\% \approx 0.035\%$$

63. $(64.1)^{1/3}$

SOLUTION Let $f(x) = x^{1/3}$, $a = 64$, and $\Delta x = 0.1$. Then $f'(x) = \frac{1}{3}x^{-2/3}$, $f'(a) = f'(64) = \frac{1}{48}$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = \frac{1}{48}(x-64) + 4 = \frac{1}{48}x + \frac{8}{3}.$$

Thus, we have $(64.1)^{1/3} \approx L(64.1) \approx 4.002083$. The percentage error in this estimate is

$$\left|\frac{(64.1)^{1/3} - 4.002083}{(64.1)^{1/3}}\right| \times 100\% \approx 0.000019\%$$

64. $(1.2)^{5/3}$

SOLUTION Let $f(x) = (1+x)^{5/3}$ and $a = 0$. Then $f'(x) = \frac{5}{3}(1+x)^{2/3}$, $f'(a) = f'(0) = \frac{5}{3}$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x-a) + f(a) = \frac{5}{3}x + 1.$$

Thus, we have $(1.2)^{5/3} \approx L(0.2) = \frac{5}{3}(0.2) + 1 = 1.3333$. The percentage error in this estimate is

$$\left| \frac{(1.2)^{5/3} - 1.3333}{(1.2)^{5/3}} \right| \times 100\% \approx 1.61\%$$

65. $\cos^{-1}(0.52)$

SOLUTION Let $f(x) = \cos^{-1} x$ and $a = 0.5$. Then

$$f'(x) = -\frac{1}{\sqrt{1 - x^2}}, \quad f'(a) = f'(0) = -\frac{2\sqrt{3}}{3},$$

and the linearization to $f(x)$ is

$$L(x) = f'(a)(x - a) + f(a) = -\frac{2\sqrt{3}}{3}(x - 0.5) + \frac{\pi}{3}.$$

Thus, we have $\cos^{-1}(0.52) \approx L(0.02) = 1.024104$. The percentage error in this estimate is

$$\left| \frac{\cos^{-1}(0.52) - 1.024104}{\cos^{-1}(0.52)} \right| \times 100\% \approx 0.015\%.$$

66. $\ln 1.07$

SOLUTION Let $f(x) = \ln(1 + x)$ and $a = 0$. Then $f'(x) = \frac{1}{1+x}$, $f'(a) = f'(0) = 1$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x - a) + f(a) = x.$$

Thus, we have $\ln 1.07 \approx L(0.07) = 0.07$. The percentage error in this estimate is

$$\left| \frac{\ln 1.07 - 0.07}{\ln 1.07} \right| \times 100\% \approx 3.46\%.$$

67. $e^{-0.012}$

SOLUTION Let $f(x) = e^x$ and $a = 0$. Then $f'(x) = e^x$, $f'(a) = f'(0) = 1$ and the linearization to $f(x)$ is

$$L(x) = f'(a)(x - a) + f(a) = 1(x - 0) + 1 = x + 1.$$

Thus, we have $e^{-0.012} \approx L(-0.012) = 1 - 0.012 = 0.988$. The percentage error in this estimate is

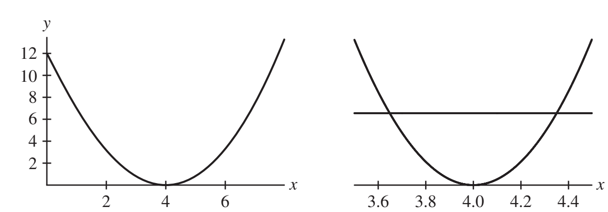
$$\left| \frac{e^{-0.012} - 0.988}{e^{-0.012}} \right| \times 100\% \approx 0.0073\%.$$

68. GU Compute the linearization $L(x)$ of $f(x) = x^2 - x^{3/2}$ at $a = 4$. Then plot $f(x) - L(x)$ and find an interval I around $a = 4$ such that $|f(x) - L(x)| \le 0.1$ for $x \in I$.

SOLUTION Let $f(x) = x^2 - x^{3/2}$ and $a = 4$. Then $f'(x) = 2x - \frac{3}{2}x^{1/2}$, $f'(4) = 5$ and

$$L(x) = f(a) + f'(a)(x - a) = 8 + 5(x - 4) = 5x - 12.$$

The graph of $y = f(x) - L(x)$ is shown below at the left, and portions of the graphs of $y = f(x) - L(x)$ and $y = 0.1$ are shown below at the right. From the graph on the right, we see that $|f(x) - L(x)| < 0.1$ roughly for $3.6 < x < 4.4$.



69. Show that the Linear Approximation to $f(x) = \sqrt{x}$ at $x = 9$ yields the estimate $\sqrt{9 + h} - 3 \approx \frac{1}{6}h$. Set $K = 0.01$ and show that $|f''(x)| \le K$ for $x \ge 9$. Then verify numerically that the error E satisfies Eq. (5) for $h = 10^{-n}$, for $1 \le n \le 4$.

SOLUTION Let $f(x) = \sqrt{x}$. Then $f(9) = 3$, $f'(x) = \frac{1}{2}x^{-1/2}$ and $f'(9) = \frac{1}{6}$. Therefore, by the Linear Approximation,

$$f(9+h) - f(9) = \sqrt{9+h} - 3 \approx \frac{1}{6}h.$$

Moreover, $f''(x) = -\frac{1}{4}x^{-3/2}$, so $|f''(x)| = \frac{1}{4}x^{-3/2}$. Because this is a decreasing function, it follows that for $x \geq 9$,

$$K = \max |f''(x)| \leq |f''(9)| = \frac{1}{108} < 0.01.$$

From the following table, we see that for $h = 10^{-n}$, $1 \leq n \leq 4$, $E \leq \frac{1}{2}Kh^2$.

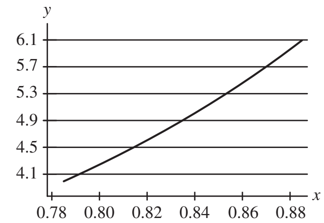
h	$E = \lvert\sqrt{9+h} - 3 - \frac{1}{6}h\rvert$	$\frac{1}{2}Kh^2$
10^{-1}	4.604×10^{-5}	5.00×10^{-5}
10^{-2}	4.627×10^{-7}	5.00×10^{-7}
10^{-3}	4.629×10^{-9}	5.00×10^{-9}
10^{-4}	4.627×10^{-11}	5.00×10^{-11}

70. GU The Linear Approximation to $f(x) = \tan x$ at $x = \frac{\pi}{4}$ yields the estimate $\tan\left(\frac{\pi}{4} + h\right) - 1 \approx 2h$. Set $K = 6.2$ and show, using a plot, that $|f''(x)| \leq K$ for $x \in [\frac{\pi}{4}, \frac{\pi}{4} + 0.1]$. Then verify numerically that the error E satisfies Eq. (5) for $h = 10^{-n}$, for $1 \leq n \leq 4$.

SOLUTION Let $f(x) = \tan x$. Then $f(\frac{\pi}{4}) = 1$, $f'(x) = \sec^2 x$ and $f'(\frac{\pi}{4}) = 2$. Therefore, by the Linear Approximation,

$$f\left(\frac{\pi}{4} + h\right) - f\left(\frac{\pi}{4}\right) = \tan\left(\frac{\pi}{4} + h\right) - 1 \approx 2h.$$

Moreover, $f''(x) = 2\sec^2 x \tan x$. The graph of the second derivative over the interval $[\pi/4, \pi/4 + 0.1]$ is shown below. From this graph we see that $K = \max |f''(x)| \approx 6.1 < 6.2$.



Finally, from the following table, we see that for $h = 10^{-n}$, $1 \leq n \leq 4$, $E \leq \frac{1}{2}Kh^2$.

h	$E = \lvert\tan(\frac{\pi}{4} + h) - 1 - 2h\rvert$	$\frac{1}{2}Kh^2$

Further Insights and Challenges

71. Compute dy/dx at the point $P = (2, 1)$ on the curve $y^3 + 3xy = 7$ and show that the linearization at P is $L(x) = -\frac{1}{3}x + \frac{5}{3}$. Use $L(x)$ to estimate the y-coordinate of the point on the curve where $x = 2.1$.

SOLUTION Differentiating both sides of the equation $y^3 + 3xy = 7$ with respect to x yields

$$3y^2\frac{dy}{dx} + 3x\frac{dy}{dx} + 3y = 0,$$

so

$$\frac{dy}{dx} = -\frac{y}{y^2 + x}.$$

Thus,

$$\left.\frac{dy}{dx}\right|_{(2,1)} = -\frac{1}{1^2 + 2} = -\frac{1}{3},$$

and the linearization at $P = (2, 1)$ is

$$L(x) = 1 - \frac{1}{3}(x - 2) = -\frac{1}{3}x + \frac{5}{3}.$$

Finally, when $x = 2.1$, we estimate that the y-coordinate of the point on the curve is

$$y \approx L(2.1) = -\frac{1}{3}(2.1) + \frac{5}{3} = 0.967.$$

72. Apply the method of Exercise 71 to $P = (0.5, 1)$ on $y^5 + y - 2x = 1$ to estimate the y-coordinate of the point on the curve where $x = 0.55$.

SOLUTION Differentiating both sides of the equation $y^5 + y - 2x = 1$ with respect to x yields

$$5y^4\frac{dy}{dx} + \frac{dy}{dx} - 2 = 0,$$

so

$$\frac{dy}{dx} = \frac{2}{5y^4 + 1}.$$

Thus,

$$\left.\frac{dy}{dx}\right|_{(0.5,1)} = \frac{2}{5(1)^2 + 1} = \frac{1}{3},$$

and the linearization at $P = (0.5, 1)$ is

$$L(x) = 1 + \frac{1}{3}\left(x - \frac{1}{2}\right) = \frac{1}{3}x + \frac{5}{6}.$$

Finally, when $x = 0.55$, we estimate that the y-coordinate of the point on the curve is

$$y \approx L(0.55) = \frac{1}{3}(0.55) + \frac{5}{6} = 1.017.$$

73. Apply the method of Exercise 71 to $P = (-1, 2)$ on $y^4 + 7xy = 2$ to estimate the solution of $y^4 - 7.7y = 2$ near $y = 2$.

SOLUTION Differentiating both sides of the equation $y^4 + 7xy = 2$ with respect to x yields

$$4y^3\frac{dy}{dx} + 7x\frac{dy}{dx} + 7y = 0,$$

so

$$\frac{dy}{dx} = -\frac{7y}{4y^3 + 7x}.$$

Thus,

$$\left.\frac{dy}{dx}\right|_{(-1,2)} = -\frac{7(2)}{4(2)^3 + 7(-1)} = -\frac{14}{25},$$

and the linearization at $P = (-1, 2)$ is

$$L(x) = 2 - \frac{14}{25}(x + 1) = -\frac{14}{25}x + \frac{36}{25}.$$

Finally, the equation $y^4 - 7.7y = 2$ corresponds to $x = -1.1$, so we estimate the solution of this equation near $y = 2$ is

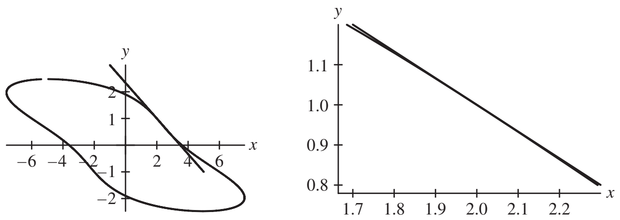
$$y \approx L(-1.1) = -\frac{14}{25}(-1.1) + \frac{36}{25} = 2.056.$$

74. Show that for any real number k, $(1 + \Delta x)^k \approx 1 + k\Delta x$ for small Δx. Estimate $(1.02)^{0.7}$ and $(1.02)^{-0.3}$.

SOLUTION Let $f(x) = (1 + x)^k$. Then for small Δx, we have

$$f(\Delta x) \approx L(\Delta x) = f'(0)(\Delta x - 0) + f(0) = k(1 + 0)^{k-1}(\Delta x - 0) + 1 = 1 + k\Delta x$$

- Let $k = 0.7$ and $\Delta x = 0.02$. Then $L(0.02) = 1 + (0.7)(0.02) = 1.014$.
- Let $k = -0.3$ and $\Delta x = 0.02$. Then $L(0.02) = 1 + (-0.3)(0.02) = 0.994$.



75. Let $\Delta f = f(5+h) - f(5)$, where $f(x) = x^2$. Verify directly that $E = |\Delta f - f'(5)h|$ satisfies (5) with $K = 2$.

SOLUTION Let $f(x) = x^2$. Then

$$\Delta f = f(5+h) - f(5) = (5+h)^2 - 5^2 = h^2 + 10h$$

and

$$E = |\Delta f - f'(5)h| = |h^2 + 10h - 10h| = h^2 = \frac{1}{2}(2)h^2 = \frac{1}{2}Kh^2.$$

76. Let $\Delta f = f(1+h) - f(1)$ where $f(x) = x^{-1}$. Show directly that $E = |\Delta f - f'(1)h|$ is equal to $h^2/(1+h)$. Then prove that $E \le 2h^2$ if $-\frac{1}{2} \le h \le \frac{1}{2}$. *Hint:* In this case, $\frac{1}{2} \le 1+h \le \frac{3}{2}$.

SOLUTION Let $f(x) = x^{-1}$. Then

$$\Delta f = f(1+h) - f(1) = \frac{1}{1+h} - 1 = -\frac{h}{1+h}$$

and

$$E = |\Delta f - f'(1)h| = \left| -\frac{h}{1+h} + h \right| = \frac{h^2}{1+h}.$$

If $-\frac{1}{2} \le h \le \frac{1}{2}$, then $\frac{1}{2} \le 1+h \le \frac{3}{2}$ and $\frac{2}{3} \le \frac{1}{1+h} \le 2$. Thus, $E \le 2h^2$ for $-\frac{1}{2} \le h \le \frac{1}{2}$.

4.2 Extreme Values

Preliminary Questions

1. What is the definition of a critical point?

SOLUTION A critical point is a value of the independent variable x in the domain of a function f at which either $f'(x) = 0$ or $f'(x)$ does not exist.

In Questions 2 and 3, choose the correct conclusion.

2. If $f(x)$ is not continuous on [0, 1], then

(a) $f(x)$ has no extreme values on [0, 1].

(b) $f(x)$ might not have any extreme values on [0, 1].

SOLUTION The correct response is **(b)**: $f(x)$ might not have any extreme values on [0, 1]. Although [0, 1] is closed, because f is not continuous, the function is not guaranteed to have any extreme values on [0, 1].

3. If $f(x)$ is continuous but has no critical points in [0, 1], then

(a) $f(x)$ has no min or max on [0, 1].

(b) Either $f(0)$ or $f(1)$ is the minimum value on [0, 1].

SOLUTION The correct response is **(b)**: either $f(0)$ or $f(1)$ is the minimum value on [0, 1]. Remember that extreme values occur either at critical points or endpoints. If a continuous function on a closed interval has no critical points, the extreme values must occur at the endpoints.

4. Fermat's Theorem *does not* claim that if $f'(c) = 0$, then $f(c)$ is a local extreme value (this is false). What *does* Fermat's Theorem assert?

SOLUTION Fermat's Theorem claims: If $f(c)$ is a local extreme value, then either $f'(c) = 0$ or $f'(c)$ does not exist.

Exercises

1. The following questions refer to Figure 15.

(a) How many critical points does $f(x)$ have on [0, 8]?
(b) What is the maximum value of $f(x)$ on [0, 8]?
(c) What are the local maximum values of $f(x)$?
(d) Find a closed interval on which both the minimum and maximum values of $f(x)$ occur at critical points.
(e) Find an interval on which the minimum value occurs at an endpoint.

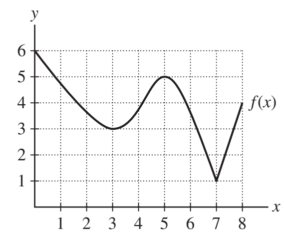


FIGURE 15

SOLUTION

(a) $f(x)$ has three critical points on the interval [0, 8]: at $x = 3$, $x = 5$ and $x = 7$. Two of these, $x = 3$ and $x = 5$, are where the derivative is zero and one, $x = 7$, is where the derivative does not exist.

(b) The maximum value of $f(x)$ on [0, 8] is 6; the function takes this value at $x = 0$.

(c) $f(x)$ achieves a local maximum of 5 at $x = 5$.

(d) Answers may vary. One example is the interval [4, 8]. Another is [2, 6].

(e) Answers may vary. The easiest way to ensure this is to choose an interval on which the graph takes no local minimum. One example is [0, 2].

2. State whether $f(x) = x^{-1}$ (Figure 16) has a minimum or maximum value on the following intervals:

(a) $(0, 2)$ **(b)** $(1, 2)$ **(c)** $[1, 2]$

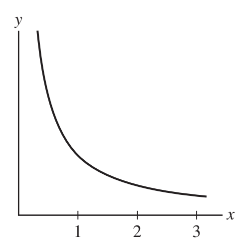

FIGURE 16 Graph of $f(x) = x^{-1}$.

SOLUTION $f(x)$ has no local minima or maxima. Hence, $f(x)$ only takes minimum and maximum values on an interval if it takes them at the endpoints.

(a) $f(x)$ takes no minimum or maximum value on this interval, since the interval does not contain its endpoints.

(b) $f(x)$ takes no minimum or maximum value on this interval, since the interval does not contain its endpoints.

(c) The function is decreasing on the whole interval [1, 2]. Hence, $f(x)$ takes on its maximum value of 1 at $x = 1$ and $f(x)$ takes on its minimum value of $\frac{1}{2}$ at $x = 2$.

In Exercises 3–20, find all critical points of the function.

3. $f(x) = x^2 - 2x + 4$

SOLUTION Let $f(x) = x^2 - 2x + 4$. Then $f'(x) = 2x - 2 = 0$ implies that $x = 1$ is the lone critical point of f.

4. $f(x) = 7x - 2$

SOLUTION Let $f(x) = 7x - 2$. Then $f'(x) = 7$, which is never zero, so $f(x)$ has no critical points.

5. $f(x) = x^3 - \frac{9}{2}x^2 - 54x + 2$

SOLUTION Let $f(x) = x^3 - \frac{9}{2}x^2 - 54x + 2$. Then $f'(x) = 3x^2 - 9x - 54 = 3(x + 3)(x - 6) = 0$ implies that $x = -3$ and $x = 6$ are the critical points of f.

6. $f(t) = 8t^3 - t^2$

SOLUTION Let $f(t) = 8t^3 - t^2$. Then $f'(t) = 24t^2 - 2t = 2t(12t - 1) = 0$ implies that $t = 0$ and $t = \frac{1}{12}$ are the critical points of f.

7. $f(x) = x^{-1} - x^{-2}$

SOLUTION Let $f(x) = x^{-1} - x^{-2}$. Then

$$f'(x) = -x^{-2} + 2x^{-3} = \frac{2-x}{x^3} = 0$$

implies that $x = 2$ is the only critical point of f. Though $f'(x)$ does not exist at $x = 0$, this is not a critical point of f because $x = 0$ is not in the domain of f.

8. $g(z) = \dfrac{1}{z-1} - \dfrac{1}{z}$

SOLUTION Let

$$g(z) = \frac{1}{z-1} - \frac{1}{z} = \frac{z-(z-1)}{z(z-1)} = \frac{1}{z^2-z}.$$

Then

$$g'(z) = -\frac{1}{(z^2-z)^2}(2z-1) = -\frac{2z-1}{(z^2-z)^2} = 0$$

implies that $z = 1/2$ is the only critical point of g. Though $g'(z)$ does not exist at either $z = 0$ or $z = 1$, neither is a critical point of g because neither is in the domain of g.

9. $f(x) = \dfrac{x}{x^2+1}$

SOLUTION Let $f(x) = \dfrac{x}{x^2+1}$. Then $f'(x) = \dfrac{1-x^2}{(x^2+1)^2} = 0$ implies that $x = \pm 1$ are the critical points of f.

10. $f(x) = \dfrac{x^2}{x^2-4x+8}$

SOLUTION Let $f(x) = \dfrac{x^2}{x^2-4x+8}$. Then

$$f'(x) = \frac{(x^2-4x+8)(2x) - x^2(2x-4)}{(x^2-4x+8)^2} = \frac{4x(4-x)}{(x^2-4x+8)^2} = 0$$

implies that $x = 0$ and $x = 4$ are the critical points of f.

11. $f(t) = t - 4\sqrt{t+1}$

SOLUTION Let $f(t) = t - 4\sqrt{t+1}$. Then

$$f'(t) = 1 - \frac{2}{\sqrt{t+1}} = 0$$

implies that $t = 3$ is a critical point of f. Because $f'(t)$ does not exist at $t = -1$, this is another critical point of f.

12. $f(t) = 4t - \sqrt{t^2+1}$

SOLUTION Let $f(t) = 4t - \sqrt{t^2+1}$. Then

$$f'(t) = 4 - \frac{t}{(t^2+1)^{1/2}} = \frac{4(t^2+1)^{1/2} - t}{(t^2+1)^{1/2}} = 0$$

implies that there are no critical points of f since neither the numerator nor denominator equals 0 for any value of t.

13. $f(x) = x^2\sqrt{1-x^2}$

SOLUTION Let $f(x) = x^2\sqrt{1-x^2}$. Then

$$f'(x) = -\frac{x^3}{\sqrt{1-x^2}} + 2x\sqrt{1-x^2} = \frac{2x-3x^3}{\sqrt{1-x^2}}.$$

This derivative is 0 when $x = 0$ and when $x = \pm\sqrt{2/3}$; the derivative does not exist when $x = \pm 1$. All five of these values are critical points of f

14. $f(x) = x + |2x + 1|$

SOLUTION Removing the absolute values, we see that

$$f(x) = \begin{cases} -x - 1, & x < -\frac{1}{2} \\ 3x + 1, & x \ge -\frac{1}{2} \end{cases}$$

Thus,

$$f'(x) = \begin{cases} -1, & x < -\frac{1}{2} \\ 3, & x \ge -\frac{1}{2} \end{cases}$$

and we see that $f'(0)$ is never equal to 0. However, $f'(-1/2)$ does not exist, so $x = -1/2$ is the only critical point of f.

15. $g(\theta) = \sin^2 \theta$

SOLUTION Let $g(\theta) = \sin^2 \theta$. Then $g'(\theta) = 2 \sin \theta \cos \theta = \sin 2\theta = 0$ implies that

$$\theta = \frac{n\pi}{2}$$

is a critical value of g for all integer values of n.

16. $R(\theta) = \cos \theta + \sin^2 \theta$

SOLUTION Let $R(\theta) = \cos \theta + \sin^2 \theta$. Then

$$R'(\theta) = -\sin \theta + 2 \sin \theta \cos \theta = \sin \theta (2 \cos \theta - 1) = 0$$

implies that $\theta = n\pi$,

$$\theta = \frac{\pi}{3} + 2n\pi \quad \text{and} \quad \theta = \frac{5\pi}{3} + 2n\pi$$

are critical points of R for all integer values of n.

17. $f(x) = x \ln x$

SOLUTION Let $f(x) = x \ln x$. Then $f'(x) = 1 + \ln x = 0$ implies that $x = e^{-1} = \frac{1}{e}$ is the only critical point of f.

18. $f(x) = xe^{2x}$

SOLUTION Let $f(x) = xe^{2x}$. Then $f'(x) = (2x + 1)e^{2x} = 0$ implies that $x = -\frac{1}{2}$ is the only critical point of f.

19. $f(x) = \sin^{-1} x - 2x$

SOLUTION Let $f(x) = \sin^{-1} x - 2x$. Then

$$f'(x) = \frac{1}{\sqrt{1 - x^2}} - 2 = 0$$

implies that $x = \pm\frac{\sqrt{3}}{2}$ are the critical points of f.

20. $f(x) = \sec^{-1} x - \ln x$

SOLUTION Let $f(x) = \sec^{-1} x - \ln x$. Then

$$f'(x) = \frac{1}{x\sqrt{x^2 - 1}} - \frac{1}{x}.$$

This derivative is equal to zero when $\sqrt{x^2 - 1} = 1$, or when $x = \pm\sqrt{2}$. Moreover, the derivative does not exist at $x = 0$ and at $x = \pm 1$. Among these numbers, $x = 1$ and $x = \sqrt{2}$ are the only critical points of f. $x = -\sqrt{2}$, $x = -1$, and $x = 0$ are not critical points of f because none are in the domain of f.

21. Let $f(x) = x^2 - 4x + 1$.

(a) Find the critical point c of $f(x)$ and compute $f(c)$.

(b) Compute the value of $f(x)$ at the endpoints of the interval $[0, 4]$.

(c) Determine the min and max of $f(x)$ on $[0, 4]$.

(d) Find the extreme values of $f(x)$ on $[0, 1]$.

SOLUTION Let $f(x) = x^2 - 4x + 1$.

(a) Then $f'(c) = 2c - 4 = 0$ implies that $c = 2$ is the sole critical point of f. We have $f(2) = -3$.

(b) $f(0) = f(4) = 1$.

(c) Using the results from (a) and (b), we find the maximum value of f on $[0, 4]$ is 1 and the minimum value is -3.

(d) We have $f(1) = -2$. Hence the maximum value of f on $[0, 1]$ is 1 and the minimum value is -2.

22. Find the extreme values of $f(x) = 2x^3 - 9x^2 + 12x$ on [0, 3] and [0, 2].

SOLUTION Let $f(x) = 2x^3 - 9x^2 + 12x$. First, we find the critical points. Setting $f'(x) = 6x^2 - 18x + 12 = 0$ yields $x^2 - 3x + 2 = 0$ so that $x = 2$ or $x = 1$. Next, we compare: first, for [0, 3]:

x-value	Value of f	
1 (critical point)	$f(1) = 5$	
2 (critical point)	$f(2) = 4$	
0 (endpoint)	$f(0) = 0$	min
3 (endpoint)	$f(3) = 9$	max

Then, for [0, 2]:

x-value	Value of f	
1 (critical point)	$f(1) = 5$	max
2 (endpoint)	$f(2) = 4$	
0 (endpoint)	$f(0) = 0$	min

23. Find the critical points of $f(x) = \sin x + \cos x$ and determine the extreme values on $\left[0, \frac{\pi}{2}\right]$.

SOLUTION

- Let $f(x) = \sin x + \cos x$. Then on the interval $\left[0, \frac{\pi}{2}\right]$, we have $f'(x) = \cos x - \sin x = 0$ at $x = \frac{\pi}{4}$, the only critical point of f in this interval.
- Since $f(\frac{\pi}{4}) = \sqrt{2}$ and $f(0) = f(\frac{\pi}{2}) = 1$, the maximum value of f on $\left[0, \frac{\pi}{2}\right]$ is $\sqrt{2}$, while the minimum value is 1.

24. Compute the critical points of $h(t) = (t^2 - 1)^{1/3}$. Check that your answer is consistent with Figure 17. Then find the extreme values of $h(t)$ on [0, 1] and [0, 2].

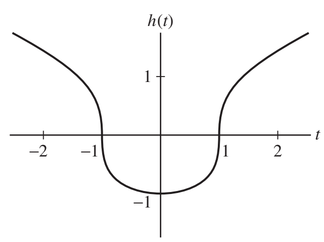

FIGURE 17 Graph of $h(t) = (t^2 - 1)^{1/3}$.

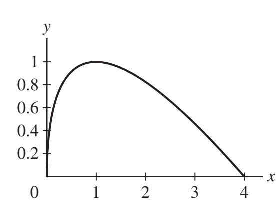
SOLUTION

- Let $h(t) = (t^2 - 1)^{1/3}$. Then $h'(t) = \dfrac{2t}{3(t^2 - 1)^{2/3}} = 0$ implies critical points at $t = 0$ and $t = \pm 1$. These results are consistent with Figure 17 which shows a horizontal tangent at $t = 0$ and vertical tangents at $t = \pm 1$.
- Since $h(0) = -1$ and $h(1) = 0$, the maximum value on [0, 1] is $h(1) = 0$ and the minimum is $h(0) = -1$. Similarly, the minimum on [0, 2] is $h(0) = -1$ and the maximum is $h(2) = 3^{1/3} \approx 1.44225$.

25. $\boxed{\text{GU}}$ Plot $f(x) = 2\sqrt{x} - x$ on [0, 4] and determine the maximum value graphically. Then verify your answer using calculus.

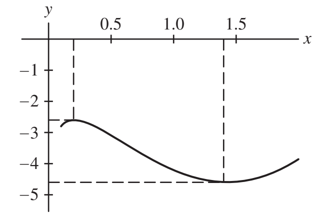
SOLUTION The graph of $y = 2\sqrt{x} - x$ over the interval [0, 4] is shown below. From the graph, we see that at $x = 1$, the function achieves its maximum value of 1.



To verify the information obtained from the plot, let $f(x) = 2\sqrt{x} - x$. Then $f'(x) = x^{-1/2} - 1$. Solving $f'(x) = 0$ yields the critical points $x = 0$ and $x = 1$. Because $f(0) = f(4) = 0$ and $f(1) = 1$, we see that the maximum value of f on $[0, 4]$ is 1.

26. GU Plot $f(x) = \ln x - 5\sin x$ on $[0.1, 2]$ and approximate both the critical points and the extreme values.

SOLUTION The graph of $f(x) = \ln x - 5\sin x$ is shown below. From the graph, we see that critical points occur at approximately $x = 0.2$ and $x = 1.4$. The maximum value of approximately -2.6 occurs at $x \approx 0.2$; the minimum value of approximately -4.6 occurs at $x \approx 1.4$.



27. CAS Approximate the critical points of $g(x) = x\cos^{-1} x$ and estimate the maximum value of $g(x)$.

SOLUTION $g'(x) = \frac{-x}{\sqrt{1-x^2}} + \cos^{-1} x$, so $g'(x) = 0$ when $x \approx 0.652185$. Evaluating g at the endpoints of its domain, $x = \pm 1$, and at the critical point $x \approx 0.652185$, we find $g(-1) = -\pi$, $g(0.652185) \approx 0.561096$, and $g(1) = 0$. Hence, the maximum value of $g(x)$ is approximately 0.561096.

28. CAS Approximate the critical points of $g(x) = 5e^x - \tan x$ in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

SOLUTION Let $g(x) = 5e^x - \tan x$. Then $g'(x) = 5e^x - \sec^2 x$. The derivative is defined for all $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ and is equal to 0 for $x \approx 1.339895$ and $x \approx -0.82780$. Hence, the critical points of g are $x \approx 1.339895$ and $x \approx -0.82780$.

In Exercises 29–58, find the min and max of the function on the given interval by comparing values at the critical points and endpoints.

29. $y = 2x^2 + 4x + 5$, $[-2, 2]$

SOLUTION Let $f(x) = 2x^2 + 4x + 5$. Then $f'(x) = 4x + 4 = 0$ implies that $x = -1$ is the only critical point of f. The minimum of f on the interval $[-2, 2]$ is $f(-1) = 3$, whereas its maximum is $f(2) = 21$. (*Note:* $f(-2) = 5$.)

30. $y = 2x^2 + 4x + 5$, $[0, 2]$

SOLUTION Let $f(x) = 2x^2 + 4x + 5$. Then $f'(x) = 4x + 4 = 0$ implies that $x = -1$ is the only critical point of f. The minimum of f on the interval $[0, 2]$ is $f(0) = 5$, whereas its maximum is $f(2) = 21$. (*Note:* The critical point $x = -1$ is not on the interval $[0, 2]$.)

31. $y = 6t - t^2$, $[0, 5]$

SOLUTION Let $f(t) = 6t - t^2$. Then $f'(t) = 6 - 2t = 0$ implies that $t = 3$ is the only critical point of f. The minimum of f on the interval $[0, 5]$ is $f(0) = 0$, whereas the maximum is $f(3) = 9$. (*Note:* $f(5) = 5$.)

32. $y = 6t - t^2$, $[4, 6]$

SOLUTION Let $f(t) = 6t - t^2$. Then $f'(t) = 6 - 2t = 0$ implies that $t = 3$ is the only critical point of f. The minimum of f on the interval $[4, 6]$ is $f(6) = 0$, whereas the maximum is $f(4) = 8$. (*Note:* The critical point $t = 3$ is not on the interval $[4, 6]$.)

33. $y = x^3 - 6x^2 + 8$, $[1, 6]$

SOLUTION Let $f(x) = x^3 - 6x^2 + 8$. Then $f'(x) = 3x^2 - 12x = 3x(x - 4) = 0$ implies that $x = 0$ and $x = 4$ are the critical points of f. The minimum of f on the interval $[1, 6]$ is $f(4) = -24$, whereas the maximum is $f(6) = 8$. (*Note:* $f(1) = 3$ and the critical point $x = 0$ is not in the interval $[1, 6]$.)

34. $y = x^3 + x^2 - x$, $[-2, 2]$

SOLUTION Let $f(x) = x^3 + x^2 - x$. Then $f'(x) = 3x^2 + 2x - 1 = (3x - 1)(x + 1) = 0$ implies that $x = 1/3$ and $x = -1$ are critical points of f. The minimum of f on the interval $[-2, 2]$ is $f(-2) = -2$, whereas the maximum is $f(2) = 10$. (*Note:* $f(-1) = 1$ and $f(1/3) = -5/27$.)

35. $y = 2t^3 + 3t^2$, $[1, 2]$

SOLUTION Let $f(t) = 2t^3 + 3t^2$. Then $f'(t) = 6t^2 + 6t = 6t(t + 1) = 0$ implies that $t = 0$ and $t = -1$ are the critical points of f. The minimum of f on the interval $[1, 2]$ is $f(1) = 5$, whereas the maximum is $f(2) = 28$. (*Note:* Neither critical points are in the interval $[1, 2]$.)

36. $y = x^3 - 12x^2 + 21x$, $[0, 2]$

SOLUTION Let $f(x) = x^3 - 12x^2 + 21x$. Then $f'(x) = 3x^2 - 24x + 21 = 3(x - 7)(x - 1) = 0$ implies that $x = 1$ and $x = 7$ are the critical points of f. The minimum of f on the interval $[0, 2]$ is $f(0) = 0$, whereas its maximum is $f(1) = 10$. (*Note:* $f(2) = 2$ and the critical point $x = 7$ is not in the interval $[0, 2]$.)

37. $y = z^5 - 80z$, $[-3, 3]$

SOLUTION Let $f(z) = z^5 - 80z$. Then $f'(z) = 5z^4 - 80 = 5(z^4 - 16) = 5(z^2 + 4)(z + 2)(z - 2) = 0$ implies that $z = \pm 2$ are the critical points of f. The minimum value of f on the interval $[-3, 3]$ is $f(2) = -128$, whereas the maximum is $f(-2) = 128$. (*Note:* $f(-3) = 3$ and $f(3) = -3$.)

38. $y = 2x^5 + 5x^2$, $[-2, 2]$

SOLUTION Let $f(x) = 2x^5 + 5x^2$. Then $f'(x) = 10x^4 + 10x = 10x(x^3 + 1) = 0$ implies that $x = 0$ and $x = -1$ are critical points of f. The minimum value of f on the interval $[-2, 2]$ is $f(-2) = -44$, whereas the maximum is $f(2) = 84$. (*Note:* $f(-1) = 3$ and $f(0) = 0$.)

39. $y = \dfrac{x^2 + 1}{x - 4}$, $[5, 6]$

SOLUTION Let $f(x) = \dfrac{x^2 + 1}{x - 4}$. Then

$$f'(x) = \frac{(x - 4) \cdot 2x - (x^2 + 1) \cdot 1}{(x - 4)^2} = \frac{x^2 - 8x - 1}{(x - 4)^2} = 0$$

implies $x = 4 \pm \sqrt{17}$ are critical points of f. $x = 4$ is not a critical point because $x = 4$ is not in the domain of f. On the interval $[5, 6]$, the minimum of f is $f(6) = \frac{37}{2} = 18.5$, whereas the maximum of f is $f(5) = 26$. (*Note:* The critical points $x = 4 \pm \sqrt{17}$ are not in the interval $[5, 6]$.)

40. $y = \dfrac{1 - x}{x^2 + 3x}$, $[1, 4]$

SOLUTION Let $f(x) = \dfrac{1 - x}{x^2 + 3x}$. Then

$$f'(x) = \frac{-(x^2 + 3x) - (1 - x)(2x + 3)}{(x^2 + 3x)^2} = \frac{(x - 3)(x + 1)}{(x^2 + 3x)^2} = 0$$

implies that $x = 3$ and $x = -1$ are critical points. Neither $x = 0$ nor $x = -3$ is a critical point because neither is in the domain of f. On the interval $[1, 4]$, the maximum value is $f(1) = 0$ and the minimum value is $f(3) = -\frac{1}{9}$. (*Note:* The critical point $x = -1$ is not in the interval $[1, 4]$.)

41. $y = x - \dfrac{4x}{x + 1}$, $[0, 3]$

SOLUTION Let $f(x) = x - \dfrac{4x}{x + 1}$. Then

$$f'(x) = 1 - \frac{4}{(x + 1)^2} = \frac{(x - 1)(x + 3)}{(x + 1)^2} = 0$$

implies that $x = 1$ and $x = -3$ are critical points of f. $x = -1$ is not a critical point because $x = -1$ is not in the domain of f. The minimum of f on the interval $[0, 3]$ is $f(1) = -1$, whereas the maximum is $f(0) = f(3) = 0$. (*Note:* The critical point $x = -3$ is not in the interval $[0, 3]$.)

42. $y = 2\sqrt{x^2 + 1} - x$, $[0, 2]$

SOLUTION Let $f(x) = 2\sqrt{x^2 + 1} - x$. Then

$$f'(x) = \frac{2x}{\sqrt{x^2 + 1}} - 1 = 0$$

implies that $x = \pm\sqrt{\frac{1}{3}}$ are critical points of f. On the interval $[0, 2]$, the minimum is $f\left(\sqrt{\frac{1}{3}}\right) = \sqrt{3}$ and the maximum is $f(2) = 2\sqrt{5} - 2$. (*Note:* The critical point $x = -\sqrt{\frac{1}{3}}$ is not in the interval $[0, 2]$.)

43. $y = (2+x)\sqrt{2+(2-x)^2}, \quad [0,2]$

SOLUTION Let $f(x) = (2+x)\sqrt{2+(2-x)^2}$. Then

$$f'(x) = \sqrt{2+(2-x)^2} - (2+x)(2+(2-x)^2)^{-1/2}(2-x) = \frac{2(x-1)^2}{\sqrt{2+(2-x)^2}} = 0$$

implies that $x = 1$ is the critical point of f. On the interval $[0, 2]$, the minimum is $f(0) = 2\sqrt{6} \approx 4.9$ and the maximum is $f(2) = 4\sqrt{2} \approx 5.66$. (*Note:* $f(1) = 3\sqrt{3} \approx 5.2$.)

44. $y = \sqrt{1+x^2} - 2x, \quad [0,1]$

SOLUTION Let $f(x) = \sqrt{1+x^2} - 2x$. Then

$$f'(x) = \frac{x}{\sqrt{1+x^2}} - 2 = 0$$

implies that f has no critical points. The minimum value of f on the interval $[0, 1]$ is $f(1) = \sqrt{2} - 2$, whereas the maximum is $f(0) = 1$.

45. $y = \sqrt{x+x^2} - 2\sqrt{x}, \quad [0,4]$

SOLUTION Let $f(x) = \sqrt{x+x^2} - 2\sqrt{x}$. Then

$$f'(x) = \frac{1}{2}(x+x^2)^{-1/2}(1+2x) - x^{-1/2} = \frac{1+2x-2\sqrt{1+x}}{2\sqrt{x}\sqrt{1+x}} = 0$$

implies that $x = 0$ and $x = \frac{\sqrt{3}}{2}$ are the critical points of f. Neither $x = -1$ nor $x = -\frac{\sqrt{3}}{2}$ is a critical point because neither is in the domain of f. On the interval $[0, 4]$, the minimum of f is $f\left(\frac{\sqrt{3}}{2}\right) \approx -0.589980$ and the maximum is $f(4) \approx 0.472136$. (*Note:* $f(0) = 0$.)

46. $y = (t-t^2)^{1/3}, \quad [-1,2]$

SOLUTION Let $s(t) = (t-t^2)^{1/3}$. Then $s'(t) = \frac{1}{3}(t-t^2)^{-2/3}(1-2t) = 0$ at $t = \frac{1}{2}$, a critical point of s. Other critical points of s are $t = 0$ and $t = 1$, where the derivative of s does not exist. Therefore, on the interval $[-1, 2]$, the minimum of s is $s(-1) = s(2) = -2^{1/3} \approx -1.26$ and the maximum is $s(\frac{1}{2}) = (\frac{1}{4})^{1/3} \approx 0.63$. (*Note:* $s(0) = s(1) = 0$.)

47. $y = \sin x \cos x, \quad \left[0, \frac{\pi}{2}\right]$

SOLUTION Let $f(x) = \sin x \cos x = \frac{1}{2}\sin 2x$. On the interval $\left[0, \frac{\pi}{2}\right]$, $f'(x) = \cos 2x = 0$ when $x = \frac{\pi}{4}$. The minimum of f on this interval is $f(0) = f(\frac{\pi}{2}) = 0$, whereas the maximum is $f(\frac{\pi}{4}) = \frac{1}{2}$.

48. $y = x + \sin x, \quad [0, 2\pi]$

SOLUTION Let $f(x) = x + \sin x$. Then $f'(x) = 1 + \cos x = 0$ implies that $x = \pi$ is the only critical point on $[0, 2\pi]$. The minimum value of f on the interval $[0, 2\pi]$ is $f(0) = 0$, whereas the maximum is $f(2\pi) = 2\pi$. (*Note:* $f(\pi) = \pi - 1$.)

49. $y = \sqrt{2}\,\theta - \sec\theta, \quad \left[0, \frac{\pi}{3}\right]$

SOLUTION Let $f(\theta) = \sqrt{2}\theta - \sec\theta$. On the interval $[0, \frac{\pi}{3}]$, $f'(\theta) = \sqrt{2} - \sec\theta\tan\theta = 0$ at $\theta = \frac{\pi}{4}$. The minimum value of f on this interval is $f(0) = -1$, whereas the maximum value over this interval is $f(\frac{\pi}{4}) = \sqrt{2}(\frac{\pi}{4} - 1) \approx -0.303493$. (*Note:* $f(\frac{\pi}{3}) = \sqrt{2}\frac{\pi}{3} - 2 \approx -.519039$.)

50. $y = \cos\theta + \sin\theta, \quad [0, 2\pi]$

SOLUTION Let $f(\theta) = \cos\theta + \sin\theta$. On the interval $[0, 2\pi]$, $f'(\theta) = -\sin\theta + \cos\theta = 0$ where $\sin\theta = \cos\theta$, which is at the two points $\theta = \frac{\pi}{4}$ and $\frac{5\pi}{4}$. The minimum value on the interval is $f(\frac{5\pi}{4}) = -\sqrt{2}$, whereas the maximum value on the interval is $f(\frac{\pi}{4}) = \sqrt{2}$. (*Note:* $f(0) = f(2\pi) = 1$.)

51. $y = \theta - 2\sin\theta, \quad [0, 2\pi]$

SOLUTION Let $g(\theta) = \theta - 2\sin\theta$. On the interval $[0, 2\pi]$, $g'(\theta) = 1 - 2\cos\theta = 0$ at $\theta = \frac{\pi}{3}$ and $\theta = \frac{5}{3}\pi$. The minimum of g on this interval is $g(\frac{\pi}{3}) = \frac{\pi}{3} - \sqrt{3} \approx -.685$ and the maximum is $g(\frac{5}{3}\pi) = \frac{5}{3}\pi + \sqrt{3} \approx 6.968$. (*Note:* $g(0) = 0$ and $g(2\pi) = 2\pi \approx 6.283$.)

52. $y = 4\sin^3\theta - 3\cos^2\theta, \quad [0, 2\pi]$

SOLUTION Let $f(\theta) = 4\sin^3\theta - 3\cos^2\theta$. Then

$$\begin{aligned} f'(\theta) &= 12\sin^2\theta\cos\theta + 6\cos\theta\sin\theta \\ &= 6\cos\theta\sin\theta(2\sin\theta + 1) = 0 \end{aligned}$$

yields $\theta = 0, \pi/2, \pi, 7\pi/6, 3\pi/2, 11\pi/6, 2\pi$ as critical points of f. The minimum value of f on the interval $[0, 2\pi]$ is $f(3\pi/2) = -4$, whereas the maximum is $f(\pi/2) = 4$. (*Note:* $f(0) = f(\pi) = f(2\pi) = -3$ and $f(7\pi/6) = f(11\pi/6) = -11/4$.)

53. $y = \tan x - 2x, \quad [0, 1]$

SOLUTION Let $f(x) = \tan x - 2x$. Then on the interval $[0, 1]$, $f'(x) = \sec^2 x - 2 = 0$ at $x = \frac{\pi}{4}$. The minimum of f is $f(\frac{\pi}{4}) = 1 - \frac{\pi}{2} \approx -0.570796$ and the maximum is $f(0) = 0$. (*Note:* $f(1) = \tan 1 - 2 \approx -0.442592$.)

54. $y = xe^{-x}, \quad [0, 2]$

SOLUTION Let $f(x) = xe^{-x}$. Then, on the interval $[0, 2]$, $f'(x) = -xe^{-x} + e^{-x} = (1 - x)e^{-x} = 0$ at $x = 1$. The minimum of f on this interval is $f(0) = 0$ and the maximum is $f(1) = e^{-1} \approx 0.367879$. (*Note:* $f(2) = 2e^{-2} \approx 0.270671$.)

55. $y = \dfrac{\ln x}{x}, \quad [1, 3]$

SOLUTION Let $f(x) = \frac{\ln x}{x}$. Then, on the interval $[1, 3]$,

$$f'(x) = \frac{1 - \ln x}{x^2} = 0$$

at $x = e$. The minimum of f on this interval is $f(1) = 0$ and the maximum is $f(e) = e^{-1} \approx 0.367879$. (*Note:* $f(3) = \frac{1}{3} \ln 3 \approx 0.366204$.)

56. $y = 3e^x - e^{2x}, \quad \left[-\frac{1}{2}, 1\right]$

SOLUTION Let $f(x) = 3e^x - e^{2x}$. Then, on the interval $\left[-\frac{1}{2}, 1\right]$, $f'(x) = 3e^x - 2e^{2x} = e^x(3 - 2e^x) = 0$ at $x = \ln(3/2)$. The minimum of f on this interval is $f(1) = 3e - e^2 \approx 0.765789$ and the maximum is $f(\ln(3/2)) = 2.25$. (*Note:* $f(-1/2) = 3e^{-1/2} - e^{-1} \approx 1.451713$.)

57. $y = 5\tan^{-1} x - x, \quad [1, 5]$

SOLUTION Let $f(x) = 5\tan^{-1} x - x$. Then, on the interval $[1, 5]$,

$$f'(x) = 5\frac{1}{1 + x^2} - 1 = 0$$

at $x = 2$. The minimum of f on this interval is $f(5) = 5\tan^{-1} 5 - 5 \approx 1.867004$ and the maximum is $f(2) = 5\tan^{-1} 2 - 2 \approx 3.535744$. (*Note:* $f(1) = \frac{5\pi}{4} - 1 \approx 2.926991$.)

58. $y = x^3 - 24\ln x, \quad \left[\frac{1}{2}, 3\right]$

SOLUTION Let $f(x) = x^3 - 24\ln x$. Then, on the interval $\left[\frac{1}{2}, 3\right]$,

$$f'(x) = 3x^2 - \frac{24}{x} = 0$$

at $x = 2$. The minimum of f on this interval is $f(2) = 8 - 24\ln 2 \approx -8.635532$ and the maximum is $f(1/2) = \frac{1}{8} + 24\ln 2 \approx 16.760532$. (*Note:* $f(3) = 27 - 24\ln 2 \approx 0.633305$.)

59. Let $f(\theta) = 2\sin 2\theta + \sin 4\theta$.

(a) Show that θ is a critical point if $\cos 4\theta = -\cos 2\theta$.

(b) Show, using a unit circle, that $\cos\theta_1 = -\cos\theta_2$ if and only if $\theta_1 = \pi \pm \theta_2 + 2\pi k$ for an integer k.

(c) Show that $\cos 4\theta = -\cos 2\theta$ if and only if $\theta = \frac{\pi}{2} + \pi k$ or $\theta = \frac{\pi}{6} + \left(\frac{\pi}{3}\right)k$.

(d) Find the six critical points of $f(\theta)$ on $[0, 2\pi]$ and find the extreme values of $f(\theta)$ on this interval.

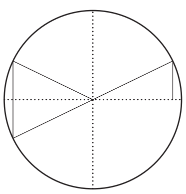
(e) $\boxed{\text{GU}}$ Check your results against a graph of $f(\theta)$.

SOLUTION $f(\theta) = 2\sin 2\theta + \sin 4\theta$ is differentiable at all θ, so the way to find the critical points is to find all points such that $f'(\theta) = 0$.

(a) $f'(\theta) = 4\cos 2\theta + 4\cos 4\theta$. If $f'(\theta) = 0$, then $4\cos 4\theta = -4\cos 2\theta$, so $\cos 4\theta = -\cos 2\theta$.

(b) Given the point $(\cos\theta, \sin\theta)$ at angle θ on the unit circle, there are two points with x coordinate $-\cos\theta$. The graphic shows these two points, which are:

- The point $(\cos(\theta + \pi), \sin(\theta + \pi))$ on the opposite end of the unit circle.
- The point $(\cos(\pi - \theta), \sin(\theta - \pi))$ obtained by reflecting through the y axis.



If we include all angles representing these points on the circle, we find that $\cos\theta_1 = -\cos\theta_2$ if and only if $\theta_1 = (\pi+\theta_2)+2\pi k$ or $\theta_1 = (\pi-\theta_2)+2\pi k$ for integers k.

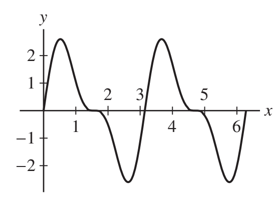
(c) Using (b), we recognize that $\cos 4\theta = -\cos 2\theta$ if $4\theta = 2\theta+\pi+2\pi k$ or $4\theta = \pi - 2\theta + 2\pi k$. Solving for θ, we obtain $\theta = \frac{\pi}{2}+k\pi$ or $\theta = \frac{\pi}{6}+\frac{\pi}{3}k$.

(d) To find all θ, $0 \le \theta < 2\pi$ indicated by (c), we use the following table:

k	0	1	2	3	4	5
$\frac{\pi}{2}+k\pi$	$\frac{\pi}{2}$	$\frac{3\pi}{2}$				
$\frac{\pi}{6}+\frac{\pi}{3}k$	$\frac{\pi}{6}$	$\frac{\pi}{2}$	$\frac{5\pi}{6}$	$\frac{7\pi}{6}$	$\frac{3\pi}{2}$	$\frac{11\pi}{6}$

The critical points in the range $[0, 2\pi]$ are $\frac{\pi}{6}, \frac{\pi}{2}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{3\pi}{2}$, and $\frac{11\pi}{6}$. On this interval, the maximum value is $f(\frac{\pi}{6}) = f(\frac{7\pi}{6}) = \frac{3\sqrt{3}}{2}$ and the minimum value is $f(\frac{5\pi}{6}) = f(\frac{11\pi}{6}) = -\frac{3\sqrt{3}}{2}$.

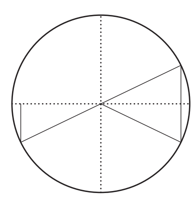
(e) The graph of $f(\theta) = 2\sin 2\theta + \sin 4\theta$ is shown here:



We can see that there are six flat points on the graph between 0 and 2π, as predicted. There are 4 local extrema, and two points at $(\frac{\pi}{2}, 0)$ and $(\frac{3\pi}{2}, 0)$ where the graph has neither a local maximum nor a local minimum.

60. GU Find the critical points of $f(x) = 2\cos 3x + 3\cos 2x$ in $[0, 2\pi]$. Check your answer against a graph of $f(x)$.

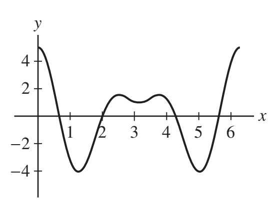
SOLUTION $f(x)$ is differentiable for all x, so we are looking for points where $f'(x) = 0$ only. Setting $f'(x) = -6\sin 3x - 6\sin 2x$, we get $\sin 3x = -\sin 2x$. Looking at a unit circle, we find the relationship between angles y and x such that $\sin y = -\sin x$. This technique is also used in Exercise 59.



From the diagram, we see that $\sin y = -\sin x$ if y is either (i.) the point antipodal to x ($y = \pi + x + 2\pi k$) or (ii.) the point obtained by reflecting x through the horizontal axis ($y = -x + 2\pi k$).

Since $\sin 3x = -\sin 2x$, we get either $3x = \pi + 2x + 2\pi k$ or $3x = -2x + 2\pi k$. Solving each of these equations for x yields $x = \pi + 2\pi k$ and $x = \frac{2\pi}{5}k$, respectively. The values of x between 0 and 2π are $0, \frac{2\pi}{5}, \frac{4\pi}{5}, \pi, \frac{6\pi}{5}, \frac{8\pi}{5}$, and 2π.

The graph is shown below. As predicted, it has horizontal tangent lines at $\frac{2\pi}{5}k$ and at $x = \frac{\pi}{2}$. Each of these points is a local extremum.



In Exercises 61–64, find the critical points and the extreme values on $[0, 4]$. *In Exercises 63 and 64, refer to Figure 18.*

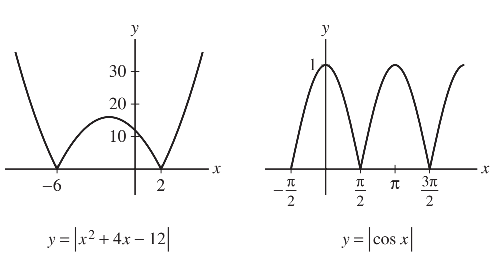


FIGURE 18

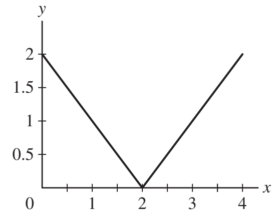
61. $y = |x - 2|$

SOLUTION Let $f(x) = |x - 2|$. For $x < 2$, we have $f'(x) = -1$. For $x > 2$, we have $f'(x) = 1$. Now as $x \to 2-$, we have $\dfrac{f(x) - f(2)}{x - 2} = \dfrac{(2 - x) - 0}{x - 2} \to -1$; whereas as $x \to 2+$, we have $\dfrac{f(x) - f(2)}{x - 2} = \dfrac{(x - 2) - 0}{x - 2} \to 1$. Therefore, $f'(2) = \lim_{x \to 2} \dfrac{f(x) - f(2)}{x - 2}$ does not exist and the lone critical point of f is $x = 2$. Alternately, we examine the graph of $f(x) = |x - 2|$ shown below.

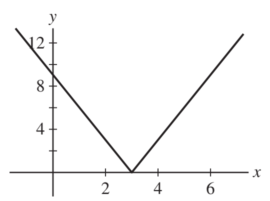
To find the extremum, we check the values of $f(x)$ at the critical point and the endpoints. $f(0) = 2$, $f(4) = 2$, and $f(2) = 0$. $f(x)$ takes its minimum value of 0 at $x = 2$, and its maximum of 2 at $x = 0$ and at $x = 4$.



62. $y = |3x - 9|$

SOLUTION Let $f(x) = |3x - 9| = 3|x - 3|$. For $x < 3$, we have $f'(x) = -3$. For $x > 3$, we have $f'(x) = 3$. Now as $x \to 3-$, we have $\dfrac{f(x) - f(3)}{x - 3} = \dfrac{3(3 - x) - 0}{x - 3} \to -3$; whereas as $x \to 3+$, we have $\dfrac{f(x) - f(3)}{x - 3} = \dfrac{3(x - 3) - 0}{x - 3} \to 3$. Therefore, $f'(3) = \lim_{x \to 3} \dfrac{f(x) - f(3)}{x - 3}$ does not exist and the lone critical point of f is $x = 3$. Alternately, we examine the graph of $f(x) = |3x - 9|$ shown below.

To find the extrema of $f(x)$ on $[0, 4]$, we test the values of $f(x)$ at the critical point and the endpoints. $f(0) = 9$, $f(3) = 0$ and $f(4) = 3$, so $f(x)$ takes its minimum value of 0 at $x = 3$, and its maximum value of 9 at $x = 0$.



63. $y = |x^2 + 4x - 12|$

SOLUTION Let $f(x) = |x^2 + 4x - 12| = |(x + 6)(x - 2)|$. From the graph of f in Figure 18, we see that $f'(x)$ does not exist at $x = -6$ and at $x = 2$, so these are critical points of f. There is also a critical point between $x = -6$ and $x = 2$ at which $f'(x) = 0$. For $-6 < x < 2$, $f(x) = -x^2 - 4x + 12$, so $f'(x) = -2x - 4 = 0$ when $x = -2$. On the interval $[0, 4]$ the minimum value of f is $f(2) = 0$ and the maximum value is $f(4) = 20$. (*Note:* $f(0) = 12$ and the critical points $x = -6$ and $x = -2$ are not in the interval.)

64. $y = |\cos x|$

SOLUTION Let $f(x) = |\cos x|$. There are two types of critical points: points of the form πn where the derivative is zero and points of the form $n\pi + \pi/2$ where the derivative does not exist. Only two of these, $x = \frac{\pi}{2}$ and $x = \pi$ are in the interval $[0, 4]$. Now, $f(0) = f(\pi) = 1$, $f(4) = |\cos 4| \approx 0.6536$, and $f(\frac{\pi}{2}) = 0$, so $f(x)$ takes its maximum value of 1 at $x = 0$ and $x = \pi$ and its minimum of 0 at $x = \frac{\pi}{2}$.

In Exercises 65–68, verify Rolle's Theorem for the given interval.

65. $f(x) = x + x^{-1}$, $\left[\frac{1}{2}, 2\right]$

SOLUTION Because f is continuous on $[\frac{1}{2}, 2]$, differentiable on $(\frac{1}{2}, 2)$ and

$$f\left(\frac{1}{2}\right) = \frac{1}{2} + \frac{1}{\frac{1}{2}} = \frac{5}{2} = 2 + \frac{1}{2} = f(2),$$

we may conclude from Rolle's Theorem that there exists a $c \in (\frac{1}{2}, 2)$ at which $f'(c) = 0$. Here, $f'(x) = 1 - x^{-2} = \frac{x^2 - 1}{x^2}$, so we may take $c = 1$.

66. $f(x) = \sin x, \quad \left[\frac{\pi}{4}, \frac{3\pi}{4}\right]$

SOLUTION Because f is continuous on $[\frac{\pi}{4}, \frac{3\pi}{4}]$, differentiable on $(\frac{\pi}{4}, \frac{3\pi}{4})$ and

$$f\left(\frac{\pi}{4}\right) = f\left(\frac{3\pi}{4}\right) = \frac{\sqrt{2}}{2},$$

we may conclude from Rolle's Theorem that there exists a $c \in (\frac{\pi}{4}, \frac{3\pi}{4})$ at which $f'(c) = 0$. Here, $f'(x) = \cos x$, so we may take $c = \frac{\pi}{2}$.

67. $f(x) = \dfrac{x^2}{8x - 15}, \quad [3, 5]$

SOLUTION Because f is continuous on $[3, 5]$, differentiable on $(3, 5)$ and $f(3) = f(5) = 1$, we may conclude from Rolle's Theorem that there exists a $c \in (3, 5)$ at which $f'(c) = 0$. Here,

$$f'(x) = \frac{(8x - 15)(2x) - 8x^2}{(8x - 15)^2} = \frac{2x(4x - 15)}{(8x - 15)^2},$$

so we may take $c = \frac{15}{4}$.

68. $f(x) = \sin^2 x - \cos^2 x, \quad \left[\frac{\pi}{4}, \frac{3\pi}{4}\right]$

SOLUTION Because f is continuous on $[\frac{\pi}{4}, \frac{3\pi}{4}]$, differentiable on $(\frac{\pi}{4}, \frac{3\pi}{4})$ and

$$f\left(\frac{\pi}{4}\right) = f\left(\frac{3\pi}{4}\right) = 0,$$

we may conclude from Rolle's Theorem that there exists a $c \in (\frac{\pi}{4}, \frac{3\pi}{4})$ at which $f'(c) = 0$. Here,

$$f'(x) = 2\sin x \cos x - 2\cos x(-\sin x) = 2\sin 2x,$$

so we may take $c = \frac{\pi}{2}$.

69. Prove that $f(x) = x^5 + 2x^3 + 4x - 12$ has precisely one real root.

SOLUTION Let's first establish the $f(x) = x^5 + 2x^3 + 4x - 12$ has at least one root. Because f is a polynomial, it is continuous for all x. Moreover, $f(0) = -12 < 0$ and $f(2) = 44 > 0$. Therefore, by the Intermediate Value Theorem, there exists a $c \in (0, 2)$ such that $f(c) = 0$.

Next, we prove that this is the only root. We will use proof by contradiction. Suppose $f(x) = x^5 + 2x^3 + 4x - 12$ has two real roots, $x = a$ and $x = b$. Then $f(a) = f(b) = 0$ and Rolle's Theorem guarantees that there exists a $c \in (a, b)$ at which $f'(c) = 0$. However, $f'(x) = 5x^4 + 6x^2 + 4 \geq 4$ for all x, so there is no $c \in (a, b)$ at which $f'(c) = 0$. Based on this contradiction, we conclude that $f(x) = x^5 + 2x^3 + 4x - 12$ cannot have more than one real root. Finally, f must have precisely one real root.

70. Prove that $f(x) = x^3 + 3x^2 + 6x$ has precisely one real root.

SOLUTION First, note that $f(0) = 0$, so f has at least one real root. We will proceed by contradiction to establish that $x = 0$ is the only real root. Suppose there exists another real root, say $x = a$. Because the polynomial f is continuous and differentiable for all real x, it follows by Rolle's Theorem that there exists a real number c between 0 and a such that $f'(c) = 0$. However, $f'(x) = 3x^2 + 6x + 6 = 3(x + 1)^2 + 3 \geq 3$ for all x. Thus, there is no c between 0 and a at which $f'(c) = 0$. Based on this contradiction, we conclude that $f(x) = x^3 + 3x^2 + 6x$ cannot have more than one real root. Finally, f must have precisely one real root.

71. Prove that $f(x) = x^4 + 5x^3 + 4x$ has no root c satisfying $c > 0$. *Hint:* Note that $x = 0$ is a root and apply Rolle's Theorem.

SOLUTION We will proceed by contradiction. Note that $f(0) = 0$ and suppose that there exists a $c > 0$ such that $f(c) = 0$. Then $f(0) = f(c) = 0$ and Rolle's Theorem guarantees that there exists a $d \in (0, c)$ such that $f'(d) = 0$. However, $f'(x) = 4x^3 + 15x^2 + 4 > 4$ for all $x > 0$, so there is no $d \in (0, c)$ such that $f'(d) = 0$. Based on this contradiction, we conclude that $f(x) = x^4 + 5x^3 + 4x$ has no root c satisfying $c > 0$.

72. Prove that $c = 4$ is the largest root of $f(x) = x^4 - 8x^2 - 128$.

SOLUTION First, note that $f(4) = 4^4 - 8(4)^2 - 128 = 256 - 128 - 128 = 0$, so $c = 4$ is a root of f. We will proceed by contradiction to establish that $c = 4$ is the largest real root. Suppose there exists real root, say $x = a$, where $a > 4$. Because the polynomial f is continuous and differentiable for all real x, it follows by Rolle's Theorem that there exists a real number $c \in (4, a)$ such that $f'(c) = 0$. However, $f'(x) = 4x^3 - 16x = 4x(x^2 - 4) > 0$ for all $x > 4$. Thus, there is no $c \in (4, a)$ at which $f'(c) = 0$. Based on this contradiction, we conclude that $f(x) = x^4 - 8x^2 - 128$ has no real root larger than 4.

73. The position of a mass oscillating at the end of a spring is $s(t) = A\sin\omega t$, where A is the amplitude and ω is the angular frequency. Show that the speed $|v(t)|$ is at a maximum when the acceleration $a(t)$ is zero and that $|a(t)|$ is at a maximum when $v(t)$ is zero.

SOLUTION Let $s(t) = A\sin\omega t$. Then

$$v(t) = \frac{ds}{dt} = A\omega\cos\omega t$$

and

$$a(t) = \frac{dv}{dt} = -A\omega^2\sin\omega t.$$

Thus, the speed

$$|v(t)| = |A\omega\cos\omega t|$$

is a maximum when $|\cos\omega t| = 1$, which is precisely when $\sin\omega t = 0$; that is, the speed $|v(t)|$ is at a maximum when the acceleration $a(t)$ is zero. Similarly,

$$|a(t)| = |A\omega^2\sin\omega t|$$

is a maximum when $|\sin\omega t| = 1$, which is precisely when $\cos\omega t = 0$; that is, $|a(t)|$ is at a maximum when $v(t)$ is zero.

74. The concentration $C(t)$ (in mg/cm^3) of a drug in a patient's bloodstream after t hours is

$$C(t) = \frac{0.016t}{t^2+4t+4}$$

Find the maximum concentration in the time interval [0, 8] and the time at which it occurs.

SOLUTION

$$C'(t) = \frac{0.016(t^2+4t+4) - (0.016t(2t+4))}{(t^2+4t+4)^2} = 0.016\frac{-t^2+4}{(t^2+4t+4)^2} = 0.016\frac{2-t}{(t+2)^3}.$$

$C'(t)$ exists for all $t \geq 0$, so we are looking for points where $C'(t) = 0$. $C'(t) = 0$ when $t = 2$. Using a calculator, we find that $C(2) = 0.002\frac{\text{mg}}{\text{cm}^3}$. On the other hand, $C(0) = 0$ and $C(10) \approx 0.001$. Hence, the maximum concentration occurs at $t = 2$ hours and is equal to $.002\frac{\text{mg}}{\text{cm}^3}$.

75. CAS **Antibiotic Levels** A study shows that the concentration $C(t)$ (in micrograms per milliliter) of antibiotic in a patient's blood serum after t hours is $C(t) = 120(e^{-0.2t} - e^{-bt})$, where $b \geq 1$ is a constant that depends on the particular combination of antibiotic agents used. Solve numerically for the value of b (to two decimal places) for which maximum concentration occurs at $t = 1$ h. You may assume that the maximum occurs at a critical point as suggested by Figure 19.

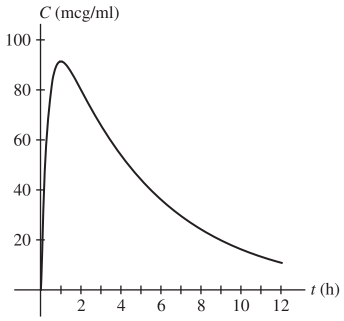


FIGURE 19 Graph of $C(t) = 120(e^{-0.2t} - e^{-bt})$ with b chosen so that the maximum occurs at $t = 1$ h.

SOLUTION Answer is $b = 2.86$. The max of $C(t)$ occurs at $t = \ln(5b)/(b-0.2)$ so we solve $\ln(5b)/(b-0.1) = 1$ numerically.

Let $C(t) = 120(e^{-0.2t} - e^{-bt})$. Then $C'(t) = 120(-0.2e^{-0.2t} + be^{-bt}) = 0$ when

$$t = \frac{\ln 5b}{b-0.2}.$$

Substituting $t = 1$ and solving for b numerically yields $b \approx 2.86$.

76. CAS In the notation of Exercise 75, find the value of b (to two decimal places) for which the maximum value of $C(t)$ is equal to 100 mcg/ml.

SOLUTION From the previous exercise, we know that $C(t)$ achieves its maximum when

$$t = \frac{\ln 5b}{b - 0.2}.$$

Substituting this expression into the formula for $C(t)$, setting the resulting expression equal to 100 and solving for b yields $b \approx 4.75$.

77. In 1919, physicist Alfred Betz argued that the maximum efficiency of a wind turbine is around 59%. If wind enters a turbine with speed v_1 and exits with speed v_2, then the power extracted is the difference in kinetic energy per unit time:

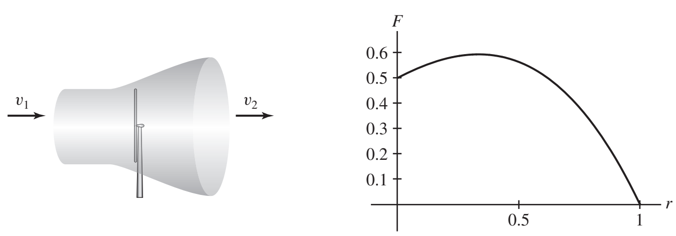
$$P = \frac{1}{2}mv_1^2 - \frac{1}{2}mv_2^2 \quad \text{watts}$$

where m is the mass of wind flowing through the rotor per unit time (Figure 20). Betz assumed that $m = \rho A(v_1 + v_2)/2$, where ρ is the density of air and A is the area swept out by the rotor. Wind flowing undisturbed through the same area A would have mass per unit time $\rho A v_1$ and power $P_0 = \frac{1}{2}\rho A v_1^3$. The fraction of power extracted by the turbine is $F = P/P_0$.

(a) Show that F depends only on the ratio $r = v_2/v_1$ and is equal to $F(r) = \frac{1}{2}(1 - r^2)(1 + r)$, where $0 \le r \le 1$.

(b) Show that the maximum value of $F(r)$, called the **Betz Limit**, is $16/27 \approx 0.59$.

(c) Explain why Betz's formula for $F(r)$ is not meaningful for r close to zero. *Hint:* How much wind would pass through the turbine if v_2 were zero? Is this realistic?



(A) Wind flowing through a turbine.

(B) F is the fraction of energy extracted by the turbine as a function of $r = v_2/v_1$.

FIGURE 20

SOLUTION

(a) We note that

$$F = \frac{P}{P_0} = \frac{\frac{1}{2}\frac{\rho A(v_1+v_2)}{2}(v_1^2 - v_2^2)}{\frac{1}{2}\rho A v_1^3}$$

$$= \frac{1}{2}\frac{v_1^2 - v_2^2}{v_1^2} \cdot \frac{v_1 + v_2}{v_1}$$

$$= \frac{1}{2}\left(1 - \frac{v_2^2}{v_1^2}\right)\left(1 + \frac{v_2}{v_1}\right)$$

$$= \frac{1}{2}(1 - r^2)(1 + r).$$

(b) Based on part (a),

$$F'(r) = \frac{1}{2}(1 - r^2) - r(1 + r) = -\frac{3}{2}r^2 - r + \frac{1}{2}.$$

The roots of this quadratic are $r = -1$ and $r = \frac{1}{3}$. Now, $F(0) = \frac{1}{2}$, $F(1) = 0$ and

$$F\left(\frac{1}{3}\right) = \frac{1}{2} \cdot \frac{8}{9} \cdot \frac{4}{3} = \frac{16}{27} \approx 0.59.$$

Thus, the Betz Limit is $16/27 \approx 0.59$.

(c) If v_2 were 0, then no air would be passing through the turbine, which is not realistic.

78. GU The **Bohr radius** a_0 of the hydrogen atom is the value of r that minimizes the energy

$$E(r) = \frac{\hbar^2}{2mr^2} - \frac{e^2}{4\pi\epsilon_0 r}$$

where $\hbar$, m, e, and ϵ_0 are physical constants. Show that $a_0 = 4\pi\epsilon_0\hbar^2/(me^2)$. Assume that the minimum occurs at a critical point, as suggested by Figure 21.

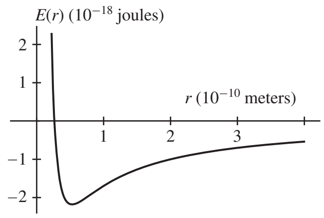


FIGURE 21

SOLUTION Let

$$E(r) = \frac{\hbar^2}{2mr^2} - \frac{e^2}{4\pi\epsilon_0 r}.$$

Then

$$\frac{dE}{dr} = -\frac{\hbar^2}{mr^3} + \frac{e^2}{4\pi\epsilon_0 r^2} = 0$$

implies

$$r = \frac{4\pi\epsilon_0\hbar^2}{me^2}.$$

Thus,

$$a_0 = \frac{4\pi\epsilon_0\hbar^2}{me^2}.$$

79. The response of a circuit or other oscillatory system to an input of frequency ω ("omega") is described by the function

$$\phi(\omega) = \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + 4D^2\omega^2}}$$

Both ω_0 (the natural frequency of the system) and D (the damping factor) are positive constants. The graph of ϕ is called a **resonance curve**, and the positive frequency $\omega_r > 0$, where ϕ takes its maximum value, if it exists, is called the **resonant frequency**. Show that $\omega_r = \sqrt{\omega_0^2 - 2D^2}$ if $0 < D < \omega_0/\sqrt{2}$ and that no resonant frequency exists otherwise (Figure 22).

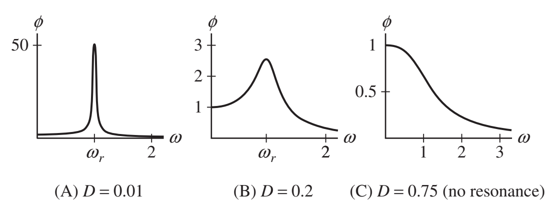

FIGURE 22 Resonance curves with $\omega_0 = 1$.

SOLUTION Let $\phi(\omega) = ((\omega_0^2 - \omega^2)^2 + 4D^2\omega^2)^{-1/2}$. Then

$$\phi'(\omega) = \frac{2\omega((\omega_0^2 - \omega^2) - 2D^2)}{((\omega_0^2 - \omega^2)^2 + 4D^2\omega^2)^{3/2}}$$

and the non-negative critical points are $\omega = 0$ and $\omega = \sqrt{\omega_0^2 - 2D^2}$. The latter critical point is positive if and only if $\omega_0^2 - 2D^2 > 0$, and since we are given $D > 0$, this is equivalent to $0 < D < \omega_0/\sqrt{2}$.

Define $\omega_r = \sqrt{\omega_0^2 - 2D^2}$. Now, $\phi(0) = 1/\omega_0^2$ and $\phi(\omega) \to 0$ as $\omega \to \infty$. Finally,

$$\phi(\omega_r) = \frac{1}{2D\sqrt{\omega_0^2 - D^2}},$$

which, for $0 < D < \omega_0/\sqrt{2}$, is larger than $1/\omega_0^2$. Hence, the point $\omega = \sqrt{\omega_0^2 - 2D^2}$, if defined, is a local maximum.

80. Bees build honeycomb structures out of cells with a hexagonal base and three rhombus-shaped faces on top, as in Figure 23. We can show that the surface area of this cell is

$$A(\theta) = 6hs + \frac{3}{2}s^2(\sqrt{3}\ \csc\theta - \cot\theta)$$

with h, s, and θ as indicated in the figure. Remarkably, bees "know" which angle θ minimizes the surface area (and therefore requires the least amount of wax).

(a) Show that $\theta \approx 54.7^\circ$ (assume h and s are constant). *Hint:* Find the critical point of $A(\theta)$ for $0 < \theta < \pi/2$.

(b) $\boxed{\text{GU}}$ Confirm, by graphing $f(\theta) = \sqrt{3}\csc\theta - \cot\theta$, that the critical point indeed minimizes the surface area.

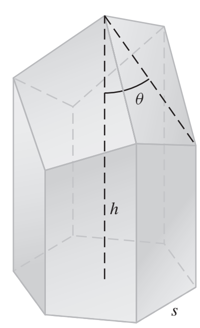

FIGURE 23 A cell in a honeycomb constructed by bees.

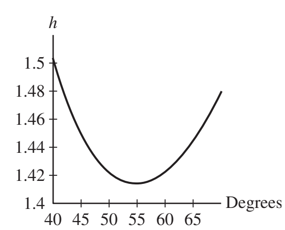
SOLUTION

(a) Because h and s are constant relative to θ, we have $A'(\theta) = \frac{3}{2}s^2(-\sqrt{3}\csc\theta\cot\theta + \csc^2\theta) = 0$. From this, we get $\sqrt{3}\csc\theta\cot\theta = \csc^2\theta$, or $\cos\theta = \frac{1}{\sqrt{3}}$, whence $\theta = \cos^{-1}\left(\frac{1}{\sqrt{3}}\right) = 0.955317$ radians = 54.736°.

(b) The plot of $\sqrt{3}\csc\theta - \cot\theta$, where θ is given in degrees, is given below. We can see that the minimum occurs just below 55°.



81. Find the maximum of $y = x^a - x^b$ on [0, 1] where $0 < a < b$. In particular, find the maximum of $y = x^5 - x^{10}$ on [0, 1].

SOLUTION

- Let $f(x) = x^a - x^b$. Then $f'(x) = ax^{a-1} - bx^{b-1}$. Since $a < b$, $f'(x) = x^{a-1}(a - bx^{b-a}) = 0$ implies critical points $x = 0$ and $x = (\frac{a}{b})^{1/(b-a)}$, which is in the interval [0, 1] as $a < b$ implies $\frac{a}{b} < 1$ and consequently $x = (\frac{a}{b})^{1/(b-a)} < 1$. Also, $f(0) = f(1) = 0$ and $a < b$ implies $x^a > x^b$ on the interval [0, 1], which gives $f(x) > 0$ and thus the maximum value of f on [0, 1] is

$$f\left(\left(\frac{a}{b}\right)^{1/(b-a)}\right) = \left(\frac{a}{b}\right)^{a/(b-a)} - \left(\frac{a}{b}\right)^{b/(b-a)}.$$

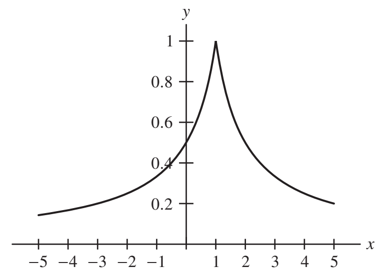
- Let $f(x) = x^5 - x^{10}$. Then by part (a), the maximum value of f on [0, 1] is

$$f\left(\left(\frac{1}{2}\right)^{1/5}\right) = \left(\frac{1}{2}\right) - \left(\frac{1}{2}\right)^2 = \frac{1}{2} - \frac{1}{4} = \frac{1}{4}.$$

In Exercises 82–84, plot the function using a graphing utility and find its critical points and extreme values on $[-5, 5]$.

82. GU $y = \dfrac{1}{1 + |x - 1|}$

SOLUTION Let $f(x) = \frac{1}{1+|x-1|}$. The plot follows:



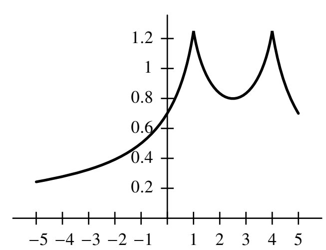
We can see on the plot that the only critical point of $f(x)$ lies at $x = 1$. With $f(-5) = \frac{1}{7}$, $f(1) = 1$ and $f(5) = \frac{1}{5}$, it follows that the maximum value of $f(x)$ on $[-5, 5]$ is $f(1) = 1$ and the minimum value is $f(-5) = \frac{1}{7}$.

83. GU $y = \dfrac{1}{1 + |x - 1|} + \dfrac{1}{1 + |x - 4|}$

SOLUTION Let

$$f(x) = \frac{1}{1 + |x - 1|} + \frac{1}{1 + |x - 4|}.$$

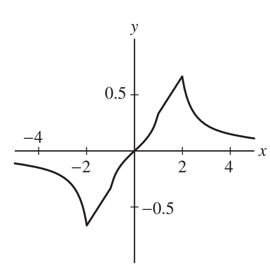
The plot follows:



We can see on the plot that the critical points of $f(x)$ lie at the cusps at $x = 1$ and $x = 4$ and at the location of the horizontal tangent line at $x = \frac{5}{2}$. With $f(-5) = \frac{17}{70}$, $f(1) = f(4) = \frac{5}{4}$, $f(\frac{5}{2}) = \frac{4}{5}$ and $f(5) = \frac{7}{10}$, it follows that the maximum value of $f(x)$ on $[-5, 5]$ is $f(1) = f(4) = \frac{5}{4}$ and the minimum value is $f(-5) = \frac{17}{70}$.

84. GU $y = \dfrac{x}{|x^2 - 1| + |x^2 - 4|}$

SOLUTION Let $f(x) = \frac{x}{|x^2-1|+|x^2-4|}$. The cusps of the graph of a function containing $|g(x)|$ are likely to lie where $g(x) = 0$, so we choose a plot range that includes $x = \pm 2$ and $x = \pm 1$:



As we can see from the graph, the function has cusps at $x = \pm 2$ and sharp corners at $x = \pm 1$. The cusps at $(2, \frac{2}{3})$ and $(-2, -\frac{2}{3})$ are the locations of the maximum and minimum values of $f(x)$, respectively.

85. **(a)** Use implicit differentiation to find the critical points on the curve $27x^2 = (x^2 + y^2)^3$.
(b) GU Plot the curve and the horizontal tangent lines on the same set of axes.

SOLUTION

(a) Differentiating both sides of the equation $27x^2 = (x^2 + y^2)^3$ with respect to x yields

$$54x = 3(x^2 + y^2)^2 \left(2x + 2y\frac{dy}{dx}\right).$$

Solving for dy/dx we obtain

$$\frac{dy}{dx} = \frac{27x - 3x(x^2 + y^2)^2}{3y(x^2 + y^2)^2} = \frac{x(9 - (x^2 + y^2)^2)}{y(x^2 + y^2)^2}.$$

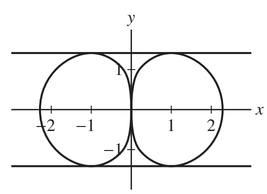
Thus, the derivative is zero when $x^2 + y^2 = 3$. Substituting into the equation for the curve, this yields $x^2 = 1$, or $x = \pm 1$. There are therefore four points at which the derivative is zero:

$$(-1, -\sqrt{2}),\ (-1, \sqrt{2}),\ (1, -\sqrt{2}),\ (1, \sqrt{2}).$$

There are also critical points where the derivative does not exist. This occurs when $y = 0$ and gives the following points with vertical tangents:

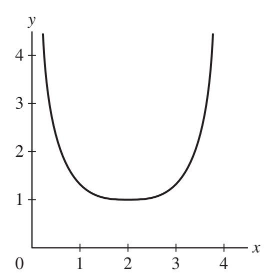
$$(0, 0),\ (\pm\sqrt[4]{27}, 0).$$

(b) The curve $27x^2 = (x^2 + y^2)^3$ and its horizontal tangents are plotted below.



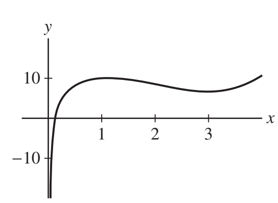
86. Sketch the graph of a continuous function on $(0, 4)$ with a minimum value but no maximum value.

SOLUTION Here is the graph of a function f on $(0, 4)$ with a minimum value [at $x = 2$] but no maximum value [since $f(x) \to \infty$ as $x \to 0+$ and as $x \to 4-$].



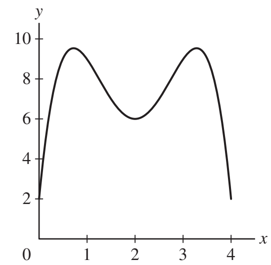
87. Sketch the graph of a continuous function on $(0, 4)$ having a local minimum but no absolute minimum.

SOLUTION Here is the graph of a function f on $(0, 4)$ with a local minimum value [between $x = 2$ and $x = 4$] but no absolute minimum [since $f(x) \to -\infty$ as $x \to 0+$].



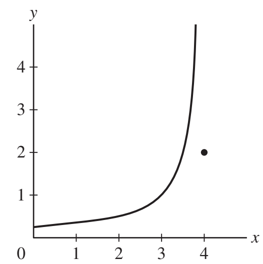
88. Sketch the graph of a function on $[0, 4]$ having
(a) Two local maxima and one local minimum.
(b) An absolute minimum that occurs at an endpoint, and an absolute maximum that occurs at a critical point.

SOLUTION Here is the graph of a function on $[0, 4]$ that (a) has two local maxima and one local minimum and (b) has an absolute minimum that occurs at an endpoint (at $x = 0$ or $x = 4$) and has an absolute maximum that occurs at a critical point.



89. Sketch the graph of a function $f(x)$ on $[0, 4]$ with a discontinuity such that $f(x)$ has an absolute minimum but no absolute maximum.

SOLUTION Here is the graph of a function f on $[0, 4]$ that (a) has a discontinuity [at $x = 4$] and (b) has an absolute minimum [at $x = 0$] but no absolute maximum [since $f(x) \to \infty$ as $x \to 4-$].



90. A rainbow is produced by light rays that enter a raindrop (assumed spherical) and exit after being reflected internally as in Figure 24. The angle between the incoming and reflected rays is $\theta = 4r - 2i$, where the angle of incidence i and refraction r are related by Snell's Law $\sin i = n \sin r$ with $n \approx 1.33$ (the index of refraction for air and water).

(a) Use Snell's Law to show that $\dfrac{dr}{di} = \dfrac{\cos i}{n \cos r}$.

(b) Show that the maximum value $\theta_{\max}$ of θ occurs when i satisfies $\cos i = \sqrt{\dfrac{n^2 - 1}{3}}$. *Hint:* Show that $\dfrac{d\theta}{di} = 0$ if $\cos i = \dfrac{n}{2} \cos r$. Then use Snell's Law to eliminate r.

(c) Show that $\theta_{\max} \approx 59.58°$.

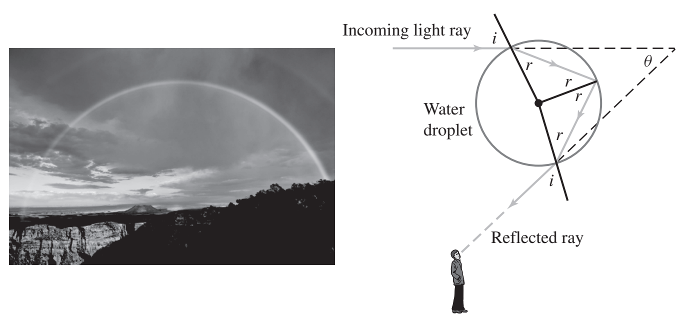


FIGURE 24

SOLUTION

(a) Differentiating Snell's Law with respect to i yields

$$\cos i = n \cos r \frac{dr}{di} \quad \text{or} \quad \frac{dr}{di} = \frac{\cos i}{n \cos r}.$$

(b) Differentiating the formula for θ with respect to i yields

$$\frac{d\theta}{di} = 4\frac{dr}{di} - 2 = 4\frac{\cos i}{n \cos r} - 2$$

by part (a). Thus,

$$\frac{d\theta}{di} = 0 \quad \text{when} \quad \cos i = \frac{n}{2} \cos r.$$

Squaring both sides of this last equation gives

$$\cos^2 i = \frac{n^2}{4}\cos^2 r,$$

while squaring both sides of Snell's Law gives

$$\sin^2 i = n^2 \sin^2 r \quad \text{or} \quad 1 - \cos^2 i = n^2(1 - \cos^2 r).$$

Solving this equation for $\cos^2 r$ gives

$$\cos^2 r = 1 - \frac{1 - \cos^2 i}{n^2};$$

Combining these last two equations and solving for $\cos i$ yields

$$\cos i = \sqrt{\frac{n^2 - 1}{3}}.$$

(c) With $n = 1.33$,

$$\cos i = \sqrt{\frac{(1.33)^2 - 1}{3}} = 0.5063$$

and

$$\cos r = \frac{2}{1.33}\cos i = 0.7613.$$

Thus, $r = 40.42°$, $i = 59.58°$ and

$$\theta_{\text{max}} = 4r - 2i = 42.53°.$$

Further Insights and Challenges

91. Show that the extreme values of $f(x) = a\sin x + b\cos x$ are $\pm\sqrt{a^2 + b^2}$.

SOLUTION If $f(x) = a\sin x + b\cos x$, then $f'(x) = a\cos x - b\sin x$, so that $f'(x) = 0$ implies $a\cos x - b\sin x = 0$. This implies $\tan x = \frac{a}{b}$. Then,

$$\sin x = \frac{\pm a}{\sqrt{a^2 + b^2}} \quad \text{and} \quad \cos x = \frac{\pm b}{\sqrt{a^2 + b^2}}.$$

Therefore

$$f(x) = a\sin x + b\cos x = a\frac{\pm a}{\sqrt{a^2 + b^2}} + b\frac{\pm b}{\sqrt{a^2 + b^2}} = \pm\frac{a^2 + b^2}{\sqrt{a^2 + b^2}} = \pm\sqrt{a^2 + b^2}.$$

92. Show, by considering its minimum, that $f(x) = x^2 - 2x + 3$ takes on only positive values. More generally, find the conditions on r and s under which the quadratic function $f(x) = x^2 + rx + s$ takes on only positive values. Give examples of r and s for which f takes on both positive and negative values.

SOLUTION

- Observe that $f(x) = x^2 - 2x + 3 = (x - 1)^2 + 2 > 0$ for all x. Let $f(x) = x^2 + rx + s$. Completing the square, we note that $f(x) = (x + \frac{1}{2}r)^2 + s - \frac{1}{4}r^2 > 0$ for all x provided that $s > \frac{1}{4}r^2$.
- Let $f(x) = x^2 - 4x + 3 = (x - 1)(x - 3)$. Then f takes on both positive and negative values. Here, $r = -4$ and $s = 3$.

93. Show that if the quadratic polynomial $f(x) = x^2 + rx + s$ takes on both positive and negative values, then its minimum value occurs at the midpoint between the two roots.

SOLUTION Let $f(x) = x^2 + rx + s$ and suppose that $f(x)$ takes on both positive and negative values. This will guarantee that f has two real roots. By the quadratic formula, the roots of f are

$$x = \frac{-r \pm \sqrt{r^2 - 4s}}{2}.$$

Observe that the midpoint between these roots is

$$\frac{1}{2}\left(\frac{-r+\sqrt{r^2-4s}}{2}+\frac{-r-\sqrt{r^2-4s}}{2}\right)=-\frac{r}{2}.$$

Next, $f'(x)=2x+r=0$ when $x=-\frac{r}{2}$ and, because the graph of $f(x)$ is an upward opening parabola, it follows that $f(-\frac{r}{2})$ is a minimum. Thus, f takes on its minimum value at the midpoint between the two roots.

94. Generalize Exercise 93: Show that if the horizontal line $y=c$ intersects the graph of $f(x)=x^2+rx+s$ at two points $(x_1, f(x_1))$ and $(x_2, f(x_2))$, then $f(x)$ takes its minimum value at the midpoint $M=\dfrac{x_1+x_2}{2}$ (Figure 25).

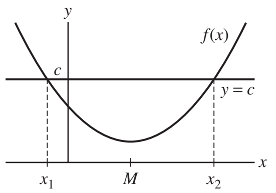

FIGURE 25

SOLUTION Suppose that a horizontal line $y=c$ intersects the graph of a quadratic function $f(x)=x^2+rx+s$ in two points $(x_1, f(x_1))$ and $(x_2, f(x_2))$. Then of course $f(x_1)=f(x_2)=c$. Let $g(x)=f(x)-c$. Then $g(x_1)=g(x_2)=0$. By Exercise 93, g takes on its minimum value at $x=\frac{1}{2}(x_1+x_2)$. Hence so does $f(x)=g(x)+c$.

95. A cubic polynomial may have a local min and max, or it may have neither (Figure 26). Find conditions on the coefficients a and b of

$$f(x)=\frac{1}{3}x^3+\frac{1}{2}ax^2+bx+c$$

that ensure that f has neither a local min nor a local max. *Hint:* Apply Exercise 92 to $f'(x)$.

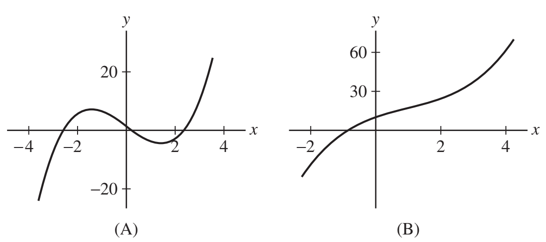

FIGURE 26 Cubic polynomials

SOLUTION Let $f(x)=\frac{1}{3}x^3+\frac{1}{2}ax^2+bx+c$. Using Exercise 92, we have $g(x)=f'(x)=x^2+ax+b>0$ for all x provided $b>\frac{1}{4}a^2$, in which case f has no critical points and hence no local extrema. (Actually $b\ge\frac{1}{4}a^2$ will suffice, since in this case [as we'll see in a later section] f has an inflection point but no local extrema.)

96. Find the min and max of

$$f(x)=x^p(1-x)^q \quad \text{on } [0,1],$$

where $p, q>0$.

SOLUTION Let $f(x)=x^p(1-x)^q$, $0\le x\le 1$, where p and q are positive numbers. Then

$$\begin{aligned} f'(x)&=x^pq(1-x)^{q-1}(-1)+(1-x)^qpx^{p-1}\\ &=x^{p-1}(1-x)^{q-1}(p(1-x)-qx)=0 \quad \text{at} \quad x=0,1,\frac{p}{p+q}\end{aligned}$$

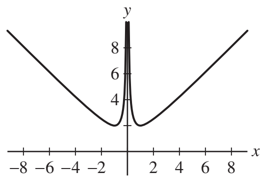
The minimum value of f on $[0,1]$ is $f(0)=f(1)=0$, whereas its maximum value is

$$f\left(\frac{p}{p+q}\right)=\frac{p^pq^q}{(p+q)^{p+q}}.$$

97. Prove that if f is continuous and $f(a)$ and $f(b)$ are local minima where $a<b$, then there exists a value c between a and b such that $f(c)$ is a local maximum. (*Hint:* Apply Theorem 1 to the interval $[a,b]$.) Show that continuity is a necessary hypothesis by sketching the graph of a function (necessarily discontinuous) with two local minima but no local maximum.

SOLUTION

- Let $f(x)$ be a continuous function with $f(a)$ and $f(b)$ local minima on the interval $[a, b]$. By Theorem 1, $f(x)$ must take on both a minimum and a maximum on $[a, b]$. Since local minima occur at $f(a)$ and $f(b)$, the maximum must occur at some other point in the interval, call it c, where $f(c)$ is a local maximum.
- The function graphed here is discontinuous at $x = 0$.



4.3 The Mean Value Theorem and Monotonicity

Preliminary Questions

1. For which value of m is the following statement correct? If $f(2) = 3$ and $f(4) = 9$, and $f(x)$ is differentiable, then f has a tangent line of slope m.

SOLUTION The Mean Value Theorem guarantees that the function has a tangent line with slope equal to

$$\frac{f(4) - f(2)}{4 - 2} = \frac{9 - 3}{4 - 2} = 3.$$

Hence, $m = 3$ makes the statement correct.

2. Assume f is differentiable. Which of the following statements does *not* follow from the MVT?

(a) If f has a secant line of slope 0, then f has a tangent line of slope 0.

(b) If $f(5) < f(9)$, then $f'(c) > 0$ for some $c \in (5, 9)$.

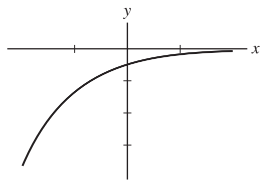
(c) If f has a tangent line of slope 0, then f has a secant line of slope 0.

(d) If $f'(x) > 0$ for all x, then every secant line has positive slope.

SOLUTION Conclusion **(c)** does not follow from the Mean Value Theorem. As a counterexample, consider the function $f(x) = x^3$. Note that $f'(0) = 0$, but no secant line has zero slope.

3. Can a function that takes on only negative values have a positive derivative? If so, sketch an example.

SOLUTION Yes. The figure below displays a function that takes on only negative values but has a positive derivative.



4. For $f(x)$ with derivative as in Figure 12:

(a) Is $f(c)$ a local minimum or maximum?

(b) Is $f(x)$ a decreasing function?

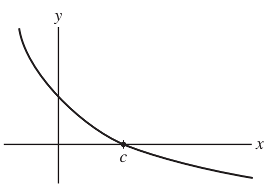


FIGURE 12 Graph of derivative $f'(x)$.

SOLUTION

(a) To the left of $x = c$, the derivative is positive, so f is increasing; to the right of $x = c$, the derivative is negative, so f is decreasing. Consequently, $f(c)$ must be a local maximum.

(b) No. The derivative is a decreasing function, but as noted in part (a), $f(x)$ is increasing for $x < c$ and decreasing for $x > c$.

Exercises

In Exercises 1–8, find a point c satisfying the conclusion of the MVT for the given function and interval.

1. $y = x^{-1}$, $[2, 8]$

SOLUTION Let $f(x) = x^{-1}$, $a = 2$, $b = 8$. Then $f'(x) = -x^{-2}$, and by the MVT, there exists a $c \in (2, 8)$ such that

$$-\frac{1}{c^2} = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{\frac{1}{8} - \frac{1}{2}}{8 - 2} = -\frac{1}{16}.$$

Thus $c^2 = 16$ and $c = \pm 4$. Choose $c = 4 \in (2, 8)$.

2. $y = \sqrt{x}$, $[9, 25]$

SOLUTION Let $f(x) = x^{1/2}$, $a = 9$, $b = 25$. Then $f'(x) = \frac{1}{2}x^{-1/2}$, and by the MVT, there exists a $c \in (9, 25)$ such that

$$\frac{1}{2}c^{-1/2} = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{5 - 3}{25 - 9} = \frac{1}{8}.$$

Thus $\frac{1}{\sqrt{c}} = \frac{1}{4}$ and $c = 16 \in (9, 25)$.

3. $y = \cos x - \sin x$, $[0, 2\pi]$

SOLUTION Let $f(x) = \cos x - \sin x$, $a = 0$, $b = 2\pi$. Then $f'(x) = -\sin x - \cos x$, and by the MVT, there exists a $c \in (0, 2\pi)$ such that

$$-\sin c - \cos c = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{1 - 1}{2\pi - 0} = 0.$$

Thus $-\sin c = \cos c$. Choose either $c = \frac{3\pi}{4}$ or $c = \frac{7\pi}{4} \in (0, 2\pi)$.

4. $y = \dfrac{x}{x + 2}$, $[1, 4]$

SOLUTION Let $f(x) = x/(x + 2)$, $a = 1$, $b = 4$. Then $f'(x) = \frac{2}{(x+2)^2}$, and by the MVT, there exists a $c \in (1, 4)$ such that

$$\frac{2}{(c + 2)^2} = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{\frac{2}{3} - \frac{1}{3}}{4 - 1} = \frac{1}{9}.$$

Thus $(c + 2)^2 = 18$ and $c = -2 \pm 3\sqrt{2}$. Choose $c = 3\sqrt{2} - 2 \approx 2.24 \in (1, 4)$.

5. $y = x^3$, $[-4, 5]$

SOLUTION Let $f(x) = x^3$, $a = -4$, $b = 5$. Then $f'(x) = 3x^2$, and by the MVT, there exists a $c \in (-4, 5)$ such that

$$3c^2 = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{189}{9} = 21.$$

Solving for c yields $c^2 = 7$, so $c = \pm\sqrt{7}$. Both of these values are in the interval $[-4, 5]$, so either value can be chosen.

6. $y = x \ln x$, $[1, 2]$

SOLUTION Let $f(x) = x \ln x$, $a = 1$, $b = 2$. Then $f'(x) = 1 + \ln x$, and by the MVT, there exists a $c \in (1, 2)$ such that

$$1 + \ln c = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{2 \ln 2}{1} = 2 \ln 2.$$

Solving for c yields $c = e^{2ln2-1} = \frac{4}{e} \approx 1.4715 \in (1, 2)$.

7. $y = e^{-2x}$, $[0, 3]$

SOLUTION Let $f(x) = e^{-2x}$, $a = 0$, $b = 3$. Then $f'(x) = -2e^{-2x}$, and by the MVT, there exists a $c \in (0, 3)$ such that

$$-2e^{-2c} = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{e^{-6} - 1}{3 - 0} = \frac{e^{-6} - 1}{3}.$$

Solving for c yields

$$c = -\frac{1}{2} \ln\left(\frac{1 - e^{-6}}{6}\right) \approx 0.8971 \in (0, 3).$$

8. $y = e^x - x, \quad [-1, 1]$

SOLUTION Let $f(x) = e^x - x$, $a = -1$, $b = 1$. Then $f'(x) = e^x - 1$, and by the MVT, there exists a $c \in (-1, 1)$ such that

$$e^c - 1 = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{(e - 1) - (e^{-1} + 1)}{1 - (-1)} = \frac{1}{2}(e - e^{-1}) - 1.$$

Solving for c yields

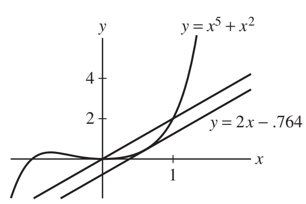
$$c = \ln\left(\frac{e - e^{-1}}{2}\right) \approx 0.1614 \in (-1, 1).$$

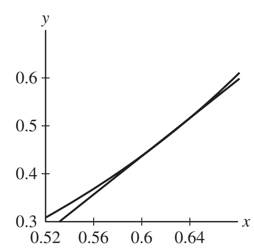
9. GU Let $f(x) = x^5 + x^2$. The secant line between $x = 0$ and $x = 1$ has slope 2 (check this), so by the MVT, $f'(c) = 2$ for some $c \in (0, 1)$. Plot $f(x)$ and the secant line on the same axes. Then plot $y = 2x + b$ for different values of b until the line becomes tangent to the graph of f. Zoom in on the point of tangency to estimate x-coordinate c of the point of tangency.

SOLUTION Let $f(x) = x^5 + x^2$. The slope of the secant line between $x = 0$ and $x = 1$ is

$$\frac{f(1) - f(0)}{1 - 0} = \frac{2 - 0}{1} = 2.$$

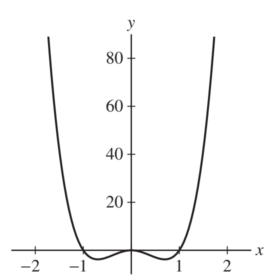
A plot of $f(x)$, the secant line between $x = 0$ and $x = 1$, and the line $y = 2x - 0.764$ is shown below at the left. The line $y = 2x - 0.764$ appears to be tangent to the graph of $y = f(x)$. Zooming in on the point of tangency (see below at the right), it appears that the x-coordinate of the point of tangency is approximately 0.62.

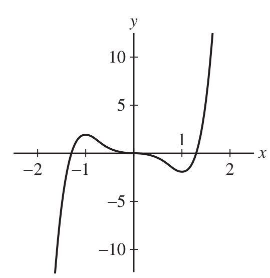




10. GU Plot the derivative of $f(x) = 3x^5 - 5x^3$. Describe its sign changes and use this to determine the local extreme values of $f(x)$. Then graph $f(x)$ to confirm your conclusions.

SOLUTION Let $f(x) = 3x^5 - 5x^3$. Then $f'(x) = 15x^4 - 15x^2 = 15x^2(x^2 - 1)$. The graph of $f'(x)$ is shown below at the left. Because $f'(x)$ changes from positive to negative at $x = -1$, $f(x)$ changes from increasing to decreasing and therefore has a local maximum at $x = -1$. At $x = 1$, $f'(x)$ changes from negative to positive, so $f(x)$ changes from decreasing to increasing and therefore has a local minimum. Though $f'(x) = 0$ at $x = 0$, $f'(x)$ does not change sign at $x = 0$, so $f(x)$ has neither a local maximum nor a local minimum at $x = 0$. The graph of $f(x)$, shown below at the right, confirms each of these conclusions.





11. Determine the intervals on which $f'(x)$ is positive and negative, assuming that Figure 13 is the graph of $f(x)$.

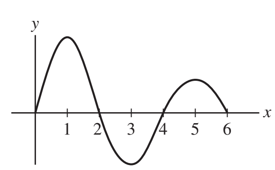


FIGURE 13

SOLUTION The derivative of f is positive on the intervals $(0, 1)$ and $(3, 5)$ where f is increasing; it is negative on the intervals $(1, 3)$ and $(5, 6)$ where f is decreasing.

12. Determine the intervals on which $f(x)$ is increasing or decreasing, assuming that Figure 13 is the graph of $f'(x)$.

SOLUTION $f(x)$ is increasing on every interval (a, b) over which $f'(x) > 0$, and is decreasing on every interval over which $f'(x) < 0$. If the graph of $f'(x)$ is given in Figure 13, then $f(x)$ is increasing on the intervals $(0, 2)$ and $(4, 6)$, and is decreasing on the interval $(2, 4)$.

13. State whether $f(2)$ and $f(4)$ are local minima or local maxima, assuming that Figure 13 is the graph of $f'(x)$.

SOLUTION

- $f'(x)$ makes a transition from positive to negative at $x = 2$, so $f(2)$ is a local maximum.
- $f'(x)$ makes a transition from negative to positive at $x = 4$, so $f(4)$ is a local minimum.

14. Figure 14 shows the graph of the derivative $f'(x)$ of a function $f(x)$. Find the critical points of $f(x)$ and determine whether they are local minima, local maxima, or neither.

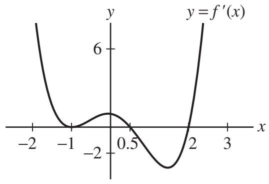

FIGURE 14

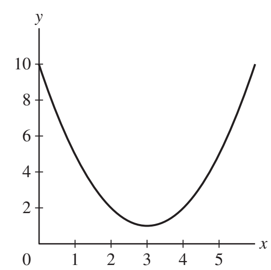
SOLUTION Since $f'(x) = 0$ when $x = -1$, $x = \frac{1}{2}$ and $x = 2$, these are the critical points of f. At $x = -1$, there is no sign transition in f', so $f(-1)$ is neither a local maximum nor a local minimum. At $x = \frac{1}{2}$, f' transitions from $+$ to $-$, so $f(\frac{1}{2})$ is a local maximum. Finally, at $x = 2$, f' transitions from $-$ to $+$, so $f(2)$ is a local minimum.

In Exercises 15–18, sketch the graph of a function $f(x)$ whose derivative $f'(x)$ has the given description.

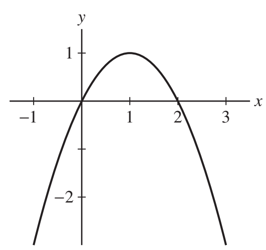
15. $f'(x) > 0$ for $x > 3$ and $f'(x) < 0$ for $x < 3$

SOLUTION Here is the graph of a function f for which $f'(x) > 0$ for $x > 3$ and $f'(x) < 0$ for $x < 3$.



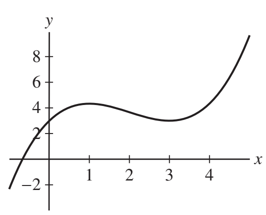
16. $f'(x) > 0$ for $x < 1$ and $f'(x) < 0$ for $x > 1$

SOLUTION Here is the graph of a function f for which $f'(x) > 0$ for $x < 1$ and $f'(x) < 0$ for $x > 1$.



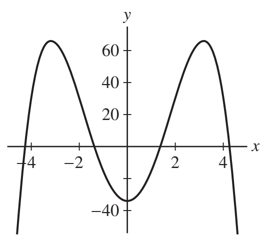
17. $f'(x)$ is negative on $(1, 3)$ and positive everywhere else.

SOLUTION Here is the graph of a function f for which $f'(x)$ is negative on $(1, 3)$ and positive elsewhere.



18. $f'(x)$ makes the sign transitions $+, -, +, -$.

SOLUTION Here is the graph of a function f for which f' makes the sign transitions $+, -, +, -$.



In Exercises 19–22, find all critical points of f and use the First Derivative Test to determine whether they are local minima or maxima.

19. $f(x) = 4 + 6x - x^2$

SOLUTION Let $f(x) = 4 + 6x - x^2$. Then $f'(x) = 6 - 2x = 0$ implies that $x = 3$ is the only critical point of f. As x increases through 3, $f'(x)$ makes the sign transition $+, -$. Therefore, $f(3) = 13$ is a local maximum.

20. $f(x) = x^3 - 12x - 4$

SOLUTION Let $f(x) = x^3 - 12x - 4$. Then, $f'(x) = 3x^2 - 12 = 3(x-2)(x+2) = 0$ implies that $x = \pm 2$ are critical points of f. As x increases through -2, $f'(x)$ makes the sign transition $+, -$; therefore, $f(-2)$ is a local maximum. On the other hand, as x increases through 2, $f'(x)$ makes the sign transition $-, +$; therefore, $f(2)$ is a local minimum.

21. $f(x) = \dfrac{x^2}{x+1}$

SOLUTION Let $f(x) = \dfrac{x^2}{x+1}$. Then

$$f'(x) = \frac{x(x+2)}{(x+1)^2} = 0$$

implies that $x = 0$ and $x = -2$ are critical points. Note that $x = -1$ is not a critical point because it is not in the domain of f. As x increases through -2, $f'(x)$ makes the sign transition $+, -$ so $f(-2) = -4$ is a local maximum. As x increases through 0, $f'(x)$ makes the sign transition $-, +$ so $f(0) = 0$ is a local minimum.

22. $f(x) = x^3 + x^{-3}$

SOLUTION Let $f(x) = x^3 + x^{-3}$. Then

$$f'(x) = 3x^2 - 3x^{-4} = \frac{3}{x^4}(x^6 - 1) = \frac{3}{x^4}(x-1)(x+1)(x^2 - x + 1)(x^2 + x + 1) = 0$$

implies that $x = \pm 1$ are critical points of f. Though $f'(x)$ does not exist at $x = 0$, $x = 0$ is not a critical point of f because it is not in the domain of f. As x increases through -1, $f'(x)$ makes the sign transition $+, -$; therefore, $f(-1)$ is a local maximum. On the other hand, as x increases through 1, $f'(x)$ makes the sign transition $-, +$; therefore, $f(1)$ is a local minimum.

In Exercises 23–52, find the critical points and the intervals on which the function is increasing or decreasing. Use the First Derivative Test to determine whether the critical point is a local min or max (or neither).

53. Find the minimum value of $f(x) = x^x$ for $x > 0$.

SOLUTION Let $f(x) = x^x$. By logarithmic differentiation, we know that $f'(x) = x^x(1 + \ln x)$. Thus, $x = \frac{1}{e}$ is the only critical point. Because $f'(x) < 0$ for $0 < x < \frac{1}{e}$ and $f'(x) > 0$ for $x > \frac{1}{e}$,

$$f\left(\frac{1}{e}\right) = \left(\frac{1}{e}\right)^{1/e} \approx 0.692201$$

is the minimum value.

54. Show that $f(x) = x^2 + bx + c$ is decreasing on $\left(-\infty, -\frac{b}{2}\right)$ and increasing on $\left(-\frac{b}{2}, \infty\right)$.

SOLUTION Let $f(x) = x^2 + bx + c$. Then $f'(x) = 2x + b = 0$ yields the critical point $c = -\frac{b}{2}$.

- For $x < -\frac{b}{2}$, we have $f'(x) < 0$, so f is decreasing on $\left(-\infty, -\frac{b}{2}\right)$.
- For $x > -\frac{b}{2}$, we have $f'(x) > 0$, so f is increasing on $\left(-\frac{b}{2}, \infty\right)$.

55. Show that $f(x) = x^3 - 2x^2 + 2x$ is an increasing function. *Hint:* Find the minimum value of $f'(x)$.

SOLUTION Let $f(x) = x^3 - 2x^2 + 2x$. For all x, we have

$$f'(x) = 3x^2 - 4x + 2 = 3\left(x - \frac{2}{3}\right)^2 + \frac{2}{3} \geq \frac{2}{3} > 0.$$

Since $f'(x) > 0$ for all x, the function f is everywhere increasing.

56. Find conditions on a and b that ensure that $f(x) = x^3 + ax + b$ is increasing on $(-\infty, \infty)$.

SOLUTION Let $f(x) = x^3 + ax + b$.

- If $a > 0$, then $f'(x) = 3x^2 + a > 0$ and f is increasing for all x.
- If $a = 0$, then

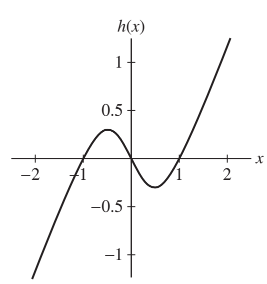
  $$f(x_2) - f(x_1) = (3x_2^3 + b) - (3x_1^3 + b) = 3(x_2 - x_1)(x_2^2 + x_2x_1 + x_1^2) > 0$$

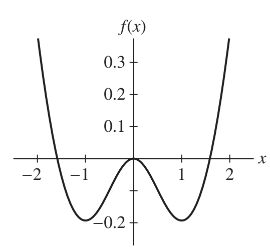
  whenever $x_2 > x_1$. Thus, f is increasing for all x.
- If $a < 0$, then $f'(x) = 3x^2 + a < 0$ and f is decreasing for $|x| < \sqrt{-\frac{a}{3}}$.

In summary, $f(x) = x^3 + ax + b$ is increasing on $(-\infty, \infty)$ whenever $a \geq 0$.

57. $\boxed{\text{GU}}$ Let $h(x) = \dfrac{x(x^2 - 1)}{x^2 + 1}$ and suppose that $f'(x) = h(x)$. Plot $h(x)$ and use the plot to describe the local extrema and the increasing/decreasing behavior of $f(x)$. Sketch a plausible graph for $f(x)$ itself.

SOLUTION The graph of $h(x)$ is shown below at the left. Because $h(x)$ is negative for $x < -1$ and for $0 < x < 1$, it follows that $f(x)$ is decreasing for $x < -1$ and for $0 < x < 1$. Similarly, $f(x)$ is increasing for $-1 < x < 0$ and for $x > 1$ because $h(x)$ is positive on these intervals. Moreover, $f(x)$ has local minima at $x = -1$ and $x = 1$ and a local maximum at $x = 0$. A plausible graph for $f(x)$ is shown below at the right.





58. Sam made two statements that Deborah found dubious.

(a) "The average velocity for my trip was 70 mph; at no point in time did my speedometer read 70 mph."

(b) "A policeman clocked me going 70 mph, but my speedometer never read 65 mph."

In each case, which theorem did Deborah apply to prove Sam's statement false: the Intermediate Value Theorem or the Mean Value Theorem? Explain.

SOLUTION

(a) Deborah is applying the Mean Value Theorem here. Let $s(t)$ be Sam's distance, in miles, from his starting point, let a be the start time for Sam's trip, and let b be the end time of the same trip. Sam is claiming that at no point was

$$s'(t) = \frac{s(b) - s(a)}{b - a}.$$

This violates the MVT.

(b) Deborah is applying the Intermediate Value Theorem here. Let $v(t)$ be Sam's velocity in miles per hour. Sam started out at rest, and reached a velocity of 70 mph. By the IVT, he should have reached a velocity of 65 mph at some point.

59. Determine where $f(x) = (1000 - x)^2 + x^2$ is decreasing. Use this to decide which is larger: $800^2 + 200^2$ or $600^2 + 400^2$.

SOLUTION If $f(x) = (1000 - x)^2 + x^2$, then $f'(x) = -2(1000 - x) + 2x = 4x - 2000$. $f'(x) < 0$ as long as $x < 500$. Therefore, $800^2 + 200^2 = f(200) > f(400) = 600^2 + 400^2$.

60. Show that $f(x) = 1 - |x|$ satisfies the conclusion of the MVT on $[a, b]$ if both a and b are positive or negative, but not if $a < 0$ and $b > 0$.

SOLUTION Let $f(x) = 1 - |x|$.

- If a and b (where $a < b$) are both positive (or both negative), then f is continuous on $[a, b]$ and differentiable on (a, b). Accordingly, the hypotheses of the MVT are met and the theorem does apply. Indeed, in these cases, any point $c \in (a, b)$ satisfies the conclusion of the MVT (since f' is constant on $[a, b]$ in these instances).
- For $a = -2$ and $b = 1$, we have $\dfrac{f(b) - f(a)}{b - a} = \dfrac{0 - (-1)}{1 - (-2)} = \dfrac{1}{3}$. Yet there is no point $c \in (-2, 1)$ such that $f'(c) = \frac{1}{3}$. Indeed, $f'(x) = 1$ for $x < 0$, $f'(x) = -1$ for $x > 0$, and $f'(0)$ is undefined. The MVT does not apply in this case, since f is not differentiable on the open interval $(-2, 1)$.

61. Which values of c satisfy the conclusion of the MVT on the interval $[a, b]$ if $f(x)$ is a linear function?

SOLUTION Let $f(x) = px + q$, where p and q are constants. Then the slope of *every* secant line and tangent line of f is p. Accordingly, considering the interval $[a, b]$, *every* point $c \in (a, b)$ satisfies $f'(c) = p = \dfrac{f(b) - f(a)}{b - a}$, the conclusion of the MVT.

62. Show that if $f(x)$ is any quadratic polynomial, then the midpoint $c = \dfrac{a + b}{2}$ satisfies the conclusion of the MVT on $[a, b]$ for any a and b.

SOLUTION Let $f(x) = px^2 + qx + r$ with $p \neq 0$ and consider the interval $[a, b]$. Then $f'(x) = 2px + q$, and by the MVT we have

$$2pc + q = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{\left(pb^2 + qb + r\right) - \left(pa^2 + qa + r\right)}{b - a}$$
$$= \frac{(b - a)\,(p\,(b + a) + q)}{b - a} = p\,(b + a) + q$$

Thus $2pc + q = p(a + b) + q$, and $c = \dfrac{a + b}{2}$.

63. Suppose that $f(0) = 2$ and $f'(x) \le 3$ for $x > 0$. Apply the MVT to the interval $[0, 4]$ to prove that $f(4) \le 14$. Prove more generally that $f(x) \le 2 + 3x$ for all $x > 0$.

SOLUTION The MVT, applied to the interval $[0, 4]$, guarantees that there exists a $c \in (0, 4)$ such that

$$f'(c) = \frac{f(4) - f(0)}{4 - 0} \qquad \text{or} \qquad f(4) - f(0) = 4f'(c).$$

Because $c > 0$, $f'(c) \le 3$, so $f(4) - f(0) \le 12$. Finally, $f(4) \le f(0) + 12 = 14$.

More generally, let $x > 0$. The MVT, applied to the interval $[0, x]$, guarantees there exists a $c \in (0, x)$ such that

$$f'(c) = \frac{f(x) - f(0)}{x - 0} \qquad \text{or} \qquad f(x) - f(0) = f'(c)x.$$

Because $c > 0$, $f'(c) \le 3$, so $f(x) - f(0) \le 3x$. Finally, $f(x) \le f(0) + 3x = 3x + 2$.

64. Show that if $f(2) = -2$ and $f'(x) \ge 5$ for $x > 2$, then $f(4) \ge 8$.

SOLUTION The MVT, applied to the interval $[2, 4]$, guarantees there exists a $c \in (2, 4)$ such that

$$f'(c) = \frac{f(4) - f(2)}{4 - 2} \qquad \text{or} \qquad f(4) - f(2) = 2f'(c).$$

Because $f'(x) \ge 5$, it follows that $f(4) - f(2) \ge 10$, or $f(4) \ge f(2) + 10 = 8$.

65. Show that if $f(2) = 5$ and $f'(x) \geq 10$ for $x > 2$, then $f(x) \geq 10x - 15$ for all $x > 2$.

SOLUTION Let $x > 2$. The MVT, applied to the interval $[2, x]$, guarantees there exists a $c \in (2, x)$ such that

$$f'(c) = \frac{f(x) - f(2)}{x - 2} \qquad \text{or} \qquad f(x) - f(2) = (x - 2) f'(c).$$

Because $f'(x) \geq 10$, it follows that $f(x) - f(2) \geq 10(x - 2)$, or $f(x) \geq f(2) + 10(x - 2) = 10x - 15$.

Further Insights and Challenges

66. Show that a cubic function $f(x) = x^3 + ax^2 + bx + c$ is increasing on $(-\infty, \infty)$ if $b > a^2/3$.

SOLUTION Let $f(x) = x^3 + ax^2 + bx + c$. Then $f'(x) = 3x^2 + 2ax + b = 3\left(x + \frac{a}{3}\right)^2 - \frac{a^2}{3} + b > 0$ for all x if $b - \frac{a^2}{3} > 0$. Therefore, if $b > a^2/3$, then $f(x)$ is increasing on $(-\infty, \infty)$.

67. Prove that if $f(0) = g(0)$ and $f'(x) \leq g'(x)$ for $x \geq 0$, then $f(x) \leq g(x)$ for all $x \geq 0$. *Hint:* Show that $f(x) - g(x)$ is nonincreasing.

SOLUTION Let $h(x) = f(x) - g(x)$. By the sum rule, $h'(x) = f'(x) - g'(x)$. Since $f'(x) \leq g'(x)$ for all $x \geq 0$, $h'(x) \leq 0$ for all $x \geq 0$. This implies that h is nonincreasing. Since $h(0) = f(0) - g(0) = 0$, $h(x) \leq 0$ for all $x \geq 0$ (as h is nonincreasing, it cannot climb above zero). Hence $f(x) - g(x) \leq 0$ for all $x \geq 0$, and so $f(x) \leq g(x)$ for $x \geq 0$.

68. Use Exercise 67 to prove that $x \leq \tan x$ for $0 \leq x < \frac{\pi}{2}$.

SOLUTION Let $f(x) = x$ and $g(x) = \tan x$. Then $f(0) = g(0) = 0$ and $f'(x) = 1 \leq \sec^2 x = g'(x)$ for $0 \leq x < \frac{\pi}{2}$. Apply the result of Exercise 67 to conclude that $x \leq \tan x$ for $0 \leq x < \frac{\pi}{2}$.

69. Use Exercise 67 and the inequality $\sin x \leq x$ for $x \geq 0$ (established in Theorem 3 of Section 2.6) to prove the following assertions for all $x \geq 0$ (each assertion follows from the previous one).

(a) $\cos x \geq 1 - \frac{1}{2}x^2$

(b) $\sin x \geq x - \frac{1}{6}x^3$

(c) $\cos x \leq 1 - \frac{1}{2}x^2 + \frac{1}{24}x^4$

(d) Can you guess the next inequality in the series?

SOLUTION

(a) We prove this using Exercise 67: Let $g(x) = \cos x$ and $f(x) = 1 - \frac{1}{2}x^2$. Then $f(0) = g(0) = 1$ and $g'(x) = -\sin x \geq -x = f'(x)$ for $x \geq 0$ by Exercise 68. Now apply Exercise 67 to conclude that $\cos x \geq 1 - \frac{1}{2}x^2$ for $x \geq 0$.

(b) Let $g(x) = \sin x$ and $f(x) = x - \frac{1}{6}x^3$. Then $f(0) = g(0) = 0$ and $g'(x) = \cos x \geq 1 - \frac{1}{2}x^2 = f'(x)$ for $x \geq 0$ by part (a). Now apply Exercise 67 to conclude that $\sin x \geq x - \frac{1}{6}x^3$ for $x \geq 0$.

(c) Let $g(x) = 1 - \frac{1}{2}x^2 + \frac{1}{24}x^4$ and $f(x) = \cos x$. Then $f(0) = g(0) = 1$ and $g'(x) = -x + \frac{1}{6}x^3 \geq -\sin x = f'(x)$ for $x \geq 0$ by part (b). Now apply Exercise 67 to conclude that $\cos x \leq 1 - \frac{1}{2}x^2 + \frac{1}{24}x^4$ for $x \geq 0$.

(d) The next inequality in the series is $\sin x \leq x - \frac{1}{6}x^3 + \frac{1}{120}x^5$, valid for $x \geq 0$. To construct (d) from (c), we note that the derivative of $\sin x$ is $\cos x$, and look for a polynomial (which we currently must do by educated guess) whose derivative is $1 - \frac{1}{2}x^2 + \frac{1}{24}x^4$. We know the derivative of x is 1, and that a term whose derivative is $-\frac{1}{2}x^2$ should be of the form Cx^3. $\frac{d}{dx}Cx^3 = 3Cx^2 = -\frac{1}{2}x^2$, so $C = -\frac{1}{6}$. A term whose derivative is $\frac{1}{24}x^4$ should be of the form Dx^5. From this, $\frac{d}{dx}Dx^5 = 5Dx^4 = \frac{1}{24}x^4$, so that $5D = \frac{1}{24}$, or $D = \frac{1}{120}$.

70. Let $f(x) = e^{-x}$. Use the method of Exercise 69 to prove the following inequalities for $x \geq 0$.

(a) $e^{-x} \geq 1 - x$

(b) $e^{-x} \leq 1 - x + \frac{1}{2}x^2$

(c) $e^{-x} \geq 1 - x + \frac{1}{2}x^2 - \frac{1}{6}x^3$

Can you guess the next inequality in the series?

SOLUTION

(a) Let $f(x) = 1 - x$ and $g(x) = e^{-x}$. Then $f(0) = g(0) = 1$ and, for $x \geq 0$,

$$f'(x) = -1 \leq -e^{-x} = g'(x).$$

Thus, by Exercise 67 we conclude that $e^{-x} \geq 1 - x$ for $x \geq 0$.

(b) Let $f(x) = e^{-x}$ and $g(x) = 1 - x + \frac{1}{2}x^2$. Then $f(0) = g(0) = 1$ and, for $x \geq 0$,

$$f'(x) = -e^{-x} \leq x - 1 = g'(x)$$

by the result from part (a). Thus, by Exercise 67 we conclude that $e^{-x} \leq 1 - x + \dfrac{1}{2}x^2$ for $x \geq 0$.

(c) Let $f(x) = 1 - x + \frac{1}{2}x^2 - \frac{1}{6}x^3$ and $g(x) = e^{-x}$. Then $f(0) = g(0) = 1$ and, for $x \geq 0$,

$$f'(x) = -1 + x - \frac{1}{2}x^2 \leq -e^{-x} = g'(x)$$

by the result from part (b). Thus, by Exercise 67 we conclude that $e^{-x} \geq 1 - x + \dfrac{1}{2}x^2 - \dfrac{1}{6}x^3$ for $x \geq 0$.

The next inequality in the series is $e^{-x} \leq 1 - x + \dfrac{1}{2}x^2 - \dfrac{1}{6}x^3 + \dfrac{1}{24}x^4$ for $x \geq 0$

71. Assume that f'' exists and $f''(x) = 0$ for all x. Prove that $f(x) = mx + b$, where $m = f'(0)$ and $b = f(0)$.

SOLUTION

- Let $f''(x) = 0$ for all x. Then $f'(x) =$ constant for all x. Since $f'(0) = m$, we conclude that $f'(x) = m$ for all x.
- Let $g(x) = f(x) - mx$. Then $g'(x) = f'(x) - m = m - m = 0$ which implies that $g(x) =$ constant for all x and consequently $f(x) - mx =$ constant for all x. Rearranging the statement, $f(x) = mx +$ constant. Since $f(0) = b$, we conclude that $f(x) = mx + b$ for all x.

72. Define $f(x) = x^3 \sin\left(\frac{1}{x}\right)$ for $x \neq 0$ and $f(0) = 0$.
(a) Show that $f'(x)$ is continuous at $x = 0$ and that $x = 0$ is a critical point of f.
(b) GU Examine the graphs of $f(x)$ and $f'(x)$. Can the First Derivative Test be applied?
(c) Show that $f(0)$ is neither a local min nor a local max.

SOLUTION

(a) Let $f(x) = x^3 \sin(\frac{1}{x})$. Then

$$f'(x) = 3x^2 \sin\left(\frac{1}{x}\right) + x^3 \cos\left(\frac{1}{x}\right)(-x^{-2}) = x\left(3x \sin\left(\frac{1}{x}\right) - \cos\left(\frac{1}{x}\right)\right).$$

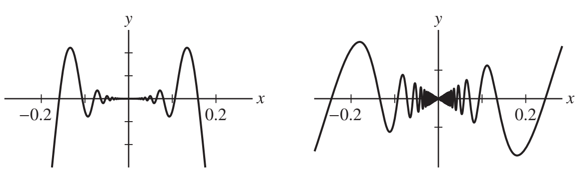
This formula is not defined at $x = 0$, but its limit is. Since $-1 \leq \sin x \leq 1$ and $-1 \leq \cos x \leq 1$ for all x,

$$|f'(x)| = |x|\left|3x \sin\left(\frac{1}{x}\right) - \cos\left(\frac{1}{x}\right)\right| \leq |x|\left(\left|3x \sin\left(\frac{1}{x}\right)\right| + \left|\cos\left(\frac{1}{x}\right)\right|\right) \leq |x|(3|x| + 1)$$

so, by the Squeeze Theorem, $\lim\limits_{x\to 0} |f'(x)| = 0$. But does $f'(0) = 0$? We check using the limit definition of the derivative:

$$f'(0) = \lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} x^2 \sin\left(\frac{1}{x}\right) = 0.$$

Thus $f'(x)$ is continuous at $x = 0$, and $x = 0$ is a critical point of f.
(b) The figure below at the left shows $f(x)$, and the figure below at the right shows $f'(x)$. Note how the two functions oscillate near $x = 0$, which implies that the First Derivative Test cannot be applied.



(c) As x approaches 0 from either direction, $f(x)$ alternates between positive and negative arbitrarily close to $x = 0$. This means that $f(0)$ cannot be a local minimum (since $f(x)$ gets lower than $f(0)$ arbitrarily close to 0), nor can $f(0)$ be a local maximum (since $f(x)$ takes values higher than $f(0)$ arbitrarily close to $x = 0$). Therefore $f(0)$ is neither a local minimum nor a local maximum of f.

73. Suppose that $f(x)$ satisfies the following equation (an example of a **differential equation**):

$$f''(x) = -f(x) \qquad \boxed{1}$$

(a) Show that $f(x)^2 + f'(x)^2 = f(0)^2 + f'(0)^2$ for all x. *Hint:* Show that the function on the left has zero derivative.
(b) Verify that $\sin x$ and $\cos x$ satisfy Eq. (1), and deduce that $\sin^2 x + \cos^2 x = 1$.

SOLUTION

(a) Let $g(x) = f(x)^2 + f'(x)^2$. Then

$$g'(x) = 2f(x)f'(x) + 2f'(x)f''(x) = 2f(x)f'(x) + 2f'(x)(-f(x)) = 0,$$

where we have used the fact that $f''(x) = -f(x)$. Because $g'(0) = 0$ for all x, $g(x) = f(x)^2 + f'(x)^2$ must be a constant function. In other words, $f(x)^2 + f'(x)^2 = C$ for some constant C. To determine the value of C, we can substitute any number for x. In particular, for this problem, we want to substitute $x = 0$ and find $C = f(0)^2 + f'(0)^2$. Hence,

$$f(x)^2 + f'(x)^2 = f(0)^2 + f'(0)^2.$$

(b) Let $f(x) = \sin x$. Then $f'(x) = \cos x$ and $f''(x) = -\sin x$, so $f''(x) = -f(x)$. Next, let $f(x) = \cos x$. Then $f'(x) = -\sin x$, $f''(x) = -\cos x$, and we again have $f''(x) = -f(x)$. Finally, if we take $f(x) = \sin x$, the result from part (a) guarantees that

$$\sin^2 x + \cos^2 x = \sin^2 0 + \cos^2 0 = 0 + 1 = 1.$$

74. Suppose that functions f and g satisfy Eq. (1) and have the same initial values—that is, $f(0) = g(0)$ and $f'(0) = g'(0)$. Prove that $f(x) = g(x)$ for all x. *Hint:* Apply Exercise 73(a) to $f - g$.

SOLUTION Let $h(x) = f(x) - g(x)$. Then

$$h''(x) = f''(x) - g''(x) = -f(x) - (-g(x)) = -(f(x) - g(x)) = -h(x).$$

Furthermore, $h(0) = f(0) - g(0) = 0$ and $h'(0) = f'(0) - g'(0) = 0$. Thus, by part (a) of Exercise 73, $h(x)^2 + h'(x)^2 = 0$. This can only happen if $h(x) = 0$ for all x, or, equivalently, $f(x) = g(x)$ for all x.

75. Use Exercise 74 to prove: $f(x) = \sin x$ is the unique solution of Eq. (1) such that $f(0) = 0$ and $f'(0) = 1$; and $g(x) = \cos x$ is the unique solution such that $g(0) = 1$ and $g'(0) = 0$. This result can be used to develop all the properties of the trigonometric functions "analytically"—that is, without reference to triangles.

SOLUTION In part (b) of Exercise 73, it was shown that $f(x) = \sin x$ satisfies Eq. (1), and we can directly calculate that $f(0) = \sin 0 = 0$ and $f'(0) = \cos 0 = 1$. Suppose there is another function, call it $F(x)$, that satisfies Eq. (1) with the same initial conditions: $F(0) = 0$ and $F'(0) = 1$. By Exercise 74, it follows that $F(x) = \sin x$ for all x. Hence, $f(x) = \sin x$ is the unique solution of Eq. (1) satisfying $f(0) = 0$ and $f'(0) = 1$. The proof that $g(x) = \cos x$ is the unique solution of Eq. (1) satisfying $g(0) = 1$ and $g'(0) = 0$ is carried out in a similar manner.

4.4 The Shape of a Graph

Preliminary Questions

1. If f is concave up, then f' is (choose one):

(a) increasing **(b)** decreasing

SOLUTION The correct response is **(a)**: increasing. If the function is concave up, then f'' is positive. Since f'' is the derivative of f', it follows that the derivative of f' is positive and f' must therefore be increasing.

2. What conclusion can you draw if $f'(c) = 0$ and $f''(c) < 0$?

SOLUTION If $f'(c) = 0$ and $f''(c) < 0$, then $f(c)$ is a local maximum.

3. True or False? If $f(c)$ is a local min, then $f''(c)$ must be positive.

SOLUTION False. $f''(c)$ could be zero.

4. True or False? If $f''(x)$ changes from $+$ to $-$ at $x = c$, then f has a point of inflection at $x = c$.

SOLUTION False. f will have a point of inflection at $x = c$ only if $x = c$ is in the domain of f.

Exercises

1. Match the graphs in Figure 13 with the description:

(a) $f''(x) < 0$ for all x.

(b) $f''(x)$ goes from $+$ to $-$.

(c) $f''(x) > 0$ for all x.

(d) $f''(x)$ goes from $-$ to $+$.

(A) (B) (C) (D)

FIGURE 13

SOLUTION

(a) In C, we have $f''(x) < 0$ for all x.

(b) In A, $f''(x)$ goes from $+$ to $-$.

(c) In B, we have $f''(x) > 0$ for all x.

(d) In D, $f''(x)$ goes from $-$ to $+$.

2. Match each statement with a graph in Figure 14 that represents company profits as a function of time.
(a) The outlook is great: The growth rate keeps increasing.
(b) We're losing money, but not as quickly as before.
(c) We're losing money, and it's getting worse as time goes on.
(d) We're doing well, but our growth rate is leveling off.
(e) Business had been cooling off, but now it's picking up.
(f) Business had been picking up, but now it's cooling off.

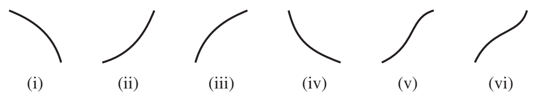


FIGURE 14

SOLUTION
(a) **(ii)** An increasing growth rate implies an increasing f', and so a graph that is concave up.
(b) **(iv)** "Losing money" implies a downward curve. "Not as fast" implies that f' is becoming less negative, so that $f''(x) > 0$.
(c) **(i)** "Losing money" implies a downward curve. "Getting worse" implies that f' is becoming more negative, so the curve is concave down.
(d) **(iii)** "We're doing well" implies that f is increasing, but "the growth rate is leveling off" implies that f' is decreasing, so that the graph is concave down.
(e) **(vi)** "Cooling off" generally means increasing at a decreasing rate. The use of "had" implies that only the beginning of the graph is that way. The phrase "...now it's picking up" implies that the end of the graph is concave up.
(f) **(v)** "Business had been picking up" implies that the graph started out concave up. The phrase "…but now it's cooling off" implies that the graph ends up concave down.

In Exercises 3–18, determine the intervals on which the function is concave up or down and find the points of inflection.

3. $y = x^2 - 4x + 3$

SOLUTION Let $f(x) = x^2 - 4x + 3$. Then $f'(x) = 2x - 4$ and $f''(x) = 2 > 0$ for all x. Therefore, f is concave up everywhere, and there are no points of inflection.

4. $y = t^3 - 6t^2 + 4$

SOLUTION Let $f(t) = t^3 - 6t^2 + 4$. Then $f'(t) = 3t^2 - 12t$ and $f''(t) = 6t - 12 = 0$ at $t = 2$. Now, f is concave up on $(2, \infty)$, since $f''(t) > 0$ there. Moreover, f is concave down on $(-\infty, 2)$, since $f''(t) < 0$ there. Finally, because $f''(t)$ changes sign at $t = 2$, $f(t)$ has a point of inflection at $t = 2$.

5. $y = 10x^3 - x^5$

SOLUTION Let $f(x) = 10x^3 - x^5$. Then $f'(x) = 30x^2 - 5x^4$ and $f''(x) = 60x - 20x^3 = 20x(3 - x^2)$. Now, f is concave up for $x < -\sqrt{3}$ and for $0 < x < \sqrt{3}$ since $f''(x) > 0$ there. Moreover, f is concave down for $-\sqrt{3} < x < 0$ and for $x > \sqrt{3}$ since $f''(x) < 0$ there. Finally, because $f''(x)$ changes sign at $x = 0$ and at $x = \pm\sqrt{3}$, $f(x)$ has a point of inflection at $x = 0$ and at $x = \pm\sqrt{3}$.

6. $y = 5x^2 + x^4$

SOLUTION Let $f(x) = 5x^2 + x^4$. Then $f'(x) = 10x + 4x^3$ and $f''(x) = 10 + 12x^2 > 10$ for all x. Thus, f is concave up for all x and has no points of inflection.

7. $y = \theta - 2\sin\theta, \quad [0, 2\pi]$

SOLUTION Let $f(\theta) = \theta - 2\sin\theta$. Then $f'(\theta) = 1 - 2\cos\theta$ and $f''(\theta) = 2\sin\theta$. Now, f is concave up for $0 < \theta < \pi$ since $f''(\theta) > 0$ there. Moreover, f is concave down for $\pi < \theta < 2\pi$ since $f''(\theta) < 0$ there. Finally, because $f''(\theta)$ changes sign at $\theta = \pi$, $f(\theta)$ has a point of inflection at $\theta = \pi$.

8. $y = \theta + \sin^2\theta, \quad [0, \pi]$

SOLUTION Let $f(\theta) = \theta + \sin^2\theta$. Then $f'(\theta) = 1 + 2\sin\theta\cos\theta = 1 + \sin 2\theta$ and $f''(\theta) = 2\cos 2\theta$. Now, f is concave up for $0 < \theta < \pi/4$ and for $3\pi/4 < \theta < \pi$ since $f''(\theta) > 0$ there. Moreover, f is concave down for $\pi/4 < \theta < 3\pi/4$ since $f''(\theta) < 0$ there. Finally, because $f''(\theta)$ changes sign at $\theta = \pi/4$ and at $\theta = 3\pi/4$, $f(\theta)$ has a point of inflection at $\theta = \pi/4$ and at $\theta = 3\pi/4$.

9. $y = x(x - 8\sqrt{x}) \quad (x \geq 0)$

SOLUTION Let $f(x) = x(x - 8\sqrt{x}) = x^2 - 8x^{3/2}$. Then $f'(x) = 2x - 12x^{1/2}$ and $f''(x) = 2 - 6x^{-1/2}$. Now, f is concave down for $0 < x < 9$ since $f''(x) < 0$ there. Moreover, f is concave up for $x > 9$ since $f''(x) > 0$ there. Finally, because $f''(x)$ changes sign at $x = 9$, $f(x)$ has a point of inflection at $x = 9$.

10. $y = x^{7/2} - 35x^2$

SOLUTION Let $f(x) = x^{7/2} - 35x^2$. Then

$$f'(x) = \frac{7}{2}x^{5/2} - 70x \quad \text{and} \quad f''(x) = \frac{35}{4}x^{3/2} - 70.$$

Now, f is concave down for $0 < x < 4$ since $f''(x) < 0$ there. Moreover, f is concave up for $x > 4$ since $f''(x) > 0$ there. Finally, because $f''(x)$ changes sign at $x = 4$, $f(x)$ has a point of inflection at $x = 4$.

11. $y = (x-2)(1-x^3)$

SOLUTION Let $f(x) = (x-2)\left(1-x^3\right) = x - x^4 - 2 + 2x^3$. Then $f'(x) = 1 - 4x^3 + 6x^2$ and $f''(x) = 12x - 12x^2 = 12x(1-x) = 0$ at $x = 0$ and $x = 1$. Now, f is concave up on $(0, 1)$ since $f''(x) > 0$ there. Moreover, f is concave down on $(-\infty, 0) \cup (1, \infty)$ since $f''(x) < 0$ there. Finally, because $f''(x)$ changes sign at both $x = 0$ and $x = 1$, $f(x)$ has a point of inflection at both $x = 0$ and $x = 1$.

12. $y = x^{7/5}$

SOLUTION Let $f(x) = x^{7/5}$. Then $f'(x) = \frac{7}{5}x^{2/5}$ and $f''(x) = \frac{14}{25}x^{-3/5}$. Now, f is concave down for $x < 0$ since $f''(x) < 0$ there. Moreover, f is concave up for $x > 0$ since $f''(x) > 0$ there. Finally, because $f''(x)$ changes sign at $x = 0$, $f(x)$ has a point of inflection at $x = 0$.

13. $y = \dfrac{1}{x^2+3}$

SOLUTION Let $f(x) = \dfrac{1}{x^2+3}$. Then $f'(x) = -\dfrac{2x}{(x^2+3)^2}$ and

$$f''(x) = -\frac{2(x^2+3)^2 - 8x^2(x^2+3)}{(x^2+3)^4} = \frac{6x^2-6}{(x^2+3)^3}.$$

Now, f is concave up for $|x| > 1$ since $f''(x) > 0$ there. Moreover, f is concave down for $|x| < 1$ since $f''(x) < 0$ there. Finally, because $f''(x)$ changes sign at both $x = -1$ and $x = 1$, $f(x)$ has a point of inflection at both $x = -1$ and $x = 1$.

14. $y = \dfrac{x}{x^2+9}$

SOLUTION Let $f(x) = \frac{x}{x^2+9}$. Then

$$f'(x) = \frac{(x^2+9)(1) - x(2x)}{(x^2+9)^2} = \frac{9-x^2}{(x^2+9)^2}$$

and

$$f''(x) = \frac{(x^2+9)^2(-2x) - (9-x^2)(2)(x^2+9)(2x)}{(x^2+9)^4} = \frac{2x(x^2-27)}{(x^2+9)^3}.$$

Now, f is concave up for $-3\sqrt{3} < x < 0$ and for $x > 3\sqrt{3}$ since $f''(x) > 0$ there. Moreover, f is concave down for $x < -3\sqrt{3}$ and for $0 < x < 3\sqrt{3}$ since $f''(x) < 0$ there. Finally, because $f''(x)$ changes sign at $x = 0$ and at $x = \pm 3\sqrt{3}$, $f(x)$ has a point of inflection at $x = 0$ and at $x = \pm 3\sqrt{3}$.

15. $y = xe^{-3x}$

SOLUTION Let $f(x) = xe^{-3x}$. Then $f'(x) = -3xe^{-3x} + e^{-3x} = (1-3x)e^{-3x}$ and $f''(x) = -3(1-3x)e^{-3x} - 3e^{-3x} = (9x-6)e^{-3x}$. Now, f is concave down for $x < \frac{2}{3}$ since $f''(x) < 0$ there. Moreover, f is concave up for $x > \frac{2}{3}$ since $f''(x) > 0$ there. Finally, because $f''(x)$ changes sign at $x = \frac{2}{3}$, $x = \frac{2}{3}$ is a point of inflection.

16. $y = (x^2-7)e^x$

SOLUTION Let $f(x) = (x^2-7)e^x$. Then $f'(x) = (x^2-7)e^x + 2xe^x = (x^2 + 2x07)e^x$ and $f''(x) = (x^2 + 2x - 7)e^x + (2x+2)e^x = (x+5)(x-1)e^x$. Now, f is concave up for $x < -5$ and for $x > 1$ since $f''(x) > 0$ there. Moreover, f is concave down for $-5 < x < 1$ since $f''(x) < 0$ there. Finally, because $f''(x)$ changes sign at $x = -5$ and at $x = 1$, f has a point of inflection at $x = -5$ and at $x = 1$.

17. $y = 2x^2 + \ln x \quad (x > 0)$

SOLUTION Let $f(x) = 2x^2 + \ln x$. Then $f'(x) = 4x + x^{-1}$ and $f''(x) = 4 - x^{-2}$. Now, f is concave down for $x < \frac{1}{2}$ since $f''(x) < 0$ there. Moreover, f is concave up for $x > \frac{1}{2}$ since $f''(x) > 0$ there. Finally, because $f''(x)$ changes sign at $x = \frac{1}{2}$, f has a point of inflection at $x = \frac{1}{2}$.

18. $y = x - \ln x \quad (x > 0)$

SOLUTION Let $f(x) = x - \ln x$. Then $f'(x) = 1 - 1/x$ and $f''(x) = x^{-2} > 0$ for all $x > 0$. Thus, f is concave up for all $x > 0$ and has no points of inflection.

19. The growth of a sunflower during the first 100 days after sprouting is modeled well by the *logistic curve* $y = h(t)$ shown in Figure 15. Estimate the growth rate at the point of inflection and explain its significance. Then make a rough sketch of the first and second derivatives of $h(t)$.

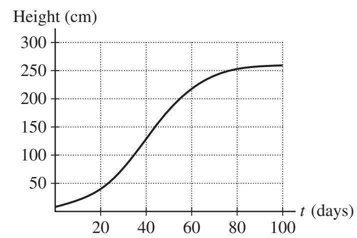

FIGURE 15

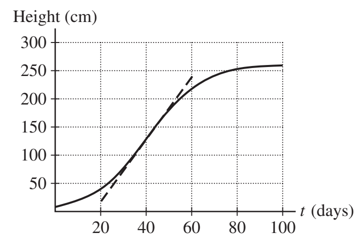
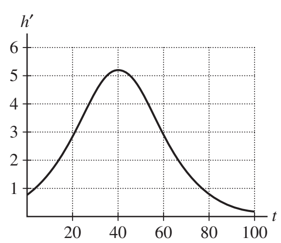
SOLUTION The point of inflection in Figure 15 appears to occur at $t = 40$ days. The graph below shows the logistic curve with an approximate tangent line drawn at $t = 40$. The approximate tangent line passes roughly through the points (20, 20) and (60, 240). The growth rate at the point of inflection is thus

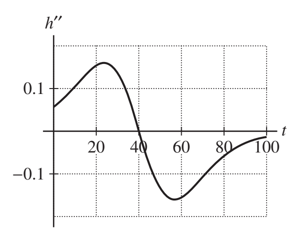
$$\frac{240 - 20}{60 - 20} = \frac{220}{40} = 5.5 \text{ cm/day}.$$

Because the logistic curve changes from concave up to concave down at $t = 40$, the growth rate at this point is the maximum growth rate for the sunflower plant.



Sketches of the first and second derivative of $h(t)$ are shown below at the left and at the right, respectively.





20. Assume that Figure 16 is the graph of $f(x)$. Where do the points of inflection of $f(x)$ occur, and on which interval is $f(x)$ concave down?

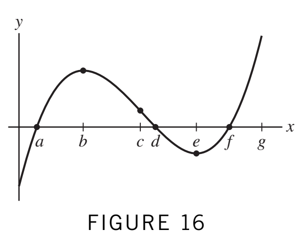


FIGURE 16

SOLUTION The function in Figure 16 changes concavity at $x = c$; therefore, there is a single point of inflection at $x = c$. The graph is concave down for $x < c$.

21. Repeat Exercise 20 but assume that Figure 16 is the graph of the *derivative* $f'(x)$.

SOLUTION Points of inflection occur when $f''(x)$ changes sign. Consequently, points of inflection occur when $f'(x)$ changes from increasing to decreasing or from decreasing to increasing. In Figure 16, this occurs at $x = b$ and at $x = e$; therefore, $f(x)$ has an inflection point at $x = b$ and another at $x = e$. The function $f(x)$ will be concave down when $f''(x) < 0$ or when $f'(x)$ is decreasing. Thus, $f(x)$ is concave down for $b < x < e$.

22. Repeat Exercise 20 but assume that Figure 16 is the graph of the *second derivative* $f''(x)$.

SOLUTION Inflection points occur when $f''(x)$ changes sign; therefore, $f(x)$ has inflection points at $x = a$, $x = d$ and $x = f$. The function $f(x)$ is concave down for $x < a$ and for $d < x < f$.

23. Figure 17 shows the *derivative* $f'(x)$ on [0, 1.2]. Locate the points of inflection of $f(x)$ and the points where the local minima and maxima occur. Determine the intervals on which $f(x)$ has the following properties:

(a) Increasing
(b) Decreasing
(c) Concave up
(d) Concave down

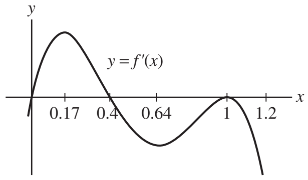

FIGURE 17

SOLUTION Recall that the graph is that of f', *not* f. The inflection points of f occur where f' changes from increasing to decreasing or vice versa because it is at these points that the sign of f'' changes. From the graph we conclude that f has points of inflection at $x = 0.17$, $x = 0.64$, and $x = 1$. The local extrema of f occur where f' changes sign. This occurs at $x = 0.4$. Because the sign of f' changes from + to −, $f(0.4)$ is a local maximum. There are no local minima.

(a) f is increasing when f' is positive. Hence, f is increasing on $(0, 0.4)$.

(b) f is decreasing when f' is negative. Hence, f is decreasing on $(0.4, 1) \cup (1, 1.2)$.

(c) Now f is concave up where f' is increasing. This occurs on $(0, 0.17) \cup (0.64, 1)$.

(d) Moreover, f is concave down where f' is decreasing. This occurs on $(0.17, 0.64) \cup (1, 1.2)$.

24. Leticia has been selling solar-powered laptop chargers through her website, with monthly sales as recorded below. In a report to investors, she states, "Sales reached a point of inflection when I started using pay-per-click advertising." In which month did that occur? Explain.

Month	1	2	3	4	5	6	7	8
Sales	2	30	50	60	90	150	230	340

SOLUTION Note that in successive months, sales increased by 28, 20, 10, 30, 60, 80 and 110. Until month 5, the rate of increase in sales was decreasing. After month 5, the rate of increase in sales increased. Thus, Leticia began using pay-per-click advertising in month 5.

In Exercises 25–38, find the critical points and apply the Second Derivative Test.

25. $f(x) = x^3 - 12x^2 + 45x$

SOLUTION Let $f(x) = x^3 - 12x^2 + 45x$. Then $f'(x) = 3x^2 - 24x + 45 = 3(x-3)(x-5)$, and the critical points are $x = 3$ and $x = 5$. Moreover, $f''(x) = 6x - 24$, so $f''(3) = -6 < 0$ and $f''(5) = 6 > 0$. Therefore, by the Second Derivative Test, $f(3) = 54$ is a local maximum, and $f(5) = 50$ is a local minimum.

26. $f(x) = x^4 - 8x^2 + 1$

SOLUTION Let $f(x) = x^4 - 8x^2 + 1$. Then $f'(x) = 4x^3 - 16x = 4x(x^2 - 4)$, and the critical points are $x = 0$ and $x = \pm 2$. Moreover, $f''(x) = 12x^2 - 16$, so $f''(-2) = f''(2) = 32 > 0$ and $f''(0) = -16 < 0$. Therefore, by the second derivative test, $f(-2) = -15$ and $f(2) = -15$ are local minima, and $f(0) = 1$ is a local maximum.

27. $f(x) = 3x^4 - 8x^3 + 6x^2$

SOLUTION Let $f(x) = 3x^4 - 8x^3 + 6x^2$. Then $f'(x) = 12x^3 - 24x^2 + 12x = 12x(x-1)^2 = 0$ at $x = 0, 1$ and $f''(x) = 36x^2 - 48x + 12$. Thus, $f''(0) > 0$, which implies $f(0)$ is a local minimum; however, $f''(1) = 0$, which is inconclusive.

28. $f(x) = x^5 - x^3$

SOLUTION Let $f(x) = x^5 - x^3$. Then $f'(x) = 5x^4 - 3x^2 = x^2(5x^2 - 3) = 0$ at $x = 0$, $x = \pm\sqrt{\frac{3}{5}}$ and $f''(x) = 20x^3 - 6x = x(20x^2 - 6)$. Thus, $f''\left(\sqrt{\frac{3}{5}}\right) > 0$, which implies $f\left(\sqrt{\frac{3}{5}}\right)$ is a local minimum, and $f''\left(-\sqrt{\frac{3}{5}}\right) < 0$, which implies that $f\left(-\sqrt{\frac{3}{5}}\right)$ is a local maximum; however, $f''(0) = 0$, which is inconclusive.

29. $f(x) = \dfrac{x^2 - 8x}{x + 1}$

SOLUTION Let $f(x) = \dfrac{x^2 - 8x}{x + 1}$. Then

$$f'(x) = \frac{x^2 + 2x - 8}{(x + 1)^2} \quad \text{and} \quad f''(x) = \frac{2(x + 1)^2 - 2(x^2 + 2x - 8)}{(x + 1)^3}.$$

Thus, the critical points are $x = -4$ and $x = 2$. Moreover, $f''(-4) < 0$ and $f''(2) > 0$. Therefore, by the second derivative test, $f(-4) = -16$ is a local maximum and $f(2) = -4$ is a local minimum.

30. $f(x) = \dfrac{1}{x^2 - x + 2}$

SOLUTION Let $f(x) = \dfrac{1}{x^2 - x + 2}$. Then $f'(x) = \dfrac{-2x + 1}{(x^2 - x + 2)^2} = 0$ at $x = \frac{1}{2}$ and

$$f''(x) = \frac{-2(x^2 - x + 2) + 2(2x - 1)^2}{(x^2 - x + 2)^3}.$$

Thus $f''\left(\frac{1}{2}\right) < 0$, which implies that $f\left(\frac{1}{2}\right)$ is a local maximum.

31. $y = 6x^{3/2} - 4x^{1/2}$

SOLUTION Let $f(x) = 6x^{3/2} - 4x^{1/2}$. Then $f'(x) = 9x^{1/2} - 2x^{-1/2} = x^{-1/2}(9x - 2)$, so there are two critical points: $x = 0$ and $x = \frac{2}{9}$. Now,

$$f''(x) = \frac{9}{2}x^{-1/2} + x^{-3/2} = \frac{1}{2}x^{-3/2}(9x + 2).$$

Thus, $f''\left(\frac{2}{9}\right) > 0$, which implies $f\left(\frac{2}{9}\right)$ is a local minimum. $f''(x)$ is undefined at $x = 0$, so the Second Derivative Test cannot be applied there.

32. $y = 9x^{7/3} - 21x^{1/2}$

SOLUTION Let $f(x) = 9x^{7/3} - 21x^{1/2}$. Then $f'(x) = 21x^{4/3} - \frac{21}{2}x^{-1/2} = 0$ when

$$x = \left(\frac{1}{2}\right)^{6/11},$$

and $f''(x) = 28x^{1/3} + \frac{21}{4}x^{-3/2}$. Thus,

$$f''\left(\left(\frac{1}{2}\right)^{6/11}\right) > 0,$$

which implies $f\left(\left(\frac{1}{2}\right)^{6/11}\right)$ is a local minimum.

33. $f(x) = \sin^2 x + \cos x, \quad [0, \pi]$

SOLUTION Let $f(x) = \sin^2 x + \cos x$. Then $f'(x) = 2\sin x \cos x - \sin x = \sin x(2\cos x - 1)$. On the interval $[0, \pi]$, $f'(x) = 0$ at $x = 0$, $x = \frac{\pi}{3}$ and $x = \pi$. Now,

$$f''(x) = 2\cos^2 x - 2\sin^2 x - \cos x.$$

Thus, $f''(0) > 0$, so $f(0)$ is a local minimum. On the other hand, $f''(\frac{\pi}{3}) < 0$, so $f(\frac{\pi}{3})$ is a local maximum. Finally, $f''(\pi) > 0$, so $f(\pi)$ is a local minimum.

34. $y = \dfrac{1}{\sin x + 4}, \quad [0, 2\pi]$

SOLUTION Let $f(x) = (\sin x + 4)^{-1}$. Then

$$f'(x) = -\frac{\cos x}{(\sin x + 4)^2} \quad \text{and} \quad f''(x) = \frac{2\cos^2 x + \sin^2 x + 4\sin x}{(\sin x + 4)^3}.$$

Now, $f'(x) = 0$ when $x = \pi/2$ and when $x = 3\pi/2$. Since $f''(\pi/2) > 0$, it follows that $f(\pi/2)$ is a local minimum. On the other hand, $f''(3\pi/2) < 0$, so $f(3\pi/2)$ is a local maximum.

35. $f(x) = xe^{-x^2}$

SOLUTION Let $f(x) = xe^{-x^2}$. Then $f'(x) = -2x^2e^{-x^2} + e^{-x^2} = (1-2x^2)e^{-x^2}$, so there are two critical points: $x = \pm\frac{\sqrt{2}}{2}$. Now,

$$f''(x) = (4x^3 - 2x)e^{-x^2} - 4xe^{-x^2} = (4x^3 - 6x)e^{-x^2}.$$

Thus, $f''\left(\frac{\sqrt{2}}{2}\right) < 0$, so $f\left(\frac{\sqrt{2}}{2}\right)$ is a local maximum. On the other hand, $f''\left(-\frac{\sqrt{2}}{2}\right) > 0$, so $f\left(-\frac{\sqrt{2}}{2}\right)$ is a local minimum.

36. $f(x) = e^{-x} - 4e^{-2x}$

SOLUTION Let $f(x) = e^{-x} - 4e^{-2x}$. Then $f'(x) = -e^{-x} + 8e^{-2x} = 0$ when $x = 3\ln 2$. Now, $f''(x) = e^{-x} - 16e^{-2x}$, so $f''(3\ln 2) < 0$. Thus, $f(3\ln 2)$ is a local maximum.

37. $f(x) = x^3 \ln x \quad (x > 0)$

SOLUTION Let $f(x) = x^3 \ln x$. Then $f'(x) = x^2 + 3x^2 \ln x = x^2(1 + 3\ln x)$, so there is only one critical point: $x = e^{-1/3}$. Now,

$$f''(x) = 3x + 2x(1 + 3\ln x) = x(5 + 6lnx).$$

Thus, $f''\left(e^{-1/3}\right) > 0$, so $f\left(e^{-1/3}\right)$ is a local minimum.

38. $f(x) = \ln x + \ln(4 - x^2), \quad (0, 2)$

SOLUTION Let $f(x) = \ln x + \ln(4 - x^2)$. Then

$$f'(x) = \frac{1}{x} - \frac{2x}{4 - x^2},$$

so there is only one critical point on the interval $0 < x < 2$: $x = \frac{2\sqrt{3}}{3}$. Now,

$$f''(x) = -\frac{1}{x^2} - \frac{(4 - x^2)(2) - 2x(-2x)}{(4 - x^2)^2} = -\frac{1}{x^2} - \frac{8 + 2x^2}{(4 - x^2)^2}.$$

Thus, $f''\left(\frac{2\sqrt{3}}{3}\right) < 0$, so $f\left(\frac{2\sqrt{3}}{3}\right)$ is a local maximum.

In Exercises 39–52, find the intervals on which f is concave up or down, the points of inflection, the critical points, and the local minima and maxima.

SOLUTION Here is a table legend for Exercises 39–49.

SYMBOL	MEANING
−	The entity is negative on the given interval.
0	The entity is zero at the specified point.
+	The entity is positive on the given interval.
U	The entity is undefined at the specified point.
↗	The function (f, g, etc.) is increasing on the given interval.
↘	The function (f, g, etc.) is decreasing on the given interval.
⌣	The function (f, g, etc.) is concave up on the given interval.
⌢	The function (f, g, etc.) is concave down on the given interval.
M	The function (f, g, etc.) has a local maximum at the specified point.
m	The function (f, g, etc.) has a local minimum at the specified point.
I	The function (f, g, etc.) has an inflection point here.
¬	There is no local extremum or inflection point here.

39. $f(x) = x^3 - 2x^2 + x$

SOLUTION Let $f(x) = x^3 - 2x^2 + x$.

- Then $f'(x) = 3x^2 - 4x + 1 = (x-1)(3x-1) = 0$ yields $x = 1$ and $x = \frac{1}{3}$ as candidates for extrema.
- Moreover, $f''(x) = 6x - 4 = 0$ gives a candidate for a point of inflection at $x = \frac{2}{3}$.

44. $f(x) = x^{3/2} - 4x^{-1/2} \quad (x > 0)$

SOLUTION Let $f(x) = x^{3/2} - 4x^{-1/2}$. Then

$$f'(x) = \frac{3}{2}x^{1/2} + 2x^{-3/2} > 0$$

for all $x > 0$. Thus, f is always increasing and there are no local extrema. Now,

$$f''(x) = \frac{3}{4}x^{-1/2} - 3x^{-5/2}$$

so $x = 2$ is a candidate point of inflection.

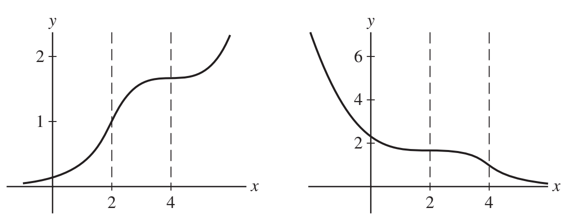
53. Sketch the graph of an increasing function such that $f''(x)$ changes from $+$ to $-$ at $x = 2$ and from $-$ to $+$ at $x = 4$. Do the same for a decreasing function.

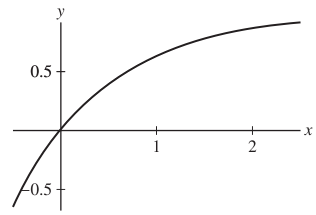
SOLUTION The graph shown below at the left is an increasing function which changes from concave up to concave down at $x = 2$ and from concave down to concave up at $x = 4$. The graph shown below at the right is a decreasing function which changes from concave up to concave down at $x = 2$ and from concave down to concave up at $x = 4$.



In Exercises 54–56, sketch the graph of a function $f(x)$ satisfying all of the given conditions.

54. $f'(x) > 0$ and $f''(x) < 0$ for all x.

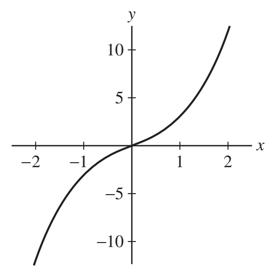
SOLUTION Here is the graph of a function $f(x)$ satisfying $f'(x) > 0$ for all x and $f''(x) < 0$ for all x.



55. **(i)** $f'(x) > 0$ for all x, and

(ii) $f''(x) < 0$ for $x < 0$ and $f''(x) > 0$ for $x > 0$.

SOLUTION Here is the graph of a function $f(x)$ satisfying **(i)** $f'(x) > 0$ for all x and **(ii)** $f''(x) < 0$ for $x < 0$ and $f''(x) > 0$ for $x > 0$.



56. **(i)** $f'(x) < 0$ for $x < 0$ and $f'(x) > 0$ for $x > 0$, and

(ii) $f''(x) < 0$ for $|x| > 2$, and $f''(x) > 0$ for $|x| < 2$.

SOLUTION

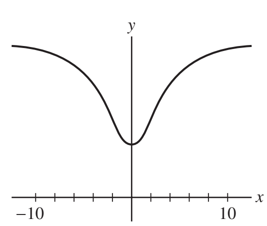
Direction	↘	↘	↗	↗
Concavity	$\frown$	$\smile$	$\smile$	$\frown$

One potential graph with this shape is the following:



57. An infectious flu spreads slowly at the beginning of an epidemic. The infection process accelerates until a majority of the susceptible individuals are infected, at which point the process slows down.

(a) If $R(t)$ is the number of individuals infected at time t, describe the concavity of the graph of R near the beginning and end of the epidemic.

(b) Describe the status of the epidemic on the day that $R(t)$ has a point of inflection.

SOLUTION

(a) Near the beginning of the epidemic, the graph of R is concave up. Near the epidemic's end, R is concave down.

(b) "Epidemic subsiding: number of new cases declining."

58. Water is pumped into a sphere at a constant rate (Figure 18). Let $h(t)$ be the water level at time t. Sketch the graph of $h(t)$ (approximately, but with the correct concavity). Where does the point of inflection occur?

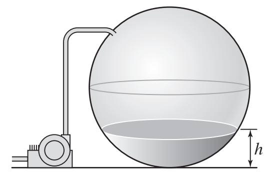


FIGURE 18

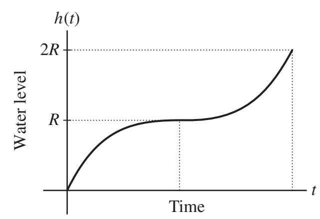
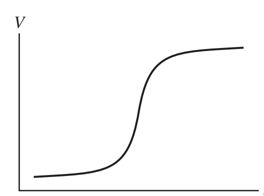
SOLUTION Because water is entering the sphere at a constant rate, we expect the water level to rise more rapidly near the bottom and top of the sphere where the sphere is not as "wide" and to rise more slowly near the middle of the sphere. The graph of $h(t)$ should therefore start concave down and end concave up, with an inflection point when the sphere is half full; that is, when the water level is equal to the radius of the sphere. A possible graph of $h(t)$ is shown below.



59. Water is pumped into a sphere of radius R at a variable rate in such a way that the water level rises at a constant rate (Figure 18). Let $V(t)$ be the volume of water in the tank at time t. Sketch the graph $V(t)$ (approximately, but with the correct concavity). Where does the point of inflection occur?

SOLUTION Because water is entering the sphere in such a way that the water level rises at a constant rate, we expect the volume to increase more slowly near the bottom and top of the sphere where the sphere is not as "wide" and to increase more rapidly near the middle of the sphere. The graph of $V(t)$ should therefore start concave up and change to concave down when the sphere is half full; that is, the point of inflection should occur when the water level is equal to the radius of the sphere. A possible graph of $V(t)$ is shown below.



60. (Continuation of Exercise 59) If the sphere has radius R, the volume of water is $V = \pi\left(Rh^2 - \frac{1}{3}h^3\right)$ where h is the water level. Assume the level rises at a constant rate of 1 (that is, $h = t$).

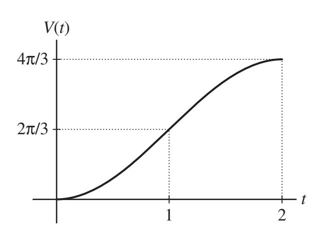
(a) Find the inflection point of $V(t)$. Does this agree with your conclusion in Exercise 59?

(b) GU Plot $V(t)$ for $R = 1$.

SOLUTION

(a) With $h = t$ and $V(t) = \pi(Rt^2 - \frac{1}{3}t^3)$. Then, $V'(t) = \pi(2Rt - t^2)$ and $V''(t) = \pi(2R - 2t)$. Therefore, $V(t)$ is concave up for $t < R$, concave down for $t > R$ and has an inflection point at $t = R$. In other words, $V(t)$ has an inflection point when the water level is equal to the radius of the sphere, in agreement with the conclusion of Exercise 59.

(b) With $h = t$ and $R = 1$, $V(t) = \pi(t^2 - \frac{1}{3}t^3)$. The graph of $V(t)$ is shown below.



61. Image Processing The intensity of a pixel in a digital image is measured by a number u between 0 and 1. Often, images can be enhanced by rescaling intensities (Figure 19), where pixels of intensity u are displayed with intensity $g(u)$ for a suitable function $g(u)$. One common choice is the **sigmoidal correction**, defined for constants a, b by

$$g(u) = \frac{f(u) - f(0)}{f(1) - f(0)} \quad \text{where} \quad f(u) = \left(1 + e^{b(a-u)}\right)^{-1}$$

Figure 20 shows that $g(u)$ reduces the intensity of low-intensity pixels (where $g(u) < u$) and increases the intensity of high-intensity pixels.

(a) Verify that $f'(u) > 0$ and use this to show that $g(u)$ increases from 0 to 1 for $0 \le u \le 1$.
(b) Where does $g'(u)$ have a point of inflection?

Original Sigmoidal correction

FIGURE 19

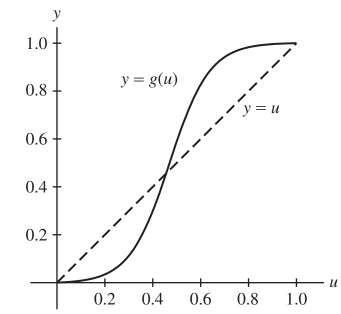


FIGURE 20 Sigmoidal correction with $a = 0.47$, $b = 12$.

SOLUTION

(a) With $f(u) = (1 + e^{b(a-u)})^{-1}$, it follows that

$$f'(u) = -(1 + e^{b(a-u)})^{-2} \cdot -be^{b(a-u)} = \frac{be^{b(a-u)}}{(1 + e^{b(a-u)})^2} > 0$$

for all u. Next, observe that

$$g(0) = \frac{f(0) - f(0)}{f(1) - f(0)} = 0, \quad g(1) = \frac{f(1) - f(0)}{f(1) - f(0)} = 1,$$

and

$$g'(u) = \frac{1}{f(1) - f(0)} f'(u) > 0$$

for all u. Thus, $g(u)$ increases from 0 to 1 for $0 \le u \le 1$.

(b) Working from part (a), we find

$$f''(u) = \frac{b^2 e^{b(a-u)}(2e^{b(a-u)} - 1)}{(1 + e^{b(a-u)})^3}.$$

Because

$$g''(u) = \frac{1}{f(1) - f(0)} f''(u),$$

it follows that $g(u)$ has a point of inflection when

$$2e^{b(a-u)} - 1 = 0 \quad \text{or} \quad u = a + \frac{1}{b} \ln 2.$$

62. Use graphical reasoning to determine whether the following statements are true or false. If false, modify the statement to make it correct.

(a) If $f(x)$ is increasing, then $f^{-1}(x)$ is decreasing.
(b) If $f(x)$ is decreasing, then $f^{-1}(x)$ is decreasing.
(c) If $f(x)$ is concave up, then $f^{-1}(x)$ is concave up.
(d) If $f(x)$ is concave down, then $f^{-1}(x)$ is concave up.

SOLUTION

(a) False. Should be: If $f(x)$ is increasing, then $f^{-1}(x)$ is increasing.
(b) True.
(c) False. Should be: If $f(x)$ is concave up, then $f^{-1}(x)$ is concave down.
(d) True.

Further Insights and Challenges

In Exercises 63–65, assume that $f(x)$ is differentiable.

63. Proof of the Second Derivative Test Let c be a critical point such that $f''(c) > 0$ (the case $f''(c) < 0$ is similar).

(a) Show that $f''(c) = \lim_{h\to 0} \dfrac{f'(c+h)}{h}$.

(b) Use (a) to show that there exists an open interval (a, b) containing c such that $f'(x) < 0$ if $a < x < c$ and $f'(x) > 0$ if $c < x < b$. Conclude that $f(c)$ is a local minimum.

SOLUTION

(a) Because c is a critical point, either $f'(c) = 0$ or $f'(c)$ does not exist; however, $f''(c)$ exists, so $f'(c)$ must also exist. Therefore, $f'(c) = 0$. Now, from the definition of the derivative, we have

$$f''(c) = \lim_{h\to 0} \frac{f'(c+h) - f'(c)}{h} = \lim_{h\to 0} \frac{f'(c+h)}{h}.$$

(b) We are given that $f''(c) > 0$. By part (a), it follows that

$$\lim_{h\to 0} \frac{f'(c+h)}{h} > 0;$$

in other words, for sufficiently small h,

$$\frac{f'(c+h)}{h} > 0.$$

Now, if h is sufficiently small but negative, then $f'(c+h)$ must also be negative (so that the ratio $f'(c+h)/h$ will be positive) and $c + h < c$. On the other hand, if h is sufficiently small but positive, then $f'(c+h)$ must also be positive and $c + h > c$. Thus, there exists an open interval (a, b) containing c such that $f'(x) < 0$ for $a < x < c$ and $f'(c) > 0$ for $c < x < b$. Finally, because $f'(x)$ changes from negative to positive at $x = c$, $f(c)$ must be a local minimum.

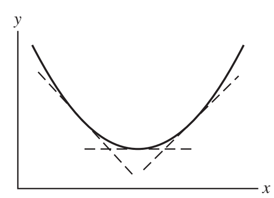
64. Prove that if $f''(x)$ exists and $f''(x) > 0$ for all x, then the graph of $f(x)$ "sits above" its tangent lines.

(a) For any c, set $G(x) = f(x) - f'(c)(x - c) - f(c)$. It is sufficient to prove that $G(x) \geq 0$ for all c. Explain why with a sketch.

(b) Show that $G(c) = G'(c) = 0$ and $G''(x) > 0$ for all x. Conclude that $G'(x) < 0$ for $x < c$ and $G'(x) > 0$ for $x > c$. Then deduce, using the MVT, that $G(x) > G(c)$ for $x \neq c$.

SOLUTION

(a) Let c be any number. Then $y = f'(c)(x - c) + f(c)$ is the equation of the line tangent to the graph of $f(x)$ at $x = c$ and $G(x) = f(x) - f'(c)(x - c) - f(c)$ measures the amount by which the value of the function exceeds the value of the tangent line (see the figure below). Thus, to prove that the graph of $f(x)$ "sits above" its tangent lines, it is sufficient to prove that $G(x) \geq 0$ for all c.



(b) Note that $G(c) = f(c) - f'(c)(c - c) - f(c) = 0$, $G'(x) = f'(x) - f'(c)$ and $G'(c) = f'(c) - f'(c) = 0$. Moreover, $G''(x) = f''(x) > 0$ for all x. Now, because $G'(c) = 0$ and $G'(x)$ is increasing, it must be true that $G'(x) < 0$ for $x < c$ and that $G'(x) > 0$ for $x > c$. Therefore, $G(x)$ is decreasing for $x < c$ and increasing for $x > c$. This implies that $G(c) = 0$ is a minimum; consequently $G(x) > G(c) = 0$ for $x \neq c$.

65. Assume that $f''(x)$ exists and let c be a point of inflection of $f(x)$.

(a) Use the method of Exercise 64 to prove that the tangent line at $x = c$ *crosses the graph* (Figure 21). *Hint:* Show that $G(x)$ changes sign at $x = c$.

(b) GU Verify this conclusion for $f(x) = \dfrac{x}{3x^2+1}$ by graphing $f(x)$ and the tangent line at each inflection point on the same set of axes.

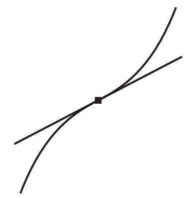


FIGURE 21 Tangent line crosses graph at point of inflection.

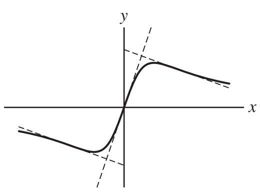
SOLUTION

(a) Let $G(x) = f(x) - f'(c)(x-c) - f(c)$. Then, as in Exercise 63, $G(c) = G'(c) = 0$ and $G''(x) = f''(x)$. If $f''(x)$ changes from positive to negative at $x = c$, then so does $G''(x)$ and $G'(x)$ is increasing for $x < c$ and decreasing for $x > c$. This means that $G'(x) < 0$ for $x < c$ and $G'(x) < 0$ for $x > c$. This in turn implies that $G(x)$ is decreasing, so $G(x) > 0$ for $x < c$ but $G(x) < 0$ for $x > c$. On the other hand, if $f''(x)$ changes from negative to positive at $x = c$, then so does $G''(x)$ and $G'(x)$ is decreasing for $x < c$ and increasing for $x > c$. Thus, $G'(x) > 0$ for $x < c$ and $G'(x) > 0$ for $x > c$. This in turn implies that $G(x)$ is increasing, so $G(x) < 0$ for $x < c$ and $G(x) > 0$ for $x > c$. In either case, $G(x)$ changes sign at $x = c$, and the tangent line at $x = c$ crosses the graph of the function.

(b) Let $f(x) = \dfrac{x}{3x^2+1}$. Then

$$f'(x) = \frac{1-3x^2}{(3x^2+1)^2} \qquad \text{and} \qquad f''(x) = \frac{-18x(1-x^2)}{(3x^2+1)^3}.$$

Therefore $f(x)$ has a point of inflection at $x = 0$ and at $x = \pm 1$. The figure below shows the graph of $y = f(x)$ and its tangent lines at each of the points of inflection. It is clear that each tangent line crosses the graph of $f(x)$ at the inflection point.



66. Let $C(x)$ be the cost of producing x units of a certain good. Assume that the graph of $C(x)$ is concave up.

(a) Show that the average cost $A(x) = C(x)/x$ is minimized at the production level x_0 such that average cost equals marginal cost—that is, $A(x_0) = C'(x_0)$.

(b) Show that the line through $(0, 0)$ and $(x_0, C(x_0))$ is tangent to the graph of $C(x)$.

SOLUTION Let $C(x)$ be the cost of producing x units of a commodity. Assume the graph of C is concave up.

(a) Let $A(x) = C(x)/x$ be the average cost and let x_0 be the production level at which average cost is minimized. Then $A'(x_0) = \dfrac{x_0C'(x_0) - C(x_0)}{x_0^2} = 0$ implies $x_0C'(x_0) - C(x_0) = 0$, whence $C'(x_0) = C(x_0)/x_0 = A(x_0)$. In other words, $A(x_0) = C'(x_0)$ or average cost equals marginal cost at production level x_0. To confirm that x_0 corresponds to a local minimum of A, we use the Second Derivative Test. We find

$$A''(x_0) = \frac{x_0^2C''(x_0) - 2(x_0C'(x_0) - C(x_0))}{x_0^3} = \frac{C''(x_0)}{x_0} > 0$$

because C is concave up. Hence, x_0 corresponds to a local minimum.

(b) The line between $(0, 0)$ and $(x_0, C(x_0))$ is

$$\begin{aligned}\frac{C(x_0)-0}{x_0-0}(x-x_0) + C(x_0) &= \frac{C(x_0)}{x_0}(x-x_0) + C(x_0) = A(x_0)(x-x_0) + C(x_0)\\ &= C'(x_0)(x-x_0) + C(x_0)\end{aligned}$$

which is the tangent line to C at x_0.

67. Let $f(x)$ be a polynomial of degree $n \geq 2$. Show that $f(x)$ has at least one point of inflection if n is odd. Then give an example to show that $f(x)$ need not have a point of inflection if n is even.

SOLUTION Let $f(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$ be a polynomial of degree n. Then $f'(x) = na_nx^{n-1} + (n-1)a_{n-1}x^{n-2} + \cdots + 2a_2x + a_1$ and $f''(x) = n(n-1)a_nx^{n-2} + (n-1)(n-2)a_{n-1}x^{n-3} + \cdots + 6a_3x + 2a_2$. If $n \geq 3$ and is odd, then $n-2$ is also odd and $f''(x)$ is a polynomial of odd degree. Therefore $f''(x)$ must take on both positive and negative values. It follows that $f''(x)$ has at least one root c such that $f''(x)$ changes sign at c. The function $f(x)$ will then have a point of inflection at $x = c$. On the other hand, the functions $f(x) = x^2, x^4$ and x^8 are polynomials of even degree that do not have any points of inflection.

68. Critical and Inflection Points If $f'(c) = 0$ and $f(c)$ is neither a local min nor a local max, must $x = c$ be a point of inflection? This is true for "reasonable" functions (including the functions studied in this text), but it is not true in general. Let

$$f(x) = \begin{cases} x^2 \sin \frac{1}{x} & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$$

(a) Use the limit definition of the derivative to show that $f'(0)$ exists and $f'(0) = 0$.

(b) Show that $f(0)$ is neither a local min nor a local max.

(c) Show that $f'(x)$ changes sign infinitely often near $x = 0$. Conclude that $x = 0$ is not a point of inflection.

SOLUTION Let $f(x) = \begin{cases} x^2 \sin(1/x) & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$.

(a) Now $f'(0) = \lim_{x\to 0} \dfrac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \dfrac{x^2 \sin(1/x)}{x} = \lim_{x\to 0} x \sin\left(\dfrac{1}{x}\right) = 0$ by the Squeeze Theorem: as $x \to 0$ we have

$$\left| x \sin\left(\frac{1}{x}\right) - 0 \right| = |x| \left| \sin\left(\frac{1}{x}\right) \right| \to 0,$$

since $|\sin u| \le 1$.

(b) Since $\sin(\frac{1}{x})$ oscillates through every value between -1 and 1 with increasing frequency as $x \to 0$, in any open interval $(-\delta, \delta)$ there are points a and b such that $f(a) = a^2 \sin(\frac{1}{a}) < 0$ and $f(b) = b^2 \sin(\frac{1}{b}) > 0$. Accordingly, $f(0) = 0$ can neither be a local minimum value nor a local maximum value of f.

(c) In part (a) it was shown that $f'(0) = 0$. For $x \neq 0$, we have

$$f'(x) = x^2 \cos\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right) + 2x \sin\left(\frac{1}{x}\right) = 2x \sin\left(\frac{1}{x}\right) - \cos\left(\frac{1}{x}\right).$$

As $x \to 0$, $f'(x)$ oscillates increasingly rapidly; consequently, $f'(x)$ changes sign infinitely often near $x = 0$. From this we conclude that $f(x)$ does not have a point of inflection at $x = 0$.

4.5 L'Hôpital's Rule

Preliminary Questions

1. What is wrong with applying L'Hôpital's Rule to $\lim_{x\to 0} \dfrac{x^2 - 2x}{3x - 2}$?

SOLUTION As $x \to 0$,

$$\frac{x^2 - 2x}{3x - 2}$$

is not of the form $\frac{0}{0}$ or $\frac{\infty}{\infty}$, so L'Hôpital's Rule cannot be used.

2. Does L'Hôpital's Rule apply to $\lim_{x\to a} f(x)g(x)$ if $f(x)$ and $g(x)$ both approach ∞ as $x \to a$?

SOLUTION No. L'Hôpital's Rule only applies to limits of the form $\frac{0}{0}$ or $\frac{\infty}{\infty}$.

Exercises

In Exercises 1–10, use L'Hôpital's Rule to evaluate the limit, or state that L'Hôpital's Rule does not apply.

1. $\lim_{x\to 3} \dfrac{2x^2 - 5x - 3}{x - 4}$

SOLUTION Because the quotient is not indeterminate at $x = 3$,

$$\left.\frac{2x^2 - 5x - 3}{x - 4}\right|_{x=3} = \frac{18 - 15 - 3}{3 - 4} = \frac{0}{-1},$$

L'Hôpital's Rule does not apply.

2. $\lim_{x\to -5} \dfrac{x^2 - 25}{5 - 4x - x^2}$

SOLUTION The functions $x^2 - 25$ and $5 - 4x - x^2$ are differentiable, but the quotient is indeterminate at $x = -5$,

$$\left.\frac{x^2 - 25}{5 - 4x - x^2}\right|_{x=-5} = \frac{25 - 25}{5 + 20 - 25} = \frac{0}{0},$$

so L'Hôpital's Rule applies. We find

$$\lim_{x\to -5} \frac{x^2 - 25}{5 - 4x - x^2} = \lim_{x\to -5} \frac{2x}{-4 - 2x} = \frac{-10}{-4 + 10} = -\frac{5}{3}.$$

3. $\lim_{x\to 4} \dfrac{x^3 - 64}{x^2 + 16}$

SOLUTION Because the quotient is not indeterminate at $x = 4$,

$$\left.\frac{x^3 - 64}{x^2 + 16}\right|_{x=4} = \frac{64 - 64}{16 + 16} = \frac{0}{32},$$

L'Hôpital's Rule does not apply.

4. $\lim_{x\to -1} \dfrac{x^4 + 2x + 1}{x^5 - 2x - 1}$

SOLUTION The functions $x^4 + 2x + 1$ and $x^5 - 2x - 1$ are differentiable, but the quotient is indeterminate at $x = -1$,

$$\left.\frac{x^4 + 2x + 1}{x^5 - 2x - 1}\right|_{x=-1} = \frac{1 - 2 + 1}{-1 + 2 - 1} = \frac{0}{0},$$

so L'Hôpital's Rule applies. We find

$$\lim_{x\to -1} \frac{x^4 + 2x + 1}{x^5 - 2x - 1} = \lim_{x\to -1} \frac{4x^3 + 2}{5x^4 - 2} = \frac{-4 + 2}{5 - 2} = -\frac{2}{3}.$$

5. $\lim_{x\to 9} \dfrac{x^{1/2} + x - 6}{x^{3/2} - 27}$

SOLUTION Because the quotient is not indeterminate at $x = 9$,

$$\left.\frac{x^{1/2} + x - 6}{x^{3/2} - 27}\right|_{x=9} = \frac{3 + 9 - 6}{27 - 27} = \frac{6}{0},$$

L'Hôpital's Rule does not apply.

6. $\lim_{x\to 3} \dfrac{\sqrt{x+1} - 2}{x^3 - 7x - 6}$

SOLUTION The functions $\sqrt{x+1} - 2$ and $x^3 - 7x - 6$ are differentiable, but the quotient is indeterminate at $x = 3$,

$$\left.\frac{\sqrt{x+1} - 2}{x^3 - 7x - 6}\right|_{x=3} = \frac{2 - 2}{27 - 21 - 6} = \frac{0}{0},$$

so L'Hôpital's Rule applies. We find

$$\lim_{x\to 3} \frac{\sqrt{x+1} - 2}{x^3 - 7x - 6} = \frac{\frac{1}{2\sqrt{x+1}}}{3x^2 - 7} = \frac{\frac{1}{4}}{20} = \frac{1}{80}.$$

7. $\lim_{x\to 0} \dfrac{\sin 4x}{x^2 + 3x + 1}$

SOLUTION Because the quotient is not indeterminate at $x = 0$,

$$\left.\frac{\sin 4x}{x^2 + 3x + 1}\right|_{x=0} = \frac{0}{0 + 0 + 1} = \frac{0}{1},$$

L'Hôpital's Rule does not apply.

8. $\lim_{x\to 0} \frac{x^3}{\sin x - x}$

SOLUTION The functions x^3 and $\sin x - x$ are differentiable, but the quotient is indeterminate at $x = 0$,

$$\left.\frac{x^3}{\sin x - x}\right|_{x=0} = \frac{0}{0-0} = \frac{0}{0},$$

so L'Hôpital's Rule applies. Here, we use L'Hôpital's Rule three times to find

$$\lim_{x\to 0} \frac{x^3}{\sin x - x} = \lim_{x\to 0} \frac{3x^2}{\cos x - 1} = \lim_{x\to 0} \frac{6x}{-\sin x} = \lim_{x\to 0} \frac{6}{-\cos x} = -6.$$

9. $\lim_{x\to 0} \frac{\cos 2x - 1}{\sin 5x}$

SOLUTION The functions $\cos 2x - 1$ and $\sin 5x$ are differentiable, but the quotient is indeterminate at $x = 0$,

$$\left.\frac{\cos 2x - 1}{\sin 5x}\right|_{x=0} = \frac{1-1}{0} = \frac{0}{0},$$

so L'Hôpital's Rule applies. We find

$$\lim_{x\to 0} \frac{\cos 2x - 1}{\sin 5x} = \lim_{x\to 0} \frac{-2\sin 2x}{5\cos 5x} = \frac{0}{5} = 0.$$

10. $\lim_{x\to 0} \frac{\cos x - \sin^2 x}{\sin x}$

SOLUTION Because the quotient is not indeterminate at $x = 0$,

$$\left.\frac{\cos x - \sin^2 x}{\sin x}\right|_{x=0} = \frac{1-0}{0} = \frac{1}{0},$$

L'Hôpital's Rule does not apply.

In Exercises 11–16, show that L'Hôpital's Rule is applicable to the limit as $x \to \pm\infty$ and evaluate.

11. $\lim_{x\to\infty} \frac{9x+4}{3-2x}$

SOLUTION As $x \to \infty$, the quotient $\frac{9x+4}{3-2x}$ is of the form $\frac{\infty}{\infty}$, so L'Hôpital's Rule applies. We find

$$\lim_{x\to\infty} \frac{9x+4}{3-2x} = \lim_{x\to\infty} \frac{9}{-2} = -\frac{9}{2}.$$

12. $\lim_{x\to -\infty} x \sin \frac{1}{x}$

SOLUTION As $x \to \infty$, $x \sin \frac{1}{x}$ is of the form $\infty \cdot 0$, so L'Hôpital's Rule does not immediately apply. If we rewrite $x \sin \frac{1}{x}$ as $\frac{\sin(1/x)}{1/x}$, the rewritten expression is of the form $\frac{0}{0}$ as $x \to \infty$, so L'Hôpital's Rule now applies. We find

$$\lim_{x\to\infty} x \cdot \sin\left(\frac{1}{x}\right) = \lim_{x\to\infty} \frac{\sin(1/x)}{1/x} = \lim_{x\to\infty} \frac{\cos(1/x)(-1/x^2)}{-1/x^2} = \lim_{x\to\infty} \cos(1/x) = \cos 0 = 1.$$

13. $\lim_{x\to\infty} \frac{\ln x}{x^{1/2}}$

SOLUTION As $x \to \infty$, the quotient $\frac{\ln x}{x^{1/2}}$ is of the form $\frac{\infty}{\infty}$, so L'Hôpital's Rule applies. We find

$$\lim_{x\to\infty} \frac{\ln x}{x^{1/2}} = \lim_{x\to\infty} \frac{\frac{1}{x}}{\frac{1}{2}x^{-1/2}} = \lim_{x\to\infty} \frac{1}{2x^{1/2}} = 0.$$

14. $\lim_{x\to\infty} \frac{x}{e^x}$

SOLUTION As $x \to \infty$, the quotient $\frac{x}{e^x}$ is of the form $\frac{\infty}{\infty}$, so L'Hôpital's Rule applies. We find

$$\lim_{x\to\infty} \frac{x}{e^x} = \lim_{x\to\infty} \frac{1}{e^x} = 0.$$

15. $\lim_{x\to-\infty} \frac{\ln(x^4+1)}{x}$

SOLUTION As $x \to \infty$, the quotient $\frac{\ln(x^4+1)}{x}$ is of the form $\frac{\infty}{\infty}$, so L'Hôpital's Rule applies. Here, we use L'Hôpital's Rule twice to find

$$\lim_{x\to\infty} \frac{\ln(x^4+1)}{x} = \lim_{x\to\infty} \frac{\frac{4x^3}{x^4+1}}{1} = \lim_{x\to\infty} \frac{12x^2}{4x^3} = \lim_{x\to\infty} \frac{3}{x} = 0.$$

16. $\lim_{x\to\infty} \frac{x^2}{e^x}$

SOLUTION As $x \to \infty$, the quotient $\frac{x^2}{e^x}$ is of the form $\frac{\infty}{\infty}$, so L'Hôpital's Rule applies. Here, we use L'Hôpital's Rule twice to find

$$\lim_{x\to\infty} \frac{x^2}{e^x} = \lim_{x\to\infty} \frac{2x}{e^x} = \lim_{x\to\infty} \frac{2}{e^x} = 0.$$

In Exercises 17–54, evaluate the limit.

17. $\lim_{x\to 1} \frac{\sqrt{8+x} - 3x^{1/3}}{x^2 - 3x + 2}$

SOLUTION $\lim_{x\to 1} \frac{\sqrt{8+x} - 3x^{1/3}}{x^2 - 3x + 2} = \lim_{x\to 1} \frac{\frac{1}{2}(8+x)^{-1/2} - x^{-2/3}}{2x-3} = \frac{\frac{1}{6} - 1}{-1} = \frac{5}{6}.$

18. $\lim_{x\to 4} \left[\frac{1}{\sqrt{x}-2} - \frac{4}{x-4}\right]$

SOLUTION $\lim_{x\to 4} \left[\frac{1}{\sqrt{x}-2} - \frac{4}{x-4}\right] = \lim_{x\to 4} \left[\frac{\sqrt{x}+2}{x-4} - \frac{4}{x-4}\right] = \lim_{x\to 4} \frac{\frac{1}{2\sqrt{x}}}{1} = \frac{1}{4}.$

19. $\lim_{x\to-\infty} \frac{3x-2}{1-5x}$

SOLUTION $\lim_{x\to-\infty} \frac{3x-2}{1-5x} = \lim_{x\to-\infty} \frac{3}{-5} = -\frac{3}{5}.$

20. $\lim_{x\to\infty} \frac{x^{2/3}+3x}{x^{5/3}-x}$

SOLUTION $\lim_{x\to\infty} \frac{x^{2/3}+3x}{x^{5/3}-x} = \lim_{x\to\infty} \frac{\frac{1}{x} + \frac{3}{x^{2/3}}}{1 - \frac{1}{x^{2/3}}} = \frac{0+0}{1-0} = 0.$

21. $\lim_{x\to-\infty} \frac{7x^2+4x}{9-3x^2}$

SOLUTION $\lim_{x\to-\infty} \frac{7x^2+4x}{9-3x^2} = \lim_{x\to-\infty} \frac{14x+4}{-6x} = \lim_{x\to-\infty} \frac{14}{-6} = -\frac{7}{3}.$

22. $\lim_{x\to\infty} \frac{3x^3+4x^2}{4x^3-7}$

SOLUTION $\lim_{x\to\infty} \frac{3x^3+4x^2}{4x^3-7} = \lim_{x\to\infty} \frac{9x^2+8x}{12x^2} = \lim_{x\to\infty} \frac{18x+8}{24x} = \frac{18}{24} = \frac{3}{4}.$

23. $\lim_{x\to 1} \frac{(1+3x)^{1/2}-2}{(1+7x)^{1/3}-2}$

SOLUTION Apply L'Hôpital's Rule once:

$$\lim_{x\to 1} \frac{(1+3x)^{1/2}-2}{(1+7x)^{1/3}-2} = \lim_{x\to 1} \frac{\frac{3}{2}(1+3x)^{-1/2}}{\frac{7}{3}(1+7x)^{-2/3}}$$

$$= \frac{(\frac{3}{2})\frac{1}{2}}{(\frac{7}{3})(\frac{1}{4})} = \frac{9}{7}$$

24. $\lim_{x\to 8} \frac{x^{5/3}-2x-16}{x^{1/3}-2}$

SOLUTION $\lim_{x\to 8} \frac{x^{5/3}-2x-16}{x^{1/3}-2} = \lim_{x\to 8} \frac{\frac{5}{3}x^{2/3}-2}{\frac{1}{3}x^{-2/3}} = \frac{\frac{20}{3}-2}{\frac{1}{12}} = 56.$

25. $\lim_{x\to 0} \frac{\sin 2x}{\sin 7x}$

SOLUTION $\lim_{x\to 0} \frac{\sin 2x}{\sin 7x} = \lim_{x\to 0} \frac{2\cos 2x}{7\cos 7x} = \frac{2}{7}.$

26. $\lim_{x\to\pi/2} \frac{\tan 4x}{\tan 5x}$

SOLUTION

$$\lim_{x\to\pi/2} \frac{\tan 4x}{\tan 5x} = \lim_{x\to\pi/2} \frac{4\sec^2 4x}{5\sec^2 5x} = \frac{4}{5}\lim_{x\to\pi/2} \frac{\cos^2 5x}{\cos^2 4x}$$

$$= \frac{4}{5}\lim_{x\to\pi/2} \frac{-10\sin 5x\cos 5x}{-8\sin 4x\cos 4x} = \lim_{x\to\pi/2} \frac{\sin 10x}{\sin 8x}$$

$$= \lim_{x\to\pi/2} \frac{10\cos 10x}{8\cos 8x} = -\frac{5}{4}.$$

27. $\lim_{x\to 0} \frac{\tan x}{x}$

SOLUTION $\lim_{x\to 0} \frac{\tan x}{x} = \lim_{x\to 0} \frac{\sec^2 x}{1} = 1.$

28. $\lim_{x\to 0} \left(\cot x - \frac{1}{x}\right)$

SOLUTION

$$\lim_{x\to 0} \left(\cot x - \frac{1}{x}\right) = \lim_{x\to 0} \frac{x\cos x - \sin x}{x\sin x} = \lim_{x\to 0} \frac{-x\sin x + \cos x - \cos x}{x\cos x + \sin x} = \lim_{x\to 0} \frac{-x\sin x}{x\cos x + \sin x}$$

$$= \lim_{x\to 0} \frac{-x\cos x - x}{-x\sin x + \cos x + \cos x} = \frac{0}{2} = 0.$$

29. $\lim_{x\to 0} \frac{\sin x - x\cos x}{x - \sin x}$

SOLUTION

$$\lim_{x\to 0} \frac{\sin x - x\cos x}{x-\sin x} = \lim_{x\to 0} \frac{x\sin x}{1-\cos x} = \lim_{x\to 0} \frac{\sin x + x\cos x}{\sin x} = \lim_{x\to 0} \frac{\cos x + \cos x - x\sin x}{\cos x} = 2.$$

30. $\lim_{x\to\pi/2} \left(x - \frac{\pi}{2}\right)\tan x$

SOLUTION

$$\lim_{x\to\pi/2} \left(x-\frac{\pi}{2}\right)\tan x = \lim_{x\to\pi/2} \frac{x-\pi/2}{1/\tan x} = \lim_{x\to\pi/2} \frac{x-\pi/2}{\cot x} = \lim_{x\to\pi/2} \frac{1}{-\csc^2 x} = \lim_{x\to\pi/2} -\sin^2 x = -1.$$

31. $\lim_{x\to 0} \frac{\cos(x+\frac{\pi}{2})}{\sin x}$

SOLUTION $\lim_{x\to 0} \frac{\cos(x+\frac{\pi}{2})}{\sin x} = \lim_{x\to 0} \frac{-\sin(x+\frac{\pi}{2})}{\cos x} = -1.$

32. $\lim_{x\to 0} \frac{x^2}{1-\cos x}$

SOLUTION $\lim_{x\to 0} \frac{x^2}{1-\cos x} = \lim_{x\to 0} \frac{2x}{\sin x} = \lim_{x\to 0} \frac{2}{\cos x} = 2.$

33. $\lim_{x\to \pi/2} \frac{\cos x}{\sin(2x)}$

SOLUTION $\lim_{x\to \pi/2} \frac{\cos x}{\sin(2x)} = \lim_{x\to \pi/2} \frac{-\sin x}{2\cos(2x)} = \frac{1}{2}.$

34. $\lim_{x\to 0} \left(\frac{1}{x^2} - \csc^2 x\right)$

SOLUTION

$$\begin{aligned}
\lim_{x\to 0} \left(\frac{1}{x^2} - \csc^2 x\right) &= \lim_{x\to 0} \frac{\sin^2 x - x^2}{x^2 \sin^2 x} \\
&= \lim_{x\to 0} \frac{2\sin x\cos x - 2x}{2x^2 \sin x \cos x + 2x\sin^2 x} = \lim_{x\to 0} \frac{\sin 2x - 2x}{x^2 \sin 2x + 2x \sin^2 x} \\
&= \lim_{x\to 0} \frac{2\cos 2x - 2}{2x^2\cos 2x + 2x\sin 2x + 4x\sin x\cos x + 2\sin^2 x} = \lim_{x\to 0} \frac{\cos 2x - 1}{x^2 \cos 2x + 2x\sin 2x + \sin^2 x} \\
&= \lim_{x\to 0} \frac{-2\sin 2x}{-2x^2\sin 2x + 2x\cos 2x + 4x\cos 2x + 2\sin 2x + 2\sin x\cos x} \\
&= \lim_{x\to 0} \frac{-2\sin 2x}{(3-2x^2)\sin 2x + 6x\cos 2x} \\
&= \lim_{x\to 0} \frac{-4\cos 2x}{2(3-2x^2)\cos 2x - 4x\sin 2x + -12x\sin 2x + 6\cos 2x} = -\frac{1}{3}.
\end{aligned}$$

35. $\lim_{x\to \pi/2} (\sec x - \tan x)$

SOLUTION

$$\lim_{x\to\frac{\pi}{2}} (\sec x - \tan x) = \lim_{x\to\frac{\pi}{2}} \left(\frac{1}{\cos x} - \frac{\sin x}{\cos x}\right) = \lim_{x\to\frac{\pi}{2}} \left(\frac{1-\sin x}{\cos x}\right) = \lim_{x\to\frac{\pi}{2}} \left(\frac{-\cos x}{-\sin x}\right) = 0.$$

36. $\lim_{x\to 2} \frac{e^{x^2} - e^4}{x-2}$

SOLUTION $\lim_{x\to 2} \frac{e^{x^2} - e^4}{x-2} = \lim_{x\to 2} \frac{2xe^{x^2}}{1} = 4e^4.$

37. $\lim_{x\to 1} \tan\left(\frac{\pi x}{2}\right) \ln x$

SOLUTION $\lim_{x\to 1} \tan\left(\frac{\pi x}{2}\right)\ln x = \lim_{x\to 1} \frac{\ln x}{\cot(\frac{\pi x}{2})} = \lim_{x\to 1} \frac{\frac{1}{x}}{-\frac{\pi}{2}\csc^2(\frac{\pi x}{2})} = \lim_{x\to 1} \frac{-2}{\pi x} \sin^2\left(\frac{\pi}{2}x\right) = -\frac{2}{\pi}.$

38. $\lim_{x\to 1} \frac{x(\ln x - 1) + 1}{(x-1)\ln x}$

SOLUTION

$$\lim_{x\to 1} \frac{x(\ln x - 1)+1}{(x-1)\ln x} = \lim_{x\to 1} \frac{x(\frac{1}{x}) + (\ln x - 1)}{(x-1)(\frac{1}{x}) + \ln x} = \lim_{x\to 1} \frac{\ln x}{1 - \frac{1}{x} + \ln x} = \lim_{x\to 1} \frac{\frac{1}{x}}{\frac{1}{x^2} + \frac{1}{x}} = \frac{1}{1+1} = \frac{1}{2}.$$

39. $\lim_{x\to 0} \frac{e^x - 1}{\sin x}$

SOLUTION $\lim_{x\to 0} \frac{e^x - 1}{\sin x} = \lim_{x\to 0} \frac{e^x}{\cos x} = 1.$

40. $\lim_{x\to 1} \frac{e^x - e}{\ln x}$

SOLUTION $\lim_{x\to 1} \frac{e^x - e}{\ln x} = \lim_{x\to 1} \frac{e^x}{x^{-1}} = \frac{e}{1} = e.$

41. $\lim_{x\to 0} \frac{e^{2x} - 1 - x}{x^2}$

SOLUTION $\lim_{x\to 0} \frac{e^{2x} - 1 - x}{x^2} = \lim_{x\to 0} \frac{2e^{2x} - 1}{2x}$ which does not exist.

42. $\lim_{x\to\infty} \frac{e^{2x} - 1 - x}{x^2}$

SOLUTION

$$\lim_{x\to\infty} \frac{e^{2x} - 1 - x}{x^2} = \lim_{x\to\infty} \frac{2e^{2x} - 1}{2x}$$
$$= \lim_{x\to\infty} \frac{4e^{2x}}{2} = \infty.$$

43. $\lim_{t\to 0+} (\sin t)(\ln t)$

SOLUTION

$$\lim_{t\to 0+} (\sin t)(\ln t) = \lim_{t\to 0+} \frac{\ln t}{\csc t} = \lim_{t\to 0+} \frac{\frac{1}{t}}{-\csc t \cot t} = \lim_{t\to 0+} \frac{-\sin^2 t}{t\cos t} = \lim_{t\to 0+} \frac{-2\sin t \cos t}{\cos t - t \sin t} = 0.$$

44. $\lim_{x\to\infty} e^{-x}(x^3 - x^2 + 9)$

SOLUTION

$$\lim_{x\to\infty} e^{-x}(x^3 - x^2 + 9) = \lim_{x\to\infty} \frac{x^3 - x^2 + 9}{e^x} = \lim_{x\to\infty} \frac{3x^2 - 2x}{e^x} = \lim_{x\to\infty} \frac{6x - 2}{e^x} = \lim_{x\to\infty} \frac{6}{e^x} = 0.$$

45. $\lim_{x\to 0} \frac{a^x - 1}{x} \quad (a > 0)$

SOLUTION $\lim_{x\to 0} \frac{a^x - 1}{x} = \lim_{x\to 0} \frac{\ln a \cdot a^x}{1} = \ln a.$

46. $\lim_{x\to\infty} x^{1/x^2}$

SOLUTION $\lim_{x\to\infty} \ln x^{1/x^2} = \lim_{x\to\infty} \frac{\ln x}{x^2} = \lim_{x\to\infty} \frac{1}{2x^2} = 0.$ Hence,

$$\lim_{x\to\infty} x^{1/x^2} = \lim_{x\to\infty} e^{\ln x^{1/x^2}} = e^0 = 1.$$

47. $\lim_{x\to 1} (1 + \ln x)^{1/(x-1)}$

SOLUTION $\lim_{x\to 1} \ln(1 + \ln x)^{1/(x-1)} = \lim_{x\to 1} \frac{\ln(1 + \ln x)}{x - 1} = \lim_{x\to 1} \frac{1}{x(1 + \ln x)} = 1.$ Hence,

$$\lim_{x\to 1} (1 + \ln x)^{1/(x-1)} = \lim_{x\to 1} e^{(1+\ln x)^{1/(x-1)}} = e.$$

48. $\lim_{x\to 0+} x^{\sin x}$

SOLUTION

$$\lim_{x\to 0+} \ln(x^{\sin x}) = \lim_{x\to 0+} \sin x(\ln x) = \lim_{x\to 0+} \frac{\ln x}{\frac{1}{\sin x}} = \lim_{x\to 0+} \frac{\frac{1}{x}}{-\cos x(\sin x)^{-2}}$$
$$= \lim_{x\to 0+} -\frac{\sin^2 x}{x\cos x} = \lim_{x\to 0+} -\frac{2\sin x\cos x}{-x\sin x + \cos x} = 0.$$

Hence, $\lim_{x\to 0+} x^{\sin x} = \lim_{x\to 0+} e^{\ln(x^{\sin x})} = e^0 = 1.$

49. $\lim_{x\to 0}(\cos x)^{3/x^2}$

SOLUTION

$$\lim_{x\to 0}\ln(\cos x)^{3/x^2} = \lim_{x\to 0}\frac{3\ln\cos x}{x^2}$$
$$= \lim_{x\to 0} -\frac{3\tan x}{2x}$$
$$= \lim_{x\to 0} -\frac{3\sec^2 x}{2} = -\frac{3}{2}.$$

Hence, $\lim_{x\to 0}(\cos x)^{3/x^2} = e^{-3/2}$.

50. $\lim_{x\to\infty}\left(\frac{x}{x+1}\right)^x$

SOLUTION

$$\lim_{x\to\infty} x\ln\left(\frac{x}{x+1}\right) = \lim_{x\to\infty}\frac{\ln\left(\frac{x}{x+1}\right)}{1/x} = \lim_{x\to\infty}\frac{\left(\frac{x+1}{x}\right)\left(\frac{1}{(x+1)^2}\right)}{-1/x^2} = \lim_{x\to\infty} -\frac{x}{x+1} = -1.$$

Hence,

$$\lim_{x\to\infty}\left(\frac{x}{x+1}\right)^x = \frac{1}{e}.$$

51. $\lim_{x\to 0}\frac{\sin^{-1}x}{x}$

SOLUTION $\lim_{x\to 0}\frac{\sin^{-1}x}{x} = \lim_{x\to 0}\frac{\frac{1}{\sqrt{1-x^2}}}{1} = 1.$

52. $\lim_{x\to 0}\frac{\tan^{-1}x}{\sin^{-1}x}$

SOLUTION $\lim_{x\to 0}\frac{\tan^{-1}x}{\sin^{-1}x} = \lim_{x\to 0}\frac{\frac{1}{1+x^2}}{\frac{1}{\sqrt{1-x^2}}} = 1.$

53. $\lim_{x\to 1}\frac{\tan^{-1}x - \frac{\pi}{4}}{\tan\frac{\pi}{4}x - 1}$

SOLUTION $\lim_{x\to 1}\frac{\tan^{-1}x - \frac{\pi}{4}}{\tan(\pi x/4) - 1} = \lim_{x\to 1}\frac{\frac{1}{1+x^2}}{\frac{\pi}{4}\sec^2(\pi x/4)} = \frac{\frac{1}{2}}{\frac{\pi}{2}} = \frac{1}{\pi}.$

54. $\lim_{x\to 0+}\ln x\tan^{-1}x$

SOLUTION Let $h(x) = \ln x\tan^{-1}x$. $\lim_{x\to 0}h(x) = -\infty\cdot 0$, so we apply L'Hôpital's rule to $h(x) = \frac{f(x)}{g(x)}$, where $f(x) = \tan^{-1}(x)$ and $g(x) = \frac{1}{\ln x}$.

$$f'(x) = \frac{1}{1+x^2}$$
$$\lim_{x\to 0}f'(x) = 1$$
$$g'(x) = -\frac{1}{x(\ln x)^2}$$
$$\lim_{x\to 0}g'(x) = -\infty$$

Hence, L'Hôpital's rule yields:

$$\lim_{x\to 0}\frac{f(x)}{g(x)} = \frac{\lim_{x\to 0}f'(x)}{\lim_{x\to 0}g'(x)} = -\frac{1}{\infty} = 0.$$

55. Evaluate $\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx}$, where $m, n \neq 0$ are integers.

SOLUTION Suppose m and n are even. Then there exist integers k and l such that $m = 2k$ and $n = 2l$ and

$$\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx} = \frac{\cos k\pi}{\cos l\pi} = (-1)^{k-l}.$$

Now, suppose m is even and n is odd. Then

$$\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx}$$

does not exist (from one side the limit tends toward $-\infty$, while from the other side the limit tends toward $+\infty$). Third, suppose m is odd and n is even. Then

$$\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx} = 0.$$

Finally, suppose m and n are odd. This is the only case when the limit is indeterminate. Then there exist integers k and l such that $m = 2k+1$, $n = 2l+1$ and, by L'Hôpital's Rule,

$$\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx} = \lim_{x\to\pi/2}\frac{-m\sin mx}{-n\sin nx} = (-1)^{k-l}\frac{m}{n}.$$

To summarize,

$$\lim_{x\to\pi/2}\frac{\cos mx}{\cos nx} = \begin{cases} (-1)^{(m-n)/2}, & m, n \text{ even} \\ \text{does not exist}, & m \text{ even}, n \text{ odd} \\ 0 & m \text{ odd}, n \text{ even} \\ (-1)^{(m-n)/2}\frac{m}{n}, & m, n \text{ odd} \end{cases}$$

56. Evaluate $\lim_{x\to 1}\frac{x^m - 1}{x^n - 1}$ for any numbers $m, n \neq 0$.

SOLUTION $\lim_{x\to 1}\frac{x^m - 1}{x^n - 1} = \lim_{x\to 1}\frac{mx^{m-1}}{nx^{n-1}} = \frac{m}{n}.$

57. Prove the following limit formula for e:

$$e = \lim_{x\to 0}(1+x)^{1/x}$$

Then find a value of x such that $|(1+x)^{1/x} - e| \le 0.001$.

SOLUTION Using L'Hôpital's Rule,

$$\lim_{x\to 0}\frac{\ln(1+x)}{x} = \lim_{x\to 0}\frac{\frac{1}{1+x}}{1} = 1.$$

Thus,

$$\lim_{x\to 0}\ln\left((1+x)^{1/x}\right) = \lim_{x\to 0}\frac{1}{x}\ln(1+x) = \lim_{x\to 0}\frac{\ln(1+x)}{x} = 1,$$

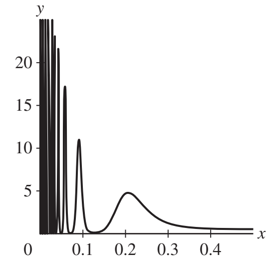
and $\lim_{x\to 0}(1+x)^{1/x} = e^1 = e$. For $x = 0.0005$,

$$\left|(1+x)^{1/x} - e\right| = |(1.0005)^{2000} - e| \approx 6.79 \times 10^{-4} < 0.001.$$

58. $\boxed{\text{GU}}$ Can L'Hôpital's Rule be applied to $\lim_{x\to 0+} x^{\sin(1/x)}$? Does a graphical or numerical investigation suggest that the limit exists?

SOLUTION Since $\sin(1/x)$ oscillates as $x \to 0+$, L'Hôpital's Rule cannot be applied. Both numerical and graphical investigations suggest that the limit does not exist due to the oscillation.

x	1	0.1	0.01	0.001	0.0001	0.00001
$x^{\sin(1/x)}$	1	3.4996	10.2975	0.003316	16.6900	0.6626



59. Let $f(x) = x^{1/x}$ for $x > 0$.

(a) Calculate $\lim_{x\to 0+} f(x)$ and $\lim_{x\to\infty} f(x)$.

(b) Find the maximum value of $f(x)$, and determine the intervals on which $f(x)$ is increasing or decreasing.

SOLUTION

(a) Let $f(x) = x^{1/x}$. Note that $\lim_{x\to 0+} x^{1/x}$ is not indeterminate. As $x \to 0+$, the base of the function tends toward 0 and the exponent tends toward $+\infty$. Both of these factors force $x^{1/x}$ toward 0. Thus, $\lim_{x\to 0+} f(x) = 0$. On the other hand, $\lim_{x\to\infty} f(x)$ is indeterminate. We calculate this limit as follows:

$$\lim_{x\to\infty} \ln f(x) = \lim_{x\to\infty} \frac{\ln x}{x} = \lim_{x\to\infty} \frac{1}{x} = 0,$$

so $\lim_{x\to\infty} f(x) = e^0 = 1$.

(b) Again, let $f(x) = x^{1/x}$, so that $\ln f(x) = \frac{1}{x}\ln x$. To find the derivative f', we apply the derivative to both sides:

$$\begin{aligned}
\frac{d}{dx}\ln f(x) &= \frac{d}{dx}\left(\frac{1}{x}\ln x\right)\\
\frac{1}{f(x)} f'(x) &= -\frac{\ln x}{x^2} + \frac{1}{x^2}\\
f'(x) &= f(x)\left(-\frac{\ln x}{x^2} + \frac{1}{x^2}\right) = \frac{x^{1/x}}{x^2}(1 - \ln x)
\end{aligned}$$

Thus, f is increasing for $0 < x < e$, is decreasing for $x > e$ and has a maximum at $x = e$. The maximum value is $f(e) = e^{1/e} \approx 1.444668$.

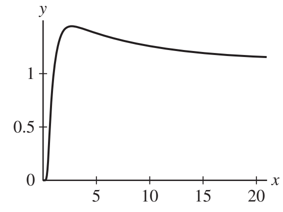
60. **(a)** Use the results of Exercise 59 to prove that $x^{1/x} = c$ has a unique solution if $0 < c \le 1$ or $c = e^{1/e}$, two solutions if $1 < c < e^{1/e}$, and no solutions if $c > e^{1/e}$.

(b) GU Plot the graph of $f(x) = x^{1/x}$ and verify that it confirms the conclusions of (a).

SOLUTION

(a) Because $(e, e^{1/e})$ is the only maximum, no solution exists for $c > e^{1/e}$ and only one solution exists for $c = e^{1/e}$. Moreover, because $f(x)$ increases from 0 to $e^{1/e}$ as x goes from 0 to e and then decreases from $e^{1/e}$ to 1 as x goes from e to $+\infty$, it follows that there are two solutions for $1 < c < e^{1/e}$, but only one solution for $0 < c \le 1$.

(b) Observe that if we sketch the horizontal line $y = c$, this line will intersect the graph of $y = f(x)$ only once for $0 < c \le 1$ and $c = e^{1/e}$ and will intersect the graph of $y = f(x)$ twice for $1 < c < e^{1/e}$. There are no points of intersection for $c > e^{1/e}$.



61. Determine whether $f << g$ or $g << f$ (or neither) for the functions $f(x) = \log_{10} x$ and $g(x) = \ln x$.

SOLUTION Because

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = \lim_{x\to\infty} \frac{\log_{10} x}{\ln x} = \lim_{x\to\infty} \frac{\frac{\ln x}{\ln 10}}{\ln x} = \frac{1}{\ln 10},$$

neither $f << g$ or $g << f$ is satisfied.

62. Show that $(\ln x)^2 << \sqrt{x}$ and $(\ln x)^4 << x^{1/10}$.

SOLUTION

- $(\ln x)^2 << \sqrt{x}$:

$$\lim_{x\to\infty} \frac{\sqrt{x}}{(\ln x)^2} = \lim_{x\to\infty} \frac{\frac{1}{2\sqrt{x}}}{\frac{2}{x}\ln x} = \lim_{x\to\infty} \frac{\sqrt{x}}{4\ln x} = \lim_{x\to\infty} \frac{\frac{1}{2\sqrt{x}}}{\frac{4}{x}} = \lim_{x\to\infty} \frac{\sqrt{x}}{8} = \infty.$$

- $(\ln x)^4 << x^{1/10}$:

$$\lim_{x\to\infty} \frac{x^{1/10}}{(\ln x)^4} = \lim_{x\to\infty} \frac{\frac{1}{10x^{9/10}}}{\frac{4}{x}(\ln x)^3} = \lim_{x\to\infty} \frac{x^{1/10}}{40(\ln x)^3} = \lim_{x\to\infty} \frac{\frac{1}{10x^{9/10}}}{\frac{120}{x}(\ln x)^2} = \lim_{x\to\infty} \frac{x^{1/10}}{1200(\ln x)^2}$$

$$= \lim_{x\to\infty} \frac{\frac{1}{10x^{9/10}}}{\frac{2400}{x}(\ln x)} = \lim_{x\to\infty} \frac{x^{1/10}}{24000\ln x} = \lim_{x\to\infty} \frac{\frac{1}{10x^{9/10}}}{\frac{24000}{x}} = \lim_{x\to\infty} \frac{x^{1/10}}{240000} = \infty.$$

63. Just as exponential functions are distinguished by their rapid rate of increase, the logarithm functions grow particularly slowly. Show that $\ln x << x^a$ for all $a > 0$.

SOLUTION Using L'Hôpital's Rule:

$$\lim_{x\to\infty} \frac{\ln x}{x^a} = \lim_{x\to\infty} \frac{x^{-1}}{ax^{a-1}} = \lim_{x\to\infty} \frac{1}{a}x^{-a} = 0;$$

hence, $\ln x << (x^a)$.

64. Show that $(\ln x)^N << x^a$ for all N and all $a > 0$.

SOLUTION

$$\lim_{x\to\infty} \frac{x^a}{(\ln x)^N} = \lim_{x\to\infty} \frac{ax^{a-1}}{\frac{N}{x}(\ln x)^{N-1}} = \lim_{x\to\infty} \frac{ax^a}{N(\ln x)^{N-1}} = \cdots$$

If we continue in this manner, L'Hôpital's Rule will give a factor of x^a in the numerator, but the power on $\ln x$ in the denominator will eventually be zero. Thus,

$$\lim_{x\to\infty} \frac{x^a}{(\ln x)^N} = \infty,$$

so $(\ln x)^N << x^a$ for all N and for all $a > 0$.

65. Determine whether $\sqrt{x} << e^{\sqrt{\ln x}}$ or $e^{\sqrt{\ln x}} << \sqrt{x}$. *Hint:* Use the substitution $u = \ln x$ instead of L'Hôpital's Rule.

SOLUTION Let $u = \ln x$, then $x = e^u$, and as $x \to \infty$, $u \to \infty$. So

$$\lim_{x\to\infty} \frac{e^{\sqrt{\ln x}}}{\sqrt{x}} = \lim_{u\to\infty} \frac{e^{\sqrt{u}}}{e^{u/2}} = \lim_{u\to\infty} e^{\sqrt{u}-\frac{u}{2}}.$$

We need to examine $\lim_{u\to\infty}(\sqrt{u} - \frac{u}{2})$. Since

$$\lim_{u\to\infty} \frac{u/2}{\sqrt{u}} = \lim_{u\to\infty} \frac{\frac{1}{2}}{\frac{1}{2\sqrt{u}}} = \lim_{u\to\infty} \sqrt{u} = \infty,$$

$\sqrt{u} = o(u/2)$ and $\lim_{u\to\infty}\left(\sqrt{u} - \dfrac{u}{2}\right) = -\infty$. Thus

$$\lim_{u\to\infty} e^{\sqrt{u}-\frac{u}{2}} = e^{-\infty} = 0 \quad \text{so} \quad \lim_{x\to\infty} \frac{e^{\sqrt{\ln x}}}{\sqrt{x}} = 0$$

and $e^{\sqrt{\ln x}} << \sqrt{x}$.

66. Show that $\lim_{x\to\infty} x^n e^{-x} = 0$ for all whole numbers $n > 0$.

SOLUTION

$$\lim_{x\to\infty} x^n e^{-x} = \lim_{x\to\infty} \frac{x^n}{e^x} = \lim_{x\to\infty} \frac{nx^{n-1}}{e^x}$$
$$= \lim_{x\to\infty} \frac{n(n-1)x^{n-2}}{e^x}$$
$$\vdots$$
$$= \lim_{x\to\infty} \frac{n!}{e^x} = 0.$$

67. Assumptions Matter Let $f(x) = x(2+\sin x)$ and $g(x) = x^2+1$.

(a) Show directly that $\lim_{x\to\infty} f(x)/g(x) = 0$.

(b) Show that $\lim_{x\to\infty} f(x) = \lim_{x\to\infty} g(x) = \infty$, but $\lim_{x\to\infty} f'(x)/g'(x)$ does not exist.

Do (a) and (b) contradict L'Hôpital's Rule? Explain.

SOLUTION

(a) $1 \le 2+\sin x \le 3$, so

$$\frac{x}{x^2+1} \le \frac{x(2+\sin x)}{x^2+1} \le \frac{3x}{x^2+1}.$$

Since,

$$\lim_{x\to\infty} \frac{x}{x^2+1} = \lim_{x\to\infty} \frac{3x}{x^2+1} = 0,$$

it follows by the Squeeze Theorem that

$$\lim_{x\to\infty} \frac{x(2+\sin x)}{x^2+1} = 0.$$

(b) $\lim_{x\to\infty} f(x) = \lim_{x\to\infty} x(2+\sin x) \ge \lim_{x\to\infty} x = \infty$ and $\lim_{x\to\infty} g(x) = \lim_{x\to\infty} (x^2+1) = \infty$, but

$$\lim_{x\to\infty} \frac{f'(x)}{g'(x)} = \lim_{x\to\infty} \frac{x(\cos x) + (2+\sin x)}{2x}$$

does not exist since $\cos x$ oscillates. This does not violate L'Hôpital's Rule since the theorem clearly states

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = \lim_{x\to\infty} \frac{f'(x)}{g'(x)}$$

"provided the limit on the right exists."

68. Let $H(b) = \lim_{x\to\infty} \dfrac{\ln(1+b^x)}{x}$ for $b > 0$.

(a) Show that $H(b) = \ln b$ if $b \ge 1$

(b) Determine $H(b)$ for $0 < b \le 1$.

SOLUTION

(a) Suppose $b \ge 1$. Then

$$H(b) = \lim_{x\to\infty} \frac{\ln(1+b^x)}{x} = \lim_{x\to\infty} \frac{b^x \ln b}{1+b^x} = \frac{b^x \ln b}{b^x} = \ln b.$$

(b) Now, suppose $0 < b < 1$. Then

$$H(b) = \lim_{x\to\infty} \frac{\ln(1+b^x)}{x} = \lim_{x\to\infty} \frac{b^x \ln b}{1+b^x} = \frac{0}{1} = 0.$$

69. Let $G(b) = \lim_{x\to\infty} (1+b^x)^{1/x}$.

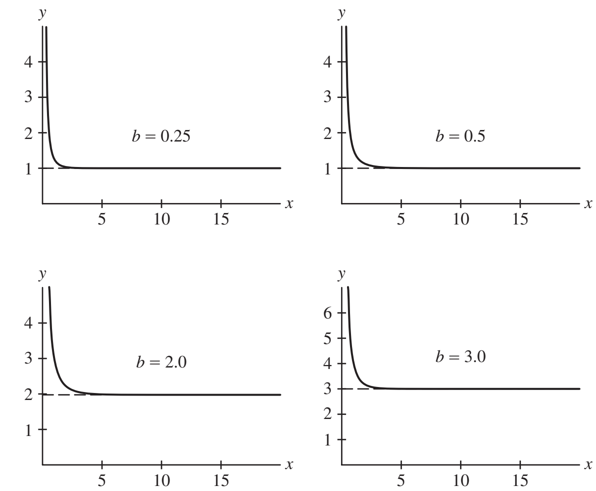
(a) Use the result of Exercise 68 to evaluate $G(b)$ for all $b > 0$.

(b) $\boxed{\text{GU}}$ Verify your result graphically by plotting $y = (1+b^x)^{1/x}$ together with the horizontal line $y = G(b)$ for the values $b = 0.25, 0.5, 2, 3$.

SOLUTION

(a) Using Exercise 68, we see that $G(b) = e^{H(b)}$. Thus, $G(b) = 1$ if $0 \le b \le 1$ and $G(b) = b$ if $b > 1$.

(b)



70. Show that $\lim\limits_{t\to\infty} t^k e^{-t^2} = 0$ for all k. *Hint:* Compare with $\lim\limits_{t\to\infty} t^k e^{-t} = 0$.

SOLUTION Because we are interested in the limit as $t \to +\infty$, we will restrict attention to $t > 1$. Then, for all k,

$$0 \le t^k e^{-t^2} \le t^k e^{-t}.$$

As $\lim\limits_{t\to\infty} t^k e^{-t} = 0$, it follows from the Squeeze Theorem that

$$\lim_{t\to\infty} t^k e^{-t^2} = 0.$$

In Exercises 71–73, let

$$f(x) = \begin{cases} e^{-1/x^2} & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$$

These exercises show that $f(x)$ has an unusual property: All of its derivatives at $x = 0$ exist and are equal to zero.

71. Show that $\lim\limits_{x\to 0} \dfrac{f(x)}{x^k} = 0$ for all k. *Hint:* Let $t = x^{-1}$ and apply the result of Exercise 70.

SOLUTION $\lim\limits_{x\to 0} \dfrac{f(x)}{x^k} = \lim\limits_{x\to 0} \dfrac{1}{x^k e^{1/x^2}}$. Let $t = 1/x$. As $x \to 0$, $t \to \infty$. Thus,

$$\lim_{x\to 0} \frac{1}{x^k e^{1/x^2}} = \lim_{t\to\infty} \frac{t^k}{e^{t^2}} = 0$$

by Exercise 70.

72. Show that $f'(0)$ exists and is equal to zero. Also, verify that $f''(0)$ exists and is equal to zero.

SOLUTION Working from the definition,

$$f'(0) = \lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{f(x)}{x} = 0$$

by the previous exercise. Thus, $f'(0)$ exists and is equal to 0. Moreover,

$$f'(x) = \begin{cases} e^{-1/x^2}\left(\frac{2}{x^3}\right) & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$$

Now,

$$f''(0) = \lim_{x\to 0} \frac{f'(x) - f'(0)}{x - 0} = \lim_{x\to 0} e^{-1/x^2}\left(\frac{2}{x^4}\right) = 2\lim_{x\to 0} \frac{f(x)}{x^4} = 0$$

by the previous exercise. Thus, $f''(0)$ exists and is equal to 0.

73. Show that for $k \geq 1$ and $x \neq 0$,

$$f^{(k)}(x) = \frac{P(x)e^{-1/x^2}}{x^r}$$

for some polynomial $P(x)$ and some exponent $r \geq 1$. Use the result of Exercise 71 to show that $f^{(k)}(0)$ exists and is equal to zero for all $k \geq 1$.

SOLUTION For $x \neq 0$, $f'(x) = e^{-1/x^2}\left(\frac{2}{x^3}\right)$. Here $P(x) = 2$ and $r = 3$. Assume $f^{(k)}(x) = \frac{P(x)e^{-1/x^2}}{x^r}$. Then

$$f^{(k+1)}(x) = e^{-1/x^2}\left(\frac{x^3P'(x) + (2 - rx^2)P(x)}{x^{r+3}}\right)$$

which is of the form desired.

Moreover, from Exercise 72, $f'(0) = 0$. Suppose $f^{(k)}(0) = 0$. Then

$$f^{(k+1)}(0) = \lim_{x\to 0} \frac{f^{(k)}(x) - f^{(k)}(0)}{x - 0} = \lim_{x\to 0} \frac{P(x)e^{-1/x^2}}{x^{r+1}} = P(0)\lim_{x\to 0}\frac{f(x)}{x^{r+1}} = 0.$$

Further Insights and Challenges

74. Show that L'Hôpital's Rule applies to $\lim_{x\to\infty} \frac{x}{\sqrt{x^2+1}}$ but that it does not help. Then evaluate the limit directly.

SOLUTION Both the numerator $f(x) = x$ and the denominator $g(x) = \sqrt{x^2+1}$ tend to infinity as $x \to \infty$, and $g'(x) = x/\sqrt{x^2+1}$ is nonzero for $x > 0$. Therefore, L'Hôpital's Rule applies:

$$\lim_{x\to\infty}\frac{x}{\sqrt{x^2+1}} = \lim_{x\to\infty}\frac{1}{x(x^2+1)^{-1/2}} = \lim_{x\to\infty}\frac{(x^2+1)^{1/2}}{x}$$

We may apply L'Hôpital's Rule again: $\lim_{x\to\infty}\frac{(x^2+1)^{1/2}}{x} = \lim_{x\to\infty}\frac{x(x^2+1)^{-1/2}}{1} = \lim_{x\to\infty}\frac{x}{\sqrt{x^2+1}}$. This takes us back to the original limit, so L'Hôpital's Rule is ineffective. However, we can evaluate the limit directly by observing that

$$\frac{x}{\sqrt{x^2+1}} = \frac{x^{-1}(x)}{x^{-1}\sqrt{x^2+1}} = \frac{1}{\sqrt{1+x^{-2}}} \quad \text{and hence} \quad \lim_{x\to\infty}\frac{x}{\sqrt{x^2+1}} = \lim_{x\to\infty}\frac{1}{\sqrt{1+x^{-2}}} = 1.$$

75. The Second Derivative Test for critical points fails if $f''(c) = 0$. This exercise develops a **Higher Derivative Test** based on the sign of the first nonzero derivative. Suppose that

$$f'(c) = f''(c) = \cdots = f^{(n-1)}(c) = 0, \quad \text{but} \quad f^{(n)}(c) \neq 0$$

(a) Show, by applying L'Hôpital's Rule n times, that

$$\lim_{x\to c}\frac{f(x) - f(c)}{(x-c)^n} = \frac{1}{n!}f^{(n)}(c)$$

where $n! = n(n-1)(n-2)\cdots(2)(1)$.

(b) Use (a) to show that if n is even, then $f(c)$ is a local minimum if $f^{(n)}(c) > 0$ and is a local maximum if $f^{(n)}(c) < 0$. *Hint:* If n is even, then $(x-c)^n > 0$ for $x \neq a$, so $f(x) - f(c)$ must be positive for x near c if $f^{(n)}(c) > 0$.

(c) Use (a) to show that if n is odd, then $f(c)$ is neither a local minimum nor a local maximum.

SOLUTION

(a) Repeated application of L'Hôpital's rule yields

$$\begin{aligned}\lim_{x\to c}\frac{f(x)-f(c)}{(x-c)^n} &= \lim_{x\to c}\frac{f'(x)}{n(x-c)^{n-1}}\\ &= \lim_{x\to c}\frac{f''(x)}{n(n-1)(x-c)^{n-2}}\\ &= \lim_{x\to c}\frac{f'''(x)}{n(n-1)(n-2)(x-c)^{n-3}}\\ &= \cdots\\ &= \frac{1}{n!}f^{(n)}(c)\end{aligned}$$

(b) Suppose n is even. Then $(x-c)^n > 0$ for all $x \neq c$. If $f^{(n)}(c) > 0$, it follows that $f(x) - f(c)$ must be positive for x near c. In other words, $f(x) > f(c)$ for x near c and $f(c)$ is a local minimum. On the other hand, if $f^{(n)}(c) < 0$, it follows that $f(x) - f(c)$ must be negative for x near c. In other words, $f(x) < f(c)$ for x near c and $f(c)$ is a local maximum.

(c) If n is odd, then $(x-c)^n > 0$ for $x > c$ but $(x-c)^n < 0$ for $x < c$. If $f^{(n)}(c) > 0$, it follows that $f(x) - f(c)$ must be positive for x near c and $x > c$ but is negative for x near c and $x < c$. In other words, $f(x) > f(c)$ for x near c and $x > c$ but $f(x) < f(c)$ for x near c and $x < c$. Thus, $f(c)$ is neither a local minimum nor a local maximum. We obtain a similar result if $f^{(n)}(c) < 0$.

76. When a spring with natural frequency $\lambda/2\pi$ is driven with a sinusoidal force $\sin(\omega t)$ with $\omega \neq \lambda$, it oscillates according to

$$y(t) = \frac{1}{\lambda^2 - \omega^2}\big(\lambda \sin(\omega t) - \omega \sin(\lambda t)\big)$$

Let $y_0(t) = \lim_{\omega \to \lambda} y(t)$.

(a) Use L'Hôpital's Rule to determine $y_0(t)$.

(b) Show that $y_0(t)$ ceases to be periodic and that its amplitude $|y_0(t)|$ tends to ∞ as $t \to \infty$ (the system is said to be in **resonance**; eventually, the spring is stretched beyond its limits).

(c) CAS Plot $y(t)$ for $\lambda = 1$ and $\omega = 0.8, 0.9, 0.99$, and 0.999. Do the graphs confirm your conclusion in (b)?

SOLUTION

(a)

$$\lim_{\omega \to \lambda} y(t) = \lim_{\omega \to \lambda} \frac{\lambda \sin(\omega t) - \omega \sin(\lambda t)}{\lambda^2 - \omega^2} = \lim_{\omega \to \lambda} \frac{\frac{d}{d\omega}(\lambda \sin(\omega t) - \omega \sin(\lambda t))}{\frac{d}{d\omega}(\lambda^2 - \omega^2)}$$

$$= \lim_{\omega \to \lambda} \frac{\lambda t \cos(\omega t) - \sin(\lambda t)}{-2\omega} = \frac{\lambda t \cos(\lambda t) - \sin(\lambda t)}{-2\lambda}$$

(b) From part (a)

$$y_0(t) = \lim_{\omega \to \lambda} y(t) = \frac{\lambda t \cos(\lambda t) - \sin(\lambda t)}{-2\lambda}.$$

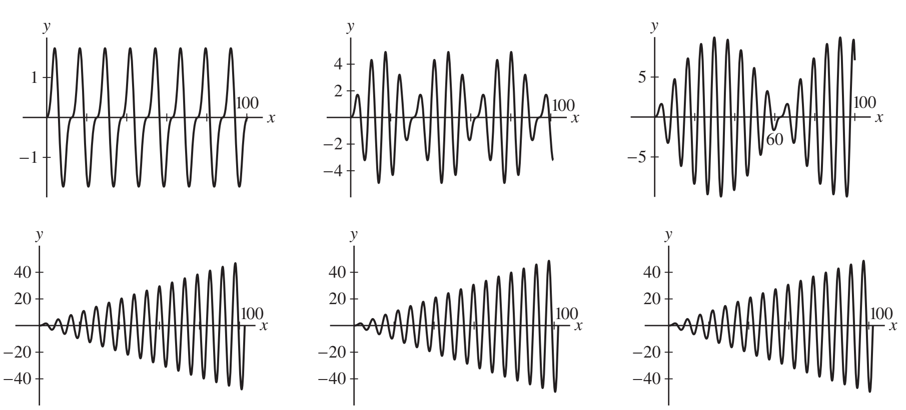
This may be rewritten as

$$y_0(t) = \frac{\sqrt{\lambda^2 t^2 + 1}}{-2\lambda} \cos(\lambda t + \phi),$$

where $\cos\phi = \dfrac{\lambda t}{\sqrt{\lambda^2 t^2 + 1}}$ and $\sin\phi = \dfrac{1}{\sqrt{\lambda^2 t^2 + 1}}$. Since the amplitude varies with t, $y_0(t)$ is not periodic. Also note that

$$\frac{\sqrt{\lambda^2 t^2 + 1}}{-2\lambda} \to \infty \quad \text{as} \quad t \to \infty.$$

(c) The graphs below were produced with $\lambda = 1$. Moving from left to right and from top to bottom, $\omega = 0.5, 0.8, 0.9, 0.99, 0.999, 1$.



77. We expended a lot of effort to evaluate $\lim_{x\to 0} \frac{\sin x}{x}$ in Chapter 2. Show that we could have evaluated it easily using L'Hôpital's Rule. Then explain why this method would involve *circular reasoning*.

SOLUTION $\lim_{x\to 0} \frac{\sin x}{x} = \lim_{x\to 0} \frac{\cos x}{1} = 1$. To use L'Hôpital's Rule to evaluate $\lim_{x\to 0} \frac{\sin x}{x}$, we must know that the derivative of $\sin x$ is $\cos x$, but to determine the derivative of $\sin x$, we must be able to evaluate $\lim_{x\to 0} \frac{\sin x}{x}$.

78. By a fact from algebra, if f, g are polynomials such that $f(a) = g(a) = 0$, then there are polynomials f_1, g_1 such that

$$f(x) = (x-a)f_1(x), \qquad g(x) = (x-a)g_1(x)$$

Use this to verify L'Hôpital's Rule directly for $\lim_{x\to a} f(x)/g(x)$.

SOLUTION As in the problem statement, let $f(x)$ and $g(x)$ be two polynomials such that $f(a) = g(a) = 0$, and let $f_1(x)$ and $g_1(x)$ be the polynomials such that $f(x) = (x-a)f_1(x)$ and $g(x) = (x-a)g_1(x)$. By the product rule, we have the following facts,

$$f'(x) = (x-a)f_1'(x) + f_1(x)$$
$$g'(x) = (x-a)g_1'(x) + g_1(x)$$

so

$$\lim_{x\to a} f'(x) = f_1(a) \quad \text{and} \quad \lim_{x\to a} g'(x) = g_1(a).$$

L'Hôpital's Rule stated for f and g is: if $\lim_{x\to a} g'(x) \neq 0$, so that $g_1(a) \neq 0$,

$$\lim_{x\to a} \frac{f(x)}{g(x)} = \lim_{x\to a} \frac{f'(x)}{g'(x)} = \frac{f_1(a)}{g_1(a)}.$$

Suppose $g_1(a) \neq 0$. Then, by direct computation,

$$\lim_{x\to a} \frac{f(x)}{g(x)} = \lim_{x\to a} \frac{(x-a)f_1(x)}{(x-a)g_1(x)} = \lim_{x\to a} \frac{f_1(x)}{g_1(x)} = \frac{f_1(a)}{g_1(a)},$$

exactly as predicted by L'Hôpital's Rule.

79. Patience Required Use L'Hôpital's Rule to evaluate and check your answers numerically:

(a) $\lim_{x\to 0+} \left(\frac{\sin x}{x}\right)^{1/x^2}$ **(b)** $\lim_{x\to 0} \left(\frac{1}{\sin^2 x} - \frac{1}{x^2}\right)$

SOLUTION

(a) We start by evaluating

$$\lim_{x\to 0+} \ln\left(\frac{\sin x}{x}\right)^{1/x^2} = \lim_{x\to 0+} \frac{\ln(\sin x) - \ln x}{x^2}.$$

Repeatedly using L'Hôpital's Rule, we find

$$\begin{aligned}\lim_{x\to 0+} \ln\left(\frac{\sin x}{x}\right)^{1/x^2} &= \lim_{x\to 0+} \frac{\cot x - x^{-1}}{2x} = \lim_{x\to 0+} \frac{x\cos x - \sin x}{2x^2 \sin x} = \lim_{x\to 0+} \frac{-x\sin x}{2x^2\cos x + 4x\sin x} \\ &= \lim_{x\to 0+} \frac{-x\cos x - \sin x}{8x\cos x + 4\sin x - 2x^2\sin x} = \lim_{x\to 0+} \frac{-2\cos x + x\sin x}{12\cos x - 2x^2\cos x - 12x\sin x} \\ &= -\frac{2}{12} = -\frac{1}{6}.\end{aligned}$$

Therefore, $\lim_{x\to 0+} \left(\frac{\sin x}{x}\right)^{1/x^2} = e^{-1/6}$. Numerically we find:

x	1	0.1	0.01
$\left(\frac{\sin x}{x}\right)^{1/x^2}$	0.841471	0.846435	0.846481

Note that $e^{-1/6} \approx 0.846481724$.

(b) Repeatedly using L'Hôpital's Rule and simplifying, we find

$$\lim_{x\to 0}\left(\frac{1}{\sin^2 x}-\frac{1}{x^2}\right)=\lim_{x\to 0}\frac{x^2-\sin^2 x}{x^2\sin^2 x}=\lim_{x\to 0}\frac{2x-2\sin x\cos x}{x^2(2\sin x\cos x)+2x\sin^2 x}=\lim_{x\to 0}\frac{2x-2\sin 2x}{x^2\sin 2x+2x\sin^2 x}$$
$$=\lim_{x\to 0}\frac{2-2\cos 2x}{2x^2\cos 2x+2x\sin 2x+4x\sin x\cos x+2\sin^2 x}$$
$$=\lim_{x\to 0}\frac{2-2\cos 2x}{2x^2\cos 2x+4x\sin 2x+2\sin^2 x}$$
$$=\lim_{x\to 0}\frac{4\sin 2x}{-4x^2\sin 2x+4x\cos 2x+8x\cos 2x+4\sin 2x+4\sin x\cos x}$$
$$=\lim_{x\to 0}\frac{4\sin 2x}{(6-4x^2)\sin 2x+12x\cos 2x}$$
$$=\lim_{x\to 0}\frac{8\cos 2x}{(12-8x^2)\cos 2x-8x\sin 2x+12\cos 2x-24x\sin 2x}=\frac{1}{3}.$$

Numerically we find:

x	1	0.1	0.01
$\frac{1}{\sin^2 x}-\frac{1}{x^2}$	0.412283	0.334001	0.333340

80. In the following cases, check that $x=c$ is a critical point and use Exercise 75 to determine whether $f(c)$ is a local minimum or a local maximum.
(a) $f(x)=x^5-6x^4+14x^3-16x^2+9x+12 \quad (c=1)$
(b) $f(x)=x^6-x^3 \quad (c=0)$

SOLUTION

(a) Let $f(x)=x^5-6x^4+14x^3-16x^2+9x+12$. Then $f'(x)=5x^4-24x^3+42x^2-32x+9$, so $f'(1)=5-24+42-32+9=0$ and $c=1$ is a critical point. Now,

$$f''(x)=20x^3-72x^2+84x-32 \text{ so } f''(1)=0;$$
$$f'''(x)=60x^2-144x+84 \text{ so } f'''(1)=0;$$
$$f^{(4)}(x)=120x-144 \text{ so } f^{(4)}(1)=-24\neq 0.$$

Thus, $n=4$ is even and $f^{(4)}<0$, so $f(1)$ is a local maximum.
(b) Let $f(x)=x^6-x^3$. Then, $f'(x)=6x^5-3x^2$, so $f'(0)=0$ and $c=0$ is a critical point. Now,

$$f''(x)=30x^4-6x \text{ so } f''(0)=0;$$
$$f'''(x)=120x-6 \text{ so } f'''(0)=-6\neq 0.$$

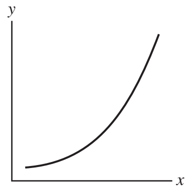
Thus, $n=3$ is odd, so $f(0)$ is neither a local minimum nor a local maximum.

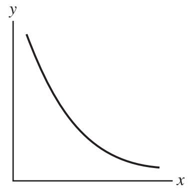
4.6 Graph Sketching and Asymptotes

Preliminary Questions

1. Sketch an arc where f' and f'' have the sign combination $++$. Do the same for $-+$.

SOLUTION An arc with the sign combination $++$ (increasing, concave up) is shown below at the left. An arc with the sign combination $-+$ (decreasing, concave up) is shown below at the right.





2. If the sign combination of f' and f'' changes from $++$ to $+-$ at $x = c$, then (choose the correct answer):

(a) $f(c)$ is a local min

(b) $f(c)$ is a local max

(c) c is a point of inflection

SOLUTION Because the sign of the second derivative changes at $x = c$, the correct response is **(c)**: c is a point of inflection.

3. The second derivative of the function $f(x) = (x-4)^{-1}$ is $f''(x) = 2(x-4)^{-3}$. Although $f''(x)$ changes sign at $x = 4$, $f(x)$ does not have a point of inflection at $x = 4$. Why not?

SOLUTION The function f does not have a point of inflection at $x = 4$ because $x = 4$ is not in the domain of f.

Exercises

1. Determine the sign combinations of f' and f'' for each interval A–G in Figure 16.

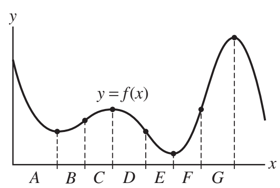


FIGURE 16

SOLUTION

- In A, f is decreasing and concave up, so $f' < 0$ and $f'' > 0$.
- In B, f is increasing and concave up, so $f' > 0$ and $f'' > 0$.
- In C, f is increasing and concave down, so $f' > 0$ and $f'' < 0$.
- In D, f is decreasing and concave down, so $f' < 0$ and $f'' < 0$.
- In E, f is decreasing and concave up, so $f' < 0$ and $f'' > 0$.
- In F, f is increasing and concave up, so $f' > 0$ and $f'' > 0$.
- In G, f is increasing and concave down, so $f' > 0$ and $f'' < 0$.

2. State the sign change at each transition point A–G in Figure 17. Example: $f'(x)$ goes from $+$ to $-$ at A.

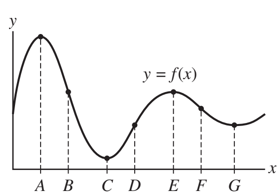

FIGURE 17

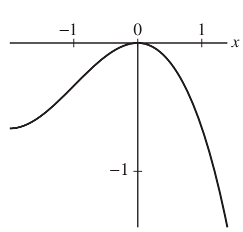
SOLUTION

- At B, the graph changes from concave down to concave up, so f'' goes from $-$ to $+$.
- At C, the graph changes from decreasing to increasing, so f' goes from $-$ to $+$.
- At D, the graph changes from concave up to concave down, so f'' goes from $+$ to $-$.
- At E, the graph changes from increasing to decreasing, so f' goes from $+$ to $-$.
- At F, the graph changes from concave down to concave up, so f'' goes from $-$ to $+$.
- At G, the graph changes from decreasing to increasing, so f' goes from $-$ to $+$.

In Exercises 3–6, draw the graph of a function for which f' and f'' take on the given sign combinations.

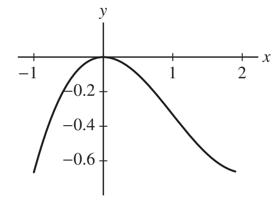
3. $++$, $+-$, $--$

SOLUTION This function changes from concave up to concave down at $x = -1$ and from increasing to decreasing at $x = 0$.



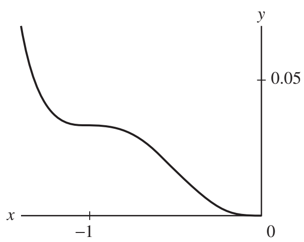
4. $+-$, $--$, $-+$

SOLUTION This function changes from increasing to decreasing at $x = 0$ and from concave down to concave up at $x = 1$.



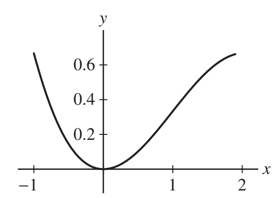
5. $-+$, $--$, $-+$

SOLUTION The function is decreasing everywhere and changes from concave up to concave down at $x = -1$ and from concave down to concave up at $x = -\frac{1}{2}$.



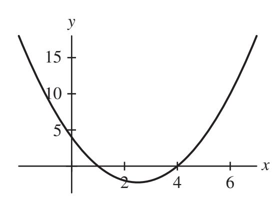
6. $-+$, $++$, $+-$

SOLUTION This function changes from decreasing to increasing at $x = 0$ and from concave up to concave down at $x = 1$.



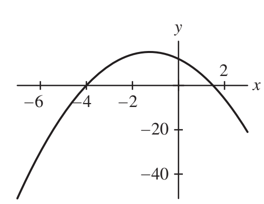
7. Sketch the graph of $y = x^2 - 5x + 4$.

SOLUTION Let $f(x) = x^2 - 5x + 4$. Then $f'(x) = 2x - 5$ and $f''(x) = 2$. Hence f is decreasing for $x < 5/2$, is increasing for $x > 5/2$, has a local minimum at $x = 5/2$ and is concave up everywhere.



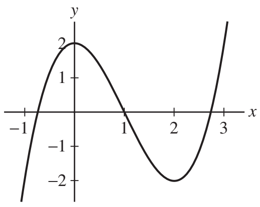
8. Sketch the graph of $y = 12 - 5x - 2x^2$.

SOLUTION Let $f(x) = 12 - 5x - 2x^2$. Then $f'(x) = -5 - 4x$ and $f''(x) = -4$. Hence f is increasing for $x < -5/4$, is decreasing for $x > -5/4$, has a local maximum at $x = -5/4$ and is concave down everywhere.



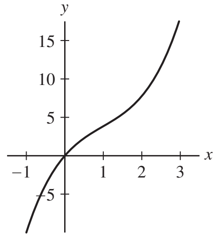
9. Sketch the graph of $f(x) = x^3 - 3x^2 + 2$. Include the zeros of $f(x)$, which are $x = 1$ and $1 \pm \sqrt{3}$ (approximately -0.73, 2.73).

SOLUTION Let $f(x) = x^3 - 3x^2 + 2$. Then $f'(x) = 3x^2 - 6x = 3x(x-2) = 0$ yields $x = 0, 2$ and $f''(x) = 6x - 6$. Thus f is concave down for $x < 1$, is concave up for $x > 1$, has an inflection point at $x = 1$, is increasing for $x < 0$ and for $x > 2$, is decreasing for $0 < x < 2$, has a local maximum at $x = 0$, and has a local minimum at $x = 2$.



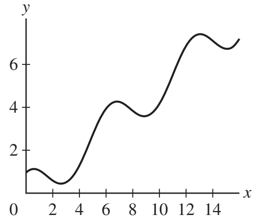
10. Show that $f(x) = x^3 - 3x^2 + 6x$ has a point of inflection but no local extreme values. Sketch the graph.

SOLUTION Let $f(x) = x^3 - 3x^2 + 6x$. Then $f'(x) = 3x^2 - 6x + 6 = 3\left((x-1)^2 + 1\right) > 0$ for all values of x and $f''(x) = 6x - 6$. Hence f is everywhere increasing and has an inflection point at $x = 1$. It is concave down on $(-\infty, 1)$ and concave up on $(1, \infty)$.



11. Extend the sketch of the graph of $f(x) = \cos x + \frac{1}{2}x$ in Example 4 to the interval $[0, 5\pi]$.

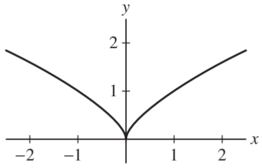
SOLUTION Let $f(x) = \cos x + \frac{1}{2}x$. Then $f'(x) = -\sin x + \frac{1}{2} = 0$ yields critical points at $x = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{13\pi}{6}, \frac{17\pi}{6}, \frac{25\pi}{6}$, and $\frac{29\pi}{6}$. Moreover, $f''(x) = -\cos x$ so there are points of inflection at $x = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \frac{7\pi}{2}$, and $\frac{9\pi}{2}$.



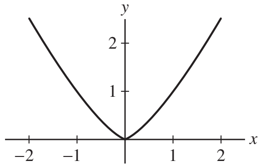
12. Sketch the graphs of $y = x^{2/3}$ and $y = x^{4/3}$.

SOLUTION

- Let $f(x) = x^{2/3}$. Then $f'(x) = \frac{2}{3}x^{-1/3}$ and $f''(x) = -\frac{2}{9}x^{-4/3}$, neither of which exist at $x = 0$. Thus f is decreasing and concave down for $x < 0$ and increasing and concave down for $x > 0$.



- Let $f(x) = x^{4/3}$. Then $f'(x) = \frac{4}{3}x^{1/3}$ and $f''(x) = \frac{4}{9}x^{-2/3}$. Thus f is decreasing and concave up for $x < 0$ and increasing and concave up for $x > 0$.



In Exercises 13–34, find the transition points, intervals of increase/decrease, concavity, and asymptotic behavior. Then sketch the graph, with this information indicated.

13. $y = x^3 + 24x^2$

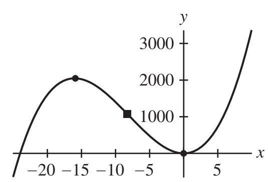
SOLUTION Let $f(x) = x^3 + 24x^2$. Then $f'(x) = 3x^2 + 48x = 3x(x + 16)$ and $f''(x) = 6x + 48$. This shows that f has critical points at $x = 0$ and $x = -16$ and a candidate for an inflection point at $x = -8$.

Interval	$(-\infty, -16)$	$(-16, -8)$	$(-8, 0)$	$(0, \infty)$
Signs of f' and f''	$+-$	$--$	$-+$	$++$

Thus, there is a local maximum at $x = -16$, a local minimum at $x = 0$, and an inflection point at $x = -8$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with these transition points highlighted as in the graphs in the textbook.



14. $y = x^3 - 3x + 5$

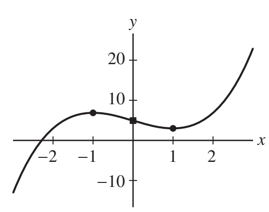
SOLUTION Let $f(x) = x^3 - 3x + 5$. Then $f'(x) = 3x^2 - 3$ and $f''(x) = 6x$. Critical points are at $x = \pm 1$ and the sole candidate point of inflection is at $x = 0$.

Interval	$(-\infty, -1)$	$(-1, 0)$	$(0, 1)$	$(1, \infty)$
Signs of f' and f''	$+-$	$--$	$-+$	$++$

Thus, $f(-1)$ is a local maximum, $f(1)$ is a local minimum, and there is a point of inflection at $x = 0$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \lim_{x\to\infty} f(x) = \infty.$$

Here is the graph of f with the transition points highlighted as in the textbook.



15. $y = x^2 - 4x^3$

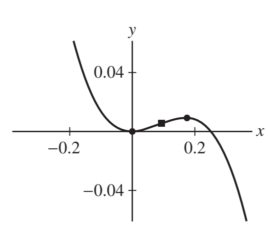
SOLUTION Let $f(x) = x^2 - 4x^3$. Then $f'(x) = 2x - 12x^2 = 2x(1 - 6x)$ and $f''(x) = 2 - 24x$. Critical points are at $x = 0$ and $x = \frac{1}{6}$, and the sole candidate point of inflection is at $x = \frac{1}{12}$.

Interval	$(-\infty, 0)$	$(0, \frac{1}{12})$	$(\frac{1}{12}, \frac{1}{6})$	$(\frac{1}{6}, \infty)$
Signs of f' and f''	$-+$	$++$	$+-$	$--$

Thus, $f(0)$ is a local minimum, $f(\frac{1}{6})$ is a local maximum, and there is a point of inflection at $x = \frac{1}{12}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is the graph of f with transition points highlighted as in the textbook:

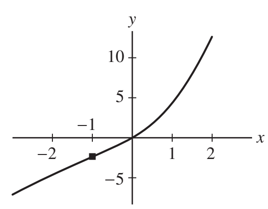


16. $y = \frac{1}{3}x^3 + x^2 + 3x$

SOLUTION Let $f(x) = \frac{1}{3}x^3 + x^2 + 3x$. Then $f'(x) = x^2 + 2x + 3$, and $f''(x) = 2x + 2 = 0$ if $x = -1$. Sign analysis shows that $f'(x) = (x+1)^2 + 2 > 0$ for all x (so that $f(x)$ has no critical points and is always increasing), and that $f''(x)$ changes from negative to positive at $x = -1$, implying that the graph of $f(x)$ has an inflection point at $(-1, f(-1))$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \lim_{x\to\infty} f(x) = \infty.$$

A graph with the inflection point indicated appears below:



17. $y = 4 - 2x^2 + \frac{1}{6}x^4$

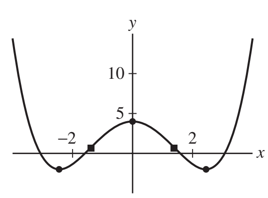
SOLUTION Let $f(x) = \frac{1}{6}x^4 - 2x^2 + 4$. Then $f'(x) = \frac{2}{3}x^3 - 4x = \frac{2}{3}x\left(x^2 - 6\right)$ and $f''(x) = 2x^2 - 4$. This shows that f has critical points at $x = 0$ and $x = \pm\sqrt{6}$ and has candidates for points of inflection at $x = \pm\sqrt{2}$.

Interval	$(-\infty, -\sqrt{6})$	$(-\sqrt{6}, -\sqrt{2})$	$(-\sqrt{2}, 0)$	$(0, \sqrt{2})$	$(\sqrt{2}, \sqrt{6})$	$(\sqrt{6}, \infty)$
Signs of f' and f''	$-+$	$++$	$+-$	$--$	$-+$	$++$

Thus, f has local minima at $x = \pm\sqrt{6}$, a local maximum at $x = 0$, and inflection points at $x = \pm\sqrt{2}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.



18. $y = 7x^4 - 6x^2 + 1$

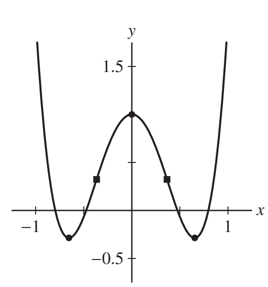
SOLUTION Let $f(x) = 7x^4 - 6x^2 + 1$. Then $f'(x) = 28x^3 - 12x = 4x\left(7x^2 - 3\right)$ and $f''(x) = 84x^2 - 12$. This shows that f has critical points at $x = 0$ and $x = \pm\frac{\sqrt{21}}{7}$ and candidates for points of inflection at $x = \pm\frac{\sqrt{7}}{7}$.

Interval	$(-\infty, -\frac{\sqrt{21}}{7})$	$(-\frac{\sqrt{21}}{7}, -\frac{\sqrt{7}}{7})$	$(-\frac{\sqrt{7}}{7}, 0)$	$(0, \frac{\sqrt{7}}{7})$	$(\frac{\sqrt{7}}{7}, \frac{\sqrt{21}}{7})$	$(\frac{\sqrt{21}}{7}, \infty)$
Signs of f' and f''	$-+$	$++$	$+-$	$--$	$-+$	$++$

Thus, f has local minima at $x = \pm\frac{\sqrt{21}}{7}$, a local maximum at $x = 0$, and inflection points at $x = \pm\frac{\sqrt{7}}{7}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.

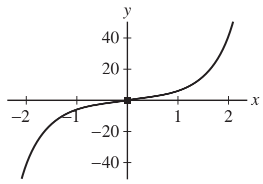


19. $y = x^5 + 5x$

SOLUTION Let $f(x) = x^5 + 5x$. Then $f'(x) = 5x^4 + 5 = 5(x^4 + 1)$ and $f''(x) = 20x^3$. $f'(x) > 0$ for all x, so the graph has no critical points and is always increasing. $f''(x) = 0$ at $x = 0$. Sign analyses reveal that $f''(x)$ changes from negative to positive at $x = 0$, so that the graph of $f(x)$ has an inflection point at $(0, 0)$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \quad \lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.

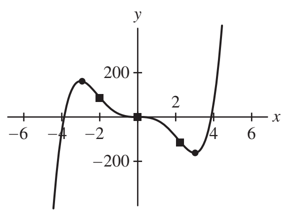


20. $y = x^5 - 15x^3$

SOLUTION Let $f(x) = x^5 - 15x^3$. Then $f'(x) = 5x^4 - 45x^2 = 5x^2(x^2 - 9)$ and $f''(x) = 20x^3 - 90x = 10x(2x^2 - 9)$. This shows that f has critical points at $x = 0$ and $x = \pm 3$ and candidate inflection points at $x = 0$ and $x = \pm 3\sqrt{2}/2$. Sign analyses reveal that $f'(x)$ changes from positive to negative at $x = -3$, is negative on either side of $x = 0$ and changes from negative to positive at $x = 3$. The graph therefore has a local maximum at $x = -3$ and a local minimum at $x = 3$. Further sign analyses show that $f''(x)$ transitions from positive to negative at $x = 0$ and from negative to positive at $x = \pm 3\sqrt{2}/2$. The graph therefore has points of inflection at $x = 0$ and $x = \pm 3\sqrt{2}/2$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \quad \lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.

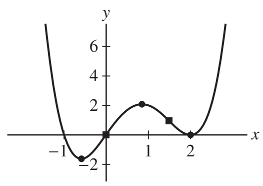


21. $y = x^4 - 3x^3 + 4x$

SOLUTION Let $f(x) = x^4 - 3x^3 + 4x$. Then $f'(x) = 4x^3 - 9x^2 + 4 = (4x^2 - x - 2)(x - 2)$ and $f''(x) = 12x^2 - 18x = 6x(2x - 3)$. This shows that f has critical points at $x = 2$ and $x = \dfrac{1 \pm \sqrt{33}}{8}$ and candidate points of inflection at $x = 0$ and $x = \frac{3}{2}$. Sign analyses reveal that $f'(x)$ changes from negative to positive at $x = \frac{1-\sqrt{33}}{8}$, from positive to negative at $x = \frac{1+\sqrt{33}}{8}$, and again from negative to positive at $x = 2$. Therefore, $f(\frac{1-\sqrt{33}}{8})$ and $f(2)$ are local minima of $f(x)$, and $f(\frac{1+\sqrt{33}}{8})$ is a local maximum. Further sign analyses reveal that $f''(x)$ changes from positive to negative at $x = 0$ and from negative to positive at $x = \frac{3}{2}$, so that there are points of inflection both at $x = 0$ and $x = \frac{3}{2}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of $f(x)$ with transition points highlighted.



22. $y = x^2(x - 4)^2$

SOLUTION Let $f(x) = x^2(x - 4)^2$. Then

$$f'(x) = 2x(x - 4)^2 + 2x^2(x - 4) = 2x(x - 4)(x - 4 + x) = 4x(x - 4)(x - 2)$$

and

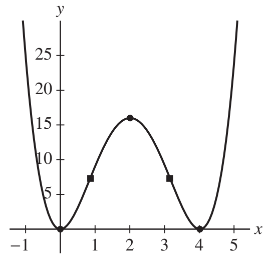
$$f''(x) = 12x^2 - 48x + 32 = 4(3x^2 - 12x + 8).$$

Critical points are therefore at $x = 0$, $x = 4$, and $x = 2$. Candidate inflection points are at solutions of $4(3x^2 - 12x + 8) = 0$, which, from the quadratic formula, are at $2 \pm \frac{\sqrt{48}}{6} = 2 \pm \frac{2\sqrt{3}}{3}$.

Sign analyses reveal that $f'(x)$ changes from negative to positive at $x = 0$ and $x = 4$, and from positive to negative at $x = 2$. Therefore, $f(0)$ and $f(4)$ are local minima, and $f(2)$ a local maximum, of $f(x)$. Also, $f''(x)$ changes from positive to negative at $2 - \frac{2\sqrt{3}}{3}$ and from negative to positive at $2 + \frac{2\sqrt{3}}{3}$. Therefore there are points of inflection at both $x = 2 \pm \frac{2\sqrt{3}}{3}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of $f(x)$ with transition points highlighted.

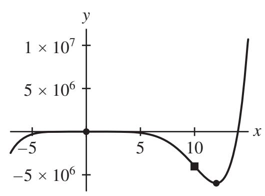


23. $y = x^7 - 14x^6$

SOLUTION Let $f(x) = x^7 - 14x^6$. Then $f'(x) = 7x^6 - 84x^5 = 7x^5(x - 12)$ and $f''(x) = 42x^5 - 420x^4 = 42x^4(x - 10)$. Critical points are at $x = 0$ and $x = 12$, and candidate inflection points are at $x = 0$ and $x = 10$. Sign analyses reveal that $f'(x)$ changes from positive to negative at $x = 0$ and from negative to positive at $x = 12$. Therefore $f(0)$ is a local maximum and $f(12)$ is a local minimum. Also, $f''(x)$ changes from negative to positive at $x = 10$. Therefore, there is a point of inflection at $x = 10$. Moreover,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \quad \lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.

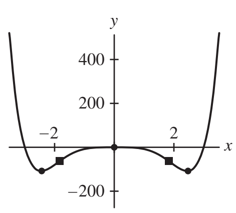


24. $y = x^6 - 9x^4$

SOLUTION Let $f(x) = x^6 - 9x^4$. Then $f'(x) = 6x^5 - 36x^3 = 6x^3(x^2 - 6)$ and $f''(x) = 30x^4 - 108x^2 = 6x^2(5x^2 - 18)$. This shows that f has critical points at $x = 0$ and $x = \pm\sqrt{6}$ and candidate inflection points at $x = 0$ and $x = \pm 3\sqrt{10}/5$. Sign analyses reveal that $f'(x)$ changes from negative to positive at $x = -\sqrt{6}$, from positive to negative at $x = 0$ and from negative to positive at $x = \sqrt{6}$. The graph therefore has a local maximum at $x = 0$ and local minima at $x = \pm\sqrt{6}$. Further sign analyses show that $f''(x)$ transitions from positive to negative at $x = -3\sqrt{10}/5$ and from negative to positive at $x = 3\sqrt{10}/5$. The graph therefore has points of inflection at $x = \pm 3\sqrt{10}/5$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.

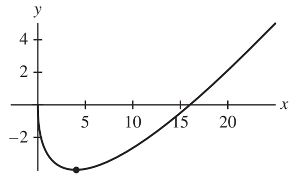


25. $y = x - 4\sqrt{x}$

SOLUTION Let $f(x) = x - 4\sqrt{x} = x - 4x^{1/2}$. Then $f'(x) = 1 - 2x^{-1/2}$. This shows that f has critical points at $x = 0$ (where the derivative does not exist) and at $x = 4$ (where the derivative is zero). Because $f'(x) < 0$ for $0 < x < 4$ and $f'(x) > 0$ for $x > 4$, $f(4)$ is a local minimum. Now $f''(x) = x^{-3/2} > 0$ for all $x > 0$, so the graph is always concave up. Moreover,

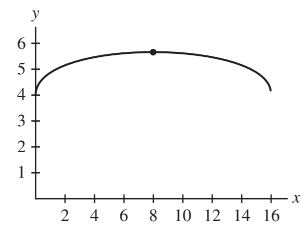
$$\lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with transition points highlighted.



26. $y = \sqrt{x} + \sqrt{16 - x}$

SOLUTION Let $f(x) = \sqrt{x} + \sqrt{16 - x} = x^{1/2} + (16 - x)^{1/2}$. Note that the domain of f is [0, 16]. Now, $f'(x) = \frac{1}{2}x^{-1/2} - \frac{1}{2}(16 - x)^{-1/2}$ and $f''(x) = -\frac{1}{4}x^{-3/2} - \frac{1}{4}(16 - x)^{-3/2}$. Thus, the critical points are $x = 0$, $x = 8$ and $x = 16$. Sign analysis reveals that $f'(x) > 0$ for $0 < x < 8$ and $f'(x) < 0$ for $8 < x < 16$, so f has a local maximum at $x = 9$. Further, $f''(x) < 0$ on (0, 16), so the graph is always concave down. Here is a graph of f with the transition point highlighted.



27. $y = x(8 - x)^{1/3}$

SOLUTION Let $f(x) = x(8 - x)^{1/3}$. Then

$$f'(x) = x \cdot \tfrac{1}{3}(8 - x)^{-2/3}(-1) + (8 - x)^{1/3} \cdot 1 = \frac{24 - 4x}{3(8 - x)^{2/3}}$$

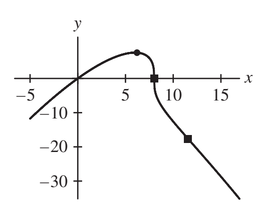
and similarly

$$f''(x) = \frac{4x - 48}{9(8 - x)^{5/3}}.$$

Critical points are at $x = 8$ and $x = 6$, and candidate inflection points are $x = 8$ and $x = 12$. Sign analyses reveal that $f'(x)$ changes from positive to negative at $x = 6$ and $f'(x)$ remains negative on either side of $x = 8$. Moreover, $f''(x)$ changes from negative to positive at $x = 8$ and from positive to negative at $x = 12$. Therefore, f has a local maximum at $x = 6$ and inflection points at $x = 8$ and $x = 12$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = -\infty.$$

Here is a graph of f with the transition points highlighted.



28. $y = (x^2 - 4x)^{1/3}$

SOLUTION Let $f(x) = (x^2 - 4x)^{1/3}$. Then

$$f'(x) = \frac{2}{3}(x-2)(x^2-4x)^{-2/3}$$

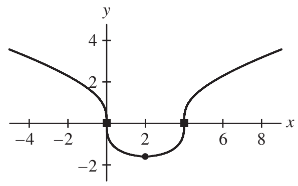
and

$$\begin{aligned} f''(x) &= \frac{2}{3}\left((x^2-4x)^{-2/3} - \frac{4}{3}(x-2)^2(x^2-4x)^{-5/3}\right) \\ &= \frac{2}{9}(x^2-4x)^{-5/3}\left(3(x^2-4x) - 4(x-2)^2\right) = -\frac{2}{9}(x^2-4x)^{-5/3}(x^2-4x+16). \end{aligned}$$

Critical points of $f(x)$ are $x = 2$ (where the derivative is zero) an $x = 0$ and $x = 4$ (where the derivative does not exist); candidate points of inflection are $x = 0$ and $x = 4$. Sign analyses reveal that $f''(x) < 0$ for $x < 0$ and for $x > 4$, while $f''(x) > 0$ for $0 < x < 4$. Therefore, the graph of $f(x)$ has points of inflection at $x = 0$ and $x = 4$. Since $(x^2 - x)^{-2/3}$ is positive wherever it is defined, the sign of $f'(x)$ depends solely on the sign of $x - 2$. Hence, $f'(x)$ does not change sign at $x = 0$ or $x = 4$, and goes from negative to positive at $x = 2$. $f(2)$ is, in that case, a local minimum. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of $f(x)$ with the transition points indicated.



29. $y = xe^{-x^2}$

SOLUTION Let $f(x) = xe^{-x^2}$. Then

$$f'(x) = -2x^2e^{-x^2} + e^{-x^2} = (1-2x^2)e^{-x^2},$$

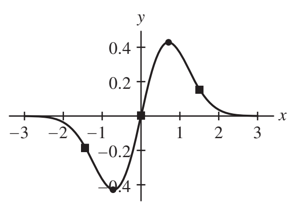
and

$$f''(x) = (4x^3 - 2x)e^{-x^2} - 4xe^{-x^2} = 2x(2x^2-3)e^{-x^2}.$$

There are critical points at $x = \pm\frac{\sqrt{2}}{2}$, and $x = 0$ and $x = \pm\frac{\sqrt{3}}{2}$ are candidates for inflection points. Sign analysis shows that $f'(x)$ changes from negative to positive at $x = -\frac{\sqrt{2}}{2}$ and from positive to negative at $x = \frac{\sqrt{2}}{2}$. Moreover, $f''(x)$ changes from negative to positive at both $x = \pm\frac{\sqrt{3}}{2}$ and from positive to negative at $x = 0$. Therefore, f has a local minimum at $x = -\frac{\sqrt{2}}{2}$, a local maximum at $x = \frac{\sqrt{2}}{2}$ and inflection points at $x = 0$ and at $x = \pm\frac{\sqrt{3}}{2}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = 0,$$

so the graph has a horizontal asymptote at $y = 0$. Here is a graph of f with the transition points highlighted.



30. $y = (2x^2 - 1)e^{-x^2}$

SOLUTION Let $f(x) = (2x^2 - 1)e^{-x^2}$. Then

$$f'(x) = (2x - 4x^3)e^{-x^2} + 4xe^{-x^2} = 2x(3-2x^2)e^{-x^2},$$

and

$$f''(x) = (8x^4 - 12x^2)e^{-x^2} + (6 - 12x^2)e^{-x^2} = 2(4x^4 - 12x^2 + 3)e^{-x^2}.$$

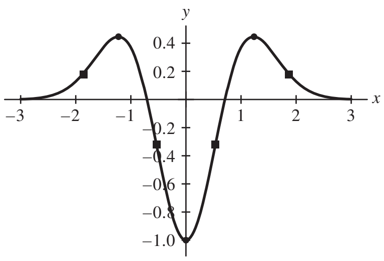
There are critical points at $x = 0$ and $x = \pm\frac{\sqrt{3}}{2}$, and

$$x = -\sqrt{\frac{3+\sqrt{6}}{2}}, \quad x = -\sqrt{\frac{3-\sqrt{6}}{2}}, \quad x = \sqrt{\frac{3-\sqrt{6}}{2}}, \quad x = \sqrt{\frac{3+\sqrt{6}}{2}}$$

are candidates for inflection points. Sign analysis shows that $f'(x)$ changes from positive to negative at $x = \pm\frac{\sqrt{3}}{2}$ and from negative to positive at $x = 0$. Moreover, $f''(x)$ changes from positive to negative at $x = -\sqrt{\frac{3+\sqrt{6}}{2}}$ and at $x = \sqrt{\frac{3-\sqrt{6}}{2}}$ and from negative to positive at $x = -\sqrt{\frac{3-\sqrt{6}}{2}}$ and at $x = \sqrt{\frac{3+\sqrt{6}}{2}}$. Therefore, f has local maxima at $x = \pm\frac{\sqrt{3}}{2}$, a local minimum at $x = 0$ and points of inflection at $x = \pm\sqrt{\frac{3\pm\sqrt{6}}{2}}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = 0,$$

so the graph has a horizontal asymptote at $y = 0$. Here is a graph of f with the transition points highlighted.



31. $y = x - 2\ln x$

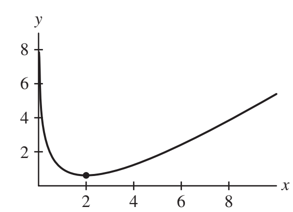
SOLUTION Let $f(x) = x - 2\ln x$. Note that the domain of f is $x > 0$. Now,

$$f'(x) = 1 - \frac{2}{x} \quad \text{and} \quad f''(x) = \frac{2}{x^2}.$$

The only critical point is $x = 2$. Sign analysis shows that $f'(x)$ changes from negative to positive at $x = 2$, so $f(2)$ is a local minimum. Further, $f''(x) > 0$ for $x > 0$, so the graph is always concave up. Moreover,

$$\lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with the transition points highlighted.



32. $y = x(4 - x) - 3\ln x$

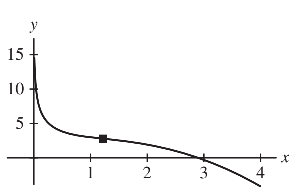
SOLUTION Let $f(x) = x(4 - x) - 3\ln x$. Note that the domain of f is $x > 0$. Now,

$$f'(x) = 4 - 2x - \frac{3}{x} \quad \text{and} \quad f''(x) = -2 + \frac{3}{x^2}.$$

Because $f'(x) < 0$ for all $x > 0$, the graph is always decreasing. On the other hand, $f''(x)$ changes from positive to negative at $x = \sqrt{\frac{3}{2}}$, so there is a point of inflection at $x = \sqrt{\frac{3}{2}}$. Moreover,

$$\lim_{x\to 0+} f(x) = \infty \quad \text{and} \quad \lim_{x\to infty} f(x) = -\infty,$$

so f has a vertical asymptote at $x = 0$. Here is a graph of f with the transition points highlighted.

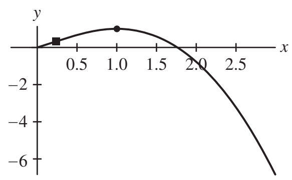


33. $y = x - x^2 \ln x$

SOLUTION Let $f(x) = x - x^2 \ln x$. Then $f'(x) = 1 - x - 2x \ln x$ and $f''(x) = -3 - 2\ln x$. There is a critical point at $x = 1$, and $x = e^{-3/2} \approx 0.223$ is a candidate inflection point. Sign analysis shows that $f'(x)$ changes from positive to negative at $x = 1$ and that $f''(x)$ changes from positive to negative at $x = e^{-3/2}$. Therefore, f has a local maximum at $x = 1$ and a point of inflection at $x = e^{-3/2}$. Moreover,

$$\lim_{x\to\infty} f(x) = -\infty.$$

Here is a graph of f with the transition points highlighted.



34. $y = x - 2\ln(x^2 + 1)$

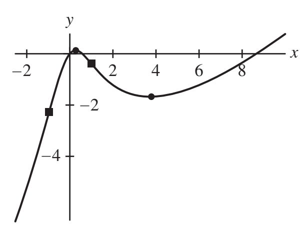
SOLUTION Let $f(x) = x - 2\ln(x^2 + 1)$. Then $f'(x) = 1 - \dfrac{4x}{x^2 + 1}$, and

$$f''(x) = -\frac{(x^2 + 1)(4) - (4x)(2x)}{(x^2 + 1)^2} = \frac{4(x^2 - 1)}{(x^2 + 1)^2}.$$

There are critical points at $x = 2 \pm \sqrt{3}$, and $x = \pm 1$ are candidates for inflection points. Sign analysis shows that $f'(x)$ changes from positive to negative at $x = 2 - \sqrt{3}$ and from negative to positive at $x = 2 + \sqrt{3}$. Moreover, $f''(x)$ changes from positive to negative at $x = -1$ and from negative to positive at $x = 1$. Therefore, f has a local maximum at $x = 2 - \sqrt{3}$, a local minimum at $x = 2 + \sqrt{3}$ and points of inflection at $x = \pm 1$. Finally,

$$\lim_{x\to-\infty} f(x) = -\infty \quad \text{and} \quad \lim_{x\to\infty} f(x) = \infty.$$

Here is a graph of f with the transition points highlighted.



35. Sketch the graph of $f(x) = 18(x - 3)(x - 1)^{2/3}$ using the formulas

$$f'(x) = \frac{30\left(x - \frac{9}{5}\right)}{(x - 1)^{1/3}}, \qquad f''(x) = \frac{20\left(x - \frac{3}{5}\right)}{(x - 1)^{4/3}}$$

SOLUTION

$$f'(x) = \frac{30(x - \frac{9}{5})}{(x - 1)^{1/3}}$$

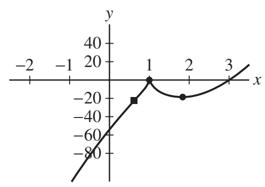
yields critical points at $x = \frac{9}{5}$, $x = 1$.

$$f''(x) = \frac{20(x - \frac{3}{5})}{(x - 1)^{4/3}}$$

yields potential inflection points at $x = \frac{3}{5}$, $x = 1$.

Interval	signs of f' and f''
$(-\infty, \frac{3}{5})$	$+-$
$(\frac{3}{5}, 1)$	$++$
$(1, \frac{9}{5})$	$-+$
$(\frac{9}{5}, \infty)$	$++$

The graph has an inflection point at $x = \frac{3}{5}$, a local maximum at $x = 1$ (at which the graph has a cusp), and a local minimum at $x = \frac{9}{5}$. The sketch looks something like this.



36. Sketch the graph of $f(x) = \dfrac{x}{x^2+1}$ using the formulas

$$f'(x) = \frac{1-x^2}{(1+x^2)^2}, \qquad f''(x) = \frac{2x(x^2-3)}{(x^2+1)^3}$$

SOLUTION Let $f(x) = \dfrac{x}{x^2+1}$.

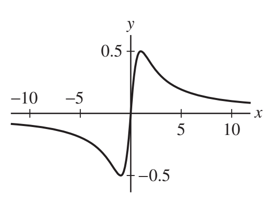
- Because $\lim_{x\to\pm\infty} f(x) = \frac{1}{1} \cdot \lim_{x\to\pm\infty} x^{-1} = 0$, $y = 0$ is a horizontal asymptote for f.
- Now $f'(x) = \dfrac{1-x^2}{\left(x^2+1\right)^2}$ is negative for $x < -1$ and $x > 1$, positive for $-1 < x < 1$, and 0 at $x = \pm 1$. Accordingly, f is decreasing for $x < -1$ and $x > 1$, is increasing for $-1 < x < 1$, has a local minimum value at $x = -1$ and a local maximum value at $x = 1$.
- Moreover,

$$f''(x) = \frac{2x\left(x^2-3\right)}{\left(x^2+1\right)^3}.$$

Here is a sign chart for the second derivative, similar to those constructed in various exercises in Section 4.4. (The legend is on page 425.)

x	$\left(-\infty, -\sqrt{3}\right)$	$-\sqrt{3}$	$\left(-\sqrt{3}, 0\right)$	0	$\left(0, \sqrt{3}\right)$	$\sqrt{3}$	$\left(\sqrt{3}, \infty\right)$
f''	$-$	0	$+$	0	$-$	0	$+$
f	$\frown$	I	$\smile$	I	$\frown$	I	$\smile$

- Here is a graph of $f(x) = \dfrac{x}{x^2+1}$.



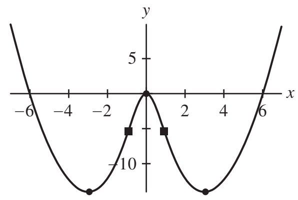
CAS *In Exercises 37–40, sketch the graph of the function, indicating all transition points. If necessary, use a graphing utility or computer algebra system to locate the transition points numerically.*

37. $y = x^2 - 10\ln(x^2+1)$

SOLUTION Let $f(x) = x^2 - 10\ln(x^2+1)$. Then $f'(x) = 2x - \dfrac{20x}{x^2+1}$, and

$$f''(x) = 2 - \frac{(x^2+1)(20) - (20x)(2x)}{(x^2+1)^2} = \frac{x^4+12x^2-9}{(x^2+1)^2}.$$

There are critical points at $x = 0$ and $x = \pm 3$, and $x = \pm\sqrt{-6+3\sqrt{5}}$ are candidates for inflection points. Sign analysis shows that $f'(x)$ changes from negative to positive at $x = \pm 3$ and from positive to negative at $x = 0$. Moreover, $f''(x)$ changes from positive to negative at $x = -\sqrt{-6+3\sqrt{5}}$ and from negative to positive at $x = \sqrt{-6+3\sqrt{5}}$. Therefore, f has a local maximum at $x = 0$, local minima at $x = \pm 3$ and points of inflection at $x = \pm\sqrt{-6+3\sqrt{5}}$. Here is a graph of f with the transition points highlighted.



38. $y = e^{-x/2} \ln x$

SOLUTION Let $f(x) = e^{-x/2} \ln x$. Then

$$f'(x) = \frac{e^{-x/2}}{x} - \frac{1}{2}e^{-x/2} \ln x = e^{-x/2}\left(\frac{1}{x} - \frac{1}{2}\ln x\right)$$

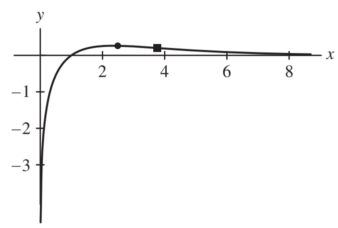
and

$$f''(x) = e^{-x/2}\left(-\frac{1}{x^2} - \frac{1}{2x}\right) - \frac{1}{2}e^{-x/2}\left(\frac{1}{x} - \frac{1}{2}\ln x\right)$$
$$= e^{-x/2}\left(-\frac{1}{x^2} - \frac{1}{x} + \frac{1}{4}\ln x\right).$$

There is a critical point at $x = 2.345751$ and a candidate point of inflection at $x = 3.792199$. Sign analysis reveals that $f'(x)$ changes from positive to negative at $x = 2.345751$ and that $f''(x)$ changes from negative to positive at $x = 3.792199$. Therefore, f has a local maximum at $x = 2.345751$ and a point of inflection at $x = 3.792199$. Moreover,

$$\lim_{x\to 0+} f(x) = -\infty \quad \text{and} \quad \lim_{x\to\infty} f(x) = 0.$$

Here is a graph of f with the transition points highlighted.

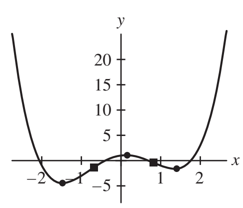


39. $y = x^4 - 4x^2 + x + 1$

SOLUTION Let $f(x) = x^4 - 4x^2 + x + 1$. Then $f'(x) = 4x^3 - 8x + 1$ and $f''(x) = 12x^2 - 8$. The critical points are $x = -1.473$, $x = 0.126$ and $x = 1.347$, while the candidates for points of inflection are $x = \pm\sqrt{\frac{2}{3}}$. Sign analysis reveals that $f'(x)$ changes from negative to positive at $x = -1.473$, from positive to negative at $x = 0.126$ and from negative to positive at $x = 1.347$. For the second derivative, $f''(x)$ changes from positive to negative at $x = -\sqrt{\frac{2}{3}}$ and from negative to positive at $x = \sqrt{\frac{2}{3}}$. Therefore, f has local minima at $x = -1.473$ and $x = 1.347$, a local maximum at $x = 0.126$ and points of inflection at $x = \pm\sqrt{\frac{2}{3}}$. Moreover,

$$\lim_{x\to\pm\infty} f(x) = \infty.$$

Here is a graph of f with the transition points highlighted.

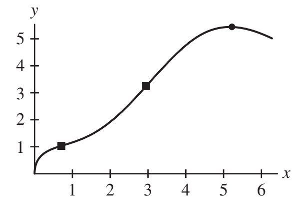


40. $y = 2\sqrt{x} - \sin x, \quad 0 \le x \le 2\pi$

SOLUTION Let $f(x) = 2\sqrt{x} - \sin x$. Then

$$f'(x) = \frac{1}{\sqrt{x}} - \cos x \quad \text{and} \quad f''(x) = -\frac{1}{2}x^{-3/2} + \sin x.$$

On $0 \le x \le 2\pi$, there is a critical point at $x = 5.167866$ and candidate points of inflection at $x = 0.790841$ and $x = 3.047468$. Sign analysis reveals that $f'(x)$ changes from positive to negative at $x = 5.167866$, while $f''(x)$ changes from negative to positive at $x = 0.790841$ and from positive to negative at $x = 3.047468$. Therefore, f has a local maximum at $x = 5.167866$ and points of inflection at $x = 0.790841$ and $x = 3.047468$. Here is a graph of f with the transition points highlighted.



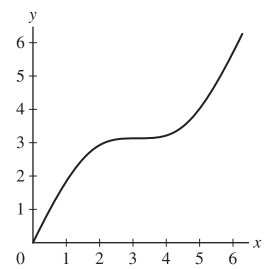
In Exercises 41–46, sketch the graph over the given interval, with all transition points indicated.

41. $y = x + \sin x, \quad [0, 2\pi]$

SOLUTION Let $f(x) = x + \sin x$. Setting $f'(x) = 1 + \cos x = 0$ yields $\cos x = -1$, so that $x = \pi$ is the lone critical point on the interval $[0, 2\pi]$. Setting $f''(x) = -\sin x = 0$ yields potential points of inflection at $x = 0, \pi, 2\pi$ on the interval $[0, 2\pi]$.

Interval	signs of f' and f''
$(0, \pi)$	$+-$
$(\pi, 2\pi)$	$++$

The graph has an inflection point at $x = \pi$, and no local maxima or minima. Here is a sketch of the graph of $f(x)$:

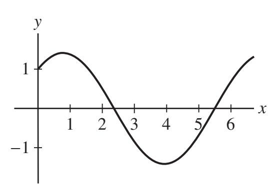


42. $y = \sin x + \cos x, \quad [0, 2\pi]$

SOLUTION Let $f(x) = \sin x + \cos x$. Setting $f'(x) = \cos x - \sin x = 0$ yields $\sin x = \cos x$, so that $\tan x = 1$, and $x = \frac{\pi}{4}, \frac{5\pi}{4}$. Setting $f''(x) = -\sin x - \cos x = 0$ yields $\sin x = -\cos x$, so that $-\tan x = 1$, and $x = \frac{3\pi}{4}, x = \frac{7\pi}{4}$.

Interval	signs of f' and f''
$(0, \frac{\pi}{4})$	$+-$
$(\frac{\pi}{4}, \frac{3\pi}{4})$	$--$
$(\frac{3\pi}{4}, \frac{5\pi}{4})$	$-+$
$(\frac{5\pi}{4}, \frac{7\pi}{4})$	$++$
$(\frac{7\pi}{4}, 2\pi)$	$+-$

The graph has a local maximum at $x = \frac{\pi}{4}$, a local minimum at $x = \frac{5\pi}{4}$, and inflection points at $x = \frac{3\pi}{4}$ and $x = \frac{7\pi}{4}$. Here is a sketch of the graph of $f(x)$:

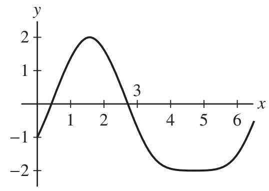


43. $y = 2\sin x - \cos^2 x, \quad [0, 2\pi]$

SOLUTION Let $f(x) = 2\sin x - \cos^2 x$. Then $f'(x) = 2\cos x - 2\cos x\,(-\sin x) = \sin 2x + 2\cos x$ and $f''(x) = 2\cos 2x - 2\sin x$. Setting $f'(x) = 0$ yields $\sin 2x = -2\cos x$, so that $2\sin x\cos x = -2\cos x$. This implies $\cos x = 0$ or $\sin x = -1$, so that $x = \frac{\pi}{2}$ or $\frac{3\pi}{2}$. Setting $f''(x) = 0$ yields $2\cos 2x = 2\sin x$, so that $2\sin(\frac{\pi}{2} - 2x) = 2\sin x$, or $\frac{\pi}{2} - 2x = x \pm 2n\pi$. This yields $3x = \frac{\pi}{2} + 2n\pi$, or $x = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{9\pi}{6} = \frac{3\pi}{2}$.

Interval	signs of f' and f''
$\left(0, \frac{\pi}{6}\right)$	$++$
$\left(\frac{\pi}{6}, \frac{\pi}{2}\right)$	$+-$
$\left(\frac{\pi}{2}, \frac{5\pi}{6}\right)$	$--$
$\left(\frac{5\pi}{6}, \frac{3\pi}{2}\right)$	$-+$
$\left(\frac{3\pi}{2}, 2\pi\right)$	$++$

The graph has a local maximum at $x = \frac{\pi}{2}$, a local minimum at $x = \frac{3\pi}{2}$, and inflection points at $x = \frac{\pi}{6}$ and $x = \frac{5\pi}{6}$. Here is a graph of f *without* transition points highlighted.

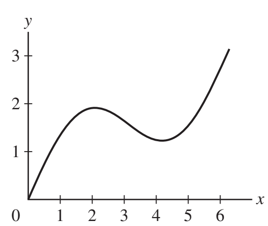


44. $y = \sin x + \frac{1}{2}x, \quad [0, 2\pi]$

SOLUTION Let $f(x) = \sin x + \frac{1}{2}x$. Setting $f'(x) = \cos x + \frac{1}{2} = 0$ yields $x = \frac{2\pi}{3}$ or $\frac{4\pi}{3}$. Setting $f''(x) = -\sin x = 0$ yields potential points of inflection at $x = 0, \pi, 2\pi$.

Interval	signs of f' and f''
$\left(0, \frac{2\pi}{3}\right)$	$+-$
$\left(\frac{2\pi}{3}, \pi\right)$	$--$
$\left(\pi, \frac{4\pi}{3}\right)$	$-+$
$\left(\frac{4\pi}{3}, 2\pi\right)$	$++$

The graph has a local maximum at $x = \frac{2\pi}{3}$, a local minimum at $x = \frac{4\pi}{3}$, and an inflection point at $x = \pi$. Here is a graph of f *without* transition points highlighted.

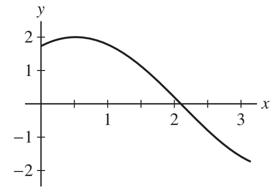


45. $y = \sin x + \sqrt{3}\cos x, \quad [0, \pi]$

SOLUTION Let $f(x) = \sin x + \sqrt{3}\cos x$. Setting $f'(x) = \cos x - \sqrt{3}\sin x = 0$ yields $\tan x = \frac{1}{\sqrt{3}}$. In the interval $[0, \pi]$, the solution is $x = \frac{\pi}{6}$. Setting $f''(x) = -\sin x - \sqrt{3}\cos x = 0$ yields $\tan x = -\sqrt{3}$. In the interval $[0, \pi]$, the lone solution is $x = \frac{2\pi}{3}$.

Interval	signs of f' and f''
$(0, \pi/6)$	$+-$
$(\pi/6, 2\pi/3)$	$--$
$(2\pi/3, \pi)$	$-+$

The graph has a local maximum at $x = \frac{\pi}{6}$ and a point of inflection at $x = \frac{2\pi}{3}$. A plot without the transition points highlighted is given below:



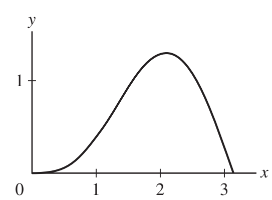
46. $y = \sin x - \frac{1}{2}\sin 2x, \quad [0, \pi]$

SOLUTION Let $f(x) = \sin x - \frac{1}{2}\sin 2x$. Setting $f'(x) = \cos x - \cos 2x = 0$ yields $\cos 2x = \cos x$. Using the double angle formula for cosine, this gives $2\cos^2 x - 1 = \cos x$ or $(2\cos x + 1)(\cos x - 1) = 0$. Solving for $x \in [0, \pi]$, we find $x = 0$ or $\frac{2\pi}{3}$.

Setting $f''(x) = -\sin x + 2\sin 2x = 0$ yields $4\sin x\cos x = \sin x$, so $\sin x = 0$ or $\cos x = \frac{1}{4}$. Hence, there are potential points of inflection at $x = 0$, $x = \pi$ and $x = \cos^{-1}\frac{1}{4} \approx 1.31812$.

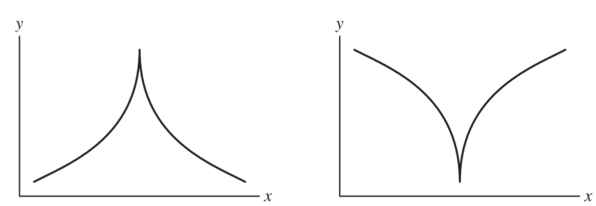
Interval	Sign of f' and f''
$\left(0, \cos^{-1}\frac{1}{4}\right)$	$++$
$\left(\cos^{-1}\frac{1}{4}, \frac{2\pi}{3}\right)$	$+-$
$\left(\frac{2\pi}{3}, \pi\right)$	$--$

The graph of $f(x)$ has a local maximum at $x = \frac{2\pi}{3}$ and a point of inflection at $x = \cos^{-1}\frac{1}{4}$.



47. Are all sign transitions possible? Explain with a sketch why the transitions $++ \rightarrow -+$ and $-- \rightarrow +-$ do not occur if the function is differentiable. (See Exercise 76 for a proof.)

SOLUTION In both cases, there is a point where f is not differentiable at the transition from increasing to decreasing or decreasing to increasing.



48. Suppose that f is twice differentiable satisfying (i) $f(0) = 1$, (ii) $f'(x) > 0$ for all $x \neq 0$, and (iii) $f''(x) < 0$ for $x < 0$ and $f''(x) > 0$ for $x > 0$. Let $g(x) = f(x^2)$.

(a) Sketch a possible graph of $f(x)$.

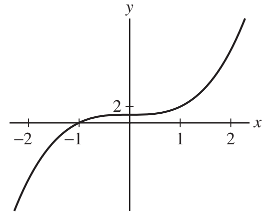
(b) Prove that $g(x)$ has no points of inflection and a unique local extreme value at $x = 0$. Sketch a possible graph of $g(x)$.

SOLUTION

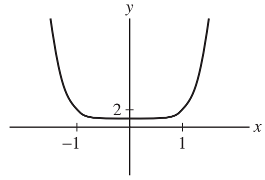
(a) To produce a possible sketch, we give the direction and concavity of the graph over every interval.

Interval	$(-\infty, 0)$	$(0, \infty)$
Direction	↗	↗
Concavity	⌢	⌣

A sketch of one possible such function appears here:



(b) Let $g(x) = f(x^2)$. Then $g'(x) = 2xf'(x^2)$. If $g'(x) = 0$, either $x = 0$ or $f'(x^2) = 0$, which implies that $x = 0$ as well. Since $f'(x^2) > 0$ for all $x \neq 0$, $g'(x) < 0$ for $x < 0$ and $g'(x) > 0$ for $x > 0$. This gives $g(x)$ a unique local extreme value at $x = 0$, a minimum. $g''(x) = 2f'(x^2) + 4x^2 f''(x^2)$. For all $x \neq 0$, $x^2 > 0$, and so $f''(x^2) > 0$ and $f'(x^2) > 0$. Thus $g''(x) > 0$, and so $g''(x)$ does not change sign, and can have no inflection points. A sketch of $g(x)$ based on the sketch we made for $f(x)$ follows: indeed, this sketch shows a unique local minimum at $x = 0$.



49. Which of the graphs in Figure 18 *cannot* be the graph of a polynomial? Explain.

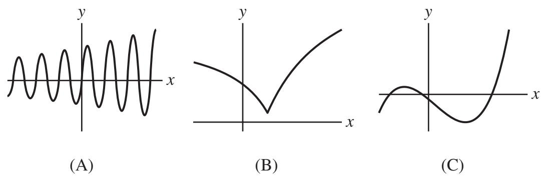


FIGURE 18

SOLUTION Polynomials are everywhere differentiable. Accordingly, graph (B) cannot be the graph of a polynomial, since the function in (B) has a cusp (sharp corner), signifying nondifferentiability at that point.

50. Which curve in Figure 19 is the graph of $f(x) = \dfrac{2x^4 - 1}{1 + x^4}$? Explain on the basis of horizontal asymptotes.

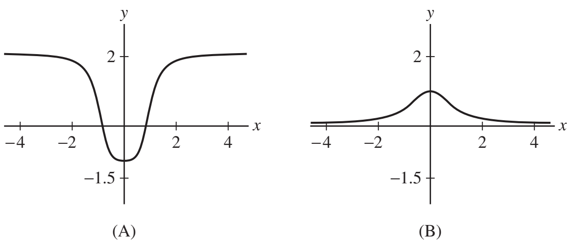

FIGURE 19

SOLUTION Since

$$\lim_{x\to\pm\infty} \frac{2x^4 - 1}{1 + x^4} = \frac{2}{1} \cdot \lim_{x\to\pm\infty} 1 = 2$$

the graph has left and right horizontal asymptotes at $y = 2$, so the left curve is the graph of $f(x) = \dfrac{2x^4 - 1}{1 + x^4}$.

51. Match the graphs in Figure 20 with the two functions $y = \dfrac{3x}{x^2-1}$ and $y = \dfrac{3x^2}{x^2-1}$. Explain.

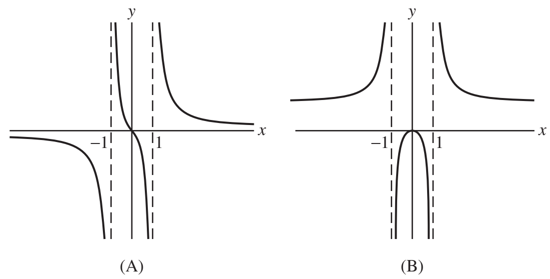

FIGURE 20

SOLUTION Since $\displaystyle\lim_{x\to\pm\infty} \frac{3x^2}{x^2-1} = \frac{3}{1} \cdot \lim_{x\to\pm\infty} 1 = 3$, the graph of $y = \dfrac{3x^2}{x^2-1}$ has a horizontal asymptote of $y = 3$; hence, the right curve is the graph of $f(x) = \dfrac{3x^2}{x^2-1}$. Since

$$\lim_{x\to\pm\infty} \frac{3x}{x^2-1} = \frac{3}{1} \cdot \lim_{x\to\pm\infty} x^{-1} = 0,$$

the graph of $y = \dfrac{3x}{x^2-1}$ has a horizontal asymptote of $y = 0$; hence, the left curve is the graph of $f(x) = \dfrac{3x}{x^2-1}$.

52. Match the functions with their graphs in Figure 21.

(a) $y = \dfrac{1}{x^2-1}$ **(b)** $y = \dfrac{x^2}{x^2+1}$

(c) $y = \dfrac{1}{x^2+1}$ **(d)** $y = \dfrac{x}{x^2-1}$

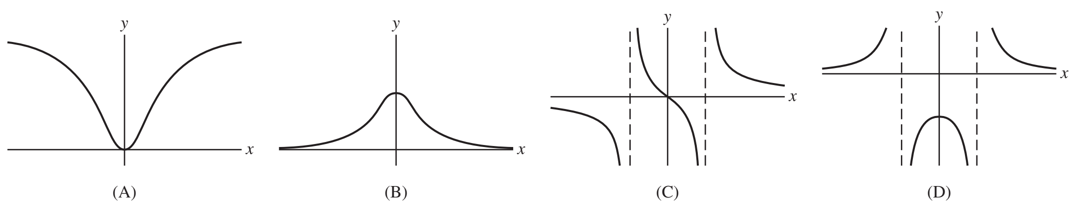

FIGURE 21

SOLUTION

(a) The graph of $\frac{1}{x^2-1}$ should have a horizontal asymptote at $y = 0$ and vertical asymptotes at $x = \pm 1$. Further, the graph should consist of positive values for $|x| > 1$ and negative values for $|x| < 1$. Hence, the graph of $\frac{1}{x^2-1}$ is (D).

(b) The graph of $\frac{x^2}{x^2+1}$ should have a horizontal asymptote at $y = 1$ and no vertical asymptotes. Hence, the graph of $\frac{x^2}{x^2+1}$ is (A).

(c) The graph of $\frac{1}{x^2+1}$ should have a horizontal asymptote at $y = 0$ and no vertical asymptotes. Hence, the graph of $\frac{1}{x^2+1}$ is (B).

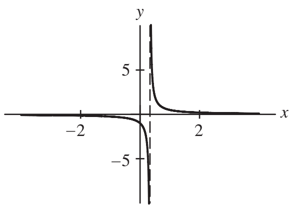
(d) The graph of $\frac{x}{x^2-1}$ should have a horizontal asymptote at $y = 0$ and vertical asymptotes at $x = \pm 1$. Further, the graph should consist of positive values for $-1 < x < 0$ and $x > 1$ and negative values for $x < 1$ and $0 < x < 1$. Hence, the graph of $\frac{x}{x^2-1}$ is (C).

In Exercises 53–70, sketch the graph of the function. Indicate the transition points and asymptotes.

53. $y = \dfrac{1}{3x-1}$

SOLUTION Let $f(x) = \dfrac{1}{3x-1}$. Then $f'(x) = \dfrac{-3}{(3x-1)^2}$, so that f is decreasing for all $x \neq \frac{1}{3}$. Moreover, $f''(x) = \dfrac{18}{(3x-1)^3}$, so that f is concave up for $x > \frac{1}{3}$ and concave down for $x < \frac{1}{3}$. Because $\displaystyle\lim_{x\to\pm\infty} \frac{1}{3x-1} = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has a vertical asymptote at $x = \frac{1}{3}$ with

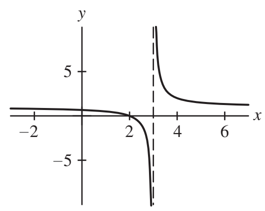
$$\lim_{x\to\frac{1}{3}-} \frac{1}{3x-1} = -\infty \qquad \text{and} \qquad \lim_{x\to\frac{1}{3}+} \frac{1}{3x-1} = \infty.$$



54. $y = \dfrac{x-2}{x-3}$

SOLUTION Let $f(x) = \dfrac{x-2}{x-3}$. Then $f'(x) = \dfrac{-1}{(x-3)^2}$, so that f is decreasing for all $x \neq 3$. Moreover, $f''(x) = \dfrac{2}{(x-3)^3}$, so that f is concave up for $x > 3$ and concave down for $x < 3$. Because $\lim_{x\to\pm\infty} \dfrac{x-2}{x-3} = 1$, f has a horizontal asymptote at $y = 1$. Finally, f has a vertical asymptote at $x = 3$ with

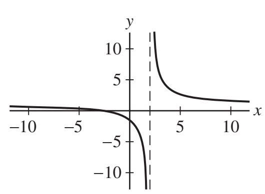
$$\lim_{x\to 3-} \frac{x-2}{x-3} = -\infty \qquad \text{and} \qquad \lim_{x\to 3+} \frac{x-2}{x-3} = \infty.$$



55. $y = \dfrac{x+3}{x-2}$

SOLUTION Let $f(x) = \dfrac{x+3}{x-2}$. Then $f'(x) = \dfrac{-5}{(x-2)^2}$, so that f is decreasing for all $x \neq 2$. Moreover, $f''(x) = \dfrac{10}{(x-2)^3}$, so that f is concave up for $x > 2$ and concave down for $x < 2$. Because $\lim_{x\to\pm\infty} \dfrac{x+3}{x-2} = 1$, f has a horizontal asymptote at $y = 1$. Finally, f has a vertical asymptote at $x = 2$ with

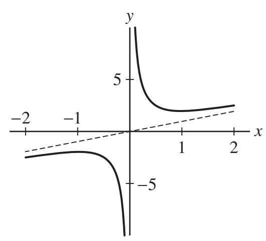
$$\lim_{x\to 2-} \frac{x+3}{x-2} = -\infty \qquad \text{and} \qquad \lim_{x\to 2+} \frac{x+3}{x-2} = \infty.$$



56. $y = x + \dfrac{1}{x}$

SOLUTION Let $f(x) = x + x^{-1}$. Then $f'(x) = 1 - x^{-2}$, so that f is increasing for $x < -1$ and $x > 1$ and decreasing for $-1 < x < 0$ and $0 < x < 1$. Moreover, $f''(x) = 2x^{-3}$, so that f is concave up for $x > 0$ and concave down for $x < 0$. f has no horizontal asymptote and has a vertical asymptote at $x = 0$ with

$$\lim_{x\to 0-} (x + x^{-1}) = -\infty \qquad \text{and} \qquad \lim_{x\to 0+} (x + x^{-1}) = \infty.$$



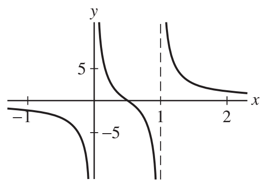
57. $y = \dfrac{1}{x} + \dfrac{1}{x-1}$

SOLUTION Let $f(x) = \dfrac{1}{x} + \dfrac{1}{x-1}$. Then $f'(x) = -\dfrac{2x^2 - 2x + 1}{x^2(x-1)^2}$, so that f is decreasing for all $x \neq 0, 1$. Moreover, $f''(x) = \dfrac{2\left(2x^3 - 3x^2 + 3x - 1\right)}{x^3(x-1)^3}$, so that f is concave up for $0 < x < \frac{1}{2}$ and $x > 1$ and concave down for $x < 0$ and $\frac{1}{2} < x < 1$. Because $\lim_{x\to\pm\infty}\left(\dfrac{1}{x} + \dfrac{1}{x-1}\right) = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = 0$ and $x = 1$ with

$$\lim_{x\to 0-}\left(\frac{1}{x} + \frac{1}{x-1}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 0+}\left(\frac{1}{x} + \frac{1}{x-1}\right) = \infty$$

and

$$\lim_{x\to 1-}\left(\frac{1}{x} + \frac{1}{x-1}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 1+}\left(\frac{1}{x} + \frac{1}{x-1}\right) = \infty.$$



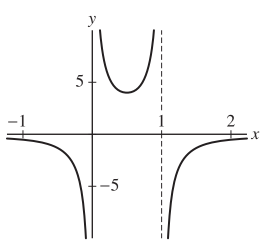
58. $y = \dfrac{1}{x} - \dfrac{1}{x-1}$

SOLUTION Let $f(x) = \dfrac{1}{x} - \dfrac{1}{x-1}$. Then $f'(x) = \dfrac{2x-1}{x^2(x-1)^2}$, so that f is decreasing for $x < 0$ and $0 < x < \frac{1}{2}$ and increasing for $\frac{1}{2} < x < 1$ and $x > 1$. Moreover, $f''(x) = -\dfrac{2\left(3x^2 - 3x + 1\right)}{x^3(x-1)^3}$, so that f is concave up for $0 < x < 1$ and concave down for $x < 0$ and $x > 1$. Because $\lim_{x\to\pm\infty}\left(\dfrac{1}{x} - \dfrac{1}{x-1}\right) = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = 0$ and $x = 1$ with

$$\lim_{x\to 0-}\left(\frac{1}{x} - \frac{1}{x-1}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 0+}\left(\frac{1}{x} - \frac{1}{x-1}\right) = \infty$$

and

$$\lim_{x\to 1-}\left(\frac{1}{x} - \frac{1}{x-1}\right) = \infty \qquad \text{and} \qquad \lim_{x\to 1+}\left(\frac{1}{x} - \frac{1}{x-1}\right) = -\infty.$$



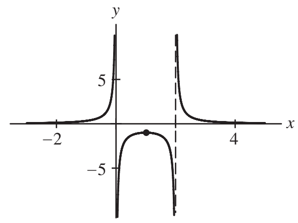
59. $y = \dfrac{1}{x(x-2)}$

SOLUTION Let $f(x) = \dfrac{1}{x(x-2)}$. Then $f'(x) = \dfrac{2(1-x)}{x^2(x-2)^2}$, so that f is increasing for $x < 0$ and $0 < x < 1$ and decreasing for $1 < x < 2$ and $x > 2$. Moreover, $f''(x) = \dfrac{2(3x^2 - 6x + 4)}{x^3(x-2)^3}$, so that f is concave up for $x < 0$ and $x > 2$ and concave down for $0 < x < 2$. Because $\lim_{x\to\pm\infty}\left(\dfrac{1}{x(x-2)}\right) = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = 0$ and $x = 2$ with

$$\lim_{x\to 0-}\left(\frac{1}{x(x-2)}\right) = +\infty \qquad \text{and} \qquad \lim_{x\to 0+}\left(\frac{1}{x(x-2)}\right) = -\infty$$

and

$$\lim_{x\to 2-}\left(\frac{1}{x(x-2)}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 2+}\left(\frac{1}{x(x-2)}\right) = \infty.$$



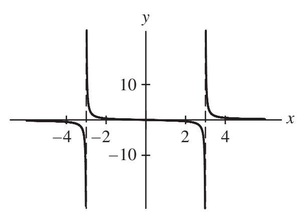
60. $y = \dfrac{x}{x^2-9}$

SOLUTION Let $f(x) = \dfrac{x}{x^2-9}$. Then $f'(x) = -\dfrac{x^2+9}{(x^2-9)^2}$, so that f is decreasing for all $x \neq \pm 3$. Moreover, $f''(x) = \dfrac{6x(x^2+6)}{(x^2-9)^3}$, so that f is concave down for $x < -3$ and for $0 < x < 3$ and is concave up for $-3 < x < 0$ and for $x > 3$. Because $\lim_{x\to\pm\infty} \dfrac{x}{x^2-9} = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = \pm 3$, with

$$\lim_{x\to -3-}\left(\frac{x}{x^2-9}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to -3+}\left(\frac{x}{x^2-9}\right) = \infty$$

and

$$\lim_{x\to 3-}\left(\frac{x}{x^2-9}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 3+}\left(\frac{x}{x^2-9}\right) = \infty.$$



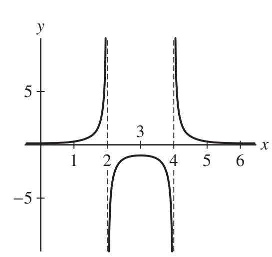
61. $y = \dfrac{1}{x^2-6x+8}$

SOLUTION Let $f(x) = \dfrac{1}{x^2-6x+8} = \dfrac{1}{(x-2)(x-4)}$. Then $f'(x) = \dfrac{6-2x}{\left(x^2-6x+8\right)^2}$, so that f is increasing for $x < 2$ and for $2 < x < 3$, is decreasing for $3 < x < 4$ and for $x > 4$, and has a local maximum at $x = 3$. Moreover, $f''(x) = \dfrac{2\left(3x^2-18x+28\right)}{\left(x^2-6x+8\right)^3}$, so that f is concave up for $x < 2$ and for $x > 4$ and is concave down for $2 < x < 4$. Because $\lim_{x\to\pm\infty} \dfrac{1}{x^2-6x+8} = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = 2$ and $x = 4$, with

$$\lim_{x\to 2-}\left(\frac{1}{x^2-6x+8}\right) = \infty \qquad \text{and} \qquad \lim_{x\to 2+}\left(\frac{1}{x^2-6x+8}\right) = -\infty$$

and

$$\lim_{x\to 4-}\left(\frac{1}{x^2-6x+8}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 4+}\left(\frac{1}{x^2-6x+8}\right) = \infty.$$



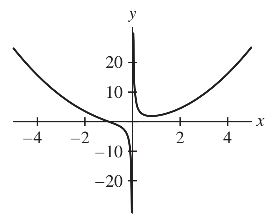
62. $y = \dfrac{x^3+1}{x}$

SOLUTION Let $f(x) = \dfrac{x^3+1}{x} = x^2 + x^{-1}$. Then $f'(x) = 2x - x^{-2}$, so that f is decreasing for $x < 0$ and for $0 < x < \sqrt[3]{1/2}$ and increasing for $x > \sqrt[3]{1/2}$. Moreover, $f''(x) = 2 + 2x^{-3}$, so f is concave up for $x < -1$ and for $x > 0$ and concave down for $-1 < x < 0$. Because

$$\lim_{x\to\pm\infty} \frac{x^3+1}{x} = \infty,$$

f has no horizontal asymptotes. Finally, f has a vertical asymptote at $x = 0$ with

$$\lim_{x\to 0-} \frac{x^3+1}{x} = -\infty \qquad \text{and} \qquad \lim_{x\to 0+} \frac{x^3+1}{x} = \infty.$$



63. $y = 1 - \dfrac{3}{x} + \dfrac{4}{x^3}$

SOLUTION Let $f(x) = 1 - \dfrac{3}{x} + \dfrac{4}{x^3}$. Then

$$f'(x) = \frac{3}{x^2} - \frac{12}{x^4} = \frac{3(x-2)(x+2)}{x^4},$$

so that f is increasing for $|x| > 2$ and decreasing for $-2 < x < 0$ and for $0 < x < 2$. Moreover,

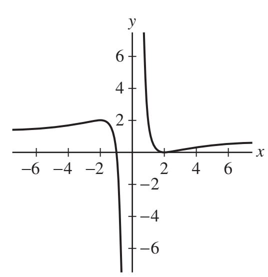
$$f''(x) = -\frac{6}{x^3} + \frac{48}{x^5} = \frac{6(8-x^2)}{x^5},$$

so that f is concave down for $-2\sqrt{2} < x < 0$ and for $x > 2\sqrt{2}$, while f is concave up for $x < -2\sqrt{2}$ and for $0 < x < 2\sqrt{2}$. Because

$$\lim_{x\to\pm\infty} \left(1 - \frac{3}{x} + \frac{4}{x^3}\right) = 1,$$

f has a horizontal asymptote at $y = 1$. Finally, f has a vertical asymptote at $x = 0$ with

$$\lim_{x\to 0-} \left(1 - \frac{3}{x} + \frac{4}{x^3}\right) = -\infty \qquad \text{and} \qquad \lim_{x\to 0+} \left(1 - \frac{3}{x} + \frac{4}{x^3}\right) = \infty.$$



64. $y = \dfrac{1}{x^2} + \dfrac{1}{(x-2)^2}$

SOLUTION Let $f(x) = \dfrac{1}{x^2} + \dfrac{1}{(x-2)^2}$. Then

$$f'(x) = -2x^{-3} - 2\,(x-2)^{-3} = -\frac{4(x-1)(x^2-2x+4)}{x^3(x-2)^3},$$

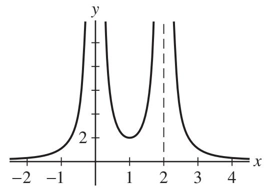
so that f is increasing for $x < 0$ and for $1 < x < 2$, is decreasing for $0 < x < 1$ and for $x > 2$, and has a local minimum at $x = 1$. Moreover, $f''(x) = 6x^{-4} + 6\,(x-2)^{-4}$, so that f is concave up for all $x \neq 0, 2$. Because

$\lim_{x\to\pm\infty}\left(\frac{1}{x^2}+\frac{1}{(x-2)^2}\right)=0$, f has a horizontal asymptote at $y=0$. Finally, f has vertical asymptotes at $x=0$ and $x=2$ with

$$\lim_{x\to 0-}\left(\frac{1}{x^2}+\frac{1}{(x-2)^2}\right)=\infty \qquad \text{and} \qquad \lim_{x\to 0+}\left(\frac{1}{x^2}+\frac{1}{(x-2)^2}\right)=\infty$$

and

$$\lim_{x\to 2-}\left(\frac{1}{x^2}+\frac{1}{(x-2)^2}\right)=\infty \qquad \text{and} \qquad \lim_{x\to 2+}\left(\frac{1}{x^2}+\frac{1}{(x-2)^2}\right)=\infty.$$



65. $y=\frac{1}{x^2}-\frac{1}{(x-2)^2}$

SOLUTION Let $f(x)=\frac{1}{x^2}-\frac{1}{(x-2)^2}$. Then $f'(x)=-2x^{-3}+2(x-2)^{-3}$, so that f is increasing for $x<0$ and for $x>2$ and is decreasing for $0<x<2$. Moreover,

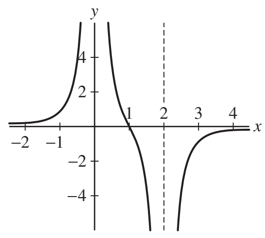
$$f''(x)=6x^{-4}-6(x-2)^{-4}=-\frac{48(x-1)(x^2-2x+2)}{x^4(x-2)^4},$$

so that f is concave up for $x<0$ and for $0<x<1$, is concave down for $1<x<2$ and for $x>2$, and has a point of inflection at $x=1$. Because $\lim_{x\to\pm\infty}\left(\frac{1}{x^2}-\frac{1}{(x-2)^2}\right)=0$, f has a horizontal asymptote at $y=0$. Finally, f has vertical asymptotes at $x=0$ and $x=2$ with

$$\lim_{x\to 0-}\left(\frac{1}{x^2}-\frac{1}{(x-2)^2}\right)=\infty \qquad \text{and} \qquad \lim_{x\to 0+}\left(\frac{1}{x^2}-\frac{1}{(x-2)^2}\right)=\infty$$

and

$$\lim_{x\to 2-}\left(\frac{1}{x^2}-\frac{1}{(x-2)^2}\right)=-\infty \qquad \text{and} \qquad \lim_{x\to 2+}\left(\frac{1}{x^2}-\frac{1}{(x-2)^2}\right)=-\infty.$$



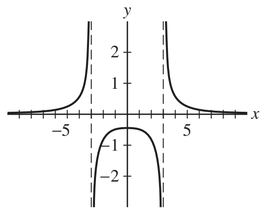
66. $y=\frac{4}{x^2-9}$

SOLUTION Let $f(x)=\frac{4}{x^2-9}$. Then $f'(x)=-\frac{8x}{\left(x^2-9\right)^2}$, so that f is increasing for $x<-3$ and for $-3<x<0$, is decreasing for $0<x<3$ and for $x>3$, and has a local maximum at $x=0$. Moreover, $f''(x)=\frac{24\left(x^2+3\right)}{\left(x^2-9\right)^3}$, so that f is concave up for $x<-3$ and for $x>3$ and is concave down for $-3<x<3$. Because $\lim_{x\to\pm\infty}\frac{4}{x^2-9}=0$, f has a horizontal asymptote at $y=0$. Finally, f has vertical asymptotes at $x=-3$ and $x=3$, with

$$\lim_{x\to -3-}\left(\frac{4}{x^2-9}\right)=\infty \qquad \text{and} \qquad \lim_{x\to -3+}\left(\frac{4}{x^2-9}\right)=-\infty$$

and

$$\lim_{x\to 3-}\left(\frac{4}{x^2-9}\right)=-\infty \qquad \text{and} \qquad \lim_{x\to 3+}\left(\frac{4}{x^2-9}\right)=\infty.$$

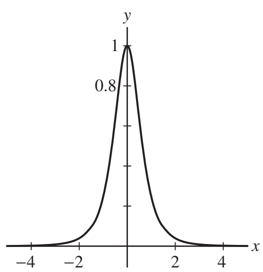


67. $y = \dfrac{1}{(x^2+1)^2}$

SOLUTION Let $f(x) = \dfrac{1}{(x^2+1)^2}$. Then $f'(x) = \dfrac{-4x}{(x^2+1)^3}$, so that f is increasing for $x < 0$, is decreasing for $x > 0$ and has a local maximum at $x = 0$. Moreover,

$$f''(x) = \frac{-4(x^2+1)^3 + 4x \cdot 3(x^2+1)^2 \cdot 2x}{(x^2+1)^6} = \frac{20x^2-4}{(x^2+1)^4},$$

so that f is concave up for $|x| > 1/\sqrt{5}$, is concave down for $|x| < 1/\sqrt{5}$, and has points of inflection at $x = \pm 1/\sqrt{5}$. Because $\lim_{x\to\pm\infty} \dfrac{1}{(x^2+1)^2} = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has no vertical asymptotes.



68. $y = \dfrac{x^2}{(x^2-1)(x^2+1)}$

SOLUTION Let

$$f(x) = \frac{x^2}{(x^2-1)(x^2+1)}.$$

Then

$$f'(x) = -\frac{2x(1+x^4)}{(x-1)^2(x+1)^2(x^2+1)^2},$$

so that f is increasing for $x < -1$ and for $-1 < x < 0$, is decreasing for $0 < x < 1$ and for $x > 1$, and has a local maximum at $x = 0$. Moreover,

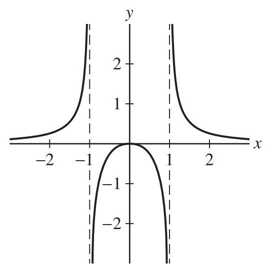
$$f''(x) = \frac{2+24x^4+6x^8}{(x-1)^3(x+1)^3(x^2+1)^3},$$

so that f is concave up for $|x| > 1$ and concave down for $|x| < 1$. Because $\lim_{x\to\pm\infty} \dfrac{x^2}{(x^2-1)(x^2+1)} = 0$, f has a horizontal asymptote at $y = 0$. Finally, f has vertical asymptotes at $x = -1$ and $x = 1$, with

$$\lim_{x\to -1-} \frac{x^2}{(x^2-1)(x^2+1)} = \infty \qquad \text{and} \qquad \lim_{x\to -1+} \frac{x^2}{(x^2-1)(x^2+1)} = -\infty$$

and

$$\lim_{x\to 1-} \frac{x^2}{(x^2-1)(x^2+1)} = -\infty \qquad \text{and} \qquad \lim_{x\to 1+} \frac{x^2}{(x^2-1)(x^2+1)} = \infty.$$



69. $y = \dfrac{1}{\sqrt{x^2+1}}$

SOLUTION Let $f(x) = \frac{1}{\sqrt{x^2+1}}$. Then

$$f'(x) = -\frac{x}{\sqrt{(x^2+1)^3}} = -x(x^2+1)^{-3/2},$$

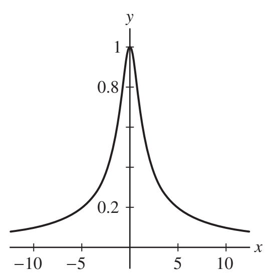
so that f is increasing for $x < 0$ and decreasing for $x > 0$. Moreover,

$$f''(x) = -\frac{3}{2}x(x^2+1)^{-5/2}(-2x) - (x^2+1)^{-3/2} = (2x^2-1)(x^2+1)^{-5/2},$$

so that f is concave down for $|x| < \frac{\sqrt{2}}{2}$ and concave up for $|x| > \frac{\sqrt{2}}{2}$. Because

$$\lim_{x\to\pm\infty} \frac{1}{\sqrt{x^2+1}} = 0,$$

f has a horizontal asymptote at $y = 0$. Finally, f has no vertical asymptotes.



70. $y = \dfrac{x}{\sqrt{x^2+1}}$

SOLUTION Let

$$f(x) = \frac{x}{\sqrt{x^2+1}}.$$

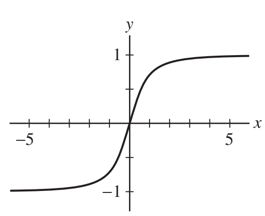
Then

$$f'(x) = (x^2+1)^{-3/2} \quad \text{and} \quad f''(x) = \frac{-3x}{(x^2+1)^{5/2}}.$$

Thus, f is increasing for all x, is concave up for $x < 0$, is concave down for $x > 0$, and has a point of inflection at $x = 0$. Because

$$\lim_{x\to\infty} \frac{x}{\sqrt{x^2+1}} = 1 \qquad \text{and} \qquad \lim_{x\to-\infty} \frac{x}{\sqrt{x^2+1}} = -1,$$

f has horizontal asymptotes of $y = -1$ and $y = 1$. There are no vertical asymptotes.



Further Insights and Challenges

*In Exercises 71–75, we explore functions whose graphs approach a nonhorizontal line as $x \to \infty$. A line $y = ax + b$ is called a **slant asymptote** if*

$$\lim_{x\to\infty} (f(x) - (ax + b)) = 0$$

or

$$\lim_{x\to-\infty} (f(x) - (ax + b)) = 0$$

71. Let $f(x) = \dfrac{x^2}{x-1}$ (Figure 22). Verify the following:

(a) $f(0)$ is a local max and $f(2)$ a local min.

(b) f is concave down on $(-\infty, 1)$ and concave up on $(1, \infty)$.

(c) $\lim_{x\to1-} f(x) = -\infty$ and $\lim_{x\to1+} f(x) = \infty$.

(d) $y = x + 1$ is a slant asymptote of $f(x)$ as $x \to \pm\infty$.

(e) The slant asymptote lies above the graph of $f(x)$ for $x < 1$ and below the graph for $x > 1$.

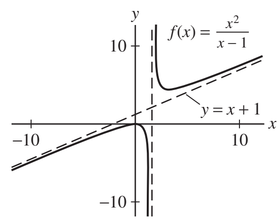


FIGURE 22

SOLUTION Let $f(x) = \dfrac{x^2}{x-1}$. Then $f'(x) = \dfrac{x(x-2)}{(x-1)^2}$ and $f''(x) = \dfrac{2}{(x-1)^3}$.

(a) Sign analysis of $f''(x)$ reveals that $f''(x) < 0$ on $(-\infty, 1)$ and $f''(x) > 0$ on $(1, \infty)$.

(b) Critical points of $f'(x)$ occur at $x = 0$ and $x = 2$. $x = 1$ is not a critical point because it is not in the domain of f. Sign analyses reveal that $x = 2$ is a local minimum of f and $x = 0$ is a local maximum.

(c)

$$\lim_{x\to1-} f(x) = -1 \lim_{x\to1-} \frac{1}{1-x} = -\infty \quad \text{and} \quad \lim_{x\to1+} f(x) = 1 \lim_{x\to1+} \frac{1}{x-1} = \infty.$$

(d) Note that using polynomial division, $f(x) = \dfrac{x^2}{x-1} = x + 1 + \dfrac{1}{x-1}$. Then $\lim_{x\to\pm\infty} (f(x) - (x+1)) = \lim_{x\to\pm\infty} x + 1 + \dfrac{1}{x-1} - (x+1) = \lim_{x\to\pm\infty} \dfrac{1}{x-1} = 0$.

(e) For $x > 1$, $f(x) - (x+1) = \dfrac{1}{x-1} > 0$, so $f(x)$ approaches $x+1$ from above. Similarly, for $x < 1$, $f(x) - (x + 1) = \dfrac{1}{x-1} < 0$, so $f(x)$ approaches $x + 1$ from below.

72. If $f(x) = P(x)/Q(x)$, where P and Q are polynomials of degrees $m + 1$ and m, then by long division, we can write

$$f(x) = (ax + b) + P_1(x)/Q(x)$$

where P_1 is a polynomial of degree $< m$. Show that $y = ax + b$ is the slant asymptote of $f(x)$. Use this procedure to find the slant asymptotes of the following functions:

(a) $y = \dfrac{x^2}{x+2}$

(b) $y = \dfrac{x^3 + x}{x^2 + x + 1}$

SOLUTION Since $\deg(P_1) < \deg(Q)$,

$$\lim_{x\to\pm\infty} \frac{P_1(x)}{Q(x)} = 0.$$

Thus

$$\lim_{x\to\pm\infty} (f(x) - (ax + b)) = 0$$

and $y = ax + b$ is a slant asymptote of f.

(a) $\dfrac{x^2}{x+2} = x - 2 + \dfrac{4}{x+2}$; hence $y = x - 2$ is a slant asymptote of $\dfrac{x^2}{x+2}$.

(b) $\dfrac{x^3+x}{x^2+x+1} = (x-1) + \dfrac{x+1}{x^2-1}$; hence, $y = x - 1$ is a slant asymptote of $\dfrac{x^3+x}{x^2+x+1}$.

73. Sketch the graph of

$$f(x) = \frac{x^2}{x+1}.$$

Proceed as in the previous exercise to find the slant asymptote.

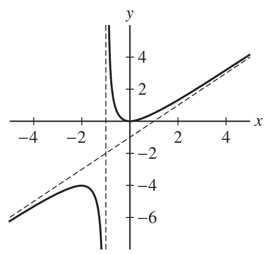
SOLUTION Let $f(x) = \dfrac{x^2}{x+1}$. Then $f'(x) = \dfrac{x(x+2)}{(x+1)^2}$ and $f''(x) = \dfrac{2}{(x+1)^3}$. Thus, f is increasing for $x < -2$ and for $x > 0$, is decreasing for $-2 < x < -1$ and for $-1 < x < 0$, has a local minimum at $x = 0$, has a local maximum at $x = -2$, is concave down on $(-\infty, -1)$ and concave up on $(-1, \infty)$. Limit analyses give a vertical asymptote at $x = -1$, with

$$\lim_{x\to -1-} \frac{x^2}{x+1} = -\infty \qquad \text{and} \qquad \lim_{x\to -1+} \frac{x^2}{x+1} = \infty.$$

By polynomial division, $f(x) = x - 1 + \dfrac{1}{x+1}$ and

$$\lim_{x\to\pm\infty} \left(x - 1 + \frac{1}{x+1} - (x-1) \right) = 0,$$

which implies that the slant asymptote is $y = x - 1$. Notice that f approaches the slant asymptote as in exercise 71.

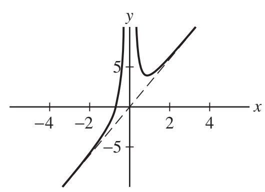


74. Show that $y = 3x$ is a slant asymptote for $f(x) = 3x + x^{-2}$. Determine whether $f(x)$ approaches the slant asymptote from above or below and make a sketch of the graph.

SOLUTION Let $f(x) = 3x + x^{-2}$. Then

$$\lim_{x\to\pm\infty} (f(x) - 3x) = \lim_{x\to\pm\infty} (3x + x^{-2} - 3x) = \lim_{x\to\pm\infty} x^{-2} = 0$$

which implies that $3x$ is the slant asymptote of $f(x)$. Since $f(x) - 3x = x^{-2} > 0$ as $x \to \pm\infty$, $f(x)$ approaches the slant asymptote from above in both directions. Moreover, $f'(x) = 3 - 2x^{-3}$ and $f''(x) = 6x^{-4}$. Sign analyses reveal a local minimum at $x = \left(\frac{3}{2}\right)^{-1/3} \approx 0.87358$ and that f is concave up for all $x \neq 0$. Limit analyses give a vertical asymptote at $x = 0$.

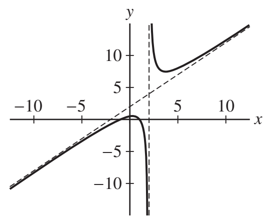


75. Sketch the graph of $f(x) = \dfrac{1-x^2}{2-x}$.

SOLUTION Let $f(x) = \dfrac{1-x^2}{2-x}$. Using polynomial division, $f(x) = x + 2 + \dfrac{3}{x-2}$. Then

$$\lim_{x\to\pm\infty} (f(x) - (x+2)) = \lim_{x\to\pm\infty} \left((x+2) + \frac{3}{x-2} - (x+2) \right) = \lim_{x\to\pm\infty} \frac{3}{x-2} = \frac{3}{1} \cdot \lim_{x\to\pm\infty} x^{-1} = 0$$

which implies that $y = x + 2$ is the slant asymptote of $f(x)$. Since $f(x) - (x + 2) = \dfrac{3}{x-2} > 0$ for $x > 2$, $f(x)$ approaches the slant asymptote from above for $x > 2$; similarly, $\dfrac{3}{x-2} < 0$ for $x < 2$ so $f(x)$ approaches the slant asymptote from below for $x < 2$. Moreover, $f'(x) = \dfrac{x^2 - 4x + 1}{(2-x)^2}$ and $f''(x) = \dfrac{-6}{(2-x)^3}$. Sign analyses reveal a local minimum at $x = 2 + \sqrt{3}$, a local maximum at $x = 2 - \sqrt{3}$ and that f is concave down on $(-\infty, 2)$ and concave up on $(2, \infty)$. Limit analyses give a vertical asymptote at $x = 2$.



76. Assume that $f'(x)$ and $f''(x)$ exist for all x and let c be a critical point of $f(x)$. Show that $f(x)$ cannot make a transition from $++$ to $-+$ at $x = c$. *Hint:* Apply the MVT to $f'(x)$.

SOLUTION Let $f(x)$ be a function such that $f''(x) > 0$ for all x and such that it transitions from $++$ to $-+$ at a critical point c where $f'(c)$ is defined. That is, $f'(c) = 0$, $f'(x) > 0$ for $x < c$ and $f'(x) < 0$ for $x > c$. Let $g(x) = f'(x)$. The previous statements indicate that $g(c) = 0$, $g(x_0) > 0$ for some $x_0 < c$, and $g(x_1) < 0$ for some $x_1 > c$. By the Mean Value Theorem,

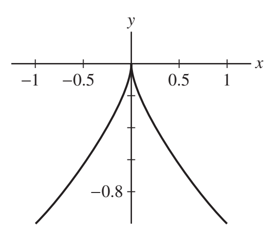
$$\frac{g(x_1) - g(x_0)}{x_1 - x_0} = g'(c_0),$$

for some c_0 between x_0 and x_1. Because $x_1 > c > x_0$ and $g(x_1) < 0 < g(x_0)$,

$$\frac{g(x_1) - g(x_0)}{x_1 - x_0} < 0.$$

But, on the other hand $g'(c_0) = f''(c_0) > 0$, so there is a contradiction. This means that our assumption of the existence of such a function $f(x)$ must be in error, so no function can transition from $++$ to $-+$.

If we drop the requirement that $f'(c)$ exist, such a function can be found. The following is a graph of $f(x) = -x^{2/3}$. $f''(x) > 0$ wherever $f''(x)$ is defined, and $f'(x)$ transitions from positive to negative at $x = 0$.



77. Assume that $f''(x)$ exists and $f''(x) > 0$ for all x. Show that $f(x)$ cannot be negative for all x. *Hint:* Show that $f'(b) \neq 0$ for some b and use the result of Exercise 64 in Section 4.4.

SOLUTION Let $f(x)$ be a function such that $f''(x)$ exists and $f''(x) > 0$ for all x. Since $f''(x) > 0$, there is at least one point $x = b$ such that $f'(b) \neq 0$. If not, $f'(x) = 0$ for all x, so $f''(x) = 0$. By the result of Exercise 64 in Section 4.4, $f(x) \geq f(b) + f'(b)(x - b)$. Now, if $f'(b) > 0$, we find that $f(b) + f'(b)(x - b) > 0$ whenever

$$x > \frac{bf'(b) - f(b)}{f'(b)},$$

a condition that must be met for some x sufficiently large. For such x, $f(x) > f(b) + f'(b)(x - b) > 0$. On the other hand, if $f'(b) < 0$, we find that $f(b) + f'(b)(x - b) > 0$ whenever

$$x < \frac{bf'(b) - f(b)}{f'(b)}.$$

For such an x, $f(x) > f(b) + f'(b)(x - b) > 0$.

4.7 Applied Optimization

Preliminary Questions

1. The problem is to find the right triangle of perimeter 10 whose area is as large as possible. What is the constraint equation relating the base b and height h of the triangle?

SOLUTION The perimeter of a right triangle is the sum of the lengths of the base, the height and the hypotenuse. If the base has length b and the height is h, then the length of the hypotenuse is $\sqrt{b^2+h^2}$ and the perimeter of the triangle is $P = b + h + \sqrt{b^2+h^2}$. The requirement that the perimeter be 10 translates to the constraint equation

$$b + h + \sqrt{b^2+h^2} = 10.$$

2. Describe a way of showing that a continuous function on an open interval (a, b) has a minimum value.

SOLUTION If the function tends to infinity at the endpoints of the interval, then the function must take on a minimum value at a critical point.

3. Is there a rectangle of area 100 of largest perimeter? Explain.

SOLUTION No. Even by fixing the area at 100, we can take one of the dimensions as large as we like thereby allowing the perimeter to become as large as we like.

Exercises

1. Find the dimensions x and y of the rectangle of maximum area that can be formed using 3 meters of wire.

(a) What is the constraint equation relating x and y?

(b) Find a formula for the area in terms of x alone.

(c) What is the interval of optimization? Is it open or closed?

(d) Solve the optimization problem.

SOLUTION

(a) The perimeter of the rectangle is 3 meters, so $3 = 2x + 2y$, which is equivalent to $y = \frac{3}{2} - x$.

(b) Using part (a), $A = xy = x(\frac{3}{2} - x) = \frac{3}{2}x - x^2$.

(c) This problem requires optimization over the closed interval $[0, \frac{3}{2}]$, since both x and y must be non-negative.

(d) $A'(x) = \frac{3}{2} - 2x = 0$, which yields $x = \frac{3}{4}$ and consequently, $y = \frac{3}{4}$. Because $A(0) = A(3/2) = 0$ and $A(\frac{3}{4}) = 0.5625$, the maximum area $0.5625\ \text{m}^2$ is achieved with $x = y = \frac{3}{4}$ m.

2. Wire of length 12 m is divided into two pieces and each piece is bent into a square. How should this be done in order to minimize the sum of the areas of the two squares?

(a) Express the sum of the areas of the squares in terms of the lengths x and y of the two pieces.

(b) What is the constraint equation relating x and y?

(c) What is the interval of optimization? Is it open or closed?

(d) Solve the optimization problem.

SOLUTION Let x and y be the lengths of the pieces.

(a) The perimeter of the first square is x, which implies the length of each side is $\frac{x}{4}$ and the area is $\left(\frac{x}{4}\right)^2$. Similarly, the area of the second square is $\left(\frac{y}{4}\right)^2$. Then the sum of the areas is given by $A = \left(\frac{x}{4}\right)^2 + \left(\frac{y}{4}\right)^2$.

(b) $x + y = 12$, so that $y = 12 - x$. Then

$$A(x) = \left(\frac{x}{4}\right)^2 + \left(\frac{y}{4}\right)^2 = \left(\frac{x}{4}\right)^2 + \left(\frac{12-x}{4}\right)^2 = \frac{1}{8}x^2 - \frac{3}{2}x + 9.$$

(c) Since it is possible for the minimum total area to be realized by not cutting the wire at all, optimization over the closed interval [0, 12] suffices.

(d) Solve $A'(x) = \frac{1}{4}x - \frac{3}{2} = 0$ to obtain $x = 6$ m. Now $A(0) = A(12) = 9\ \text{m}^2$, whereas $A(4) = \frac{9}{4}\ \text{m}^2$. Accordingly, the sum of the areas of the squares is minimized if the wire is cut in half.

3. Wire of length 12 m is divided into two pieces and the pieces are bend into a square and a circle. How should this be done in order to minimize the sum of their areas?

SOLUTION Suppose the wire is divided into one piece of length x m that is bent into a circle and a piece of length $12 - x$ m that is bent into a square. Because the circle has circumference x, it follows that the radius of the circle is $x/2\pi$; therefore, the area of the circle is

$$\pi\left(\frac{x}{2\pi}\right)^2 = \frac{x^2}{4\pi}.$$

As for the square, because the perimeter is $12 - x$, the length of each side is $3 - x/4$ and the area is $(3 - x/4)^2$. Then

$$A(x) = \frac{x^2}{4\pi} + \left(3 - \frac{1}{4}x\right)^2.$$

Now

$$A'(x) = \frac{x}{2\pi} - \frac{1}{2}\left(3 - \frac{1}{4}x\right) = 0$$

when

$$x = \frac{12\pi}{4+\pi} \text{ m} \approx 5.28 \text{ m}.$$

Because $A(0) = 9 \text{ m}^2$, $A(12) = 36/\pi \approx 11.46 \text{ m}^2$, and

$$A\left(\frac{12\pi}{4+\pi}\right) \approx 5.04 \text{ m}^2,$$

we see that the sum of the areas is minimized when approximately 5.28 m of the wire is allotted to the circle.

4. Find the positive number x such that the sum of x and its reciprocal is as small as possible. Does this problem require optimization over an open interval or a closed interval?

SOLUTION Let $x > 0$ and $f(x) = x + x^{-1}$. Here we require optimization over the open interval $(0, \infty)$. Solve $f'(x) = 1 - x^{-2} = 0$ for $x > 0$ to obtain $x = 1$. Since $f(x) \to \infty$ as $x \to 0+$ and as $x \to \infty$, we conclude that f has an absolute minimum of $f(1) = 2$ at $x = 1$.

5. A flexible tube of length 4 m is bent into an L-shape. Where should the bend be made to minimize the distance between the two ends?

SOLUTION Let $x, y > 0$ be lengths of the side of the L. Since $x + y = 4$ or $y = 4 - x$, the distance between the ends of L is $h(x) = \sqrt{x^2 + y^2} = \sqrt{x^2 + (4-x)^2}$. We may equivalently minimize the square of the distance,

$$f(x) = x^2 + y^2 = x^2 + (4-x)^2$$

This is easier computationally (when working by hand). Solve $f'(x) = 4x - 8 = 0$ to obtain $x = 2$ m. Now $f(0) = f(4) = 16$, whereas $f(2) = 8$. Hence the distance between the two ends of the L is minimized when the bend is made at the middle of the wire.

6. Find the dimensions of the box with square base with:

(a) Volume 12 and the minimal surface area.

(b) Surface area 20 and maximal volume.

SOLUTION A box has a square base of side x and height y where $x, y > 0$. Its volume is $V = x^2y$ and its surface area is $S = 2x^2 + 4xy$.

(a) If $V = x^2y = 12$, then $y = 12/x^2$ and $S(x) = 2x^2 + 4x\left(12/x^2\right) = 2x^2 + 48x^{-1}$. Solve $S'(x) = 4x - 48x^{-2} = 0$ to obtain $x = 12^{1/3}$. Since $S(x) \to \infty$ as $x \to 0+$ and as $x \to \infty$, the minimum surface area is $S(12^{1/3}) = 6\,(12)^{2/3} \approx 31.45$, when $x = 12^{1/3}$ and $y = 12^{1/3}$.

(b) If $S = 2x^2 + 4xy = 20$, then $y = 5x^{-1} - \frac{1}{2}x$ and $V(x) = x^2y = 5x - \frac{1}{2}x^3$. Note that x must lie on the closed interval $[0, \sqrt{10}]$. Solve $V'(x) = 5 - \frac{3}{2}x^2$ for $x > 0$ to obtain $x = \frac{\sqrt{30}}{3}$. Since $V(0) = V(\sqrt{10}) = 0$ and $V\left(\frac{\sqrt{30}}{3}\right) = \frac{10\sqrt{30}}{9}$, the maximum volume is $V(\frac{\sqrt{30}}{3}) = \frac{10}{9}\sqrt{30} \approx 6.086$, when $x = \frac{\sqrt{30}}{3}$ and $y = \frac{\sqrt{30}}{3}$.

7. A rancher will use 600 m of fencing to build a corral in the shape of a semicircle on top of a rectangle (Figure 9). Find the dimensions that maximize the area of the corral.

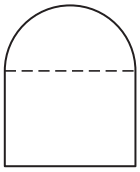


FIGURE 9

SOLUTION Let x be the width of the corral and therefore the diameter of the semicircle, and let y be the height of the rectangular section. Then the perimeter of the corral can be expressed by the equation $2y + x + \frac{\pi}{2}x = 2y + (1 + \frac{\pi}{2})x = 600$ m or equivalently, $y = \frac{1}{2}\left(600 - (1 + \frac{\pi}{2})x\right)$. Since x and y must both be nonnegative, it follows that x must be restricted to the interval $[0, \frac{600}{1+\pi/2}]$. The area of the corral is the sum of the area of the rectangle and semicircle, $A = xy + \frac{\pi}{8}x^2$. Making the substitution for y from the constraint equation,

$$A(x) = \frac{1}{2}x\left(600 - (1 + \frac{\pi}{2})x\right) + \frac{\pi}{8}x^2 = 300x - \frac{1}{2}\left(1 + \frac{\pi}{2}\right)x^2 + \frac{\pi}{8}x^2.$$

Now, $A'(x) = 300 - \left(1 + \frac{\pi}{2}\right)x + \frac{\pi}{4}x = 0$ implies $x = \frac{300}{(1+\frac{\pi}{4})} \approx 168.029746$ m. With $A(0) = 0$ m^2,

$$A\left(\frac{300}{1 + \pi/4}\right) \approx 25204.5 \text{ m}^2 \qquad \text{and} \qquad A\left(\frac{600}{1 + \pi/2}\right) \approx 21390.8 \text{ m}^2,$$

it follows that the corral of maximum area has dimensions

$$x = \frac{300}{1 + \pi/4} \text{ m} \qquad \text{and} \qquad y = \frac{150}{1 + \pi/4} \text{ m}.$$

8. What is the maximum area of a rectangle inscribed in a right triangle with 5 and 8 as in Figure 10. The sides of the rectangle are parallel to the legs of the triangle.

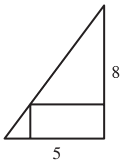

FIGURE 10

SOLUTION Position the triangle with its right angle at the origin, with its side of length 8 along the positive y-axis, and side of length 5 along the positive x-axis. Let $x, y > 0$ be the lengths of sides of the inscribed rectangle along the axes. By similar triangles, we have $\frac{8}{5} = \frac{y}{5-x}$ or $y = 8 - \frac{8}{5}x$. The area of the rectangle is thus $A(x) = xy = 8x - \frac{8}{5}x^2$. To guarantee that both x and y remain nonnegative, we must restrict x to the interval [0, 5]. Solve $A'(x) = 8 - \frac{16}{5}x = 0$ to obtain $x = \frac{5}{2}$. Since $A(0) = A(5) = 0$ and $A(\frac{5}{2}) = 10$, the maximum area is $A\left(\frac{5}{2}\right) = 10$ when $x = \frac{5}{2}$ and $y = 4$.

9. Find the dimensions of the rectangle of maximum area that can be inscribed in a circle of radius $r = 4$ (Figure 11).

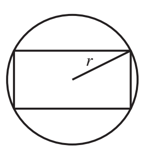

FIGURE 11

SOLUTION Place the center of the circle at the origin with the sides of the rectangle (of lengths $2x > 0$ and $2y > 0$) parallel to the coordinate axes. By the Pythagorean Theorem, $x^2 + y^2 = r^2 = 16$, so that $y = \sqrt{16 - x^2}$. Thus the area of the rectangle is $A(x) = 2x \cdot 2y = 4x\sqrt{16 - x^2}$. To guarantee both x and y are real and nonnegative, we must restrict x to the interval [0, 4]. Solve

$$A'(x) = 4\sqrt{16 - x^2} - \frac{4x^2}{\sqrt{16 - x^2}} = 0$$

for $x > 0$ to obtain $x = \frac{4}{\sqrt{2}} = 2\sqrt{2}$. Since $A(0) = A(4) = 0$ and $A(2\sqrt{2}) = 32$, the rectangle of maximum area has dimensions $2x = 2y = 4\sqrt{2}$.

10. Find the dimensions x and y of the rectangle inscribed in a circle of radius r that maximizes the quantity xy^2.

SOLUTION Place the center of the circle of radius r at the origin with the sides of the rectangle (of lengths $x > 0$ and $y > 0$) parallel to the coordinate axes. By the Pythagorean Theorem, we have $(\frac{x}{2})^2 + (\frac{y}{2})^2 = r^2$, whence $y^2 = 4r^2 - x^2$. Let $f(x) = xy^2 = 4xr^2 - x^3$. Allowing for degenerate rectangles, we have $0 \le x \le 2r$. Solve $f'(x) = 4r^2 - 3x^2$ for $x \ge 0$ to obtain $x = \frac{2r}{\sqrt{3}}$. Since $f(0) = f(2r) = 0$, the maximal value of f is $f(\frac{2r}{\sqrt{3}}) = \frac{16}{9}\sqrt{3}r^3$ when $x = \frac{2r}{\sqrt{3}}$ and $y = 2\sqrt{\frac{2}{3}}r$.

11. Find the point on the line $y = x$ closest to the point $(1, 0)$. *Hint:* It is equivalent and easier to minimize the *square* of the distance.

SOLUTION With $y = x$, let's equivalently minimize the square of the distance, $f(x) = (x-1)^2 + y^2 = 2x^2 - 2x + 1$, which is computationally easier (when working by hand). Solve $f'(x) = 4x - 2 = 0$ to obtain $x = \frac{1}{2}$. Since $f(x) \to \infty$ as $x \to \pm\infty$, $(\frac{1}{2}, \frac{1}{2})$ is the point on $y = x$ closest to $(1, 0)$.

12. Find the point P on the parabola $y = x^2$ closest to the point $(3, 0)$ (Figure 12).

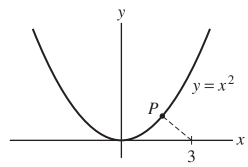

FIGURE 12

SOLUTION With $y = x^2$, let's equivalently minimize the square of the distance,

$$f(x) = (x-3)^2 + y^2 = x^4 + x^2 - 6x + 9.$$

Then

$$f'(x) = 4x^3 + 2x - 6 = 2(x-1)(2x^2 + 2x + 3),$$

so that $f'(x) = 0$ when $x = 1$ (plus two complex solutions, which we discard). Since $f(x) \to \infty$ as $x \to \pm\infty$, $P = (1, 1)$ is the point on $y = x^2$ closest to $(3, 0)$.

13. CAS Find a good numerical approximation to the coordinates of the point on the graph of $y = \ln x - x$ closest to the origin (Figure 13).

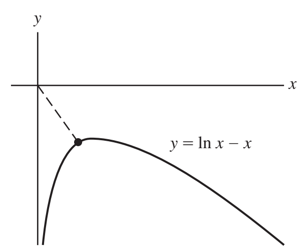

FIGURE 13

SOLUTION The distance from the origin to the point $(x, \ln x - x)$ on the graph of $y = \ln x - x$ is $d = \sqrt{x^2 + (\ln x - x)^2}$. As usual, we will minimize d^2. Let $d^2 = f(x) = x^2 + (\ln x - x)^2$. Then

$$f'(x) = 2x + 2(\ln x - x)\left(\frac{1}{x} - 1\right).$$

To determine x, we need to solve

$$4x + \frac{2\ln x}{x} - 2\ln x - 2 = 0.$$

This yields $x \approx .632784$. Thus, the point on the graph of $y = \ln x - x$ that is closest to the origin is approximately $(0.632784, -1.090410)$.

14. Problem of Tartaglia (1500–1557) Among all positive numbers a, b whose sum is 8, find those for which the product of the two numbers and their difference is largest.

SOLUTION The product of a,b and their difference is $ab(a-b)$. Since $a + b = 8$, $b = 8 - a$ and $a - b = 2a - 8$. Thus, let

$$f(a) = a(8-a)(2a-8) = -2a^3 + 24a^2 - 64a.$$

where $a \in [0, 8]$. Setting $f'(a) = -6a^2 + 48a - 64 = 0$ yields $a = 4 \pm \frac{4}{3}\sqrt{3}$. Now, $f(0) = f(8) = 0$, while

$$f\left(4 - \frac{4}{3}\sqrt{3}\right) < 0 \quad \text{and} \quad f\left(4 + \frac{4}{3}\sqrt{3}\right) > 0.$$

Hence the numbers a, b maximizing the product are

$$a = 4 + \frac{4\sqrt{3}}{3}, \quad \text{and} \quad b = 8 - a = 4 - \frac{4\sqrt{3}}{3}.$$

15. Find the angle θ that maximizes the area of the isosceles triangle whose legs have length ℓ (Figure 14).

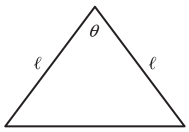

FIGURE 14

SOLUTION The area of the triangle is

$$A(\theta) = \frac{1}{2}\ell^2 \sin\theta,$$

where $0 \le \theta \le \pi$. Setting

$$A'(\theta) = \frac{1}{2}\ell^2 \cos\theta = 0$$

yields $\theta = \frac{\pi}{2}$. Since $A(0) = A(\pi) = 0$ and $A(\frac{\pi}{2}) = \frac{1}{2}\ell^2$, the angle that maximizes the area of the isosceles triangle is $\theta = \frac{\pi}{2}$.

16. A right circular cone (Figure 15) has volume $V = \frac{\pi}{3}r^2h$ and surface area is $S = \pi r\sqrt{r^2+h^2}$. Find the dimensions of the cone with surface area 1 and maximal volume.

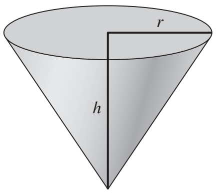

FIGURE 15

SOLUTION We have $\pi r\sqrt{r^2+h^2} = 1$ so $\pi^2 r^2(r^2+h^2) = 1$ and hence $h^2 = \frac{1-\pi^2r^4}{\pi^2r^2}$ and now we must maximize

$$V = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi\left(r^2\frac{\sqrt{1-\pi^2r^4}}{\pi r}\right) = \frac{1}{3}r\sqrt{1-\pi^2r^4},$$

where $0 < r \le 1/\sqrt{\pi}$. Because

$$\frac{d}{dr}r\sqrt{1-\pi^2r^4} = \sqrt{1-\pi^2r^4} + \frac{1}{2}r\frac{-4\pi^2r^3}{\sqrt{1-\pi^2r^4}}$$

the relevant critical point is $r = (3\pi^2)^{-1/4}$.

To find h, we back substitute our solution for r in $h^2 = (1-\pi^2r^4)/(\pi^2r^2)$. $r = (3\pi^2)^{-1/4}$, so $r^4 = \frac{1}{3\pi^2}$ and $r^2 = \frac{1}{\sqrt{3}\pi}$; hence, $\pi^2r^4 = \frac{1}{3}$ and $\pi^2r^2 = \frac{\pi}{\sqrt{3}}$, and:

$$h^2 = \left(\frac{2}{3}\right)\Big/\left(\frac{\pi}{\sqrt{3}}\right) = \frac{2}{\sqrt{3}\pi}.$$

From this, $h = \sqrt{2}/\left(3^{1/4}\sqrt{\pi}\right)$. Since

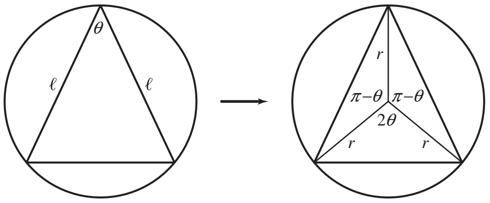
$$\lim_{r\to 0+} V(r) = 0,\ V\left(\frac{1}{\sqrt{\pi}}\right) = 0 \qquad \text{and} \qquad V\left((3\pi^2)^{-1/4}\right) = \frac{1}{3^{7/4}}\sqrt{\frac{2}{\pi}},$$

the cone of surface area 1 with maximal volume has dimensions

$$r = \frac{1}{3^{1/4}\sqrt{\pi}} \qquad \text{and} \qquad h = \frac{\sqrt{2}}{3^{1/4}\sqrt{\pi}}.$$

17. Find the area of the largest isosceles triangle that can be inscribed in a circle of radius r.

SOLUTION Consider the following diagram:



The area of the isosceles triangle is

$$A(\theta) = 2 \cdot \frac{1}{2} r^2 \sin(\pi - \theta) + \frac{1}{2} r^2 \sin(2\theta) = r^2 \sin\theta + \frac{1}{2} r^2 \sin(2\theta),$$

where $0 \le \theta \le \pi$. Solve

$$A'(\theta) = r^2 \cos\theta + r^2 \cos(2\theta) = 0$$

to obtain $\theta = \frac{\pi}{3}, \pi$. Since $A(0) = A(\pi) = 0$ and $A(\frac{\pi}{3}) = \frac{3\sqrt{3}}{4} r^2$, the area of the largest isosceles triangle that can be inscribed in a circle of radius r is $\frac{3\sqrt{3}}{4} r^2$.

18. Find the radius and height of a cylindrical can of total surface area A whose volume is as large as possible. Does there exist a cylinder of surface area A and minimal total volume?

SOLUTION Let a closed cylindrical can be of radius r and height h. Its total surface area is $S = 2\pi r^2 + 2\pi r h = A$, whence $h = \dfrac{A}{2\pi r} - r$. Its volume is thus $V(r) = \pi r^2 h = \frac{1}{2} A r - \pi r^3$, where $0 < r \le \sqrt{\frac{A}{2\pi}}$. Solve $V'(r) = \frac{1}{2} A - 3\pi r^2$ for $r > 0$ to obtain $r = \sqrt{\dfrac{A}{6\pi}}$. Since $V(0) = V(\sqrt{\frac{A}{2\pi}}) = 0$ and

$$V\left(\sqrt{\frac{A}{6\pi}}\right) = \frac{\sqrt{6} A^{3/2}}{18\sqrt{\pi}},$$

the maximum volume is achieved when

$$r = \sqrt{\frac{A}{6\pi}} \quad \text{and} \quad h = \frac{1}{3}\sqrt{\frac{6A}{\pi}}.$$

For a can of total surface area A, there are cans of arbitrarily small volume since $\lim_{r \to 0+} V(r) = 0$.

19. A poster of area 6000 cm^2 has blank margins of width 10 cm on the top and bottom and 6 cm on the sides. Find the dimensions that maximize the printed area.

SOLUTION Let x be the width of the printed region, and let y be the height. The total printed area is $A = xy$. Because the total area of the poster is 6000 cm^2, we have the constraint $(x + 12)(y + 20) = 6000$, so that $xy + 12y + 20x + 240 = 6000$, or $y = \frac{5760 - 20x}{x + 12}$. Therefore, $A(x) = 20\frac{288x - x^2}{x + 12}$, where $0 \le x \le 288$.

$A(0) = A(288) = 0$, so we are looking for a critical point on the interval $[0, 288]$. Setting $A'(x) = 0$ yields

$$\begin{aligned} 20\frac{(x + 12)(288 - 2x) - (288x - x^2)}{(x + 12)^2} &= 0 \\ \frac{-x^2 - 24x + 3456}{(x + 12)^2} &= 0 \\ x^2 + 24x - 3456 &= 0 \\ (x - 48)(x + 72) &= 0 \end{aligned}$$

Therefore $x = 48$ or $x = -72$. $x = 48$ is the only critical point of $A(x)$ in the interval $[0, 288]$, so $A(48) = 3840$ is the maximum value of $A(x)$ in the interval $[0, 288]$. Now, $y = 20\frac{288 - 48}{48 + 12} = 80$ cm, so the poster with maximum printed area is $48 + 12 = 60$ cm. wide by $80 + 20 = 100$ cm. tall.

20. According to postal regulations, a carton is classified as "oversized" if the sum of its height and girth (perimeter of its base) exceeds 108 in. Find the dimensions of a carton with square base that is not oversized and has maximum volume.

SOLUTION Let h denote the height of the carton and s denote the side length of the square base. Clearly the volume will be maximized when the sum of the height and girth equals 108; i.e., $4s + h = 108$, whence $h = 108 - 4s$. Allowing for degenerate cartons, the carton's volume is $V(s) = s^2 h = s^2(108 - 4s)$, where $0 \le s \le 27$. Solve $V'(s) = 216s - 12s^3 = 0$ for s to obtain $s = 0$ or $s = 18$. Since $V(0) = V(27) = 0$, the maximum volume is $V(18) = 11664$ in^3 when $s = 18$ in and $h = 36$ in.

21. Kepler's Wine Barrel Problem In his work *Nova stereometria doliorum vinariorum* (New Solid Geometry of a Wine Barrel), published in 1615, astronomer Johannes Kepler stated and solved the following problem: Find the dimensions of the cylinder of largest volume that can be inscribed in a sphere of radius R. *Hint:* Show that an inscribed cylinder has volume $2\pi x(R^2 - x^2)$, where x is one-half the height of the cylinder.

SOLUTION Place the center of the sphere at the origin in three-dimensional space. Let the cylinder be of radius y and half-height x. The Pythagorean Theorem states, $x^2 + y^2 = R^2$, so that $y^2 = R^2 - x^2$. The volume of the cylinder is $V(x) = \pi y^2(2x) = 2\pi\left(R^2 - x^2\right)x = 2\pi R^2 x - 2\pi x^3$. Allowing for degenerate cylinders, we have $0 \le x \le R$. Solve $V'(x) = 2\pi R^2 - 6\pi x^2 = 0$ for $x \ge 0$ to obtain $x = \frac{R}{\sqrt{3}}$. Since $V(0) = V(R) = 0$, the largest volume is $V(\frac{R}{\sqrt{3}}) = \frac{4}{9}\pi\sqrt{3}R^3$ when $x = \frac{R}{\sqrt{3}}$ and $y = \sqrt{\frac{2}{3}}R$.

22. Find the angle θ that maximizes the area of the trapezoid with a base of length 4 and sides of length 2, as in Figure 16.

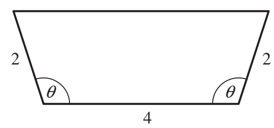


FIGURE 16

SOLUTION Allowing for degenerate trapezoids, we have $0 \le \theta \le \pi$. Via trigonometry and surgery (slice off a right triangle and rearrange the trapezoid into a rectangle), we have that the area of the trapezoid is equivalent to the area of a rectangle of base $4 - 2\cos\theta$ and height $2\sin\theta$; i.e,

$$A(\theta) = (4 - 2\cos\theta)\cdot 2\sin\theta = 8\sin\theta - 4\sin\theta\cos\theta = 8\sin\theta - 2\sin 2\theta,$$

where $0 \le \theta \le \pi$. Solve

$$A'(\theta) = 8\cos\theta - 4\cos 2\theta = 4 + 8\cos\theta - 8\cos^2\theta = 0$$

for $0 \le \theta \le \pi$ to obtain

$$\theta = \theta_0 = \cos^{-1}\left(\frac{1-\sqrt{3}}{2}\right) \approx 1.94553.$$

Since $A(0) = A(\pi) = 0$ and $A(\theta_0) = 3^{1/4}(3+\sqrt{3})\sqrt{2}$, the area of the trapezoid is maximized when $\theta = \cos^{-1}\left(\frac{1-\sqrt{3}}{2}\right)$.

23. A landscape architect wishes to enclose a rectangular garden of area 1,000 m^2 on one side by a brick wall costing \$90/m and on the other three sides by a metal fence costing \$30/m. Which dimensions minimize the total cost?

SOLUTION Let x be the length of the brick wall and y the length of an adjacent side with $x, y > 0$. With $xy = 1000$ or $y = \frac{1000}{x}$, the total cost is

$$C(x) = 90x + 30(x + 2y) = 120x + 60000x^{-1}.$$

Solve $C'(x) = 120 - 60000x^{-2} = 0$ for $x > 0$ to obtain $x = 10\sqrt{5}$. Since $C(x) \to \infty$ as $x \to 0+$ and as $x \to \infty$, the minimum cost is $C(10\sqrt{5}) = 2400\sqrt{5} \approx \$5366.56$ when $x = 10\sqrt{5} \approx 22.36$ m and $y = 20\sqrt{5} \approx 44.72$ m.

24. The amount of light reaching a point at a distance r from a light source A of intensity I_A is I_A/r^2. Suppose that a second light source B of intensity $I_B = 4I_A$ is located 10 m from A. Find the point on the segment joining A and B where the total amount of light is at a minimum.

SOLUTION Place the segment in the xy-plane with A at the origin and B at $(10, 0)$. Let x be the distance from A. Then $10 - x$ is the distance from B. The total amount of light is

$$f(x) = \frac{I_A}{x^2} + \frac{I_B}{(10-x)^2} = I_A\left(\frac{1}{x^2} + \frac{4}{(10-x)^2}\right).$$

Solve

$$f'(x) = I_A\left(\frac{8}{(10-x)^3} - \frac{2}{x^3}\right) = 0$$

for $0 \le x \le 10$ to obtain

$$4 = \frac{(10-x)^3}{x^3} = \left(\frac{10}{x} - 1\right)^3 \quad \text{or} \quad x = \frac{10}{1+\sqrt[3]{4}} \approx 3.86 \text{ m}.$$

Since $f(x) \to \infty$ as $x \to 0+$ and $x \to 10-$ we conclude that the minimal amount of light occurs 3.86 m from A.

25. Find the maximum area of a rectangle inscribed in the region bounded by the graph of $y = \dfrac{4-x}{2+x}$ and the axes (Figure 17).

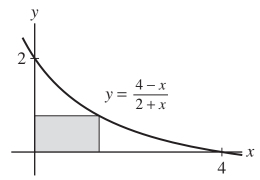

FIGURE 17

SOLUTION Let s be the width of the rectangle. The height of the rectangle is $h = \frac{4-s}{2+s}$, so that the area is

$$A(s) = s\frac{4-s}{2+s} = \frac{4s-s^2}{2+s}.$$

We are maximizing on the closed interval $[0, 4]$. It is obvious from the pictures that $A(0) = A(4) = 0$, so we look for critical points of A.

$$A'(s) = \frac{(2+s)(4-2s)-(4s-s^2)}{(2+s)^2} = -\frac{s^2+4s-8}{(s+2)^2}.$$

The only point where $A'(s)$ doesn't exist is $s = -2$ which isn't under consideration.

Setting $A'(s) = 0$ gives, by the quadratic formula,

$$s = \frac{-4 \pm \sqrt{48}}{2} = -2 \pm 2\sqrt{3}.$$

Of these, only $-2+2\sqrt{3}$ is positive, so this is our lone critical point. $A(-2+2\sqrt{3}) \approx 1.0718 > 0$. Since we are finding the maximum over a closed interval and $-2+2\sqrt{3}$ is the only critical point, the maximum area is $A(-2+2\sqrt{3}) \approx 1.0718$.

26. Find the maximum area of a triangle formed by the axes and a tangent line to the graph of $y = (x+1)^{-2}$ with $x > 0$.

SOLUTION Let $P\left(t, \frac{1}{(t+1)^2}\right)$ be a point on the graph of the curve $y = \frac{1}{(x+1)^2}$ in the first quadrant. The tangent line to the curve at P is

$$L(x) = \frac{1}{(t+1)^2} - \frac{2(x-t)}{(t+1)^3},$$

which has x-intercept $a = \frac{3t+1}{2}$ and y-intercept $b = \frac{3t+1}{(t+1)^3}$. The area of the triangle in question is

$$A(t) = \frac{1}{2}ab = \frac{(3t+1)^2}{4(t+1)^3}.$$

Solve

$$A'(t) = \frac{(3t+1)(3-3t)}{4(t+1)^4} = 0$$

for $0 \le t$ to obtain $t = 1$. Because $A(0) = \frac{1}{4}$, $A(1) = \frac{1}{2}$ and $A(t) \to 0$ as $t \to \infty$, it follows that the maximum area is $A(1) = \frac{1}{2}$.

27. Find the maximum area of a rectangle circumscribed around a rectangle of sides L and H. *Hint:* Express the area in terms of the angle θ (Figure 18).

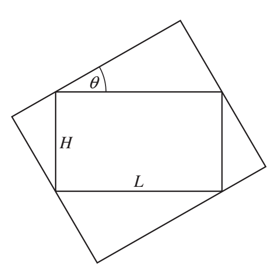

FIGURE 18

SOLUTION Position the $L \times H$ rectangle in the first quadrant of the xy-plane with its "northwest" corner at the origin. Let θ be the angle the base of the circumscribed rectangle makes with the positive x-axis, where $0 \le \theta \le \frac{\pi}{2}$. Then the area of the circumscribed rectangle is $A = LH + 2 \cdot \frac{1}{2}(H\sin\theta)(H\cos\theta) + 2 \cdot \frac{1}{2}(L\sin\theta)(L\cos\theta) = LH + \frac{1}{2}(L^2 + H^2)\sin 2\theta$, which has a maximum value of $LH + \frac{1}{2}(L^2 + H^2)$ when $\theta = \frac{\pi}{4}$ because $\sin 2\theta$ achieves its maximum when $\theta = \frac{\pi}{4}$.

28. A contractor is engaged to build steps up the slope of a hill that has the shape of the graph of $y = x^2(120 - x)/6400$ for $0 \le x \le 80$ with x in meters (Figure 19). What is the maximum vertical rise of a stair if each stair has a horizontal length of one-third meter.

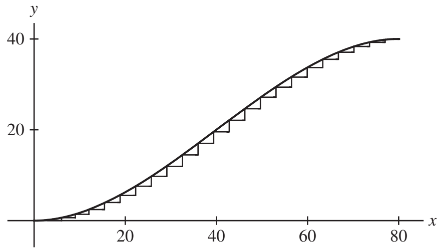

FIGURE 19

SOLUTION Let $f(x) = x^2(120 - x)/6400$. Because the horizontal length of each stair is one-third meter, the vertical rise of each stair is

$$r(x) = f\left(x + \frac{1}{3}\right) - f(x) = \frac{1}{6400}\left(x + \frac{1}{3}\right)^2\left(\frac{359}{3} - x\right) - \frac{1}{6400}x^2(120 - x)$$
$$= \frac{1}{6400}\left(-x^2 + \frac{239}{3}x + \frac{359}{27}\right),$$

where x denotes the location of the beginning of the stair. This is the equation of a downward opening parabola; thus, the maximum occurs when $r'(x) = 0$. Now,

$$r'(x) = \frac{1}{6400}\left(-2x + \frac{239}{3}\right) = 0$$

when $x = 239/6$. Because the stair must start at a location of the form $n/3$ for some integer n, we evaluate $r(x)$ at $x = 119/3$ and $x = 120/3 = 40$. We find

$$r\left(\frac{119}{3}\right) = r(40) = \frac{43199}{172800} \approx 0.249994$$

meters. Thus, the maximum vertical rise of any stair is just below 0.25 meters.

29. Find the equation of the line through $P = (4, 12)$ such that the triangle bounded by this line and the axes in the first quadrant has minimal area.

SOLUTION Let $P = (4, 12)$ be a point in the first quadrant and $y - 12 = m(x - 4)$, $-\infty < m < 0$, be a line through P that cuts the positive x- and y-axes. Then $y = L(x) = m(x - 4) + 12$. The line $L(x)$ intersects the y-axis at $H\,(0, 12 - 4m)$ and the x-axis at $W\left(4 - \frac{12}{m}, 0\right)$. Hence the area of the triangle is

$$A(m) = \frac{1}{2}(12 - 4m)\left(4 - \frac{12}{m}\right) = 48 - 8m - 72m^{-1}.$$

Solve $A'(m) = 72m^{-2} - 8 = 0$ for $m < 0$ to obtain $m = -3$. Since $A \to \infty$ as $m \to -\infty$ or $m \to 0-$, we conclude that the minimal triangular area is obtained when $m = -3$. The equation of the line through $P = (4, 12)$ is $y = -3(x - 4) + 12 = -3x + 24$.

30. Let $P = (a, b)$ lie in the first quadrant. Find the slope of the line through P such that the triangle bounded by this line and the axes in the first quadrant has minimal area. Then show that P is the midpoint of the hypotenuse of this triangle.

SOLUTION Let $P(a, b)$ be a point in the first quadrant (thus $a, b > 0$) and $y - b = m(x - a)$, $-\infty < m < 0$, be a line through P that cuts the positive x- and y-axes. Then $y = L(x) = m(x - a) + b$. The line $L(x)$ intersects the y-axis at $H\,(0, b - am)$ and the x-axis at $W\left(a - \frac{b}{m}, 0\right)$. Hence the area of the triangle is

$$A(m) = \frac{1}{2}(b - am)\left(a - \frac{b}{m}\right) = ab - \frac{1}{2}a^2m - \frac{1}{2}b^2m^{-1}.$$

Solve $A'(m) = \frac{1}{2}b^2m^{-2} - \frac{1}{2}a^2 = 0$ for $m < 0$ to obtain $m = -\frac{b}{a}$. Since $A \to \infty$ as $m \to -\infty$ or $m \to 0-$, we conclude that the minimal triangular area is obtained when $m = -\frac{b}{a}$. For $m = -b/a$, we have $H(0, 2b)$ and $W(2a, 0)$. The midpoint of the line segment connecting H and W is thus $P(a, b)$.

31. Archimedes' Problem A spherical cap (Figure 20) of radius r and height h has volume $V = \pi h^2\left(r - \frac{1}{3}h\right)$ and surface area $S = 2\pi r h$. Prove that the hemisphere encloses the largest volume among all spherical caps of fixed surface area S.

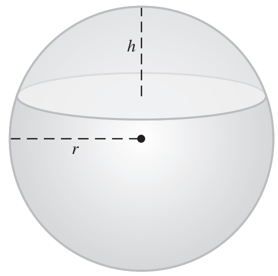

FIGURE 20

SOLUTION Consider all spherical caps of fixed surface area S. Because $S = 2\pi r h$, it follows that

$$r = \frac{S}{2\pi h}$$

and

$$V(h) = \pi h^2\left(\frac{S}{2\pi h} - \frac{1}{3}h\right) = \frac{S}{2}h - \frac{\pi}{3}h^3.$$

Now

$$V'(h) = \frac{S}{2} - \pi h^2 = 0$$

when

$$h^2 = \frac{S}{2\pi} \quad \text{or} \quad h = \frac{S}{2\pi h} = r.$$

Hence, the hemisphere encloses the largest volume among all spherical caps of fixed surface area S.

32. Find the isosceles triangle of smallest area (Figure 21) that circumscribes a circle of radius 1 (from Thomas Simpson's *The Doctrine and Application of Fluxions*, a calculus text that appeared in 1750).

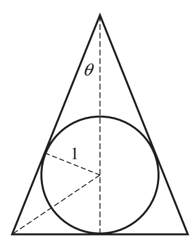

FIGURE 21

SOLUTION From the diagram, we see that the height h and base b of the triangle are $h = 1 + \csc\theta$ and $b = 2h\tan\theta = 2(1 + \csc\theta)\tan\theta$. Thus, the area of the triangle is

$$A(\theta) = \frac{1}{2}hb = (1 + \csc\theta)^2\tan\theta,$$

where $0 < \theta < \pi$. We now set the derivative equal to zero:

$$A'(\theta) = (1 + \csc\theta)(-2\csc\theta + \sec^2\theta(1 + \csc\theta)) = 0.$$

The first factor gives $\theta = 3\pi/2$ which is not in the domain of the problem. To find the roots of the second factor, multiply through by $\cos^2\theta\sin\theta$ to obtain

$$-2\cos^2\theta + \sin\theta + 1 = 0,$$

or

$$2\sin^2\theta + \sin\theta - 1 = 0.$$

This is a quadratic equation in $\sin\theta$ with roots $\sin\theta = -1$ and $\sin\theta = 1/2$. Only the second solution is relevant and gives us $\theta = \pi/6$. Since $A(\theta) \to \infty$ as $\theta \to 0+$ and as $\theta \to \pi-$, we see that the minimum area occurs when the triangle is an equilateral triangle.

33. A box of volume 72 m^3 with square bottom and no top is constructed out of two different materials. The cost of the bottom is \$40/m^2 and the cost of the sides is \$30/m^2. Find the dimensions of the box that minimize total cost.

SOLUTION Let s denote the length of the side of the square bottom of the box and h denote the height of the box. Then

$$V = s^2h = 72 \quad \text{or} \quad h = \frac{72}{s^2}.$$

The cost of the box is

$$C = 40s^2 + 120sh = 40s^2 + \frac{8640}{s},$$

so

$$C'(s) = 80s - \frac{8640}{s^2} = 0$$

when $s = 3\sqrt[3]{4}$ m and $h = 2\sqrt[3]{4}$ m. Because $C \to \infty$ as $s \to 0-$ and as $s \to \infty$, we conclude that the critical point gives the minimum cost.

34. Find the dimensions of a cylinder of volume 1 m^3 of minimal cost if the top and bottom are made of material that costs twice as much as the material for the side.

SOLUTION Let r be the radius in meters of the top and bottom of the cylinder. Let h be the height in meters of the cylinder. Since $V = \pi r^2 h = 1$, we get $h = \frac{1}{\pi r^2}$. Ignoring the actual cost, and using only the proportion, suppose that the sides cost 1 monetary unit per square meter and the top and the bottom 2. The cost of the top and bottom is $2(2\pi r^2)$ and the cost of the sides is $1(2\pi r h) = 2\pi r(\frac{1}{\pi r^2}) = \frac{2}{r}$. Let $C(r) = 4\pi r^2 + \frac{2}{r}$. Because $C(r) \to \infty$ as $r \to 0+$ and as $r \to \infty$, we are looking for critical points of $C(r)$. Setting $C'(r) = 8\pi r - \frac{2}{r^2} = 0$ yields $8\pi r = \frac{2}{r^2}$, so that $r^3 = \frac{1}{4\pi}$. This yields $r = \frac{1}{(4\pi)^{1/3}} \approx 0.430127$. The dimensions that minimize cost are

$$r = \frac{1}{(4\pi)^{1/3}} \text{ m}, \qquad h = \frac{1}{\pi r^2} = 4^{2/3}\pi^{-1/3} \text{ m}.$$

35. Your task is to design a rectangular industrial warehouse consisting of three separate spaces of equal size as in Figure 22. The wall materials cost \$500 per linear meter and your company allocates \$2,400,000 for the project.

(a) Which dimensions maximize the area of the warehouse?

(b) What is the area of each compartment in this case?

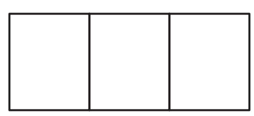

FIGURE 22

SOLUTION Let one compartment have length x and width y. Then total length of the wall of the warehouse is $P = 4x + 6y$ and the constraint equation is cost $= 2{,}400{,}000 = 500(4x + 6y)$, which gives $y = 800 - \frac{2}{3}x$.

(a) Area is given by $A = 3xy = 3x\left(800 - \frac{2}{3}x\right) = 2400x - 2x^2$, where $0 \le x \le 1200$. Then $A'(x) = 2400 - 4x = 0$ yields $x = 600$ and consequently $y = 400$. Since $A(0) = A(1200) = 0$ and $A(600) = 720,000$, the area of the warehouse is maximized when each compartment has length of 600 m and width of 400 m.

(b) The area of one compartment is $600 \cdot 400 = 240,000$ square meters.

36. Suppose, in the previous exercise, that the warehouse consists of n separate spaces of equal size. Find a formula in terms of n for the maximum possible area of the warehouse.

SOLUTION For n compartments, with x and y as before, cost $= 2{,}400{,}000 = 500((n+1)x + 2ny)$ and $y = \dfrac{4800 - (n+1)x}{2n}$. Then

$$A = nxy = x\frac{4800 - (n+1)x}{2} = 2400x - \frac{n+1}{2}x^2$$

and $A'(x) = 2400 - (n+1)x = 0$ yields $x = \dfrac{2400}{n+1}$ and consequently $y = \dfrac{1200}{n}$. Thus the maximum area is given by

$$A = n\left(\frac{2400}{n+1}\right)\left(\frac{1200}{n}\right) = \frac{28{,}800{,}000}{n+1}.$$

37. According to a model developed by economists E. Heady and J. Pesek, if fertilizer made from N pounds of nitrogen and P pounds of phosphate is used on an acre of farmland, then the yield of corn (in bushels per acre) is

$$Y = 7.5 + 0.6N + 0.7P - 0.001N^2 - 0.002P^2 + 0.001NP$$

A farmer intends to spend \$30 per acre on fertilizer. If nitrogen costs 25 cents/lb and phosphate costs 20 cents/lb, which combination of N and L produces the highest yield of corn?

SOLUTION The farmer's budget for fertilizer is \$30 per acre, so we have the constraint equation

$$0.25N + 0.2P = 30 \qquad \text{or} \qquad P = 150 - 1.25N$$

Substituting for P in the equation for Y, we find

$$\begin{aligned} Y(N) &= 7.5 + 0.6N + 0.7(150 - 1.25N) - 0.001N^2 - 0.002(150 - 1.25N)^2 + 0.001N(150 - 1.25N) \\ &= 67.5 + 0.625N - 0.005375N^2 \end{aligned}$$

Both N and P must be nonnegative. Since $P = 150 - 1.25N \geq 0$, we require that $0 \leq N \leq 120$. Next,

$$\frac{dY}{dN} = 0.625 - 0.01075N = 0 \quad \Rightarrow \quad N = \frac{0.625}{0.01075} \approx 58.14 \text{ pounds.}$$

Now, $Y(0) = 67.5$, $Y(120) = 65.1$ and $Y(58.14) \approx 85.67$, so the maximum yield of corn occurs for $N \approx 58.14$ pounds and $P \approx 77.33$ pounds.

38. Experiments show that the quantities x of corn and y of soybean required to produce a hog of weight Q satisfy $Q = 0.5x^{1/2}y^{1/4}$. The unit of x, y, and Q is the cwt, an agricultural unit equal to 100 lbs. Find the values of x and y that minimize the cost of a hog of weight $Q = 2.5$ cwt if corn costs \$3/cwt and soy costs \$7/cwt.

SOLUTION With $Q = 2.5$, we find that

$$y = \left(\frac{2.5}{0.5x^{1/2}}\right)^4 = \frac{625}{x^2}.$$

The cost is then

$$C = 3x + 7y = 3x + \frac{4375}{x^2}.$$

Solving

$$\frac{dC}{dx} = 3 - \frac{8750}{x^3} = 0$$

yields $x = \sqrt[3]{8750/3} \approx 14.29$. From this, it follows that $y = 625/14.29^2 \approx 3.06$. The overall cost is $C = 3(14.29) + 7(3.06) \approx \$64.29$.

39. All units in a 100-unit apartment building are rented out when the monthly rent is set at $r = \$900$/month. Suppose that one unit becomes vacant with each \$10 increase in rent and that each occupied unit costs \$80/month in maintenance. Which rent r maximizes monthly profit?

SOLUTION Let n denote the number of \$10 increases in rent. Then the monthly profit is given by

$$P(n) = (100 - n)(900 + 10n - 80) = 82000 + 180n - 10n^2,$$

and

$$P'(n) = 180 - 20n = 0$$

when $n = 9$. We know this results in maximum profit because this gives the location of vertex of a downward opening parabola. Thus, monthly profit is maximized with a rent of \$990.

40. An 8-billion-bushel corn crop brings a price of \$2.40/bu. A commodity broker uses the rule of thumb: If the crop is reduced by x percent, then the price increases by $10x$ cents. Which crop size results in maximum revenue and what is the price per bu? *Hint:* Revenue is equal to price times crop size.

SOLUTION Let x denote the percentage reduction in crop size. Then the price for corn is $2.40 + 0.10x$, the crop size is $8(1 - 0.01x)$ and the revenue (in billions of dollars) is

$$R(x) = (2.4 + 0.1x)8(1 - 0.01x) = 8(-0.001x^2 + 0.076x + 2.4),$$

where $0 \leq x \leq 100$. Solve

$$R'(x) = -0.002x + 0.076 = 0$$

to obtain $x = 38$ percent. Since $R(0) = 19.2$, $R(38) = 30.752$, and $R(100) = 0$, revenue is maximized when $x = 38$. So we reduce the crop size to

$$8(1 - 0.38) = 4.96 \text{ billion bushels.}$$

The price would be $\$2.40 + 0.10(38) = 2.40 + 3.80 = \$6.20$.

41. The monthly output of a Spanish light bulb factory is $P = 2LK^2$ (in millions), where L is the cost of labor and K is the cost of equipment (in millions of euros). The company needs to produce 1.7 million units per month. Which values of L and K would minimize the total cost $L + K$?

SOLUTION Since $P = 1.7$ and $P = 2LK^2$, we have $L = \dfrac{0.85}{K^2}$. Accordingly, the cost of production is

$$C(K) = L + K = K + \frac{0.85}{K^2}.$$

Solve $C'(K) = 1 - \dfrac{1.7}{K^3}$ for $K \geq 0$ to obtain $K = \sqrt[3]{1.7}$. Since $C(K) \to \infty$ as $K \to 0+$ and as $K \to \infty$, the minimum cost of production is achieved for $K = \sqrt[3]{1.7} \approx 1.2$ and $L = 0.6$. The company should invest 1.2 million euros in equipment and 600, 000 euros in labor.

42. The rectangular plot in Figure 23 has size 100 m × 200 m. Pipe is to be laid from A to a point P on side BC and from there to C. The cost of laying pipe along the side of the plot is \$45/m and the cost through the plot is \$80/m (since it is underground).

(a) Let $f(x)$ be the total cost, where x is the distance from P to B. Determine $f(x)$, but note that f is discontinuous at $x = 0$ (when $x = 0$, the cost of the entire pipe is \$45/ft).

(b) What is the most economical way to lay the pipe? What if the cost along the sides is \$65/m?

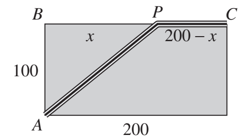

FIGURE 23

SOLUTION

(a) Let x be the distance from P to B. If $x > 0$, then the length of the underground pipe is $\sqrt{100^2 + x^2}$ and the length of the pipe along the side of the plot is $200 - x$. The total cost is

$$f(x) = 80\sqrt{100^2 + x^2} + 45(200 - x).$$

If $x = 0$, all of the pipe is along the side of the plot and $f(0) = 45(200 + 100) = \$13{,}500$.

(b) To locate the critical points of f, solve

$$f'(x) = \frac{80x}{\sqrt{100^2 + x^2}} - 45 = 0.$$

We find $x = \pm 180/\sqrt{7}$. Note that only the positive value is in the domain of the problem. Because $f(0) = \$13{,}500$, $f(180/\sqrt{7}) = \$15{,}614.38$ and $f(200) = \$17{,}888.54$, the most economical way to lay the pipe is to place the pipe along the side of the plot.

If the cost of laying the pipe along the side of the plot is \$65 per meter, then

$$f(x) = 80\sqrt{100^2 + x^2} + 65(200 - x)$$

and

$$f'(x) = \frac{80x}{\sqrt{100^2 + x^2}} - 65.$$

The only critical point in the domain of the problem is $x = 1300/\sqrt{87} \approx 139.37$. Because $f(0) = \$19{,}500$, $f(139.37) = \$17{,}663.69$ and $f(200) = \$17{,}888.54$, the most economical way to lay the pipe is place the underground pipe from A to a point 139.37 meters to the right of B and continuing to C along the side of the plot.

43. Brandon is on one side of a river that is 50 m wide and wants to reach a point 200 m downstream on the opposite side as quickly as possible by swimming diagonally across the river and then running the rest of the way. Find the best route if Brandon can swim at 1.5 m/s and run at 4 m/s.

SOLUTION Let lengths be in meters, times in seconds, and speeds in m/s. Suppose that Brandon swims diagonally to a point located x meters downstream on the opposite side. Then Brandon then swims a distance $\sqrt{x^2 + 50^2}$ and runs a distance $200 - x$. The total time of the trip is

$$f(x) = \frac{\sqrt{x^2 + 2500}}{1.5} + \frac{200 - x}{4}, \quad 0 \le x \le 200.$$

Solve

$$f'(x) = \frac{2x}{3\sqrt{x^2 + 2500}} - \frac{1}{4} = 0$$

to obtain $x = 30\frac{5}{11} \approx 20.2$ and $f(20.2) \approx 80.9$. Since $f(0) \approx 83.3$ and $f(200) \approx 137.4$, we conclude that the minimal time is 80.9 s. This occurs when Brandon swims diagonally to a point located 20.2 m downstream and then runs the rest of the way.

44. Snell's Law When a light beam travels from a point A above a swimming pool to a point B below the water (Figure 24), it chooses the path that takes the *least time*. Let v_1 be the velocity of light in air and v_2 the velocity in water (it is known that $v_1 > v_2$). Prove Snell's Law of Refraction:

$$\frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2}$$

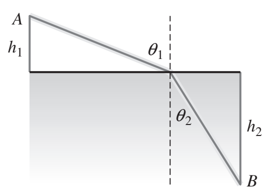

FIGURE 24

SOLUTION The time it takes a beam of light to travel from A to B is

$$f(x) = \frac{a}{v_1} + \frac{b}{v_2} = \frac{\sqrt{x^2 + h_1^2}}{v_1} + \frac{\sqrt{(L-x)^2 + h_2^2}}{v_2}$$

(See diagram below.) Now

$$f'(x) = \frac{x}{v_1\sqrt{x^2 + h_1^2}} - \frac{L - x}{v_2\sqrt{(L-x)^2 + h_2^2}} = 0$$

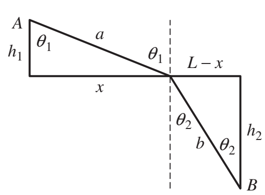
yields

$$\frac{x\Big/\sqrt{x^2 + h_1^2}}{v_1} = \frac{(L-x)\Big/\sqrt{(L-x)^2 + h_2^2}}{v_2} \qquad \text{or} \qquad \frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2},$$

which is Snell's Law. Since

$$f''(x) = \frac{h_1^2}{v_1\left(x^2 + h_1^2\right)^{3/2}} + \frac{h_2^2}{v_2\left((L-x)^2 + h_2^2\right)^{3/2}} > 0$$

for all x, the minimum time is realized when Snell's Law is satisfied.



In Exercises 45–47, a box (with no top) is to be constructed from a piece of cardboard of sides A and B by cutting out squares of length h from the corners and folding up the sides (Figure 26).

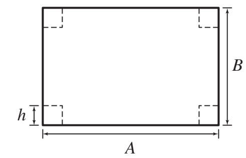


FIGURE 26

45. Find the value of h that maximizes the volume of the box if $A = 15$ and $B = 24$. What are the dimensions of this box?

SOLUTION Once the sides have been folded up, the base of the box will have dimensions $(A - 2h) \times (B - 2h)$ and the height of the box will be h. Thus

$$V(h) = h(A - 2h)(B - 2h) = 4h^3 - 2(A + B)h^2 + ABh.$$

When $A = 15$ and $B = 24$, this gives

$$V(h) = 4h^3 - 78h^2 + 360h,$$

and we need to maximize over $0 \le h \le \frac{15}{2}$. Now,

$$V'(h) = 12h^2 - 156h + 360 = 0$$

yields $h = 3$ and $h = 10$. Because $h = 10$ is not in the domain of the problem and $V(0) = V(15/2) = 0$ and $V(3) = 486$, volume is maximized when $h = 3$. The corresponding dimensions are $9 \times 18 \times 3$.

46. Vascular Branching A small blood vessel of radius r branches off at an angle θ from a larger vessel of radius R to supply blood along a path from A to B. According to Poiseuille's Law, the total resistance to blood flow is proportional to

$$T = \left(\frac{a - b\cot\theta}{R^4} + \frac{b\csc\theta}{r^4} \right)$$

where a and b are as in Figure 25. Show that the total resistance is minimized when $\cos\theta = (r/R)^4$.

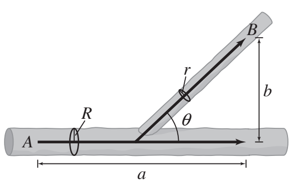

FIGURE 25

SOLUTION With $a, b, r, R > 0$ and $R > r$, let $T(\theta) = \left(\frac{a - b\cot\theta}{R^4} + \frac{b\csc\theta}{r^4} \right)$. Set

$$T'(\theta) = \left(\frac{b\csc^2\theta}{R^4} - \frac{b\csc\theta\cot\theta}{r^4} \right) = 0.$$

Then

$$\frac{b\left(r^4 - R^4\cos\theta\right)}{R^4 r^4 \sin^2\theta} = 0,$$

so that $\cos\theta = \left(\frac{r}{R}\right)^4$. Since $\lim_{\theta\to 0+} T(\theta) = \infty$ and $\lim_{\theta\to\pi-} T(\theta) = \infty$, the minimum value of $T(\theta)$ occurs when $\cos\theta = \left(\frac{r}{R}\right)^4$.

47. Which values of A and B maximize the volume of the box if $h = 10$ cm and $AB = 900$ cm.

SOLUTION With $h = 10$ and $AB = 900$ (which means that $B = 900/A$), the volume of the box is

$$V(A) = 10(A - 20)\left(\frac{900}{A} - 20\right) = 13{,}000 - 200A - \frac{180{,}000}{A},$$

where $20 \le A \le 45$. Now, solving

$$V'(A) = -200 + \frac{180{,}000}{A^2} = 0$$

yields $A = 30$. Because $V(20) = V(45) = 0$ and $V(30) = 1000\ \text{cm}^3$, maximum volume is achieved with $A = B = 30$ cm.

48. Given n numbers $x_1, \dots, x_n$, find the value of x minimizing the sum of the squares:

$$(x - x_1)^2 + (x - x_2)^2 + \cdots + (x - x_n)^2$$

First solve for $n = 2, 3$ and then try it for arbitrary n.

SOLUTION Note that the sum of squares approaches ∞ as $x \to \pm\infty$, so the minimum must occur at a critical point.

- For $n = 2$: Let $f(x) = (x - x_1)^2 + (x - x_2)^2$. Then setting $f'(x) = 2(x - x_1) + 2(x - x_2) = 0$ yields $x = \frac{1}{2}(x_1 + x_2)$.
- For $n = 3$: Let $f(x) = (x - x_1)^2 + (x - x_2)^2 + (x - x_3)^2$, so that setting $f'(x) = 2(x - x_1) + 2(x - x_2) + 2(x - x_3) = 0$ yields $x = \frac{1}{3}(x_1 + x_2 + x_3)$.
- Let $f(x) = \sum_{k=1}^{n}(x - x_k)^2$. Solve $f'(x) = 2\sum_{k=1}^{n}(x - x_k) = 0$ to obtain $x = \bar{x} = \frac{1}{n}\sum_{k=1}^{n} x_k$.

Note that the optimum value for x is the average of $x_1, \dots, x_n$.

49. A billboard of height b is mounted on the side of a building with its bottom edge at a distance h from the street as in Figure 27. At what distance x should an observer stand from the wall to maximize the angle of observation θ?

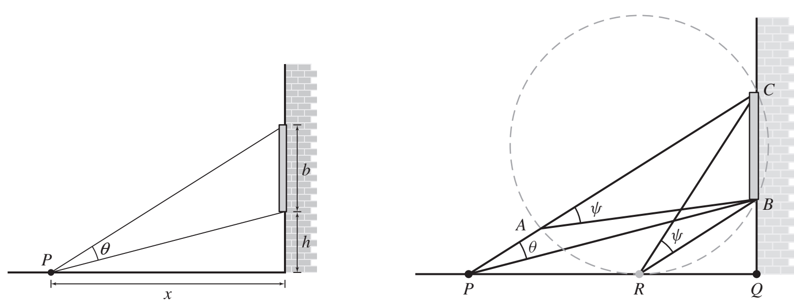

FIGURE 27

SOLUTION From the upper diagram in Figure 27 and the addition formula for the cotangent function, we see that

$$\cot\theta = \frac{1 + \frac{x}{b+h}\frac{x}{h}}{\frac{x}{h} - \frac{x}{b+h}} = \frac{x^2 + h(b+h)}{bx},$$

where b and h are constant. Now, differentiate with respect to x and solve

$$-\csc^2\theta\frac{d\theta}{dx} = \frac{x^2 - h(b+h)}{bx^2} = 0$$

to obtain $x = \sqrt{bh + h^2}$. Since this is the only critical point, and since $\theta \to 0$ as $x \to 0+$ and $\theta \to 0$ as $x \to \infty$, $\theta(x)$ reaches its maximum at $x = \sqrt{bh + h^2}$.

50. Solve Exercise 49 again using geometry rather than calculus. There is a unique circle passing through points B and C which is tangent to the street. Let R be the point of tangency. Note that the two angles labeled ψ in Figure 27 are equal because they subtend equal arcs on the circle.

(a) Show that the maximum value of θ is $\theta = \psi$. *Hint:* Show that $\psi = \theta + \angle PBA$ where A is the intersection of the circle with PC.

(b) Prove that this agrees with the answer to Exercise 49.

(c) Show that $\angle QRB = \angle RCQ$ for the maximal angle ψ.

SOLUTION

(a) We note that $\angle PAB$ is supplementary to both ψ and $\theta + \angle PBA$; hence, $\psi = \theta + \angle PBA$. From here, it is clear that θ is at a maximum when $\angle PBA = 0$; that is, when A coincides with P. This occurs when $P = R$.

(b) To show that the two answers agree, let O be the center of the circle. One observes that if d is the distance from R to the wall, then O has coordinates $(-d, \frac{b}{2} + h)$. This is because the height of the center is equidistant from points B and C and because the center must lie directly above R if the circle is tangent to the floor.

Now we can solve for d. The radius of the circle is clearly $\frac{b}{2} + h$, by the distance formula:

$$\overline{OB}^2 = d^2 + \left(\frac{b}{2} + h - h\right)^2 = \left(\frac{b}{2} + h\right)^2$$

This gives

$$d^2 = \left(\frac{b}{2} + h\right)^2 - \left(\frac{b}{2}\right)^2 = bh + h^2$$

or $d = \sqrt{bh + h^2}$ as claimed.

(c) Observe that the arc RB on the dashed circle is subtended by $\angle QRB$ and also by $\angle RCQ$. Thus, both are equal to one-half the angular measure of the arc.

51. Optimal Delivery Schedule A gas station sells Q gallons of gasoline per year, which is delivered N times per year in equal shipments of Q/N gallons. The cost of each delivery is d dollars and the yearly storage costs are sQT, where T is the length of time (a fraction of a year) between shipments and s is a constant. Show that costs are minimized for $N = \sqrt{sQ/d}$. (*Hint:* $T = 1/N$.) Find the optimal number of deliveries if $Q = 2$ million gal, $d = \$8000$, and $s = 30$ cents/gal-yr. Your answer should be a whole number, so compare costs for the two integer values of N nearest the optimal value.

SOLUTION There are N shipments per year, so the time interval between shipments is $T = 1/N$ years. Hence, the total storage costs per year are sQ/N. The yearly delivery costs are dN and the total costs is $C(N) = dN + sQ/N$. Solving,

$$C'(N) = d - \frac{sQ}{N^2} = 0$$

for N yields $N = \sqrt{sQ/d}$. For the specific case $Q = 2{,}000{,}000$, $d = 8000$ and $s = 0.30$,

$$N = \sqrt{\frac{0.30(2{,}000{,}000)}{8000}} = 8.66.$$

With $C(8) = \$139{,}000$ and $C(9) = \$138{,}667$, the optimal number of deliveries per year is $N = 9$.

52. Victor Klee's Endpoint Maximum Problem Given 40 meters of straight fence, your goal is to build a rectangular enclosure using 80 additional meters of fence that encompasses the greatest area. Let $A(x)$ be the area of the enclosure, with x as in Figure 28.

(a) Find the maximum value of $A(x)$.

(b) Which interval of x values is relevant to our problem? Find the maximum value of $A(x)$ on this interval.

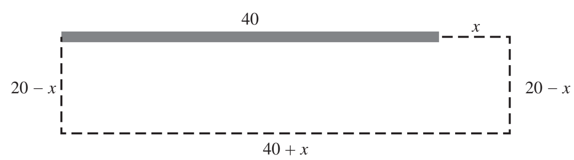

FIGURE 28

SOLUTION

(a) From the diagram, $A(x) = (40 + x)(20 - x) = 800 - 20x - x^2 = 900 - (x + 10)^2$. Thus, the maximum value of $A(x)$ is 900 square meters, occurring when $x = -10$.

(b) For our problem, $x \in [0, 20]$. On this interval, $A(x)$ has no critical points and $A(0) = 800$, while $A(20) = 0$. Thus, on the relevant interval, the maximum enclosed area is 800 square meters.

53. Let (a, b) be a fixed point in the first quadrant and let $S(d)$ be the sum of the distances from $(d, 0)$ to the points $(0, 0)$, (a, b), and $(a, -b)$.

(a) Find the value of d for which $S(d)$ is minimal. The answer depends on whether $b < \sqrt{3}a$ or $b \geq \sqrt{3}a$. *Hint:* Show that $d = 0$ when $b \geq \sqrt{3}a$.

(b) $\boxed{\text{GU}}$ Let $a = 1$. Plot $S(d)$ for $b = 0.5, \sqrt{3}, 3$ and describe the position of the minimum.

SOLUTION

(a) If $d < 0$, then the distance from $(d, 0)$ to the other three points can all be reduced by increasing the value of d. Similarly, if $d > a$, then the distance from $(d, 0)$ to the other three points can all be reduced by decreasing the value of d. It follows that the minimum of $S(d)$ must occur for $0 \leq d \leq a$. Restricting attention to this interval, we find

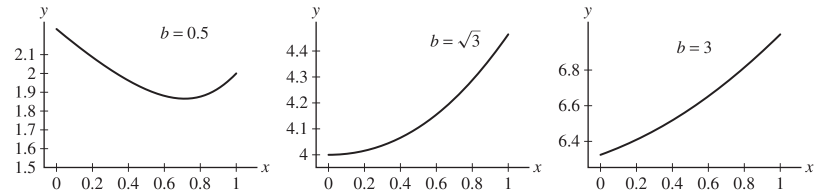
$$S(d) = d + 2\sqrt{(d - a)^2 + b^2}.$$

Solving

$$S'(d) = 1 + \frac{2(d-a)}{\sqrt{(d-a)^2 + b^2}} = 0$$

yields the critical point $d = a - b/\sqrt{3}$. If $b < \sqrt{3}a$, then $d = a - b/\sqrt{3} > 0$ and the minimum occurs at this value of d. On the other hand, if $b \geq \sqrt{3}a$, then the minimum occurs at the endpoint $d = 0$.

(b) Let $a = 1$. Plots of $S(d)$ for $b = 0.5$, $b = \sqrt{3}$ and $b = 3$ are shown below. For $b = 0.5$, the results of (a) indicate the minimum should occur for $d = 1 - 0.5/\sqrt{3} \approx 0.711$, and this is confirmed in the plot. For both $b = \sqrt{3}$ and $b = 3$, the results of (a) indicate that the minimum should occur at $d = 0$, and both of these conclusions are confirmed in the plots.



54. The force F (in Newtons) required to move a box of mass m kg in motion by pulling on an attached rope (Figure 29) is

$$F(\theta) = \frac{fmg}{\cos\theta + f\sin\theta}$$

where θ is the angle between the rope and the horizontal, f is the coefficient of static friction, and $g = 9.8$ m/s^2. Find the angle θ that minimizes the required force F, assuming $f = 0.4$. *Hint:* Find the maximum value of $\cos\theta + f\sin\theta$.

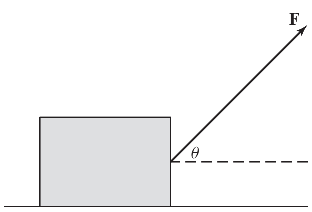


FIGURE 29

SOLUTION Let $F(\alpha) = \dfrac{3.92m}{\sin\alpha + \frac{2}{5}\cos\alpha}$, where $0 \leq \alpha \leq \frac{\pi}{2}$. Solve

$$F'(\alpha) = \frac{3.92m\left(\frac{2}{5}\sin\alpha - \cos\alpha\right)}{\left(\sin\alpha + \frac{2}{5}\cos\alpha\right)^2} = 0$$

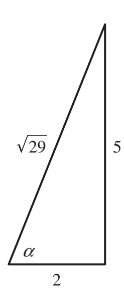
for $0 \leq \alpha \leq \frac{\pi}{2}$ to obtain $\tan\alpha = \frac{5}{2}$. From the diagram below, we note that when $\tan\alpha = \frac{5}{2}$,

$$\sin\alpha = \frac{5}{\sqrt{29}} \qquad \text{and} \qquad \cos\alpha = \frac{2}{\sqrt{29}}.$$

Therefore, at the critical point the force is

$$\frac{3.92m}{\frac{5}{\sqrt{29}} + \frac{2}{5}\frac{2}{\sqrt{29}}} = \frac{5\sqrt{29}}{29}(3.92m) \approx 3.64m.$$

Since $F(0) = \frac{5}{2}(3.92m) = 9.8m$ and $F\left(\frac{\pi}{2}\right) = 3.92m$, we conclude that the minimum force occurs when $\tan\alpha = \frac{5}{2}$.



55. In the setting of Exercise 54, show that for any f the minimal force required is proportional to $1/\sqrt{1+f^2}$.

SOLUTION We minimize $F(\theta)$ by finding the maximum value $g(\theta) = \cos\theta + f\sin\theta$. The angle θ is restricted to the interval $[0, \frac{\pi}{2}]$. We solve for the critical points:

$$g'(\theta) = -\sin\theta + f\cos\theta = 0$$

We obtain

$$f\cos\theta = \sin\theta \Rightarrow \tan\theta = f$$

From the figure below we find that $\cos\theta = 1/\sqrt{1+f^2}$ and $\sin\theta = f/\sqrt{1+f^2}$. Hence

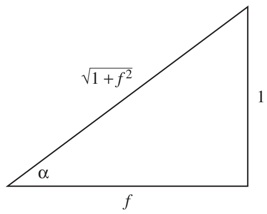
$$g(\theta) = \frac{1}{f} + \frac{f^2}{\sqrt{1+f^2}} = \frac{1+f^2}{\sqrt{1+f^2}} = \sqrt{1+f^2}$$

The values at the endpoints are

$$g(0) = 1, \qquad g\left(\frac{\pi}{2}\right) = f$$

Both of these values are less than $\sqrt{1+f^2}$. Therefore the maximum value of $g(\theta)$ is $\sqrt{1+f^2}$ and the minimum value of $F(\theta)$ is

$$F = \frac{fmg}{g(\theta)} = \frac{fmg}{\sqrt{1+f^2}}$$



56. Bird Migration Ornithologists have found that the power (in joules per second) consumed by a certain pigeon flying at velocity v m/s is described well by the function $P(v) = 17v^{-1} + 10^{-3}v^3$ J/s. Assume that the pigeon can store 5×10^4 J of usable energy as body fat.

(a) Show that at velocity v, a pigeon can fly a total distance of $D(v) = (5 \times 10^4)v/P(v)$ if it uses all of its stored energy.

(b) Find the velocity v_p that *minimizes* $P(v)$.

(c) Migrating birds are smart enough to fly at the velocity that maximizes distance traveled rather than minimizes power consumption. Show that the velocity v_d which maximizes $D(v)$ satisfies $P'(v_d) = P(v_d)/v_d$. Show that v_d is obtained graphically as the velocity coordinate of the point where a line through the origin is tangent to the graph of $P(v)$ (Figure 30).

(d) Find v_d and the maximum distance $D(v_d)$.

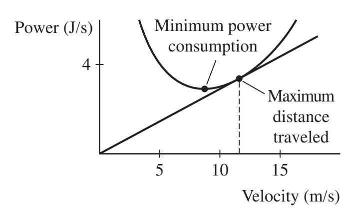


FIGURE 30

SOLUTION

(a) Flying at a velocity v, the birds will exhaust their energy store after $T = \dfrac{5 \cdot 10^4 \text{ joules}}{P(v) \text{ joules/sec}} = \dfrac{5 \cdot 10^4 \text{ sec}}{P(v)}$. The total distance traveled is then $D(v) = vT = \dfrac{5 \cdot 10^4 v}{P(v)}$.

(b) Let $P(v) = 17v^{-1} + 10^{-3}v^3$. Then $P'(v) = -17v^{-2} + 0.003v^2 = 0$ implies $v_p = \left(\frac{17}{0.003}\right)^{1/4} \approx 8.676247$. This critical point is a minimum, because it is the only critical point and $P(v) \to \infty$ both as $v \to 0+$ and as $v \to \infty$.

(c) $D'(v) = \dfrac{P(v) \cdot 5 \cdot 10^4 - 5 \cdot 10^4 v \cdot P'(v)}{(P(v))^2} = 5 \cdot 10^4 \dfrac{P(v) - vP'(v)}{(P(v))^2} = 0$ implies $P(v) - vP'(v) = 0$, or $P'(v) = \dfrac{P(v)}{v}$. Since $D(v) \to 0$ as $v \to 0$ and as $v \to \infty$, the critical point determined by $P'(v) = P(v)/v$ corresponds to a maximum.

Graphically, the expression

$$\frac{P(v)}{v} = \frac{P(v) - 0}{v - 0}$$

is the slope of the line passing through the origin and $(v, P(v))$. The condition $P'(v) = P(v)/v$ which defines v_d therefore indicates that v_d is the velocity component of the point where a line through the origin is tangent to the graph of $P(v)$.

(d) Using $P'(v) = \dfrac{P(v)}{v}$ gives

$$-17v^{-2} + 0.003v^2 = \frac{17v^{-1} + 0.001v^3}{v} = 17v^{-2} + 0.001v^2,$$

which simplifies to $0.002v^4 = 34$ and thus $v_d \approx 11.418583$. The maximum total distance is given by $D(v_d) = \dfrac{5 \cdot 10^4 \cdot v_d}{P(v_d)} = 191.741$ kilometers.

57. The problem is to put a "roof" of side s on an attic room of height h and width b. Find the smallest length s for which this is possible if $b = 27$ and $h = 8$ (Figure 31).

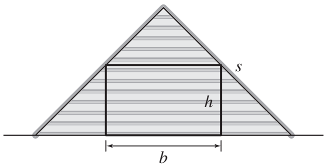

FIGURE 31

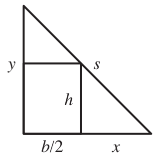
SOLUTION Consider the right triangle formed by the right half of the rectangle and its "roof". This triangle has hypotenuse s.



As shown, let y be the height of the roof, and let x be the distance from the right base of the rectangle to the base of the roof. By similar triangles applied to the smaller right triangles at the top and right of the larger triangle, we get:

$$\frac{y-8}{27/2} = \frac{8}{x} \qquad \text{or} \qquad y = \frac{108}{x} + 8.$$

s, y, and x are related by the Pythagorean Theorem:

$$s^2 = \left(\frac{27}{2} + x\right)^2 + y^2 = \left(\frac{27}{2} + x\right)^2 + \left(\frac{108}{x} + 8\right)^2.$$

Since $s > 0$, s^2 is least whenever s is least, so we can minimize s^2 instead of s. Setting the derivative equal to zero yields

$$2\left(\frac{27}{2} + x\right) + 2\left(\frac{108}{x} + 8\right)\left(-\frac{108}{x^2}\right) = 0$$

$$2\left(\frac{27}{2} + x\right) + 2\frac{8}{x}\left(\frac{27}{2} + x\right)\left(-\frac{108}{x^2}\right) = 0$$

$$2\left(\frac{27}{2} + x\right)\left(1 - \frac{864}{x^3}\right) = 0$$

The zeros are $x = -\frac{27}{2}$ (irrelevant) and $x = 6\sqrt[3]{4}$. Since this is the only critical point of s with $x > 0$, and since $s \to \infty$ as $x \to 0$ and $s \to \infty$ as $x \to \infty$, this is the point where s attains its minimum. For this value of x,

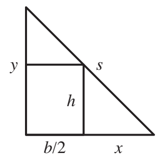
$$s^2 = \left(\frac{27}{2} + 6\sqrt[3]{4}\right)^2 + \left(9\sqrt[3]{2} + 8\right)^2 \approx 904.13,$$

so the smallest roof length is

$$s \approx 30.07.$$

58. Redo Exercise 57 for arbitrary b and h.

SOLUTION Consider the right triangle formed by the right half of the rectangle and its "roof". This triangle has hypotenuse s.



As shown, let y be the height of the roof, and let x be the distance from the right base of the rectangle to the base of the roof. By similar triangles applied to the smaller right triangles at the top and right of the larger triangle, we get:

$$\frac{y-h}{b/2} = \frac{h}{x} \qquad \text{or} \qquad y = \frac{bh}{2x} + h.$$

s, y, and x are related by the Pythagorean Theorem:

$$s^2 = \left(\frac{b}{2} + x\right)^2 + y^2 = \left(\frac{b}{2} + x\right)^2 + \left(\frac{bh}{2x} + h\right)^2.$$

Since $s > 0$, s^2 is least whenever s is least, so we can minimize s^2 instead of s. Setting the derivative equal to zero yields

$$\begin{aligned} 2\left(\frac{b}{2} + x\right) + 2\left(\frac{bh}{2x} + h\right)\left(-\frac{bh}{2x^2}\right) &= 0 \\ 2\left(\frac{b}{2} + x\right) + 2\frac{h}{x}\left(\frac{b}{2} + x\right)\left(-\frac{bh}{2x^2}\right) &= 0 \\ 2\left(\frac{b}{2} + x\right)\left(1 - \frac{bh^2}{2x^3}\right) &= 0 \end{aligned}$$

The zeros are $x = -\frac{b}{2}$ (irrelevant) and

$$x = \frac{b^{1/3}h^{2/3}}{2^{1/3}}.$$

Since this is the only critical point of s with $x > 0$, and since $s \to \infty$ as $x \to 0$ and $s \to \infty$ as $x \to \infty$, this is the point where s attains its minimum. For this value of x,

$$\begin{aligned} s^2 &= \left(\frac{b}{2} + \frac{b^{1/3}h^{2/3}}{2^{1/3}}\right)^2 + \left(\frac{b^{2/3}h^{1/3}}{2^{2/3}} + h\right)^2 \\ &= \frac{b^{2/3}}{2^{2/3}}\left(\frac{b^{2/3}}{2^{2/3}} + h^{2/3}\right)^2 + h^{2/3}\left(\frac{b^{2/3}}{2^{2/3}} + h^{2/3}\right)^2 = \left(\frac{b^{2/3}}{2^{2/3}} + h^{2/3}\right)^3, \end{aligned}$$

so the smallest roof length is

$$s = \left(\frac{b^{2/3}}{2^{2/3}} + h^{2/3}\right)^{3/2}.$$

59. Find the maximum length of a pole that can be carried horizontally around a corner joining corridors of widths $a = 24$ and $b = 3$ (Figure 32).

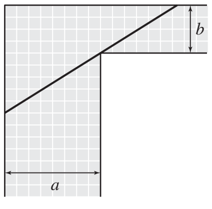


FIGURE 32

SOLUTION In order to find the length of the *longest* pole that can be carried around the corridor, we have to find the *shortest* length from the left wall to the top wall touching the corner of the inside wall. Any pole that does not fit in this shortest space cannot be carried around the corner, so an exact fit represents the longest possible pole.

Let θ be the angle between the pole and a horizontal line to the right. Let c_1 be the length of pole in the corridor of width 24 and let c_2 be the length of pole in the corridor of width 3. By the definitions of sine and cosine,

$$\frac{3}{c_2} = \sin\theta \quad \text{and} \quad \frac{24}{c_1} = \cos\theta,$$

so that $c_1 = \frac{24}{\cos\theta}$, $c_2 = \frac{3}{\sin\theta}$. What must be minimized is the total length, given by

$$f(\theta) = \frac{24}{\cos\theta} + \frac{3}{\sin\theta}.$$

Setting $f'(\theta) = 0$ yields

$$\begin{aligned}\frac{24\sin\theta}{\cos^2\theta} - \frac{3\cos\theta}{\sin^2\theta} &= 0\\ \frac{24\sin\theta}{\cos^2\theta} &= \frac{3\cos\theta}{\sin^2\theta}\\ 24\sin^3\theta &= 3\cos^3\theta\end{aligned}$$

As $\theta < \frac{\pi}{2}$ (the pole is being turned around a corner, after all), we can divide both sides by $\cos^3\theta$, getting $\tan^3\theta = \frac{1}{8}$. This implies that $\tan\theta = \frac{1}{2}$ ($\tan\theta > 0$ as the angle is acute).

Since $f(\theta) \to \infty$ as $\theta \to 0+$ and as $\theta \to \frac{\pi}{2}-$, we can tell that the *minimum* is attained at θ_0 where $\tan\theta_0 = \frac{1}{2}$. Because

$$\tan\theta_0 = \frac{\text{opposite}}{\text{adjacent}} = \frac{1}{2},$$

we draw a triangle with opposite side 1 and adjacent side 2. By Pythagoras, $c = \sqrt{5}$, so

$$\sin\theta_0 = \frac{1}{\sqrt{5}} \quad \text{and} \quad \cos\theta_0 = \frac{2}{\sqrt{5}}.$$

From this, we get

$$f(\theta_0) = \frac{24}{\cos\theta_0} + \frac{3}{\sin\theta_0} = \frac{24}{2}\sqrt{5} + 3\sqrt{5} = 15\sqrt{5}.$$

60. Redo Exercise 59 for arbitrary widths a and b.

SOLUTION If the corridors have widths a and b, and if θ is the angle between the beam and the line perpendicular to the corridor of width a, then we have to *minimize*

$$f(\theta) = \frac{a}{\cos\theta} + \frac{b}{\sin\theta}.$$

Setting the derivative equal to zero,

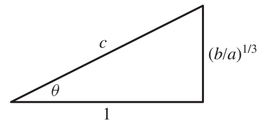
$$a\sec\theta\tan\theta - b\cot\theta\csc\theta = 0,$$

we obtain the critical value θ_0 defined by

$$\tan\theta_0 = \left(\frac{b}{a}\right)^{1/3}$$

and from this we conclude (witness the diagram below) that

$$\cos\theta_0 = \frac{1}{\sqrt{1 + (b/a)^{2/3}}} \quad \text{and} \quad \sin\theta_0 = \frac{(b/a)^{1/3}}{\sqrt{1 + (b/a)^{2/3}}}.$$



This gives the minimum value as

$$\begin{aligned} f(\theta_0) &= a\sqrt{1+(b/a)^{2/3}} + b(b/a)^{-1/3}\sqrt{1+(b/a)^{2/3}} \\ &= a^{2/3}\sqrt{a^{2/3}+b^{2/3}} + b^{2/3}\sqrt{a^{2/3}+b^{2/3}} \\ &= (a^{2/3}+b^{2/3})^{3/2} \end{aligned}$$

61. Find the minimum length ℓ of a beam that can clear a fence of height h and touch a wall located b ft behind the fence (Figure 33).

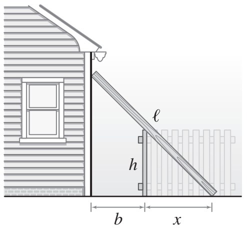


FIGURE 33

SOLUTION Let y be the height of the point where the beam touches the wall in feet. By similar triangles,

$$\frac{y-h}{b} = \frac{h}{x} \quad \text{or} \quad y = \frac{bh}{x} + h$$

and by Pythagoras:

$$\ell^2 = (b+x)^2 + \left(\frac{bh}{x} + h\right)^2.$$

We can minimize ℓ^2 rather than ℓ, so setting the derivative equal to zero gives:

$$2(b+x) + 2\left(\frac{bh}{x}+h\right)\left(-\frac{bh}{x^2}\right) = 2(b+x)\left(1 - \frac{h^2b}{x^3}\right) = 0.$$

The zeroes are $b = -x$ (irrelevant) and $x = \sqrt[3]{h^2b}$. Since $\ell^2 \to \infty$ as $x \to 0+$ and as $x \to \infty$, $x = \sqrt[3]{h^2b}$ corresponds to a minimum for ℓ^2. For this value of x, we have

$$\begin{aligned} \ell^2 &= (b + h^{2/3}b^{1/3})^2 + (h + h^{1/3}b^{2/3})^2 \\ &= b^{2/3}(b^{2/3}+h^{2/3})^2 + h^{2/3}(h^{2/3}+b^{2/3})^2 \\ &= (b^{2/3}+h^{2/3})^3 \end{aligned}$$

and so

$$\ell = (b^{2/3}+h^{2/3})^{3/2}.$$

A beam that clears a fence of height h feet and touches a wall b feet behind the fence must have length at least $\ell = (b^{2/3}+h^{2/3})^{3/2}$ ft.

62. Which value of h maximizes the volume of the box if $A = B$?

SOLUTION When $A = B$, the volume of the box is

$$V(h) = hxy = h(A-2h)^2 = 4h^3 - 4Ah^2 + A^2h,$$

where $0 \le h \le \frac{A}{2}$ (allowing for degenerate boxes). Solve $V'(h) = 12h^2 - 8Ah + A^2 = 0$ for h to obtain $h = \frac{A}{2}$ or $h = \frac{A}{6}$. Because $V(0) = V(\frac{A}{2}) = 0$ and $V(\frac{A}{6}) = \frac{2}{27}A^3$, volume is maximized when $h = \frac{A}{6}$.

63. A basketball player stands d feet from the basket. Let h and α be as in Figure 34. Using physics, one can show that if the player releases the ball at an angle θ, then the initial velocity required to make the ball go through the basket satisfies

$$v^2 = \frac{16d}{\cos^2\theta(\tan\theta - \tan\alpha)}$$

(a) Explain why this formula is meaningful only for $\alpha < \theta < \frac{\pi}{2}$. Why does v approach infinity at the endpoints of this interval?

(b) GU Take $\alpha = \frac{\pi}{6}$ and plot v^2 as a function of θ for $\frac{\pi}{6} < \theta < \frac{\pi}{2}$. Verify that the minimum occurs at $\theta = \frac{\pi}{3}$.

(c) Set $F(\theta) = \cos^2\theta(\tan\theta - \tan\alpha)$. Explain why v is minimized for θ such that $F(\theta)$ is maximized.

(d) Verify that $F'(\theta) = \cos(\alpha - 2\theta)\sec\alpha$ (you will need to use the addition formula for cosine) and show that the maximum value of $F(\theta)$ on $\left[\alpha, \frac{\pi}{2}\right]$ occurs at $\theta_0 = \frac{\alpha}{2} + \frac{\pi}{4}$.

(e) For a given α, the optimal angle for shooting the basket is θ_0 because it minimizes v^2 and therefore minimizes the energy required to make the shot (energy is proportional to v^2). Show that the velocity v_{opt} at the optimal angle θ_0 satisfies

$$v_{\text{opt}}^2 = \frac{32d\cos\alpha}{1 - \sin\alpha} = \frac{32\,d^2}{-h + \sqrt{d^2 + h^2}}$$

(f) GU Show with a graph that for fixed d (say, $d = 15$ ft, the distance of a free throw), v_{opt}^2 is an increasing function of h. Use this to explain why taller players have an advantage and why it can help to jump while shooting.

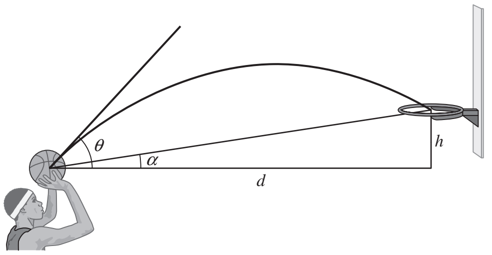

FIGURE 34

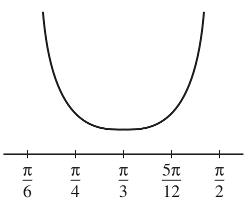
SOLUTION

(a) $\alpha = 0$ corresponds to shooting the ball directly at the basket while $\alpha = \pi/2$ corresponds to shooting the ball directly upward. In neither case is it possible for the ball to go into the basket.

If the angle α is extremely close to 0, the ball is shot almost directly at the basket, so that it must be launched with great speed, as it can only fall an extremely short distance on the way to the basket.

On the other hand, if the angle α is extremely close to $\pi/2$, the ball is launched almost vertically. This requires the ball to travel a great distance upward in order to travel the horizontal distance. In either one of these cases, the ball has to travel at an enormous speed.

(b)



The minimum clearly occurs where $\theta = \pi/3$.

(c) If $F(\theta) = \cos^2\theta\,(\tan\theta - \tan\alpha)$,

$$v^2 = \frac{16d}{\cos^2\theta\,(\tan\theta - \tan\alpha)} = \frac{16d}{F(\theta)}.$$

Since $\alpha \le \theta$, $F(\theta) > 0$, hence v^2 is smallest whenever $F(\theta)$ is greatest.

(d) $F'(\theta) = -2\sin\theta\cos\theta\,(\tan\theta - \tan\alpha) + \cos^2\theta\left(\sec^2\theta\right) = -2\sin\theta\cos\theta\tan\theta + 2\sin\theta\cos\theta\tan\alpha + 1$. We will apply all the double angle formulas:

$$\cos(2\theta) = \cos^2\theta - \sin^2\theta = 1 - 2\sin^2\theta;\ \sin 2\theta = 2\sin\theta\cos\theta,$$

getting:

$$\begin{aligned}
F'(\theta) &= 2\sin\theta\cos\theta\tan\alpha - 2\sin\theta\cos\theta\tan\theta + 1\\
&= 2\sin\theta\cos\theta\frac{\sin\alpha}{\cos\alpha} - 2\sin\theta\cos\theta\frac{\sin\theta}{\cos\theta} + 1\\
&= \sec\alpha\left(-2\sin^2\theta\cos\alpha + 2\sin\theta\cos\theta\sin\alpha + \cos\alpha\right)\\
&= \sec\alpha\left(\cos\alpha\left(1 - 2\sin^2\theta\right) + \sin\alpha\,(2\sin\theta\cos\theta)\right)\\
&= \sec\alpha\,(\cos\alpha(\cos 2\theta) + \sin\alpha(\sin 2\theta))\\
&= \sec\alpha\cos(\alpha - 2\theta)
\end{aligned}$$

A critical point of $F(\theta)$ occurs where $\cos(\alpha - 2\theta) = 0$, so that $\alpha - 2\theta = -\frac{\pi}{2}$ (negative because $2\theta > \theta > \alpha$), and this gives us $\theta = \alpha/2 + \pi/4$. The minimum value $F(\theta_0)$ takes place at $\theta_0 = \alpha/2 + \pi/4$.

(e) Plug in $\theta_0 = \alpha/2 + \pi/4$. To find v_{opt}^2 we must simplify

$$\cos^2\theta_0(\tan\theta_0 - \tan\alpha) = \frac{\cos\theta_0(\sin\theta_0\cos\alpha - \cos\theta_0\sin\alpha)}{\cos\alpha}$$

By the addition law for sine:

$$\sin\theta_0\cos\alpha - \cos\theta_0\sin\alpha = \sin(\theta_0 - \alpha) = \sin(-\alpha/2 + \pi/4)$$

and so

$$\cos\theta_0(\sin\theta_0\cos\alpha - \cos\theta_0\sin\alpha) = \cos(\alpha/2 + \pi/4)\sin(-\alpha/2 + \pi/4)$$

Now use the identity (that follows from the addition law):

$$\sin x\cos y = \frac{1}{2}(\sin(x+y) + \sin(x-y))$$

to get

$$\cos(\alpha/2 + \pi/4)\sin(-\alpha/2 + \pi/4) = (1/2)(1 - \sin\alpha)$$

So we finally get

$$\cos^2\theta_0(\tan\theta_0 - \tan\alpha) = \frac{(1/2)(1 - \sin\alpha)}{\cos\alpha}$$

and therefore

$$v_{\text{opt}}^2 = \frac{32d\cos\alpha}{1 - \sin\alpha}$$

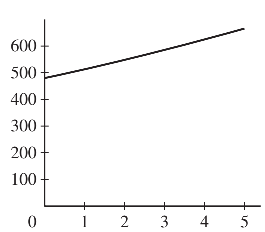
as claimed. From Figure 34 we see that

$$\cos\alpha = \frac{d}{\sqrt{d^2 + h^2}} \qquad \text{and} \qquad \sin\alpha = \frac{h}{\sqrt{d^2 + h^2}}.$$

Substituting these values into the expression for v_{opt}^2 yields

$$v_{\text{opt}}^2 = \frac{32d^2}{-h + \sqrt{d^2 + h^2}}.$$

(f) A sketch of the graph of v_{opt}^2 versus h for $d = 15$ feet is given below: v_{opt}^2 increases with respect to basket height relative to the shooter. This shows that the minimum velocity required to launch the ball to the basket drops as shooter height increases. This shows one of the ways height is an advantage in free throws; a taller shooter need not shoot the ball as hard to reach the basket.



64. Three towns A, B, and C are to be joined by an underground fiber cable as illustrated in Figure 35(A). Assume that C is located directly below the midpoint of $\overline{AB}$. Find the junction point P that minimizes the total amount of cable used.

(a) First show that P must lie directly above C. *Hint:* Use the result of Example 6 to show that if the junction is placed at point Q in Figure 35(B), then we can reduce the cable length by moving Q horizontally over to the point P lying above C.

(b) With x as in Figure 35(A), let $f(x)$ be the total length of cable used. Show that $f(x)$ has a unique critical point c. Compute c and show that $0 \le c \le L$ if and only if $D \le 2\sqrt{3}\,L$.

(c) Find the minimum of $f(x)$ on $[0, L]$ in two cases: $D = 2$, $L = 4$ and $D = 8$, $L = 2$.

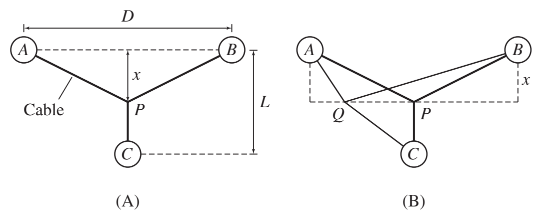


FIGURE 35

SOLUTION

(a) Look at diagram 35(B). Let T be the point directly above Q on $\overline{AB}$. Let $s = AT$ and $D = AB$ so that $TB = D - s$. Let ℓ be the total length of cable from A to Q and B to Q. By the Pythagorean Theorem applied to $\triangle AQT$ and $\triangle BQT$, we get:

$$\ell = \sqrt{s^2 + x^2} + \sqrt{(D-s)^2 + x^2}.$$

From here, it follows that

$$\frac{d\ell}{ds} = \frac{s}{\sqrt{s^2 + x^2}} - \frac{D-s}{\sqrt{(D-s)^2 + x^2}}.$$

Since s and $D - s$ must be non-negative, the only critical point occurs when $s = D/2$. As $\frac{d\ell}{ds}$ changes sign from negative to positive at $s = D/2$, it follows that ℓ is minimized when $s = D/2$, that is, when $Q = P$. Since it is obvious that $PC \le QC$ (QC is the hypotenuse of the triangle $\triangle PQC$), it follows that total cable length is minimized at $Q = P$.

(b) Let $f(x)$ be the total cable length. From diagram 35(A), we get:

$$f(x) = (L - x) + 2\sqrt{x^2 + D^2/4}.$$

Then

$$f'(x) = -1 + \frac{2x}{\sqrt{x^2 + D^2/4}} = 0$$

gives

$$2x = \sqrt{x^2 + D^2/4}$$

or

$$4x^2 = x^2 + D^2/4$$

and the critical point is

$$c = D/2\sqrt{3}.$$

This is the only critical point of f. It lies in the interval $[0, L]$ if and only if $c \le L$, or

$$D \le 2\sqrt{3}L.$$

(c) The minimum of f will depend on whether $D \le 2\sqrt{3}L$.

- $D = 2$, $L = 4$; $2\sqrt{3}L = 8\sqrt{3} > D$, so $c = D/(2\sqrt{3}) = \sqrt{3}/3 \in [0, L]$. $f(0) = L + D = 6$, $f(L) = 2\sqrt{L^2 + D^2/4} = 2\sqrt{17} \approx 8.24621$, and $f(c) = 4 - (\sqrt{3}/3) + 2\sqrt{\frac{1}{3} + 1} = 4 + \sqrt{3} \approx 5.73204$. Therefore, the total length is minimized where $x = c = \sqrt{3}/3$.
- $D = 8$, $L = 2$; $2\sqrt{3}L = 4\sqrt{3} < D$, so c does not lie in the interval $[0, L]$. $f(0) = 2 + 2\sqrt{64/4} = 10$, and $f(L) = 0 + 2\sqrt{4 + 64/4} = 2\sqrt{20} = 4\sqrt{5} \approx 8.94427$. Therefore, the total length is minimized where $x = L$, or where $P = C$.

Further Insights and Challenges

65. Tom and Ali drive along a highway represented by the graph of $f(x)$ in Figure 36. During the trip, Ali views a billboard represented by the segment $\overline{BC}$ along the y-axis. Let Q be the y-intercept of the tangent line to $y = f(x)$. Show that θ is maximized at the value of x for which the angles $\angle QPB$ and $\angle QCP$ are equal. This generalizes Exercise 50 (c) (which corresponds to the case $f(x) = 0$). *Hints:*

(a) Show that $d\theta/dx$ is equal to

$$(b-c)\cdot\frac{(x^2+(xf'(x))^2)-(b-(f(x)-xf'(x)))(c-(f(x)-xf'(x)))}{(x^2+(b-f(x))^2)(x^2+(c-f(x))^2)}$$

(b) Show that the y-coordinate of Q is $f(x) - xf'(x)$.

(c) Show that the condition $d\theta/dx = 0$ is equivalent to

$$PQ^2 = BQ\cdot CQ$$

(d) Conclude that $\triangle QPB$ and $\triangle QCP$ are similar triangles.

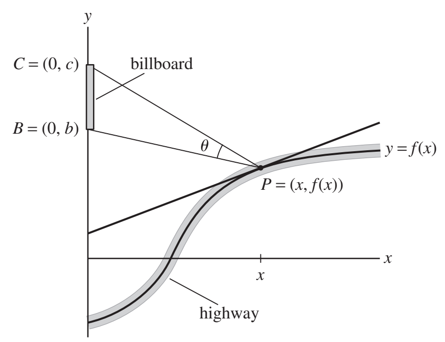

FIGURE 36

SOLUTION

(a) From the figure, we see that

$$\theta(x) = \tan^{-1}\frac{c-f(x)}{x} - \tan^{-1}\frac{b-f(x)}{x}.$$

Then

$$\begin{aligned}\theta'(x) &= \frac{b-(f(x)-xf'(x))}{x^2+(b-f(x))^2} - \frac{c-(f(x)-xf'(x))}{x^2+(c-f(x))^2}\\ &= (b-c)\frac{x^2-bc+(b+c)(f(x)-xf'(x))-(f(x))^2+2xf(x)f'(x)}{(x^2+(b-f(x))^2)(x^2+(c-f(x))^2)}\\ &= (b-c)\frac{(x^2+(xf'(x))^2-(bc-(b+c)(f(x)-xf'(x))+(f(x)-xf'(x))^2)}{(x^2+(b-f(x))^2)(x^2+(c-f(x))^2)}\\ &= (b-c)\frac{(x^2+(xf'(x))^2-(b-(f(x)-xf'(x)))(c-(f(x)-xf'(x)))}{(x^2+(b-f(x))^2)(x^2+(c-f(x))^2)}.\end{aligned}$$

(b) The point Q is the y-intercept of the line tangent to the graph of $f(x)$ at point P. The equation of this tangent line is

$$Y - f(x) = f'(x)(X - x).$$

The y-coordinate of Q is then $f(x) - xf'(x)$.

(c) From the figure, we see that

$$BQ = b-(f(x)-xf'(x)),$$
$$CQ = c-(f(x)-xf'(x))$$

and

$$PQ = \sqrt{x^2+(f(x)-(f(x)-xf'(x)))^2} = \sqrt{x^2+(xf'(x))^2}.$$

Comparing these expressions with the numerator of $d\theta/dx$, it follows that $\dfrac{d\theta}{dx} = 0$ is equivalent to

$$PQ^2 = BQ\cdot CQ.$$

(d) The equation $PQ^2 = BQ \cdot CQ$ is equivalent to

$$\frac{PQ}{BQ} = \frac{CQ}{PQ}.$$

In other words, the sides CQ and PQ from the triangle ΔQCP are proportional in length to the sides PQ and BQ from the triangle ΔQPB. As $\angle PQB = \angle CQP$, it follows that triangles ΔQCP and ΔQPB are similar.

Seismic Prospecting *Exercises 66–68 are concerned with determining the thickness d of a layer of soil that lies on top of a rock formation. Geologists send two sound pulses from point A to point D separated by a distance s. The first pulse travels directly from A to D along the surface of the earth. The second pulse travels down to the rock formation, then along its surface, and then back up to D (path ABCD), as in Figure 37. The pulse travels with velocity v_1 in the soil and v_2 in the rock.*

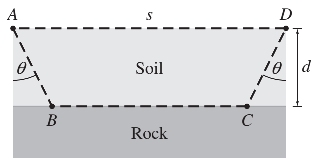

FIGURE 37

66. **(a)** Show that the time required for the first pulse to travel from A to D is $t_1 = s/v_1$.

(b) Show that the time required for the second pulse is

$$t_2 = \frac{2d}{v_1}\sec\theta + \frac{s - 2d\tan\theta}{v_2}$$

provided that

$$\tan\theta \le \frac{s}{2d} \qquad \boxed{2}$$

(*Note:* If this inequality is not satisfied, then point B does not lie to the left of C.)

(c) Show that t_2 is minimized when $\sin\theta = v_1/v_2$.

SOLUTION

(a) We have time $t_1 = \text{distance/velocity} = s/v_1$.

(b) Let p be the length of the base of the right triangle (opposite the angle θ) and h the length of the hypotenuse of this right triangle. Then $\cos\theta = \frac{d}{h}$ and $h = d\sec\theta$. Moreover, $\tan\theta = \frac{p}{d}$ gives $p = d\tan\theta$. Hence

$$t_2 = t_{AB} + t_{CD} + t_{BC} = \frac{h}{v_1} + \frac{h}{v_1} + \frac{s-2p}{v_2} = \frac{2d}{v_1}\sec\theta + \frac{s-2d\tan\theta}{v_2}$$

(c) Solve $\dfrac{dt_2}{d\theta} = \dfrac{2d\sec\theta\tan\theta}{v_1} - \dfrac{2d\sec^2\theta}{v_2} = 0$ to obtain $\dfrac{\tan\theta}{v_1} = \dfrac{\sec\theta}{v_2}$. Therefore $\dfrac{\sin\theta/\cos\theta}{1/\cos\theta} = \dfrac{v_1}{v_2}$ or $\sin\theta = \dfrac{v_1}{v_2}$.

67. In this exercise, assume that $v_2/v_1 \ge \sqrt{1 + 4(d/s)^2}$.

(a) Show that inequality (2) holds if $\sin\theta = v_1/v_2$.

(b) Show that the minimal time for the second pulse is

$$t_2 = \frac{2d}{v_1}(1-k^2)^{1/2} + \frac{s}{v_2}$$

where $k = v_1/v_2$.

(c) Conclude that $\dfrac{t_2}{t_1} = \dfrac{2d(1-k^2)^{1/2}}{s} + k$.

SOLUTION

(a) If $\sin\theta = \frac{v_1}{v_2}$, then

$$\tan\theta = \frac{v_1}{\sqrt{v_2^2 - v_1^2}} = \frac{1}{\sqrt{\left(\frac{v_2}{v_1}\right)^2 - 1}}.$$

Because $\frac{v_2}{v_1} \ge \sqrt{1 + 4(\frac{d}{s})^2}$, it follows that

$$\sqrt{\left(\frac{v_2}{v_1}\right)^2 - 1} \ge \sqrt{1 + 4\left(\frac{d}{s}\right)^2 - 1} = \frac{2d}{s}.$$

Hence, $\tan\theta \le \frac{s}{2d}$ as required.

(b) For the time-minimizing choice of θ, we have $\sin\theta = \frac{v_1}{v_2}$ from which $\sec\theta = \frac{v_2}{\sqrt{v_2^2 - v_1^2}}$ and $\tan\theta = \frac{v_1}{\sqrt{v_2^2 - v_1^2}}$.

Thus

$$\begin{aligned} t_2 &= \frac{2d}{v_1}\sec\theta + \frac{s - 2d\tan\theta}{v_2} = \frac{2d}{v_1}\frac{v_2}{\sqrt{v_2^2 - v_1^2}} + \frac{s - 2d\frac{v_1}{\sqrt{v_2^2 - v_1^2}}}{v_2} \\ &= \frac{2d}{v_1}\left(\frac{v_2}{\sqrt{v_2^2 - v_1^2}} - \frac{v_1^2}{v_2\sqrt{v_2^2 - v_1^2}}\right) + \frac{s}{v_2} \\ &= \frac{2d}{v_1}\left(\frac{v_2^2 - v_1^2}{v_2\sqrt{v_2^2 - v_1^2}}\right) + \frac{s}{v_2} = \frac{2d}{v_1}\left(\frac{\sqrt{v_2^2 - v_1^2}}{\sqrt{v_2^2}}\right) + \frac{s}{v_2} \\ &= \frac{2d}{v_1}\sqrt{1 - \left(\frac{v_1}{v_2}\right)^2} + \frac{s}{v_2} = \frac{2d\left(1 - k^2\right)^{1/2}}{v_1} + \frac{s}{v_2}. \end{aligned}$$

(c) Recall that $t_1 = \frac{s}{v_1}$. We therefore have

$$\begin{aligned} \frac{t_2}{t_1} &= \frac{\frac{2d\left(1-k^2\right)^{1/2}}{v_1} + \frac{s}{v_2}}{\frac{s}{v_1}} \\ &= \frac{2d\left(1 - k^2\right)^{1/2}}{s} + \frac{v_1}{v_2} = \frac{2d\left(1 - k^2\right)^{1/2}}{s} + k. \end{aligned}$$

68. Continue with the assumption of the previous exercise.

(a) Find the thickness of the soil layer, assuming that $v_1 = 0.7v_2$, $t_2/t_1 = 1.3$, and $s = 400$ m.

(b) The times t_1 and t_2 are measured experimentally. The equation in Exercise 67(c) shows that t_2/t_1 is a linear function of $1/s$. What might you conclude if experiments were formed for several values of s and the points $(1/s, t_2/t_1)$ did *not* lie on a straight line?

SOLUTION

(a) Substituting $k = v_1/v_2 = 0.7$, $t_2/t_1 = 1.3$, and $s = 400$ into the equation for t_2/t_1 in Exercise 67(c) gives $1.3 = \frac{2d\sqrt{1 - (0.7)^2}}{400} + 0.7$. Solving for d yields $d \approx 168.03$ m.

(b) If several experiments for different values of s showed that plots of the points $\left(\frac{1}{s}, \frac{t_2}{t_1}\right)$ did *not* lie on a straight line, then we would suspect that $\frac{t_2}{t_1}$ is *not* a linear function of $\frac{1}{s}$ and that a different model is required.

69. In this exercise we use Figure 38 to prove Heron's principle of Example 6 without calculus. By definition, C is the reflection of B across the line $\overline{MN}$ (so that $\overline{BC}$ is perpendicular to $\overline{MN}$ and $BN = CN$. Let P be the intersection of $\overline{AC}$ and $\overline{MN}$. Use geometry to justify:

(a) $\triangle PNB$ and $\triangle PNC$ are congruent and $\theta_1 = \theta_2$.

(b) The paths APB and APC have equal length.

(c) Similarly AQB and AQC have equal length.

(d) The path APC is shorter than AQC for all $Q \neq P$.

Conclude that the shortest path AQB occurs for $Q = P$.

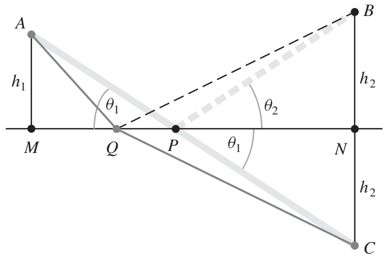

FIGURE 38

SOLUTION

(a) By definition, $\overline{BC}$ is orthogonal to $\overline{QM}$, so triangles $\triangle PNB$ and $\triangle PNC$ are congruent by side–angle–side. Therefore $\theta_1 = \theta_2$

(b) Because $\triangle PNB$ and $\triangle PNC$ are congruent, it follows that $\overline{PB}$ and $\overline{PC}$ are of equal length. Thus, paths APB and APC have equal length.

(c) The same reasoning used in parts (a) and (b) lead us to conclude that $\triangle QNB$ and $\triangle QNC$ are congruent and that $\overline{PB}$ and $\overline{PC}$ are of equal length. Thus, paths AQB and AQC are of equal length.

(d) Consider triangle $\triangle AQC$. By the triangle inequality, the length of side $\overline{AC}$ is less than or equal to the sum of the lengths of the sides $\overline{AQ}$ and $\overline{QC}$. Thus, the path APC is shorter than AQC for all $Q \neq P$.

Finally, the shortest path AQB occurs for $Q = P$.

70. A jewelry designer plans to incorporate a component made of gold in the shape of a frustum of a cone of height 1 cm and fixed lower radius r (Figure 39). The upper radius x can take on any value between 0 and r. Note that $x = 0$ and $x = r$ correspond to a cone and cylinder, respectively. As a function of x, the surface area (not including the top and bottom) is $S(x) = \pi s(r + x)$, where s is the *slant height* as indicated in the figure. Which value of x yields the least expensive design [the minimum value of $S(x)$ for $0 \le x \le r$]?

(a) Show that $S(x) = \pi(r + x)\sqrt{1 + (r - x)^2}$.

(b) Show that if $r < \sqrt{2}$, then $S(x)$ is an increasing function. Conclude that the cone ($x = 0$) has minimal area in this case.

(c) Assume that $r > \sqrt{2}$. Show that $S(x)$ has two critical points $x_1 < x_2$ in $(0, r)$, and that $S(x_1)$ is a local maximum, and $S(x_2)$ is a local minimum.

(d) Conclude that the minimum occurs at $x = 0$ or x_2.

(e) Find the minimum in the cases $r = 1.5$ and $r = 2$.

(f) Challenge: Let $c = \sqrt{(5 + 3\sqrt{3})/4} \approx 1.597$. Prove that the minimum occurs at $x = 0$ (cone) if $\sqrt{2} < r < c$, but the minimum occurs at $x = x_2$ if $r > c$.

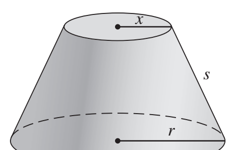

FIGURE 39 Frustrum of height 1 cm.

SOLUTION

(a) Consider a cross-section of the object and notice a triangle can be formed with height 1, hypotenuse s, and base $r - x$. Then, by the Pythagorean Theorem, $s = \sqrt{1 + (r - x)^2}$ and the surface area is $S = \pi(r + x)s = \pi(r + x)\sqrt{1 + (r - x)^2}$.

(b) $S'(x) = \pi\left(\sqrt{1 + (r - x)^2} - (r + x)(1 + (r - x)^2)^{-1/2}(r - x)\right) = \pi\dfrac{2x^2 - 2rx + 1}{\sqrt{1 + (r - x)^2}} = 0$ yields critical points $x = \frac{1}{2}r \pm \frac{1}{2}\sqrt{r^2 - 2}$. If $r < \sqrt{2}$ then there are no real critical points and $S'(x) > 0$ for $x > 0$. Hence, $S(x)$ is increasing everywhere and thus the minimum must occur at the left endpoint, $x = 0$.

(c) For $r > \sqrt{2}$, there are two critical points, $x_1 = \frac{1}{2}r - \frac{1}{2}\sqrt{r^2 - 2}$ and $x_2 = \frac{1}{2}r + \frac{1}{2}\sqrt{r^2 - 2}$. Both values are on the interval $[0, r]$ since $r > \sqrt{r^2 - 2}$. Sign analysis reveals that $S(x)$ is increasing for $0 < x < x_1$, decreasing for $x_1 < x < x_2$ and increasing for $x_2 < x < r$. Hence, $S(x_1)$ is a local maximum, and $S(x_2)$ is a local minimum.

(d) The minimum value of S must occur at an endpoint or a critical point. Since $S(x_1)$ is a local maximum and S increases for $x_2 < x < r$, we conclude that the minimum of S must occur either at $x = 0$ or at $x = x_2$.

(e) If $r = 1.5$ cm, $S(x_2) = 8.8357$ cm^2 and $S(0) = 8.4954$ cm^2, so $S(0) = 8.4954$ cm^2 is the minimum (cone). If $r = 2$ cm, $S(x_2) = 12.852$ cm^2 and $S(0) = 14.0496$ cm^2, so $S(x_2) = 12.852$ cm^2 is the minimum.

(f) *Take a deep breath*. Setting $S(x_2) = S(0)$ produces an equation in r (x_2 is given in r, and so is $S(0)$). By means of a great deal of algebraic labor and a clever substitution, we are going to solve for r. $S(0) = \pi r\sqrt{1 + r^2}$, while, since $x_2 = \frac{1}{2}r + \frac{1}{2}\sqrt{r^2 - 2}$,

$$
\begin{aligned}
S(x_2) &= \pi\left(\frac{3}{2}r + \frac{1}{2}\sqrt{r^2 - 2}\right)\sqrt{1 + (\frac{1}{2}r - \frac{1}{2}\sqrt{r^2 - 2})^2} \\
&= \frac{\pi}{2}\left(3r + \sqrt{r^2 - 2}\right)\sqrt{1 + \frac{1}{4}(r^2 - 2r\sqrt{r^2 - 2} + r^2 - 2)} \\
&= \frac{\pi}{2}\left(3r + \sqrt{r^2 - 2}\right)\sqrt{1 + \frac{1}{2}(r^2 - r\sqrt{r^2 - 2} - 1)}
\end{aligned}
$$

From this, we simplify by squaring and taking out constants:

$$S(x_2)/\pi = \frac{1}{2}\left(3r + \sqrt{r^2-2}\right)\sqrt{1+\frac{1}{2}(r^2 - r\sqrt{r^2-2}-1)}$$
$$(S(x_2)/\pi)^2 = \frac{1}{8}\left(3r + \sqrt{r^2-2}\right)^2\left(2+(r^2 - r\sqrt{r^2-2}-1)\right)$$
$$8(S(x_2)/\pi)^2 = \left(3r + \sqrt{r^2-2}\right)^2\left(r^2 - r\sqrt{r^2-2}+1\right)$$

To solve the equation $S(x_2) = S(0)$, we solve the equivalent equation $8(S(x_2)/\pi)^2 = 8(S(0)/\pi)^2$. $8(S(0)/\pi)^2 = 8r^2(1+r^2) = 8r^2 + 8r^4$. Let $u = r^2 - 2$, so that $\sqrt{r^2-2} = \sqrt{u}$, $r^2 = u+2$, and $r = \sqrt{u+2}$. The expression for $8(S(x_2)/\pi)^2$ is, then:

$$8(S(x_2)/\pi)^2 = \left(3\sqrt{u+2} + \sqrt{u}\right)^2\left((u+2) - \sqrt{u+2}\sqrt{u}+1\right)$$

while

$$8(S(0)/\pi)^2 = 8r^2 + 8r^4 = 8(u+2)(u+3) = 8u^2 + 40u + 48.$$

We compute:

$$\begin{aligned}\left(3\sqrt{u+2}+\sqrt{u}\right)^2 &= 9(u+2) + 6\sqrt{u}\sqrt{u+2} + u \\ &= 10u + 6\sqrt{u}\sqrt{u+2} + 18 \\ \left(10u + 6\sqrt{u}\sqrt{u+2}+18\right)\left(u - \sqrt{u}\sqrt{u+2}+3\right) &= 10u^2 + 6u^{3/2}\sqrt{u+2} + 18u - 10u^{3/2}\sqrt{u+2} - 6u^2 - 12u \\ &\quad - 18\sqrt{u+2}\sqrt{u} + 30u + 18\sqrt{u+2}\sqrt{u} + 54 \\ &= 4u^2 - 4u\left(\sqrt{u}\sqrt{u+2}\right) + 36u + 54\end{aligned}$$

Therefore the equation becomes:

$$\begin{aligned}8(S(0)/\pi)^2 &= 8(S(x_2)/\pi)^2 \\ 8u^2 + 40u + 48 &= 4u^2 - 4u(\sqrt{u}\sqrt{u+2}) + 36u + 54 \\ 4u^2 + 4u - 6 &= -4u(\sqrt{u}\sqrt{u+2}) \\ 16u^4 + 32u^3 - 32u^2 - 48u + 36 &= 16u^2(u)(u+2) \\ 16u^4 + 32u^3 - 32u^2 - 48u + 36 &= 16u^4 + 32u^3 \\ -32u^2 - 48u + 36 &= 0 \\ 8u^2 + 12u - 9 &= 0.\end{aligned}$$

The last quadratic has positive solution:

$$u = \frac{-12 + \sqrt{144 + 4(72)}}{16} = \frac{-12 + 12\sqrt{3}}{16} = \frac{-3+3\sqrt{3}}{4}.$$

Therefore

$$r^2 - 2 = \frac{-3+3\sqrt{3}}{4},$$

so

$$r^2 = \frac{5+3\sqrt{3}}{4}.$$

This gives us that $S(x_2) = S(0)$ when

$$r = c = \sqrt{\frac{5+3\sqrt{3}}{4}}.$$

From part (e) we know that for $r = 1.5 < c$, $S(0)$ is the minimum value for S, but for $r = 2 > c$, $S(x_2)$ is the minimum value. Since $r = c$ is the only solution of $S(0) = S(x_2)$ for $r > \sqrt{2}$, it follows that $S(0)$ provides the minimum value for $\sqrt{2} < r < c$ and $S(x_2)$ provides the minimum when $r > c$.

4.8 Newton's Method

Preliminary Questions

1. How many iterations of Newton's Method are required to compute a root if $f(x)$ is a linear function?

SOLUTION Remember that Newton's Method uses the linear approximation of a function to estimate the location of a root. If the original function is linear, then only one iteration of Newton's Method will be required to compute the root.

2. What happens in Newton's Method if your initial guess happens to be a zero of f?

SOLUTION If x_0 happens to be a zero of f, then

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = x_0 - 0 = x_0;$$

in other words, every term in the Newton's Method sequence will remain x_0.

3. What happens in Newton's Method if your initial guess happens to be a local min or max of f?

SOLUTION Assuming that the function is differentiable, then the derivative is zero at a local maximum or a local minimum. If Newton's Method is started with an initial guess such that $f'(x_0) = 0$, then Newton's Method will fail in the sense that x_1 will not be defined. That is, the tangent line will be parallel to the x-axis and will never intersect it.

4. Is the following a reasonable description of Newton's Method: "A root of the equation of the tangent line to $f(x)$ is used as an approximation to a root of $f(x)$ itself"? Explain.

SOLUTION Yes, that is a reasonable description. The iteration formula for Newton's Method was derived by solving the equation of the tangent line to $y = f(x)$ at x_0 for its x-intercept.

Exercises

In this exercise set, all approximations should be carried out using Newton's Method.

In Exercises 1–6, apply Newton's Method to $f(x)$ and initial guess x_0 to calculate x_1, x_2, x_3.

1. $f(x) = x^2 - 6, \quad x_0 = 2$

SOLUTION Let $f(x) = x^2 - 6$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - 6}{2x_n}.$$

With $x_0 = 2$, we compute

n	1	2	3
x_n	2.5	2.45	2.44948980

2. $f(x) = x^2 - 3x + 1, \quad x_0 = 3$

SOLUTION Let $f(x) = x^2 - 3x + 1$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - 3x_n + 1}{2x_n - 3}.$$

With $x_0 = 3$, we compute

n	1	2	3
x_n	2.66666667	2.61904762	2.61803445

3. $f(x) = x^3 - 10, \quad x_0 = 2$

SOLUTION Let $f(x) = x^3 - 10$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 - 10}{3x_n^2}.$$

With $x_0 = 2$ we compute

n	1	2	3
x_n	2.16666667	2.15450362	2.15443469

4. $f(x) = x^3 + x + 1, \quad x_0 = -1$

SOLUTION Let $f(x) = x^3 + x + 1$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 + x_n + 1}{3x_n^2 + 1}.$$

With $x_0 = -1$ we compute

n	1	2	3
x_n	-0.75	-0.68604651	-0.68233958

5. $f(x) = \cos x - 4x, \quad x_0 = 1$

SOLUTION Let $f(x) = \cos x - 4x$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{\cos x_n - 4x_n}{-\sin x_n - 4}.$$

With $x_0 = 1$ we compute

n	1	2	3
x_n	0.28540361	0.24288009	0.24267469

6. $f(x) = 1 - x \sin x, \quad x_0 = 7$

SOLUTION Let $f(x) = 1 - x \sin x$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{1 - x_n \sin x_n}{-x_n \cos x_n - \sin x_n}.$$

With $x_0 = 7$ we compute

n	1	2	3
x_n	6.39354183	6.43930706	6.43911724

7. Use Figure 6 to choose an initial guess x_0 to the unique real root of $x^3 + 2x + 5 = 0$ and compute the first three Newton iterates.

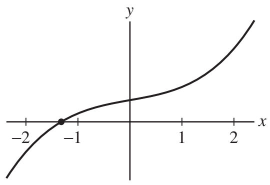

FIGURE 6 Graph of $y = x^3 + 2x + 5$.

SOLUTION Let $f(x) = x^3 + 2x + 5$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 + 2x_n + 5}{3x_n^2 + 2}.$$

We take $x_0 = -1.4$, based on the figure, and then calculate

n	1	2	3
x_n	-1.330964467	-1.328272820	-1.328268856

8. Approximate a solution of $\sin x = \cos 2x$ in the interval $\left[0, \frac{\pi}{2}\right]$ to three decimal places. Then find the exact solution and compare with your approximation.

SOLUTION Let $f(x) = \sin x - \cos 2x$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{\sin x_n - \cos 2x_n}{\cos x_n + 2 \sin 2x_n}.$$

With $x_0 = 0.5$ we find

n	1	2
x_n	0.523775116	0.523598785

The root, to three decimal places, is 0.524. The exact root is $\frac{\pi}{6}$, which is equal to 0.524 to three decimal places.

9. Approximate both solutions of $e^x = 5x$ to three decimal places (Figure 7).

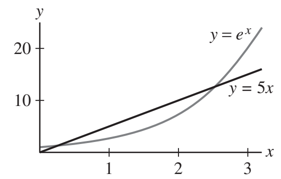

FIGURE 7 Graphs of e^x and $5x$.

SOLUTION We need to solve $e^x - 5x = 0$, so let $f(x) = e^x - 5x$. Then $f'(x) = e^x - 5$. With an initial guess of $x_0 = 0.2$, we calculate

Newton's Method (First root)	$x_0 = 0.2$ (guess)
$x_1 = 0.2 - \dfrac{f(0.2)}{f'(0.2)}$	$x_1 \approx 0.25859$
$x_2 = 0.25859 - \dfrac{f(0.25859)}{f'(0.25859)}$	$x_2 \approx 0.25917$
$x_3 = 0.25917 - \dfrac{f(0.25917)}{f'(0.25917)}$	$x_3 \approx 0.25917$

For the second root, we use an initial guess of $x_0 = 2.5$.

Newton's Method (Second root)	$x_0 = 2.5$ (guess)
$x_1 = 2.5 - \dfrac{f(2.5)}{f'(2.5)}$	$x_1 \approx 2.54421$
$x_2 = 2.54421 - \dfrac{f(2.54421)}{f'(2.54421)}$	$x_2 \approx 2.54264$
$x_3 = 2.54264 - \dfrac{f(2.54264)}{f'(2.54264)}$	$x_3 \approx 2.54264$

Thus the two solutions of $e^x = 5x$ are approximately $r_1 \approx 0.25917$ and $r_2 \approx 2.54264$.

10. The first positive solution of $\sin x = 0$ is $x = \pi$. Use Newton's Method to calculate π to four decimal places.

SOLUTION Let $f(x) = \sin x$. Taking $x_0 = 3$, we have

n	1	2	3
x_n	3.142546543	3.141592653	3.141592654

Hence, $\pi \approx 3.1416$ to four decimal places.

In Exercises 11–14, approximate to three decimal places using Newton's Method and compare with the value from a calculator.

11. $\sqrt{11}$

SOLUTION Let $f(x) = x^2 - 11$, and let $x_0 = 3$. Newton's Method yields:

n	1	2	3
x_n	3.33333333	3.31666667	3.31662479

A calculator yields 3.31662479.

12. $5^{1/3}$

SOLUTION Let $f(x) = x^3 - 5$, and let $x_0 = 2$. Here are approximations to the root of $f(x)$, which is $5^{1/3}$.

n	1	2	3	4
x_n	1.75	1.710884354	1.709976429	1.709975947

A calculator yields 1.709975947.

13. $2^{7/3}$

SOLUTION Note that $2^{7/3} = 4 \cdot 2^{1/3}$. Let $f(x) = x^3 - 2$, and let $x_0 = 1$. Newton's Method yields:

n	1	2	3
x_n	1.33333333	1.26388889	1.25993349

Thus, $2^{7/3} \approx 4 \cdot 1.25993349 = 5.03973397$. A calculator yields 5.0396842.

14. $3^{-1/4}$

SOLUTION Let $f(x) = x^{-4} - 3$, and let $x_0 = 0.8$. Here are approximations to the root of $f(x)$, which is $3^{-1/4}$.

n	1	2	3	4
x_n	0.75424	0.75973342	0.75983565	0.75983569

A calculator yields 0.75983569.

15. Approximate the largest positive root of $f(x) = x^4 - 6x^2 + x + 5$ to within an error of at most 10^{-4}. Refer to Figure 5.

SOLUTION Figure 5 from the text suggests the largest positive root of $f(x) = x^4 - 6x^2 + x + 5$ is near 2. So let $f(x) = x^4 - 6x^2 + x + 5$ and take $x_0 = 2$.

n	1	2	3	4
x_n	2.111111111	2.093568458	2.093064768	2.093064358

The largest positive root of $x^4 - 6x^2 + x + 5$ is approximately 2.093064358.

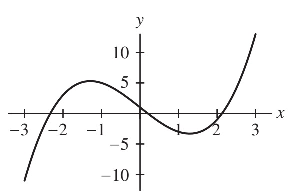
GU *In Exercises 16–19, approximate the root specified to three decimal places using Newton's Method. Use a plot to choose an initial guess.*

16. Largest positive root of $f(x) = x^3 - 5x + 1$.

SOLUTION Let $f(x) = x^3 - 5x + 1$. The graph of $f(x)$ shown below suggests the largest positive root is near $x = 2.2$. Taking $x_0 = 2.2$, Newton's Method gives

n	1	2	3
x_n	2.13193277	2.12842820	2.12841906

The largest positive root of $x^3 - 5x + 1$ is approximately 2.1284.

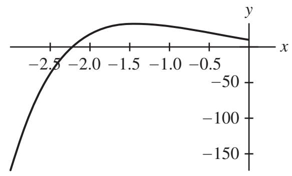


17. Negative root of $f(x) = x^5 - 20x + 10$.

SOLUTION Let $f(x) = x^5 - 20x + 10$. The graph of $f(x)$ shown below suggests taking $x_0 = -2.2$. Starting from $x_0 = -2.2$, the first three iterates of Newton's Method are:

n	1	2	3
x_n	−2.22536529	−2.22468998	−2.22468949

Thus, to three decimal places, the negative root of $f(x) = x^5 - 20x + 10$ is -2.225.



18. Positive solution of $\sin\theta = 0.8\theta$.

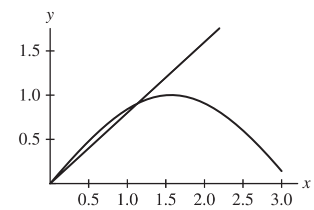
SOLUTION From the graph below, we see that the positive solution to the equation $\sin\theta = 0.8\theta$ is approximately $x = 1.1$. Now, let $f(\theta) = \sin\theta - 0.8\theta$ and define

$$\theta_{n+1} = \theta_n - \frac{f(\theta_n)}{f'(\theta_n)} = \theta_n - \frac{\sin\theta_n - 0.8\theta_n}{\cos\theta_n - 0.8}.$$

With $\theta_0 = 1.1$ we find

n	1	2	3
θ_n	1.13235345	1.13110447	1.13110259

Thus, to three decimal places, the positive solution to the equation $\sin\theta = 0.8\theta$ is 1.131.



19. Solution of $\ln(x + 4) = x$.

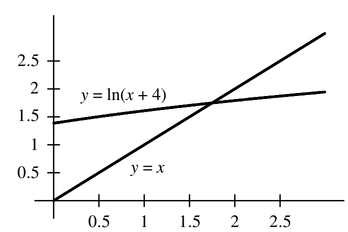
SOLUTION From the graph below, we see that the positive solution to the equation $\ln(x + 4) = x$ is approximately $x = 2$. Now, let $f(x) = \ln(x + 4) - x$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{\ln(x_n + 4) - x_n}{\frac{1}{x_n+4} - 1}.$$

With $x_0 = 2$ we find

n	1	2	3
x_n	1.750111363	1.749031407	1.749031386

Thus, to three decimal places, the positive solution to the equation $\ln(x + 4) = x$ is 1.749.



20. Let x_1, x_2 be the estimates to a root obtained by applying Newton's Method with $x_0 = 1$ to the function graphed in Figure 8. Estimate the numerical values of x_1 and x_2, and draw the tangent lines used to obtain them.

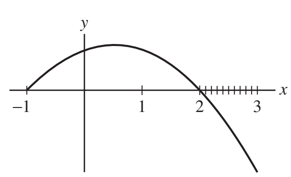


FIGURE 8

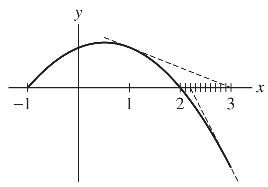
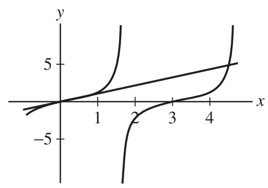
SOLUTION The graph with tangent lines drawn on it appears below. The tangent line to the curve at $(x_0, f(x_0))$ has an x-intercept at approximately $x_1 = 3.0$. The tangent line to the curve at $(x_1, f(x_1))$ has an x-intercept at approximately $x_2 = 2.2$.



21. GU Find the smallest positive value of x at which $y = x$ and $y = \tan x$ intersect. *Hint:* Draw a plot.

SOLUTION Here is a plot of $\tan x$ and x on the same axes:



The first intersection with $x > 0$ lies on the second "branch" of $y = \tan x$, between $x = \frac{5\pi}{4}$ and $x = \frac{3\pi}{2}$. Let $f(x) = \tan x - x$. The graph suggests an initial guess $x_0 = \frac{5\pi}{4}$, from which we get the following table:

n	1	2	3	4
x_n	6.85398	21.921	4480.8	7456.27

This is clearly leading nowhere, so we need to try a better initial guess. *Note: This happens with Newton's Method—it is sometimes difficult to choose an initial guess*. We try the point directly between $\frac{5\pi}{4}$ and $\frac{3\pi}{2}$, $x_0 = \frac{11\pi}{8}$:

n	1	2	3	4	5	6	7
x_n	4.64662	4.60091	4.54662	4.50658	4.49422	4.49341	4.49341

The first point where $y = x$ and $y = \tan x$ cross is at approximately $x = 4.49341$, which is approximately 1.4303π.

22. In 1535, the mathematician Antonio Fior challenged his rival Niccolo Tartaglia to solve this problem: A tree stands 12 *braccia* high; it is broken into two parts at such a point that the height of the part left standing is the cube root of the length of the part cut away. What is the height of the part left standing? Show that this is equivalent to solving $x^3 + x = 12$ and find the height to three decimal places. Tartaglia, who had discovered the secret of the cubic equation, was able to determine the exact answer:

$$x = \left(\sqrt[3]{\sqrt{2919} + 54} - \sqrt[3]{\sqrt{2919} - 54}\right) \Big/ \sqrt[3]{9}$$

SOLUTION Suppose that x is the part of the tree left standing, so that x^3 is the part cut away. Since the tree is 12 *braccia* high, this gives that $x + x^3 = 12$. Let $f(x) = x + x^3 - 12$. We are looking for a point where $f(x) = 0$. Using the initial guess $x = 2$ (it seems that most of the tree is cut away), we get the following table:

n	1	2	3	4
x_n	2.15384615385	2.14408201873	2.14404043328	2.14404043253

Hence $x \approx 2.14404043253$. Tartaglia's exact answer is 2.14404043253, so the 4th Newton's Method approximation is accurate to at least 11 decimal places.

23. Find (to two decimal places) the coordinates of the point P in Figure 9 where the tangent line to $y = \cos x$ passes through the origin.

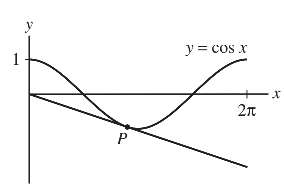


FIGURE 9

SOLUTION Let $(x_r, \cos(x_r))$ be the coordinates of the point P. The slope of the tangent line is $-\sin(x_r)$, so we are looking for a tangent line:

$$y = -\sin(x_r)(x - x_r) + \cos(x_r)$$

such that $y = 0$ when $x = 0$. This gives us the equation:

$$-\sin(x_r)(-x_r) + \cos(x_r) = 0.$$

Let $f(x) = \cos x + x \sin x$. We are looking for the first point $x = r$ where $f(r) = 0$. The sketch given indicates that $x_0 = 3\pi/4$ would be a good initial guess. The following table gives successive Newton's Method approximations:

n	1	2	3	4
x_n	2.931781309	2.803636974	2.798395826	2.798386046

The point P has approximate coordinates $(2.7984, -0.941684)$.

Newton's Method is often used to determine interest rates in financial calculations. In Exercises 24–26, r denotes a yearly interest rate expressed as a decimal (rather than as a percent).

24. If P dollars are deposited every month in an account earning interest at the yearly rate r, then the value S of the account after N years is

$$S = P\left(\frac{b^{12N+1} - b}{b - 1}\right) \qquad \text{where } b = 1 + \frac{r}{12}$$

You have decided to deposit $P = 100$ dollars per month.

(a) Determine S after 5 years if $r = 0.07$ (that is, 7%).

(b) Show that to save \$10,000 after 5 years, you must earn interest at a rate r determined bys the equation $b^{61} - 101b + 100 = 0$. Use Newton's Method to solve for b. Then find r. Note that $b = 1$ is a root, but you want the root satisfying $b > 1$.

SOLUTION

(a) If $r = 0.07$, $b = 1 + r/12 \approx 1.00583$, and :

$$S = 100\frac{(b^{61} - b)}{b - 1} = 7201.05.$$

(b) If our goal is to get \$10,000 after five years, we need $S = 10{,}000$ when $N = 5$.

$$10{,}000 = 100\left(\frac{b^{61} - b}{b - 1}\right),$$

So that:

$$\begin{aligned} 10{,}000(b - 1) &= 100\left(b^{61} - b\right) \\ 100b - 100 &= b^{61} - b \\ b^{61} - 101b + 100 &= 0 \end{aligned}$$

$b = 1$ is a root, but, since $b - 1$ appears in the denominator of our original equation, it does not satisfy the original equation. Let $f(b) = b^{61} - 101b + 100$. Let's use the initial guess $r = 0.2$, so that $x_0 = 1 + r/12 = 1.016666$.

n	1	2	3
x_n	1.01576	1.01569	1.01569

The solution is approximately $b = 1.01569$. The interest rate r required satisfies $1 + r/12 = 1.01569$, so that $r = 0.01569 \times 12 = 0.18828$. An annual interest rate of 18.828% is required to have \$10,000 after five years.

25. If you borrow L dollars for N years at a yearly interest rate r, your monthly payment of P dollars is calculated using the equation

$$L = P\left(\frac{1-b^{-12N}}{b-1}\right) \qquad \text{where } b = 1 + \frac{r}{12}$$

(a) Find P if $L = \$5000$, $N = 3$, and $r = 0.08$ (8%).
(b) You are offered a loan of $L = \$5000$ to be paid back over 3 years with monthly payments of $P = \$200$. Use Newton's Method to compute b and find the implied interest rate r of this loan. *Hint:* Show that $(L/P)b^{12N+1} - (1 + L/P)b^{12N} + 1 = 0$.

SOLUTION
(a) $b = (1 + 0.08/12) = 1.00667$

$$P = L\left(\frac{b-1}{1-b^{-12N}}\right) = 5000\left(\frac{1.00667-1}{1-1.00667^{-36}}\right) \approx \$156.69$$

(b) Starting from

$$L = P\left(\frac{1-b^{-12N}}{b-1}\right),$$

divide by P, multiply by $b-1$, multiply by b^{12N} and collect like terms to arrive at

$$(L/P)b^{12N+1} - (1 + L/P)b^{12N} + 1 = 0.$$

Since $L/P = 5000/200 = 25$, we must solve

$$25b^{37} - 26b^{36} + 1 = 0.$$

Newton's Method gives $b \approx 1.02121$ and

$$r = 12(b-1) = 12(0.02121) \approx 0.25452$$

So the interest rate is around 25.45%.

26. If you deposit P dollars in a retirement fund every year for N years with the intention of then withdrawing Q dollars per year for M years, you must earn interest at a rate r satisfying $P(b^N - 1) = Q(1 - b^{-M})$, where $b = 1 + r$. Assume that \$2,000 is deposited each year for 30 years and the goal is to withdraw \$10,000 per year for 25 years. Use Newton's Method to compute b and then find r. Note that $b = 1$ is a root, but you want the root satisfying $b > 1$.

SOLUTION Substituting $P = 2000$, $Q = 10{,}000$, $N = 30$ and $M = 25$ into the equation $P(b^N - 1) = Q(1 - b^{-M})$ and then rearranging terms, we find that b must satisfy the equation $b^{55} - 6b^{25} + 5 = 0$. Newton's Method with a starting value of $b_0 = 1.1$ yields $b \approx 1.05217$. Thus, $r \approx 0.05217 = 5.217\%$.

27. There is no simple formula for the position at time t of a planet P in its orbit (an ellipse) around the sun. Introduce the auxiliary circle and angle θ in Figure 10 (note that P determines θ because it is the central angle of point B on the circle). Let $a = OA$ and $e = OS/OA$ (the eccentricity of the orbit).
(a) Show that sector *BSA* has area $(a^2/2)(\theta - e\sin\theta)$.
(b) By Kepler's Second Law, the area of sector *BSA* is proportional to the time t elapsed since the planet passed point A, and because the circle has area πa^2, *BSA* has area $(\pi a^2)(t/T)$, where T is the period of the orbit. Deduce **Kepler's Equation**:

$$\frac{2\pi t}{T} = \theta - e\sin\theta$$

(c) The eccentricity of Mercury's orbit is approximately $e = 0.2$. Use Newton's Method to find θ after a quarter of Mercury's year has elapsed ($t = T/4$). Convert θ to degrees. Has Mercury covered more than a quarter of its orbit at $t = T/4$?

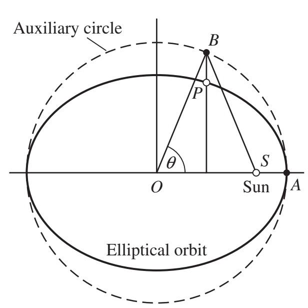

FIGURE 10

SOLUTION

(a) The sector SAB is the slice OAB with the triangle OPS removed. OAB is a central sector with arc θ and radius $\overline{OA} = a$, and therefore has area $\frac{a^2\theta}{2}$. OPS is a triangle with height $a \sin\theta$ and base length $\overline{OS} = ea$. Hence, the area of the sector is

$$\frac{a^2}{2}\theta - \frac{1}{2}ea^2 \sin\theta = \frac{a^2}{2}(\theta - e\sin\theta).$$

(b) Since Kepler's second law indicates that the area of the sector is proportional to the time t since the planet passed point A, we get

$$\pi a^2 (t/T) = a^2/2\,(\theta - e\sin\theta)$$
$$2\pi \frac{t}{T} = \theta - e\sin\theta.$$

(c) If $t = T/4$, the last equation in (b) gives:

$$\frac{\pi}{2} = \theta - e\sin\theta = \theta - .2\sin\theta.$$

Let $f(\theta) = \theta - .2\sin\theta - \frac{\pi}{2}$. We will use Newton's Method to find the point where $f(\theta) = 0$. Since a quarter of the year on Mercury has passed, a good first estimate θ_0 would be $\frac{\pi}{2}$.

n	1	2	3	4
x_n	1.7708	1.76696	1.76696	1.76696

From the point of view of the Sun, Mercury has traversed an angle of approximately 1.76696 radians $= 101.24°$. Mercury has therefore traveled more than one fourth of the way around (from the point of view of central angle) during this time.

28. The roots of $f(x) = \frac{1}{3}x^3 - 4x + 1$ to three decimal places are -3.583, 0.251, and 3.332 (Figure 11). Determine the root to which Newton's Method converges for the initial choices $x_0 = 1.85$, 1.7, and 1.55. The answer shows that a small change in x_0 can have a significant effect on the outcome of Newton's Method.

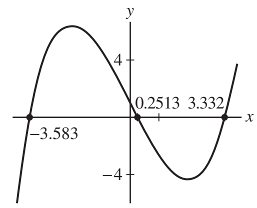

FIGURE 11 Graph of $f(x) = \frac{1}{3}x^3 - 4x + 1$.

SOLUTION Let $f(x) = \frac{1}{3}x^3 - 4x + 1$, and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{\frac{1}{3}x_n^3 - 4x_n + 1}{x_n^2 - 4}.$$

- Taking $x_0 = 1.85$, we have

n	1	2	3	4	5	6	7
x_n	−5.58	−4.31	−3.73	−3.59	−3.58294362	−3.582918671	−3.58291867

- Taking $x_0 = 1.7$, we have

n	1	2	3	4	5	6	7	8	9
x_n	−2.05	−33.40	−22.35	−15.02	−10.20	−7.08	−5.15	−4.09	−3.66

n	10	11	12	13
x_n	−3.585312288	−3.582920989	−3.58291867	−3.58291867

- Taking $x_0 = 1.55$, we have

n	1	2	3	4	5	6
x_n	−0.928	0.488	0.245	0.251320515	0.251322863	0.251322863

29. What happens when you apply Newton's Method to find a zero of $f(x) = x^{1/3}$? Note that $x = 0$ is the only zero.

SOLUTION Let $f(x) = x^{1/3}$. Define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^{1/3}}{\frac{1}{3}x_n^{-2/3}} = x_n - 3x_n = -2x_n.$$

Take $x_0 = 0.5$. Then the sequence of iterates is $-1, 2, -4, 8, -16, 32, -64, \dots$ That is, for any nonzero starting value, the sequence of iterates diverges spectacularly, since $x_n = (-2)^n x_0$. Thus $\lim_{n\to\infty} |x_n| = \lim_{n\to\infty} 2^n |x_0| = \infty$.

30. What happens when you apply Newton's Method to the equation $x^3 - 20x = 0$ with the unlucky initial guess $x_0 = 2$?

SOLUTION Let $f(x) = x^3 - 20x$. Define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 - 20x_n}{3x_n^2 - 20}.$$

Take $x_0 = 2$. Then the sequence of iterates is $-2, 2, -2, 2, \dots$, which diverges by oscillation.

Further Insights and Challenges

31. Newton's Method can be used to compute reciprocals without performing division. Let $c > 0$ and set $f(x) = x^{-1} - c$.

(a) Show that $x - (f(x)/f'(x)) = 2x - cx^2$.

(b) Calculate the first three iterates of Newton's Method with $c = 10.3$ and the two initial guesses $x_0 = 0.1$ and $x_0 = 0.5$.

(c) Explain graphically why $x_0 = 0.5$ does not yield a sequence converging to $1/10.3$.

SOLUTION

(a) Let $f(x) = \frac{1}{x} - c$. Then

$$x - \frac{f(x)}{f'(x)} = x - \frac{\frac{1}{x} - c}{-x^{-2}} = 2x - cx^2.$$

(b) For $c = 10.3$, we have $f(x) = \frac{1}{x} - 10.3$ and thus $x_{n+1} = 2x_n - 10.3x_n^2$.

- Take $x_0 = 0.1$.

n	1	2	3
x_n	0.097	0.0970873	0.09708738

- Take $x_0 = 0.5$.

n	1	2	3
x_n	-1.575	-28.7004375	-8541.66654

(c) The graph is disconnected. If $x_0 = .5$, $(x_1, f(x_1))$ is on the other portion of the graph, which will never converge to any point under Newton's Method.

In Exercises 32 and 33, consider a metal rod of length L fastened at both ends. If you cut the rod and weld on an additional segment of length m, leaving the ends fixed, the rod will bow up into a circular arc of radius R (unknown), as indicated in Figure 12.

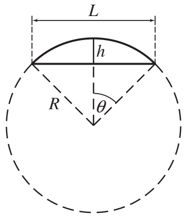

FIGURE 12 The bold circular arc has length $L + m$.

32. Let h be the maximum vertical displacement of the rod.

(a) Show that $L = 2R\sin\theta$ and conclude that

$$h = \frac{L(1 - \cos\theta)}{2\sin\theta}$$

(b) Show that $L + m = 2R\theta$ and then prove

$$\frac{\sin\theta}{\theta} = \frac{L}{L+m} \qquad \boxed{2}$$

SOLUTION

(a) From the figure, we have $\sin\theta = \frac{L/2}{R}$, so that $L = 2R\sin\theta$. Hence

$$h = R - R\cos\theta = R\,(1-\cos\theta) = \frac{\frac{1}{2}L}{\sin\theta}\,(1-\cos\theta) = \frac{L\,(1-\cos\theta)}{2\sin\theta}$$

(b) The arc length $L + m$ is also given by radius $\times$ angle $= R\cdot 2\theta$. Thus, $L + m = 2R\theta$. Dividing $L = 2R\sin\theta$ by $L + m = 2R\theta$ yields

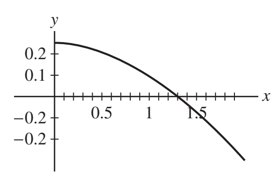
$$\frac{L}{L+m} = \frac{2R\sin\theta}{2R\theta} = \frac{\sin\theta}{\theta}.$$

33. Let $L = 3$ and $m = 1$. Apply Newton's Method to Eq. (2) to estimate θ, and use this to estimate h.

SOLUTION We let $L = 3$ and $m = 1$. We want the solution of:

$$\frac{\sin\theta}{\theta} = \frac{L}{L+m}$$
$$\frac{\sin\theta}{\theta} - \frac{L}{L+m} = 0$$
$$\frac{\sin\theta}{\theta} - \frac{3}{4} = 0.$$

Let $f(\theta) = \frac{\sin\theta}{\theta} - \frac{3}{4}$.



The figure above suggests that $\theta_0 = 1.5$ would be a good initial guess. The Newton's Method approximations for the solution follow:

n	1	2	3	4
θ_n	1.2854388	1.2757223	1.2756981	1.2756981

The angle where $\frac{\sin\theta}{\theta} = \frac{L}{L+m}$ is approximately 1.2757. Hence

$$h = L\frac{1-\cos\theta}{2\sin\theta} \approx 1.11181.$$

34. Quadratic Convergence to Square Roots Let $f(x) = x^2 - c$ and let $e_n = x_n - \sqrt{c}$ be the error in x_n.

(a) Show that $x_{n+1} = \frac{1}{2}(x_n + c/x_n)$ and $e_{n+1} = e_n^2/2x_n$.

(b) Show that if $x_0 > \sqrt{c}$, then $x_n > \sqrt{c}$ for all n. Explain graphically.

(c) Show that if $x_0 > \sqrt{c}$, then $e_{n+1} \le e_n^2/(2\sqrt{c})$.

SOLUTION

(a) Let $f(x) = x^2 - c$. Then

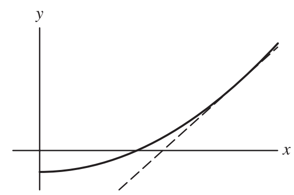
$$xn + 1 = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - c}{2x_n} = \frac{x_n^2 + c}{2x_n} = \frac{1}{2}\left(x_n + \frac{c}{x_n}\right),$$

as long as $x_n \neq 0$. Now

$$\frac{e_n^2}{2x_n} = \frac{\left(x_n - \sqrt{c}\right)^2}{2x_n} = \frac{x_n^2 - 2x_n\sqrt{c} + c}{2x_n} = \frac{1}{2}x_n - \sqrt{c} + \frac{c}{2x_n}$$
$$= \frac{1}{2}\left(x_n + \frac{c}{x_n}\right) - \sqrt{c} = x_{n+1} - \sqrt{c} = e_{n+1}.$$

(b) Since $x_0 > \sqrt{c} \geq 0$, we have $e_0 = x_0 - \sqrt{c} > 0$. Now assume that $e_k > 0$ for $k = n$. Then $0 < e_k = e_n = x_n - \sqrt{c}$, whence $x_n > \sqrt{c} \geq 0$; i.e., $x_n > 0$ and $e_n > 0$. By part (a), we have for $k = n + 1$ that $e_k = e_{n+1} = \dfrac{e_n^2}{2x_n} > 0$ since $x_n > 0$. Thus $e_{n+1} > 0$. Therefore by induction $e_n > 0$ for all $n \geq 0$. Hence $e_n = x_n - \sqrt{c} > 0$ for all $n \geq 0$. Therefore $x_n > \sqrt{c}$ for all $n \geq 0$.

The figure below shows the graph of $f(x) = x^2 - c$. The x-intercept of the graph is, of course, $x = \sqrt{c}$. We see that for any $x_n > \sqrt{c}$, the tangent line to the graph of f intersects the x-axis at a value $x_{n+1} > \sqrt{c}$.



(c) By part (b), if $x_0 > \sqrt{c}$, then $x_n > \sqrt{c}$ for all $n \geq 0$. Accordingly, for all $n \geq 0$ we have $e_{n+1} = \dfrac{e_n^2}{2x_n} < \dfrac{e_n^2}{2\sqrt{c}}$. In other words, $e_{n+1} < \dfrac{e_n^2}{2\sqrt{c}}$ for all $n \geq 0$.

In Exercises 35–37, a flexible chain of length L is suspended between two poles of equal height separated by a distance $2M$ (Figure 13). By Newton's laws, the chain describes a ***catenary*** $y = a\cosh\left(\frac{x}{a}\right)$*, where a is the number such that $L = 2a\sinh\left(\frac{M}{a}\right)$. The sag s is the vertical distance from the highest to the lowest point on the chain.*

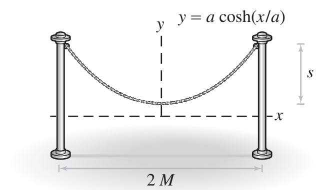


FIGURE 13 Chain hanging between two poles.

35. Suppose that $L = 120$ and $M = 50$.

(a) Use Newton's Method to find a value of a (to two decimal places) satisfying $L = 2a\sinh(M/a)$.

(b) Compute the sag s.

SOLUTION

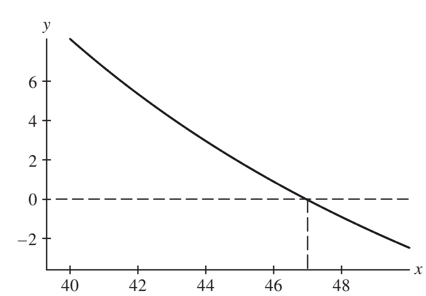
(a) Let

$$f(a) = 2a\sinh\left(\frac{50}{a}\right) - 120.$$

The graph of f shown below suggests $a \approx 47$ is a root of f. Starting with $a_0 = 47$, we find the following approximations using Newton's method:

$$a_1 = 46.95408 \quad \text{and} \quad a_2 = 46.95415$$

Thus, to two decimal places, $a = 46.95$.



(b) The sag is given by

$$s = y(M) - y(0) = \left(a\cosh\frac{M}{a} + C\right) - \left(a\cosh\frac{0}{a} + C\right) = a\cosh\frac{M}{a} - a.$$

Using $M = 50$ and $a = 46.95$, we find $s = 29.24$.

36. Assume that M is fixed.

(a) Calculate $\frac{ds}{da}$. Note that $s = a\cosh\left(\frac{M}{a}\right) - a$.

(b) Calculate $\frac{da}{dL}$ by implicit differentiation using the relation $L = 2a\sinh\left(\frac{M}{a}\right)$.

(c) Use (a) and (b) and the Chain Rule to show that

$$\frac{ds}{dL} = \frac{ds}{da}\frac{da}{dL} = \frac{\cosh(M/a) - (M/a)\sinh(M/a) - 1}{2\sinh(M/a) - (2M/a)\cosh(M/a)} \qquad \boxed{3}$$

SOLUTION The sag in the curve is

$$s = y(M) - y(0) = a\cosh\left(\frac{M}{a}\right) + C - (a\cosh 0 + C) = a\cosh\left(\frac{M}{a}\right) - a.$$

(a) $\dfrac{ds}{da} = \cosh\left(\dfrac{M}{a}\right) - \dfrac{M}{a}\sinh\left(\dfrac{M}{a}\right) - 1$

(b) If we differentiate the relation $L = 2a\sinh\left(\dfrac{M}{a}\right)$ with respect to a, we find

$$0 = 2\frac{da}{dL}\sinh\left(\frac{M}{a}\right) - \frac{2M}{a}\frac{da}{dL}\cosh\left(\frac{M}{a}\right).$$

Solving for da/dL yields

$$\frac{da}{dL} = \left(2\sinh\left(\frac{M}{a}\right) - \frac{2M}{a}\cosh\left(\frac{M}{a}\right)\right)^{-1}.$$

(c) By the Chain Rule,

$$\frac{ds}{dL} = \frac{ds}{da}\cdot\frac{da}{dL}.$$

The formula for ds/dL follows upon substituting the results from parts (a) and (b).

37. Suppose that $L = 160$ and $M = 50$.

(a) Use Newton's Method to find a value of a (to two decimal places) satisfying $L = 2a\sinh(M/a)$.

(b) Use Eq. (3) and the Linear Approximation to estimate the increase in sag Δs for changes in length $\Delta L = 1$ and $\Delta L = 5$.

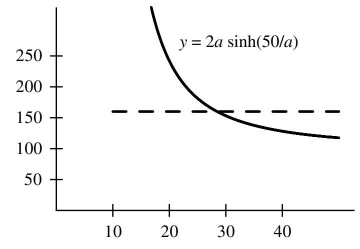
(c) CAS Compute $s(161) - s(160)$ and $s(165) - s(160)$ directly and compare with your estimates in (b).

SOLUTION

(a) Let $f(x) = 2x\sinh(50/x) - 160$. Using the graph below, we select an initial guess of $x_0 = 30$. Newton's Method then yields:

n	1	2	3
x_n	28.30622107	28.45653356	28.45797517

Thus, to two decimal places, $a \approx 28.46$.



(b) With $M = 50$ and $a \approx 28.46$, we find using Eq. (3) that

$$\frac{ds}{dL} = 0.61.$$

By the Linear Approximation,

$$\Delta s \approx \frac{ds}{dL}\cdot\Delta L.$$

If L increases from 160 to 161, then $\Delta L = 1$ and $\Delta s \approx 0.61$; if L increases from 160 to 165, then $\Delta L = 5$ and $\Delta s \approx 3.05$.

(c) When $L = 160$, $a \approx 28.46$ and

$$s(160) = 28.46 \cosh\left(\frac{50}{28.46}\right) - 28.46 \approx 56.45;$$

whereas, when $L = 161$, $a \approx 28.25$ and

$$s(161) = 28.25 \cosh\left(\frac{50}{28.25}\right) - 28.25 \approx 57.07.$$

Therefore, $s(161) - s(160) = 0.62$, very close to the approximation obtained from the Linear Approximation. Moreover, when $L = 165$, $a \approx 27.49$ and

$$s(165) = 27.49 \cosh\left(\frac{50}{27.49}\right) - 27.49 \approx 59.47;$$

thus, $s(165) - s(160) = 3.02$, again very close to the approximation obtained from the Linear Approximation.

4.9 Antiderivatives

Preliminary Questions

1. Find an antiderivative of the function $f(x) = 0$.

SOLUTION Since the derivative of any constant is zero, any constant function is an antiderivative for the function $f(x) = 0$.

2. Is there a difference between finding the general antiderivative of a function $f(x)$ and evaluating $\int f(x)\,dx$?

SOLUTION No difference. The indefinite integral is the symbol for denoting the general antiderivative.

3. Jacques was told that $f(x)$ and $g(x)$ have the same derivative, and he wonders whether $f(x) = g(x)$. Does Jacques have sufficient information to answer his question?

SOLUTION No. Knowing that the two functions have the same derivative is only good enough to tell Jacques that the functions may differ by at most an additive constant. To determine whether the functions are equal for all x, Jacques needs to know the value of each function for a single value of x. If the two functions produce the same output value for a single input value, they must take the same value for all input values.

4. Suppose that $F'(x) = f(x)$ and $G'(x) = g(x)$. Which of the following statements are true? Explain.

(a) If $f = g$, then $F = G$.
(b) If F and G differ by a constant, then $f = g$.
(c) If f and g differ by a constant, then $F = G$.

SOLUTION

(a) False. Even if $f(x) = g(x)$, the antiderivatives F and G may differ by an additive constant.
(b) True. This follows from the fact that the derivative of any constant is 0.
(c) False. If the functions f and g are different, then the antiderivatives F and G differ by a linear function: $F(x) - G(x) = ax + b$ for some constants a and b.

5. Is $y = x$ a solution of the following Initial Value Problem?

$$\frac{dy}{dx} = 1, \qquad y(0) = 1$$

SOLUTION Although $\frac{d}{dx}x = 1$, the function $f(x) = x$ takes the value 0 when $x = 0$, so $y = x$ is *not* a solution of the indicated initial value problem.

Exercises

In Exercises 1–8, find the general antiderivative of $f(x)$ and check your answer by differentiating.

1. $f(x) = 18x^2$

SOLUTION

$$\int 18x^2\,dx = 18 \int x^2\,dx = 18 \cdot \frac{1}{3}x^3 + C = 6x^3 + C.$$

As a check, we have

$$\frac{d}{dx}(6x^3 + C) = 18x^2$$

as needed.

2. $f(x) = x^{-3/5}$

SOLUTION

$$\int x^{-3/5}\,dx = \frac{x^{2/5}}{2/5} + C = \frac{5}{2}x^{2/5} + C.$$

As a check, we have

$$\frac{d}{dx}\left(\frac{5}{2}x^{2/5} + C\right) = x^{-3/5}$$

as needed.

3. $f(x) = 2x^4 - 24x^2 + 12x^{-1}$

SOLUTION

$$\begin{aligned}\int (2x^4 - 24x^2 + 12x^{-1})\,dx &= 2\int x^4\,dx - 24\int x^2\,dx + 12\int \frac{1}{x}\,dx\\ &= 2\cdot\frac{1}{5}x^5 - 24\cdot\frac{1}{3}x^3 + 12\ln|x| + C\\ &= \frac{2}{5}x^5 - 8x^3 + 12\ln|x| + C.\end{aligned}$$

As a check, we have

$$\frac{d}{dx}\left(\frac{2}{5}x^5 - 8x^3 + 12\ln|x| + C\right) = 2x^4 - 24x^2 + 12x^{-1}$$

as needed.

4. $f(x) = 9x + 15x^{-2}$

SOLUTION

$$\begin{aligned}\int (9x + 15x^{-2})\,dx &= 9\int x\,dx + 15\int x^{-2}\,dx\\ &= 9\cdot\frac{1}{2}x^2 + 15\cdot\frac{x^{-1}}{-1} + C\\ &= \frac{9}{2}x^2 - 15x^{-1} + C.\end{aligned}$$

As a check, we have

$$\frac{d}{dx}\left(\frac{9}{2}x^2 - 15x^{-1} + C\right) = 9x + 15x^{-2}$$

as needed.

5. $f(x) = 2\cos x - 9\sin x$

SOLUTION

$$\begin{aligned}\int (2\cos x - 9\sin x)\,dx &= 2\int \cos x\,dx - 9\int \sin x\,dx\\ &= 2\sin x - 9(-\cos x) + C = 2\sin x + 9\cos x + C\end{aligned}$$

As a check, we have

$$\frac{d}{dx}(2\sin x + 9\cos x + C) = 2\cos x + 9(-\sin x) = 2\cos x - 9\sin x$$

as needed.

6. $f(x) = 4x^7 - 3\cos x$

SOLUTION

$$\begin{aligned}\int (4x^7 - 3\cos x)\,dx &= 4\int x^7\,dx - 3\int \cos x\,dx\\ &= 4\cdot\frac{1}{8}x^8 - 3\sin x + C = \frac{1}{2}x^8 - 3\sin x + C.\end{aligned}$$

As a check, we have

$$\frac{d}{dx}\left(\frac{1}{2}x^8 - 3\sin x + C\right) = 4x^7 - 3\cos x,$$

as needed.

7. $f(x) = 12e^x - 5x^{-2}$

SOLUTION

$$\int (12e^x - 5x^{-2})\,dx = 12\int e^x\,dx - 5\int x^{-2}\,dx = 12e^x - 5(-x^{-1}) + C = 12e^x + 5x^{-1} + C.$$

As a check, we have

$$\frac{d}{dx}\left(12e^x + 5x^{-1} + C\right) = 12e^x + 5(-x^{-2}) = 12e^x - 5x^{-2}$$

as needed.

8. $f(x) = e^x - 4\sin x$

SOLUTION

$$\begin{aligned}\int (e^x - 4\sin x)\,dx &= e^x - 4\int \sin x\,dx \\ &= e^x - 4(-\cos x) + C = e^x + 4\cos x + C.\end{aligned}$$

As a check, we have

$$\frac{d}{dx}\left(e^x + 4\cos x + C\right) = e^x - 4\sin x$$

as needed.

9. Match functions (a)–(d) with their antiderivatives (i)–(iv).

(a) $f(x) = \sin x$	(i) $F(x) = \cos(1-x)$
(b) $f(x) = x\sin(x^2)$	(ii) $F(x) = -\cos x$
(c) $f(x) = \sin(1-x)$	(iii) $F(x) = -\frac{1}{2}\cos(x^2)$
(d) $f(x) = x\sin x$	(iv) $F(x) = \sin x - x\cos x$

SOLUTION

(a) An antiderivative of $\sin x$ is $-\cos x$, which is **(ii)**. As a check, we have $\frac{d}{dx}(-\cos x) = -(-\sin x) = \sin x$.

(b) An antiderivative of $x\sin(x^2)$ is $-\frac{1}{2}\cos(x^2)$, which is **(iii)**. This is because, by the Chain Rule, we have $\frac{d}{dx}\left(-\frac{1}{2}\cos(x^2)\right) = -\frac{1}{2}\left(-\sin(x^2)\right)\cdot 2x = x\sin(x^2)$.

(c) An antiderivative of $\sin(1-x)$ is $\cos(1-x)$ or **(i)**. As a check, we have $\frac{d}{dx}\cos(1-x) = -\sin(1-x)\cdot(-1) = \sin(1-x)$.

(d) An antiderivative of $x\sin x$ is $\sin x - x\cos x$, which is **(iv)**. This is because

$$\frac{d}{dx}(\sin x - x\cos x) = \cos x - (x(-\sin x) + \cos x\cdot 1) = x\sin x$$

In Exercises 10–39, evaluate the indefinite integral.

10. $\int (9x+2)\,dx$

SOLUTION $\int (9x+2)\,dx = \frac{9}{2}x^2 + 2x + C.$

11. $\int (4 - 18x)\, dx$

SOLUTION $\int (4 - 18x)\, dx = 4x - 9x^2 + C.$

12. $\int x^{-3}\, dx$

SOLUTION $\int x^{-3}\, dx = \dfrac{x^{-2}}{-2} + C = -\dfrac{1}{2}x^{-2} + C.$

13. $\int t^{-6/11}\, dt$

SOLUTION $\int t^{-6/11}\, dt = \dfrac{t^{5/11}}{5/11} + C = \dfrac{11}{5}t^{5/11} + C.$

14. $\int (5t^3 - t^{-3})\, dt$

SOLUTION $\int (5t^3 - t^{-3})\, dt = \dfrac{5}{4}t^4 - \dfrac{t^{-2}}{-2} + C = \dfrac{5}{4}t^4 + \dfrac{1}{2}t^{-2} + C.$

15. $\int (18t^5 - 10t^4 - 28t)\, dt$

SOLUTION $\int (18t^5 - 10t^4 - 28t)\, dt = 3t^6 - 2t^5 - 14t^2 + C.$

16. $\int 14s^{9/5}\, ds$

SOLUTION $\int 14s^{9/5}\, ds = 14 \cdot \dfrac{s^{14/5}}{14/5} + C = 5s^{14/5} + C.$

17. $\int (z^{-4/5} - z^{2/3} + z^{5/4})\, dz$

SOLUTION $\int ((z^{-4/5} - z^{2/3} + z^{5/4})\, dz = \dfrac{z^{1/5}}{1/5} - \dfrac{z^{5/3}}{5/3} + \dfrac{z^{9/4}}{9/4} + C = 5z^{1/5} - \dfrac{3}{5}z^{5/3} + \dfrac{4}{9}z^{9/4} + C.$

18. $\int \dfrac{3}{2}\, dx$

SOLUTION $\int \dfrac{3}{2}\, dx = \dfrac{3}{2}x + C.$

19. $\int \dfrac{1}{\sqrt[3]{x}}\, dx$

SOLUTION $\int \dfrac{1}{\sqrt[3]{x}}\, dx = \int x^{-1/3}\, dx = \dfrac{x^{2/3}}{2/3} + C = \dfrac{3}{2}x^{2/3} + C.$

20. $\int \dfrac{dx}{x^{4/3}}$

SOLUTION $\int \dfrac{dx}{x^{4/3}} = \int x^{-4/3}\, dx = \dfrac{x^{-1/3}}{-1/3} + C = -\dfrac{3}{x^{1/3}} + C.$

21. $\int \dfrac{36\, dt}{t^3}$

SOLUTION $\int \dfrac{36}{t^3}\, dt = \int 36t^{-3}\, dt = 36\dfrac{t^{-2}}{-2} + C = -\dfrac{18}{t^2} + C.$

22. $\int x(x^2 - 4)\, dx$

SOLUTION $\int x(x^2 - 4)\, dx = \int (x^3 - 4x)\, dx = \dfrac{1}{4}x^4 - 2x^2 + C.$

23. $\int (t^{1/2} + 1)(t + 1)\, dt$

SOLUTION

$$\begin{aligned}\int (t^{1/2} + 1)(t + 1)\, dt &= \int (t^{3/2} + t + t^{1/2} + 1)\, dt \\ &= \frac{t^{5/2}}{5/2} + \frac{1}{2}t^2 + \frac{t^{3/2}}{3/2} + t + C \\ &= \frac{2}{5}t^{5/2} + \frac{1}{2}t^2 + \frac{2}{3}t^{3/2} + t + C\end{aligned}$$

24. $\int \frac{12 - z}{\sqrt{z}}\, dz$

SOLUTION $\int \frac{12 - z}{\sqrt{z}}\, dz = \int (12z^{-1/2} - z^{1/2})\, dz = 24z^{1/2} - \frac{2}{3}z^{3/2} + C.$

25. $\int \frac{x^3 + 3x - 4}{x^2}\, dx$

SOLUTION

$$\begin{aligned}\int \frac{x^3 + 3x - 4}{x^2}\, dx &= \int (x + 3x^{-1} - 4x^{-2})\, dx \\ &= \frac{1}{2}x^2 + 3\ln|x| + 4x^{-1} + C\end{aligned}$$

26. $\int \left(\frac{1}{3}\sin x - \frac{1}{4}\cos x\right) dx$

SOLUTION $\int \left(\frac{1}{3}\sin x - \frac{1}{4}\cos x\right) dx = -\frac{1}{3}\cos x - \frac{1}{4}\sin x + C.$

27. $\int 12 \sec x \tan x\, dx$

SOLUTION $\int 12 \sec x \tan x\, dx = 12 \sec x + C.$

28. $\int (\theta + \sec^2\theta)\, d\theta$

SOLUTION $\int (\theta + \sec^2\theta)\, d\theta = \frac{1}{2}\theta^2 + \tan\theta + C.$

29. $\int (\csc t \cot t)\, dt$

SOLUTION $\int (\csc t \cot t)\, dt = -\csc t + C.$

30. $\int \sin(7x - 5)\, dx$

SOLUTION $\int \sin(7x - 5)\, dx = -\frac{1}{7}\cos(7x - 5) + C.$

31. $\int \sec^2(7 - 3\theta)\, d\theta$

SOLUTION $\int \sec^2(7 - 3\theta)\, d\theta = -\frac{1}{3}\tan(7 - 3\theta) + C.$

32. $\int (\theta - \cos(1 - \theta))\, d\theta$

SOLUTION $\int (\theta - \cos(1 - \theta))\, d\theta = \frac{1}{2}\theta^2 + \sin(1 - \theta) + C.$

33. $\int 25 \sec^2(3z + 1)\, dz$

SOLUTION $\int 25 \sec^2(3z + 1)\, dz = \frac{25}{3}\tan(3z + 1) + C.$

34. $\int \sec(x + 5)\tan(x + 5)\, dx$

SOLUTION $\int \sec(x + 5)\tan(x + 5)\, dx = \sec(x + 5) + C.$

35. $\int \left(\cos(3\theta) - \frac{1}{2}\sec^2\left(\frac{\theta}{4}\right)\right) d\theta$

SOLUTION $\int \left(\cos(3\theta) - \frac{1}{2}\sec^2\left(\frac{\theta}{4}\right)\right) d\theta = \frac{1}{3}\sin(3\theta) - 2\tan\left(\frac{\theta}{4}\right) + C.$

36. $\int \left(\frac{4}{x} - e^x\right) dx$

SOLUTION $\int \left(\frac{4}{x} - e^x\right) dx = 4\ln|x| - e^x + C.$

37. $\int (3e^{5x})\, dx$

SOLUTION $\int (3e^{5x})\, dx = \frac{3}{5}e^{5x} + C.$

38. $\int e^{3t-4}\, dt$

SOLUTION $\int e^{3t-4}\, dt = \frac{1}{3}e^{3t-4} + C.$

39. $\int (8x - 4e^{5-2x})\, dx$

SOLUTION $\int (8x - 4e^{5-2x})\, dx = 4x^2 + 2e^{5-2x} + C.$

40. In Figure 3, is graph (A) or graph (B) the graph of an antiderivative of $f(x)$?

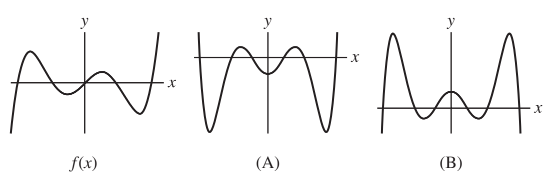


FIGURE 3

SOLUTION Let $F(x)$ be an antiderivative of $f(x)$. By definition, this means $F'(x) = f(x)$. In other words, $f(x)$ provides information as to the increasing/decreasing behavior of $F(x)$. Since, moving left to right, $f(x)$ transitions from $-$ to $+$ to $-$ to $+$ to $-$ to $+$, it follows that $F(x)$ must transition from decreasing to increasing to decreasing to increasing to decreasing to increasing. This describes the graph in (A)!

41. In Figure 4, which of graphs (A), (B), and (C) is *not* the graph of an antiderivative of $f(x)$? Explain.

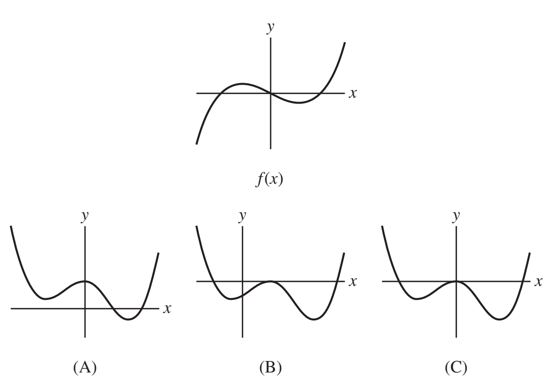

FIGURE 4

SOLUTION Let $F(x)$ be an antiderivative of $f(x)$. Notice that $f(x) = F'(x)$ changes sign from $-$ to $+$ to $-$ to $+$. Hence, $F(x)$ must transition from decreasing to increasing to decreasing to increasing.

- Both graph (A) and graph (C) meet the criteria discussed above and only differ by an additive constant. Thus either could be an antiderivative of $f(x)$.
- Graph (B) does not have the same local extrema as indicated by $f(x)$ and therefore is *not* an antiderivative of $f(x)$.

42. Show that $F(x) = \frac{1}{3}(x+13)^3$ is an antiderivative of $f(x) = (x+13)^2$.

SOLUTION Note that

$$\frac{d}{dx}F(x) = \frac{d}{dx}\frac{1}{3}(x+13)^3 = (x+13)^2.$$

Thus, $F(x) = \frac{1}{3}(x+13)^3$ is an antiderivative of $f(x) = (x+13)^2$.

In Exercises 43–46, verify by differentiation.

43. $\int (x+13)^6\,dx = \frac{1}{7}(x+13)^7 + C$

SOLUTION $\frac{d}{dx}\left(\frac{1}{7}(x+13)^7 + C\right) = (x+13)^6$ as required.

44. $\int (x+13)^{-5}\,dx = -\frac{1}{4}(x+13)^{-4} + C$

SOLUTION $\frac{d}{dx}\left(-\frac{1}{4}(x+13)^{-4} + C\right) = (x+13)^{-5}$ as required.

45. $\int (4x+13)^2\,dx = \frac{1}{12}(4x+13)^3 + C$

SOLUTION $\frac{d}{dx}\left(\frac{1}{12}(4x+13)^3 + C\right) = \frac{1}{4}(4x+13)^2(4) = (4x+13)^2$ as required.

46. $\int (ax+b)^n\,dx = \frac{1}{a(n+1)}(ax+b)^{n+1} + C$

SOLUTION $\frac{d}{dx}\left(\frac{1}{a(n+1)}(ax+b)^{n+1} + C\right) = (ax+b)^n$ as required.

In Exercises 47–62, solve the initial value problem.

47. $\frac{dy}{dx} = x^3,\ \ y(0) = 4$

SOLUTION Since $\frac{dy}{dx} = x^3$, we have

$$y = \int x^3\,dx = \frac{1}{4}x^4 + C.$$

Thus,

$$4 = y(0) = \frac{1}{4}0^4 + C = C,$$

so that $C = 4$. Therefore, $y = \frac{1}{4}x^4 + 4$.

48. $\frac{dy}{dt} = 3 - 2t,\ \ y(0) = -5$

SOLUTION Since $\frac{dy}{dt} = 3 - 2t$, we have

$$y = \int (3-2t)\,dt = 3t - t^2 + C.$$

Thus,

$$-5 = y(0) = 3(0) - (0)^2 + C = C,$$

so that $C = -5$. Therefore, $y = 3t - t^2 - 5$.

49. $\frac{dy}{dt} = 2t + 9t^2,\ \ y(1) = 2$

SOLUTION Since $\frac{dy}{dt} = 2t + 9t^2$, we have

$$y = \int (2t + 9t^2)\,dt = t^2 + 3t^3 + C.$$

Thus,

$$2 = y(1) = 1^2 + 3(1)^3 + C,$$

so that $C = -2$. Therefore $y = t^2 + 3t^3 - 2$.

50. $\dfrac{dy}{dx} = 8x^3 + 3x^2, \;\; y(2) = 0$

SOLUTION Since $\frac{dy}{dx} = 8x^3 + 3x^2$, we have

$$y = \int (8x^3 + 3x^2)\,dx = 2x^4 + x^3 + C.$$

Thus

$$0 = y(2) = 2(2)^4 + 2^3 + C,$$

so that $C = -40$. Therefore, $y = 2x^4 + x^3 - 40$.

51. $\dfrac{dy}{dt} = \sqrt{t}, \;\; y(1) = 1$

SOLUTION Since $\frac{dy}{dt} = \sqrt{t} = t^{1/2}$, we have

$$y = \int t^{1/2}\,dt = \frac{2}{3}t^{3/2} + C.$$

Thus

$$1 = y(1) = \frac{2}{3} + C,$$

so that $C = \frac{1}{3}$. Therefore, $y = \frac{2}{3}t^{3/2} + \frac{1}{3}$.

52. $\dfrac{dz}{dt} = t^{-3/2}, \;\; z(4) = -1$

SOLUTION Since $\frac{dz}{dt} = t^{-3/2}$, we have

$$z = \int t^{-3/2}\,dt = -2t^{-1/2} + C.$$

Thus

$$-1 = z(4) = -2(4)^{-1/2} + C,$$

so that $C = 0$. Therefore, $z = -2t^{-1/2}$.

53. $\dfrac{dy}{dx} = (3x + 2)^3, \;\; y(0) = 1$

SOLUTION Since $\frac{dy}{dx} = (3x + 2)^3$, we have

$$y = \int (3x + 2)^3\,dx = \frac{1}{4} \cdot \frac{1}{3}(3x + 2)^4 + C = \frac{1}{12}(3x + 2)^4 + C.$$

Thus,

$$1 = y(0) = \frac{1}{12}(2)^4 + C,$$

so that $C = 1 - \frac{4}{3} = -\frac{1}{3}$. Therefore, $y = \frac{1}{12}(3x + 2)^4 - \frac{1}{3}$.

54. $\dfrac{dy}{dt} = (4t + 3)^{-2}, \;\; y(1) = 0$

SOLUTION Since $\frac{dy}{dt} = (4t + 3)^{-2}$, we have

$$y = \int (4t + 3)^{-2}\,dt = \frac{1}{-1} \cdot \frac{1}{4}(4t + 3)^{-1} + C = -\frac{1}{4}(4t + 3)^{-1} + C.$$

Thus,

$$0 = y(1) = -\frac{1}{4}(7)^{-1} + C,$$

so that $C = \frac{1}{28}$. Therefore, $y = -\frac{1}{4}(4t + 3)^{-1} + \frac{1}{28}$.

55. $\dfrac{dy}{dx} = \sin x, \;\; y\left(\dfrac{\pi}{2}\right) = 1$

SOLUTION Since $\frac{dy}{dx} = \sin x$, we have

$$y = \int \sin x \, dx = -\cos x + C.$$

Thus

$$1 = y\left(\frac{\pi}{2}\right) = 0 + C,$$

so that $C = 1$. Therefore, $y = 1 - \cos x$.

56. $\dfrac{dy}{dz} = \sin 2z, \;\; y\left(\dfrac{\pi}{4}\right) = 4$

SOLUTION Since $\frac{dy}{dz} = \sin 2z$, we have

$$y = \int \sin 2z \, dz = -\frac{1}{2}\cos 2z + C.$$

Thus

$$4 = y\left(\frac{\pi}{4}\right) = 0 + C,$$

so that $C = 4$. Therefore, $y = 4 - \frac{1}{2}\cos 2z$.

57. $\dfrac{dy}{dx} = \cos 5x, \;\; y(\pi) = 3$

SOLUTION Since $\frac{dy}{dx} = \cos 5x$, we have

$$y = \int \cos 5x \, dx = \frac{1}{5}\sin 5x + C.$$

Thus $3 = y(\pi) = 0 + C$, so that $C = 3$. Therefore, $y = 3 + \frac{1}{5}\sin 5x$.

58. $\dfrac{dy}{dx} = \sec^2 3x, \;\; y\left(\dfrac{\pi}{4}\right) = 2$

SOLUTION Since $\frac{dy}{dx} = \sec^2 3x$, we have

$$y = \int \sec^2(3x)\, dx = \frac{1}{3}\tan(3x) + C.$$

Since $y\left(\frac{\pi}{4}\right) = 2$, we get:

$$\begin{aligned} 2 &= \frac{1}{3}\tan\left(3\frac{\pi}{4}\right) + C \\ 2 &= \frac{1}{3}(-1) + C \\ \frac{7}{3} &= C. \end{aligned}$$

Therefore, $y = \frac{1}{3}\tan(3x) + \frac{7}{3}$.

59. $\dfrac{dy}{dx} = e^x, \;\; y(2) = 0$

SOLUTION Since $\frac{dy}{dx} = e^x$, we have

$$y = \int e^x \, dx = e^x + C.$$

Thus,

$$0 = y(2) = e^2 + C,$$

so that $C = -e^2$. Therefore, $y = e^x - e^2$.

60. $\dfrac{dy}{dt} = e^{-t}, \;\; y(0) = 0$

SOLUTION Since $\frac{dy}{dt} = e^{-t}$, we have

$$y = \int e^{-t}\,dt = -e^{-t} + C.$$

Thus,

$$0 = y(0) = -e^0 + C,$$

so that $C = 1$. Therefore, $y = -e^{-t} + 1$.

61. $\dfrac{dy}{dt} = 9e^{12-3t}, \;\; y(4) = 7$

SOLUTION Since $\frac{dy}{dt} = 9e^{12-3t}$, we have

$$y = \int 9e^{12-3t}\,dt = -3e^{12-3t} + C.$$

Thus,

$$7 = y(4) = -3e^0 + C,$$

so that $C = 10$. Therefore, $y = -3e^{12-3t} + 10$.

62. $\dfrac{dy}{dt} = t + 2e^{t-9}, \;\; y(9) = 4$

SOLUTION Since $\frac{dy}{dt} = t + 2e^{t-9}$, we have

$$y = \int (t + 2e^{t-9})\,dt = \frac{1}{2}t^2 + 2e^{t-9} + C.$$

Thus,

$$4 = y(9) = \frac{1}{2}(9)^2 + 2e^0 + C,$$

so that $C = -\frac{77}{2}$. Therefore, $y = \frac{1}{2}t^2 + 2e^{t-9} - \frac{77}{2}$.

In Exercises 63–69, first find f' and then find f.

63. $f''(x) = 12x, \quad f'(0) = 1, \quad f(0) = 2$

SOLUTION Let $f''(x) = 12x$. Then $f'(x) = 6x^2 + C$. Given $f'(0) = 1$, it follows that $1 = 6(0)^2 + C$ and $C = 1$. Thus, $f'(x) = 6x^2 + 1$. Next, $f(x) = 2x^3 + x + C$. Given $f(0) = 2$, it follows that $2 = 2(0)^3 + 0 + C$ and $C = 2$. Finally, $f(x) = 2x^3 + x + 2$.

64. $f''(x) = x^3 - 2x, \quad f'(1) = 0, \quad f(1) = 2$

SOLUTION Let $f''(x) = x^3 - 2x$. Then $f'(x) = \frac{1}{4}x^4 - x^2 + C$. Given $f'(1) = 0$, it follows that $0 = \frac{1}{4}(1)^4 - (1)^2 + C$ and $C = \frac{3}{4}$. Thus, $f'(x) = \frac{1}{4}x^4 - x^2 + \frac{3}{4}$. Next, $f(x) = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{3}{4}x + C$. Given $f(1) = 2$, it follows that $2 = \frac{1}{20}(1)^5 - \frac{1}{3}(1)^3 + \frac{3}{4} + C$ and $C = \frac{23}{15}$. Finally, $f(x) = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{3}{4}x + \frac{23}{15}$.

65. $f''(x) = x^3 - 2x + 1, \quad f'(0) = 1, \quad f(0) = 0$

SOLUTION Let $g(x) = f'(x)$. The statement gives us $g'(x) = x^3 - 2x + 1$, $g(0) = 1$. From this, we get $g(x) = \frac{1}{4}x^4 - x^2 + x + C$. $g(0) = 1$ gives us $1 = C$, so $f'(x) = g(x) = \frac{1}{4}x^4 - x^2 + x + 1$. $f'(x) = \frac{1}{4}x^4 - x^2 + x + 1$, so $f(x) = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{1}{2}x^2 + x + C$. $f(0) = 0$ gives $C = 0$, so

$$f(x) = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{1}{2}x^2 + x.$$

66. $f''(x) = x^3 - 2x + 1, \quad f'(1) = 0, \quad f(1) = 4$

SOLUTION Let $g(x) = f'(x)$. The problem statement gives us $g'(x) = x^3 - 2x + 1$, $g(0) = 0$. From $g'(x)$, we get $g(x) = \frac{1}{4}x^4 - x^2 + x + C$, and from $g(1) = 0$, we get $0 = \frac{1}{4} - 1 + 1 + C$, so that $C = -\frac{1}{4}$. This gives $f'(x) = g(x) = \frac{1}{4}x^4 - x^2 + x - \frac{1}{4}$. From $f'(x)$, we get $f(x) = \frac{1}{4}(\frac{1}{5}x^5) - \frac{1}{3}x^3 + \frac{1}{2}x^2 - \frac{1}{4}x + C = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{1}{2}x^2 - \frac{1}{4}x + C$. From $f(1) = 4$, we get

$$\frac{1}{20} - \frac{1}{3} + \frac{1}{2} - \frac{1}{4} + C = 4,$$

so that $C = \frac{121}{30}$. Hence,

$$f(x) = \frac{1}{20}x^5 - \frac{1}{3}x^3 + \frac{1}{2}x^2 - \frac{1}{4}x + \frac{121}{30}.$$

67. $f''(t) = t^{-3/2}, \quad f'(4) = 1, \quad f(4) = 4$

SOLUTION Let $g(t) = f'(t)$. The problem statement is $g'(t) = t^{-3/2}$, $g(4) = 1$. From $g'(t)$ we get $g(t) = \frac{1}{-1/2}t^{-1/2} + C = -2t^{-1/2} + C$. From $g(4) = 1$ we get $-1 + C = 1$ so that $C = 2$. Hence $f'(t) = g(t) = -2t^{-1/2} + 2$. From $f'(t)$ we get $f(t) = -2\frac{1}{1/2}t^{1/2} + 2t + C = -4t^{1/2} + 2t + C$. From $f(4) = 4$ we get $-8 + 8 + C = 4$, so that $C = 4$. Hence, $f(t) = -4t^{1/2} + 2t + 4$.

68. $f''(\theta) = \cos\theta, \quad f'\left(\frac{\pi}{2}\right) = 1, \quad f\left(\frac{\pi}{2}\right) = 6$

SOLUTION Let $g(\theta) = f'(\theta)$. The problem statement gives

$$g'(\theta) = \cos\theta, \qquad g\left(\frac{\pi}{2}\right) = 1.$$

From $g'(\theta)$ we get $g(\theta) = \sin\theta + C$. From $g(\frac{\pi}{2}) = 1$ we get $1 + C = 1$, so $C = 0$. Hence $f'(\theta) = g(\theta) = \sin\theta$. From $f'(\theta)$ we get $f(\theta) = -\cos\theta + C$. From $f(\frac{\pi}{2}) = 6$ we get $C = 6$, so

$$f(\theta) = -\cos\theta + 6.$$

69. $f''(t) = t - \cos t, \quad f'(0) = 2, \quad f(0) = -2$

SOLUTION Let $g(t) = f'(t)$. The problem statement gives

$$g'(t) = t - \cos t, \qquad g(0) = 2.$$

From $g'(t)$, we get $g(t) = \frac{1}{2}t^2 - \sin t + C$. From $g(0) = 2$, we get $C = 2$. Hence $f'(t) = g(t) = \frac{1}{2}t^2 - \sin t + 2$. From $f'(t)$, we get $f(t) = \frac{1}{2}(\frac{1}{3}t^3) + \cos t + 2t + C$. From $f(0) = -2$, we get $1 + C = -2$, hence $C = -3$, and

$$f(t) = \frac{1}{6}t^3 + \cos t + 2t - 3.$$

70. Show that $F(x) = \tan^2 x$ and $G(x) = \sec^2 x$ have the same derivative. What can you conclude about the relation between F and G? Verify this conclusion directly.

SOLUTION Let $f(x) = \tan^2 x$ and $g(x) = \sec^2 x$. Then $f'(x) = 2\tan x \sec^2 x$ and $g'(x) = 2\sec x \cdot \sec x \tan x = 2\tan x \sec^2 x$; hence $f'(x) = g'(x)$. Accordingly, $f(x)$ and $g(x)$ must differ by a constant; i.e., $f(x) - g(x) = \tan^2 x - \sec^2 x = C$ for some constant C. To see that this is true directly, divide the identity $\sin^2 x + \cos^2 x = 1$ by $\cos^2 x$. This yields $\tan^2 x + 1 = \sec^2 x$, so that $\tan^2 x - \sec^2 x = -1$.

71. A particle located at the origin at $t = 1$ s moves along the x-axis with velocity $v(t) = (6t^2 - t)$ m/s. State the differential equation with initial condition satisfied by the position $s(t)$ of the particle, and find $s(t)$.

SOLUTION The differential equation satisfied by $s(t)$ is

$$\frac{ds}{dt} = v(t) = 6t^2 - t,$$

and the associated initial condition is $s(1) = 0$. From the differential equation, we find

$$s(t) = \int (6t^2 - t)\, dt = 2t^3 - \frac{1}{2}t^2 + C.$$

Using the initial condition, it follows that

$$0 = s(1) = 2 - \frac{1}{2} + C \quad \text{so} \quad C = -\frac{3}{2}.$$

Finally,

$$s(t) = 2t^3 - \frac{1}{2}t^2 - \frac{3}{2}.$$

72. A particle moves along the x-axis with velocity $v(t) = (6t^2 - t)$ m/s. Find the particle's position $s(t)$ assuming that $s(2) = 4$.

SOLUTION The differential equation satisfied by $s(t)$ is

$$\frac{ds}{dt} = v(t) = 6t^2 - t,$$

and the associated initial condition is $s(2) = 4$. From the differential equation, we find

$$s(t) = \int (6t^2 - t)\,dt = 2t^3 - \frac{1}{2}t^2 + C.$$

Using the initial condition, it follows that

$$4 = s(2) = 16 - 2 + C \quad \text{so} \quad C = -10.$$

Finally,

$$s(t) = 2t^3 - \frac{1}{2}t^2 - 10.$$

73. A mass oscillates at the end of a spring. Let $s(t)$ be the displacement of the mass from the equilibrium position at time t. Assuming that the mass is located at the origin at $t = 0$ and has velocity $v(t) = \sin(\pi t/2)$ m/s, state the differential equation with initial condition satisfied by $s(t)$, and find $s(t)$.

SOLUTION The differential equation satisfied by $s(t)$ is

$$\frac{ds}{dt} = v(t) = \sin(\pi t/2),$$

and the associated initial condition is $s(0) = 0$. From the differential equation, we find

$$s(t) = \int \sin(\pi t/2)\,dt = -\frac{2}{\pi}\cos(\pi t/2) + C.$$

Using the initial condition, it follows that

$$0 = s(0) = -\frac{2}{\pi} + C \quad \text{so} \quad C = \frac{2}{\pi}.$$

Finally,

$$s(t) = \frac{2}{\pi}(1 - \cos(\pi t/2)).$$

74. Beginning at $t = 0$ with initial velocity 4 m/s, a particle moves in a straight line with acceleration $a(t) = 3t^{1/2}$ m/s^2. Find the distance traveled after 25 seconds.

SOLUTION Given $a(t) = 3t^{1/2}$ and an initial velocity of 4 m/s, it follows that $v(t)$ satisfies

$$\frac{dv}{dt} = 3t^{1/2}, \quad v(0) = 4.$$

Thus,

$$v(t) = \int 3t^{1/2}\,dt = 2t^{3/2} + C.$$

Using the initial condition, we find

$$4 = v(0) = 2(0)^{3/2} + C \quad \text{so} \quad C = 4$$

and $v(t) = 2t^{3/2} + 4$. Next,

$$s = \int v(t)\,dt = \int (2t^{3/2} + 4)\,dt = \frac{4}{5}t^{5/2} + 4t + C.$$

Finally, the distance traveled after 25 seconds is

$$s(25) - s(0) = \frac{4}{5}(25)^{5/2} + 4(25) = 2600$$

meters.

75. A car traveling 25 m/s begins to decelerate at a constant rate of 4 m/s^2. After how many seconds does the car come to a stop and how far will the car have traveled before stopping?

SOLUTION Since the acceleration of the car is a constant -4m/s^2, v is given by the differential equation:

$$\frac{dv}{dt} = -4, \qquad v(0) = 25.$$

From $\frac{dv}{dt}$, we get $v(t) = \int -4\,dt = -4t + C$. Since $v(0)25$, $C = 25$. From this, $v(t) = -4t + 25\ \frac{\text{m}}{\text{s}}$. To find the time until the car stops, we must solve $v(t) = 0$:

$$\begin{aligned} -4t + 25 &= 0 \\ 4t &= 25 \\ t &= 25/4 = 6.25 \text{ s.} \end{aligned}$$

Now we have a differential equation for $s(t)$. Since we want to know how far the car has traveled from the beginning of its deceleration at time $t = 0$, we have $s(0) = 0$ by definition, so:

$$\frac{ds}{dt} = v(t) = -4t + 25, \qquad s(0) = 0.$$

From this, $s(t) = \int(-4t + 25)\,dt = -2t^2 + 25t + C$. Since $s(0) = 0$, we have $C = 0$, and

$$s(t) = -2t^2 + 25t.$$

At stopping time $t = 0.25$ s, the car has traveled

$$s(6.25) = -2(6.25)^2 + 25(6.25) = 78.125 \text{ m.}$$

76. At time $t = 1$ s, a particle is traveling at 72 m/s and begins to decelerate at the rate $a(t) = -t^{-1/2}$ until it stops. How far does the particle travel before stopping?

SOLUTION With $a(t) = -t^{-1/2}$ and a velocity of 72 m/s at $t = 1$ s, it follows that $v(t)$ satisfies

$$\frac{dv}{dt} = -t^{-1/2}, \quad v(1) = 72.$$

Thus,

$$v(t) = \int -t^{-1/2}\,dt = -2t^{1/2} + C.$$

Using the initial condition, we find

$$72 = v(1) = -2 + C \quad \text{so} \quad C = 74,$$

and $v(t) = 74 - 2t^{1/2}$. The particle comes to rest when

$$74 - 2t^{1/2} = 0 \quad \text{or when} \quad t = 37^2 = 1369$$

seconds. Now,

$$s(t) = \int v(t)\,dt = \int (74 - 2t^{1/2})\,dt = 74t - \frac{4}{3}t^{3/2} + C.$$

The distance traveled by the particle before it comes to rest is then

$$s(1369) - s(1) = 74(1369) - \frac{202612}{3} - 74 + \frac{4}{3} = 33696$$

meters.

77. A 900-kg rocket is released from a space station. As it burns fuel, the rocket's mass decreases and its velocity increases. Let $v(m)$ be the velocity (in meters per second) as a function of mass m. Find the velocity when $m = 729$ if $dv/dm = -50m^{-1/2}$. Assume that $v(900) = 0$.

SOLUTION Since $\frac{dv}{dm} = -50m^{-1/2}$, we have $v(m) = \int -50m^{-1/2}\,dm = -100m^{1/2} + C$. Thus $0 = v(900) = -100\sqrt{900} + C = -3000 + C$, and $C = 3000$. Therefore, $v(m) = 3000 - 100\sqrt{m}$. Accordingly,

$$v(729) = 3000 - 100\sqrt{729} = 3000 - 100(27) = 300 \text{ meters/sec.}$$

78. As water flows through a tube of radius $R = 10$ cm, the velocity v of an individual water particle depends only on its distance r from the center of the tube. The particles at the walls of the tube have zero velocity and $dv/dr = -0.06r$. Determine $v(r)$.

SOLUTION The statement amounts to the differential equation and initial condition:

$$\frac{dv}{dr} = -0.06r, \qquad v(R) = 0.$$

From $\frac{dv}{dr} = -0.06r$, we get

$$v(r) = \int -0.06r\,dr = -0.06\frac{r^2}{2} + C = -0.03r^2 + C.$$

Plugging in $v(R) = 0$, we get $-0.03R^2 + C = 0$, so that $C = 0.03R^2$. Therefore,

$$v(r) = -0.03r^2 + 0.03R^2 = 0.03(R^2 - r^2) \text{ cm/s}.$$

If $R = 10$ centimeters, we get:

$$v(r) = 0.03(10^2 - r^2).$$

79. Verify the linearity properties of the indefinite integral stated in Theorem 4.

SOLUTION To verify the Sum Rule, let $F(x)$ and $G(x)$ be any antiderivatives of $f(x)$ and $g(x)$, respectively. Because

$$\frac{d}{dx}(F(x) + G(x)) = \frac{d}{dx}F(x) + \frac{d}{dx}G(x) = f(x) + g(x),$$

it follows that $F(x) + G(x)$ is an antiderivative of $f(x) + g(x)$; i.e.,

$$\int (f(x) + g(x))\,dx = \int f(x)\,dx + \int g(x)\,dx.$$

To verify the Multiples Rule, again let $F(x)$ be any antiderivative of $f(x)$ and let c be a constant. Because

$$\frac{d}{dx}(cF(x)) = c\frac{d}{dx}F(x) = cf(x),$$

it follows that $cF(x)$ is and antiderivative of $cf(x)$; i.e.,

$$\int (cf(x))\,dx = c\int f(x)\,dx.$$

Further Insights and Challenges

80. Find constants c_1 and c_2 such that $F(x) = c_1 x\sin x + c_2\cos x$ is an antiderivative of $f(x) = x\cos x$.

SOLUTION Let $F(x) = c_1 x\sin x + c_2\cos x$. If $F(x)$ is to be an antiderivative of $f(x) = x\cos x$, we must have $F'(x) = f(x)$ for all x. Hence $c_1\,(x\cos x + \sin x) - c_2\sin x = x\cos x$ for all x. Equating coefficients on the left- and right-hand sides, we have $c_1 = 1$ (i.e., the coefficients of $x\cos x$ are equal) and $c_1 - c_2 = 0$ (i.e., the coefficients of $\sin x$ are equal). Thus $c_1 = c_2 = 1$ and hence $F(x) = x\sin x + \cos x$. As a check, we have $F'(x) = x\cos x + \sin x - \sin x = x\cos x = f(x)$, as required.

81. Find constants c_1 and c_2 such that $F(x) = c_1 xe^x + c_2 e^x$ is an antiderivative of $f(x) = xe^x$.

SOLUTION Let $F(x) = c_1 xe^x + c_2 e^x$. If $F(x)$ is to be an antiderivative of $f(x) = xe^x$, we must have $F'(x) = f(x)$ for all x. Hence,

$$c_1 xe^x + (c_1 + c_2)e^x = xe^x = 1 \cdot xe^x + 0 \cdot e^x.$$

Equating coefficients of like terms we have $c_1 = 1$ and $c_1 + c_2 = 0$. Thus, $c_1 = 1$ and $c_2 = -1$.

82. Suppose that $F'(x) = f(x)$ and $G'(x) = g(x)$. Is it true that $F(x)G(x)$ is an antiderivative of $f(x)g(x)$? Confirm or provide a counterexample.

SOLUTION Let $f(x) = x^2$ and $g(x) = x^3$. Then $F(x) = \frac{1}{3}x^3$ and $G(x) = \frac{1}{4}x^4$ are antiderivatives for $f(x)$ and $g(x)$, respectively. Let $h(x) = f(x)g(x) = x^5$, the general antiderivative of which is $H(x) = \frac{1}{6}x^6 + C$. There is no value of the constant C for which $F(x)G(x) = \frac{1}{12}x^7$ equals $H(x)$. Accordingly, $F(x)G(x)$ is *not* an antiderivative of $h(x) = f(x)g(x)$.

83. Suppose that $F'(x) = f(x)$.
(a) Show that $\frac{1}{2}F(2x)$ is an antiderivative of $f(2x)$.
(b) Find the general antiderivative of $f(kx)$ for $k \neq 0$.

SOLUTION Let $F'(x) = f(x)$.
(a) By the Chain Rule, we have

$$\frac{d}{dx}\left(\frac{1}{2}F(2x)\right) = \frac{1}{2}F'(2x) \cdot 2 = F'(2x) = f(2x).$$

Thus $\frac{1}{2}F(2x)$ is an antiderivative of $f(2x)$.
(b) For nonzero constant k, the Chain Rules gives

$$\frac{d}{dx}\left(\frac{1}{k}F(kx)\right) = \frac{1}{k}F'(kx) \cdot k = F'(kx) = f(kx).$$

Thus $\frac{1}{k}F(kx)$ is an antiderivative of $f(kx)$. Hence the general antiderivative of $f(kx)$ is $\frac{1}{k}F(kx) + C$, where C is a constant.

84. Find an antiderivative for $f(x) = |x|$.

SOLUTION Let $f(x) = |x| = \begin{cases} x & \text{for } x \geq 0 \\ -x & \text{for } x < 0 \end{cases}$. Then the general antiderivative of $f(x)$ is

$$F(x) = \int f(x)\,dx = \begin{cases} \int x\,dx & \text{for } x \geq 0 \\ \int -x\,dx & \text{for } x < 0 \end{cases} = \begin{cases} \frac{1}{2}x^2 + C & \text{for } x \geq 0 \\ -\frac{1}{2}x^2 + C & \text{for } x < 0 \end{cases}.$$

85. Using Theorem 1, prove that $F'(x) = f(x)$ where $f(x)$ is a polynomial of degree $n-1$, then $F(x)$ is a polynomial of degree n. Then prove that if $g(x)$ is any function such that $g^{(n)}(x) = 0$, then $g(x)$ is a polynomial of degree at most n.

SOLUTION Suppose $F'(x) = f(x)$ where $f(x)$ is a polynomial of degree $n-1$. Now, we know that the derivative of a polynomial of degree n is a polynomial of degree $n-1$, and hence an antiderivative of a polynomial of degree $n-1$ is a polynomial of degree n. Thus, by Theorem 1, $F(x)$ can differ from a polynomial of degree n by at most a constant term, which is still a polynomial of degree n. Now, suppose that $g(x)$ is any function such that $g^{(n+1)}(x) = 0$. We know that the $n+1$-st derivative of any polynomial of degree at most n is zero, so by repeated application of Theorem 1, $g(x)$ can differ from a polynomial of degree at most n by at most a constant term. Hence, $g(x)$ is a polynomial of degree at most n.

86. Show that $F(x) = \dfrac{x^{n+1} - 1}{n+1}$ is an antiderivative of $y = x^n$ for $n \neq -1$. Then use L'Hôpital's Rule to prove that

$$\lim_{n \to -1} F(x) = \ln x$$

In this limit, x is fixed and n is the variable. This result shows that, although the Power Rule breaks down for $n = -1$, the antiderivative of $y = x^{-1}$ is a limit of antiderivatives of x^n as $n \to -1$.

SOLUTION If $n \neq -1$, then

$$\frac{d}{dx}F(x) = \frac{d}{dx}\left(\frac{x^{n+1} - 1}{n+1}\right) = x^n.$$

Therefore, $F(x)$ is an antiderivative of $y = x^n$. Using L'Hôpital's Rule,

$$\lim_{n \to -1} F(x) = \lim_{n \to -1} \frac{x^{n+1} - 1}{n+1} = \lim_{n \to -1} \frac{x^{n+1}\ln x}{1} = \ln x.$$

CHAPTER REVIEW EXERCISES

In Exercises 1–6, estimate using the Linear Approximation or linearization, and use a calculator to estimate the error.

1. $8.1^{1/3} - 2$

SOLUTION Let $f(x) = x^{1/3}$, $a = 8$ and $\Delta x = 0.1$. Then $f'(x) = \frac{1}{3}x^{-2/3}$, $f'(a) = \frac{1}{12}$ and, by the Linear Approximation,

$$\Delta f = 8.1^{1/3} - 2 \approx f'(a)\Delta x = \frac{1}{12}(0.1) = 0.00833333.$$

Using a calculator, $8.1^{1/3} - 2 = 0.00829885$. The error in the Linear Approximation is therefore

$$|0.00829885 - 0.00833333| = 3.445 \times 10^{-5}.$$

2. $\dfrac{1}{\sqrt{4.1}} - \dfrac{1}{2}$

SOLUTION Let $f(x) = x^{-1/2}$, $a = 4$ and $\Delta x = 0.1$. Then $f'(x) = -\frac{1}{2}x^{-3/2}$, $f'(a) = -\frac{1}{16}$ and, by the Linear Approximation,

$$\Delta f = \frac{1}{\sqrt{4.1}} - \frac{1}{2} \approx f'(a)\Delta x = -\frac{1}{16}(0.1) = -0.00625.$$

Using a calculator,

$$\frac{1}{\sqrt{4.1}} - \frac{1}{2} = -0.00613520.$$

The error in the Linear Approximation is therefore

$$|-0.00613520 - (-0.00625)| = 1.148 \times 10^{-4}.$$

3. $625^{1/4} - 624^{1/4}$

SOLUTION Let $f(x) = x^{1/4}$, $a = 625$ and $\Delta x = -1$. Then $f'(x) = \frac{1}{4}x^{-3/4}$, $f'(a) = \frac{1}{500}$ and, by the Linear Approximation,

$$\Delta f = 624^{1/4} - 625^{1/4} \approx f'(a)\Delta x = \frac{1}{500}(-1) = -0.002.$$

Thus $625^{1/4} - 624^{1/4} \approx 0.002$. Using a calculator,

$$625^{1/4} - 624^{1/4} = 0.00200120.$$

The error in the Linear Approximation is therefore

$$|0.00200120 - (0.002)| = 1.201 \times 10^{-6}.$$

4. $\sqrt{101}$

SOLUTION Let $f(x) = \sqrt{x}$ and $a = 100$. Then $f(a) = 10$, $f'(x) = \frac{1}{2}x^{-1/2}$ and $f'(a) = \frac{1}{20}$. The linearization of $f(x)$ at $a = 100$ is therefore

$$L(x) = f(a) + f'(a)(x - a) = 10 + \frac{1}{20}(x - 100),$$

and $\sqrt{101} \approx L(101) = 10.05$. Using a calculator, $\sqrt{101} = 10.049876$, so the error in the Linear Approximation is

$$|10.049876 - 10.05| = 1.244 \times 10^{-4}.$$

5. $\dfrac{1}{1.02}$

SOLUTION Let $f(x) = x^{-1}$ and $a = 1$. Then $f(a) = 1$, $f'(x) = -x^{-2}$ and $f'(a) = -1$. The linearization of $f(x)$ at $a = 1$ is therefore

$$L(x) = f(a) + f'(a)(x - a) = 1 - (x - 1) = 2 - x,$$

and $\frac{1}{1.02} \approx L(1.02) = 0.98$. Using a calculator, $\frac{1}{1.02} = 0.980392$, so the error in the Linear Approximation is

$$|0.980392 - 0.98| = 3.922 \times 10^{-4}.$$

6. $\sqrt[5]{33}$

SOLUTION Let $f(x) = x^{1/5}$ and $a = 32$. Then $f(a) = 2$, $f'(x) = \frac{1}{5}x^{-4/5}$ and $f'(a) = \frac{1}{80}$. The linearization of $f(x)$ at $a = 32$ is therefore

$$L(x) = f(a) + f'(a)(x - a) = 2 + \frac{1}{80}(x - 32),$$

and $\sqrt[5]{33} \approx L(33) = 2.0125$. Using a calculator, $\sqrt[5]{33} = 2.012347$, so the error in the Linear Approximation is

$$|2.012347 - 2.0125| = 1.534 \times 10^{-4}.$$

In Exercises 7–12, find the linearization at the point indicated.

7. $y = \sqrt{x}, \quad a = 25$

SOLUTION Let $y = \sqrt{x}$ and $a = 25$. Then $y(a) = 5$, $y' = \frac{1}{2}x^{-1/2}$ and $y'(a) = \frac{1}{10}$. The linearization of y at $a = 25$ is therefore

$$L(x) = y(a) + y'(a)(x - 25) = 5 + \frac{1}{10}(x - 25).$$

8. $v(t) = 32t - 4t^2, \quad a = 2$

SOLUTION Let $v(t) = 32t - 4t^2$ and $a = 2$. Then $v(a) = 48$, $v'(t) = 32 - 8t$ and $v'(a) = 16$. The linearization of $v(t)$ at $a = 2$ is therefore

$$L(t) = v(a) + v'(a)(t - a) = 48 + 16(t - 2) = 16t + 16.$$

9. $A(r) = \frac{4}{3}\pi r^3, \quad a = 3$

SOLUTION Let $A(r) = \frac{4}{3}\pi r^3$ and $a = 3$. Then $A(a) = 36\pi$, $A'(r) = 4\pi r^2$ and $A'(a) = 36\pi$. The linearization of $A(r)$ at $a = 3$ is therefore

$$L(r) = A(a) + A'(a)(r - a) = 36\pi + 36\pi(r - 3) = 36\pi(r - 2).$$

10. $V(h) = 4h(2 - h)(4 - 2h), \quad a = 1$

SOLUTION Let $V(h) = 4h(2 - h)(4 - 2h) = 32h - 32h^2 + 8h^3$ and $a = 1$. Then $V(a) = 8$, $V'(h) = 32 - 64h + 24h^2$ and $V'(a) = -8$. The linearization of $V(h)$ at $a = 1$ is therefore

$$L(h) = V(a) + V'(a)(h - a) = 8 - 8(h - 1) = 16 - 8h.$$

11. $P(x) = e^{-x^2/2}, \quad a = 1$

SOLUTION Let $P(x) = e^{-x^2/2}$ and $a = 1$. Then $P(a) = e^{-1/2}$, $P'(x) = -xe^{-x^2/2}$, and $P'(a) = -e^{-1/2}$. The linearization of $P(x)$ at $a = 1$ is therefore

$$L(x) = P(a) + P'(a)(x - a) = e^{-1/2} - e^{-1/2}(x - 1) = \frac{1}{\sqrt{e}}(2 - x).$$

12. $f(x) = \ln(x + e), \quad a = e$

SOLUTION Let $f(x) = \ln(x + e)$ and $a = e$. Then $f(a) = \ln(2e) = 1 + \ln 2$, $P'(x) = \frac{1}{x+e}$, and $P'(a) = \frac{1}{2e}$. The linearization of $f(x)$ at $a = e$ is therefore

$$L(x) = f(a) + f'(a)(x - a) = 1 + \ln 2 + \frac{1}{2e}(x - e).$$

In Exercises 13–18, use the Linear Approximation.

13. The position of an object in linear motion at time t is $s(t) = 0.4t^2 + (t + 1)^{-1}$. Estimate the distance traveled over the time interval $[4, 4.2]$.

SOLUTION Let $s(t) = 0.4t^2 + (t + 1)^{-1}$, $a = 4$ and $\Delta t = 0.2$. Then $s'(t) = 0.8t - (t + 1)^{-2}$ and $s'(a) = 3.16$. Using the Linear Approximation, the distance traveled over the time interval $[4, 4.2]$ is approximately

$$\Delta s = s(4.2) - s(4) \approx s'(a)\Delta t = 3.16(0.2) = 0.632.$$

14. A bond that pays \$10,000 in 6 years is offered for sale at a price P. The percentage yield Y of the bond is

$$Y = 100\left(\left(\frac{10{,}000}{P}\right)^{1/6} - 1\right)$$

Verify that if $P = \$7500$, then $Y = 4.91\%$. Estimate the drop in yield if the price rises to \$7700.

SOLUTION Let $P = \$7500$. Then

$$Y = 100\left(\left(\frac{10{,}000}{7500}\right)^{1/6} - 1\right) = 4.91\%.$$

If the price is raised to \$7700, then $\Delta P = 200$. With

$$\frac{dY}{dP} = -\frac{1}{6}100(10{,}000)^{1/6}P^{-7/6} = -\frac{10^{8/3}}{6}P^{-7/6},$$

we estimate using the Linear Approximation that

$$\Delta Y \approx Y'(7500)\Delta P = -0.46\%.$$

15. When a bus pass from Albuquerque to Los Alamos is priced at p dollars, a bus company takes in a monthly revenue of $R(p) = 1.5p - 0.01p^2$ (in thousands of dollars).

(a) Estimate ΔR if the price rises from \$50 to \$53.

(b) If $p = 80$, how will revenue be affected by a small increase in price? Explain using the Linear Approximation.

SOLUTION

(a) If the price is raised from \$50 to \$53, then $\Delta p = 3$ and

$$\Delta R \approx R'(50)\Delta p = (1.5 - 0.02(50))(3) = 1.5$$

We therefore estimate an increase of \$1500 in revenue.

(b) Because $R'(80) = 1.5 - 0.02(80) = -0.1$, the Linear Approximation gives $\Delta R \approx -0.1\Delta p$. A small increase in price would thus result in a decrease in revenue.

16. A store sells 80 MP4 players per week when the players are priced at $P = \$75$. Estimate the number N sold if P is raised to \$80, assuming that $dN/dP = -4$. Estimate N if the price is lowered to \$69.

SOLUTION If P is raised to \$80, then $\Delta P = 5$. With the assumption that $dN/dP = -4$, we estimate, using the Linear Approximation, that

$$\Delta N \approx \frac{dN}{dP}\Delta P = (-4)(5) = -20;$$

therefore, we estimate that only 60 MP4 players will be sold per week when the price is \$80. On the other hand, if the price is lowered to \$69, then $\Delta P = -6$ and $\Delta N \approx (-4)(-6) = 24$. We therefore estimate that 104 MP4 players will be sold per week when the price is \$69.

17. The circumference of a sphere is measured at $C = 100$ cm. Estimate the maximum percentage error in V if the error in C is at most 3 cm.

SOLUTION The volume of a sphere is $V = \frac{4}{3}\pi r^3$ and the circumference is $C = 2\pi r$, where r is the radius of the sphere. Thus, $r = \frac{1}{2\pi}C$ and

$$V = \frac{4}{3}\pi\left(\frac{C}{2\pi}\right)^3 = \frac{1}{6\pi^2}C^3.$$

Using the Linear Approximation,

$$\Delta V \approx \frac{dV}{dC}\Delta C = \frac{1}{2\pi^2}C^2\Delta C,$$

so

$$\frac{\Delta V}{V} \approx \frac{\frac{1}{2\pi^2}C^2\Delta C}{\frac{1}{6\pi^2}C^3} = 3\frac{\Delta C}{C}.$$

With $C = 100$ cm and ΔC at most 3 cm, we estimate that the maximum percentage error in V is $3\frac{3}{100} = 0.09$, or 9%.

18. Show that $\sqrt{a^2 + b} \approx a + \frac{b}{2a}$ if b is small. Use this to estimate $\sqrt{26}$ and find the error using a calculator.

SOLUTION Let $a > 0$ and let $f(b) = \sqrt{a^2 + b}$. Then

$$f'(b) = \frac{1}{2\sqrt{a^2 + b}}.$$

By the Linear Approximation, $f(b) \approx f(0) + f'(0)b$, so

$$\sqrt{a^2 + b} \approx a + \frac{b}{2a}.$$

To estimate $\sqrt{26}$, let $a = 5$ and $b = 1$. Then

$$\sqrt{26} = \sqrt{5^2 + 1} \approx 5 + \frac{1}{10} = 5.1.$$

The error in this estimate is $|\sqrt{26} - 5.1| = 9.80 \times 10^{-4}$.

19. Use the Intermediate Value Theorem to prove that $\sin x - \cos x = 3x$ has a solution, and use Rolle's Theorem to show that this solution is unique.

SOLUTION Let $f(x) = \sin x - \cos x - 3x$, and observe that each root of this function corresponds to a solution of the equation $\sin x - \cos x = 3x$. Now,

$$f\left(-\frac{\pi}{2}\right) = -1 + \frac{3\pi}{2} > 0 \qquad \text{and} \qquad f(0) = -1 < 0.$$

Because f is continuous on $(-\frac{\pi}{2}, 0)$ and $f(-\frac{\pi}{2})$ and $f(0)$ are of opposite sign, the Intermediate Value Theorem guarantees there exists a $c \in (-\frac{\pi}{2}, 0)$ such that $f(c) = 0$. Thus, the equation $\sin x - \cos x = 3x$ has at least one solution.

Next, suppose that the equation $\sin x - \cos x = 3x$ has two solutions, and therefore $f(x)$ has two roots, say a and b. Because f is continuous on $[a, b]$, differentiable on (a, b) and $f(a) = f(b) = 0$, Rolle's Theorem guarantees there exists $c \in (a, b)$ such that $f'(c) = 0$. However,

$$f'(x) = \cos x + \sin x - 3 \leq -1$$

for all x. We have reached a contradiction. Consequently, $f(x)$ has a unique root and the equation $\sin x - \cos x = 3x$ has a unique solution.

20. Show that $f(x) = 2x^3 + 2x + \sin x + 1$ has precisely one real root.

SOLUTION We have $f(0) = 1$ and $f(-1) = -3 + \sin(-1) = -3.84 < 0$. Therefore $f(x)$ has a root in the interval $[-1, 0]$. Now, suppose that $f(x)$ has two real roots, say a and b. Because $f(x)$ is continuous on $[a, b]$ and differentiable on (a, b) and $f(a) = f(b) = 0$, Rolle's Theorem guarantees that there exists $c \in (a, b)$ such that $f'(c) = 0$. However

$$f'(x) = 6x^2 + 2 + \cos x > 0$$

for all x (since $2 + \cos x \geq 0$). We have reached a contradiction. Consequently, $f(x)$ must have precisely one real root.

21. Verify the MVT for $f(x) = \ln x$ on $[1, 4]$.

SOLUTION Let $f(x) = \ln x$. On the interval $[1, 4]$, this function is continuous and differentiable, so the MVT applies. Now, $f'(x) = \frac{1}{x}$, so

$$\frac{1}{c} = f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{\ln 4 - \ln 1}{4 - 1} = \frac{1}{3}\ln 4,$$

or

$$c = \frac{3}{\ln 4} \approx 2.164 \in (1, 4).$$

22. Suppose that $f(1) = 5$ and $f'(x) \geq 2$ for $x \geq 1$. Use the MVT to show that $f(8) \geq 19$.

SOLUTION Because f is continuous on $[1, 8]$ and differentiable on $(1, 8)$, the Mean Value Theorem guarantees there exists a $c \in (1, 8)$ such that

$$f'(c) = \frac{f(8) - f(1)}{8 - 1} \qquad \text{or} \qquad f(8) = f(1) + 7f'(c).$$

Now, we are given that $f(1) = 5$ and that $f'(x) \geq 2$ for $x \geq 1$. Therefore,

$$f(8) \geq 5 + 7(2) = 19.$$

23. Use the MVT to prove that if $f'(x) \leq 2$ for $x > 0$ and $f(0) = 4$, then $f(x) \leq 2x + 4$ for all $x \geq 0$.

SOLUTION Let $x > 0$. Because f is continuous on $[0, x]$ and differentiable on $(0, x)$, the Mean Value Theorem guarantees there exists a $c \in (0, x)$ such that

$$f'(c) = \frac{f(x) - f(0)}{x - 0} \qquad \text{or} \qquad f(x) = f(0) + xf'(c).$$

Now, we are given that $f(0) = 4$ and that $f'(x) \leq 2$ for $x > 0$. Therefore, for all $x \geq 0$,

$$f(x) \leq 4 + x(2) = 2x + 4.$$

24. A function $f(x)$ has derivative $f'(x) = \dfrac{1}{x^4+1}$. Where on the interval $[1, 4]$ does $f(x)$ take on its maximum value?

SOLUTION Let

$$f'(x) = \frac{1}{x^4+1}.$$

Because $f'(x)$ is never 0 and exists for all x, the function f has no critical points on the interval $[1, 4]$ and so must take its maximum value at one of the interval endpoints. Moveover, as $f'(x) > 0$ for all x, the function f is increasing for all x. Consequently, on the interval $[1, 4]$, the function f must take its maximum value at $x = 4$.

In Exercises 25–30, find the critical points and determine whether they are minima, maxima, or neither.

25. $f(x) = x^3 - 4x^2 + 4x$

SOLUTION Let $f(x) = x^3 - 4x^2 + 4x$. Then $f'(x) = 3x^2 - 8x + 4 = (3x-2)(x-2)$, so that $x = \frac{2}{3}$ and $x = 2$ are critical points. Next, $f''(x) = 6x - 8$, so $f''(\frac{2}{3}) = -4 < 0$ and $f''(2) = 4 > 0$. Therefore, by the Second Derivative Test, $f(\frac{2}{3})$ is a local maximum while $f(2)$ is a local minimum.

26. $s(t) = t^4 - 8t^2$

SOLUTION Let $s(t) = t^4 - 8t^2$. Then $s'(t) = 4t^3 - 16t = 4t(t-2)(t+2)$, so that $t = 0$, $t = -2$ and $t = 2$ are critical points. Next, $s''(t) = 12t^2 - 16$, so $s''(-2) = 32 > 0$, $s''(0) = -16 < 0$ and $s''(2) = 32 > 0$. Therefore, by the Second Derivative Test, $s(0)$ is a local maximum while $s(-2)$ and $s(2)$ are local minima.

27. $f(x) = x^2(x+2)^3$

SOLUTION Let $f(x) = x^2(x+2)^3$. Then

$$f'(x) = 3x^2(x+2)^2 + 2x(x+2)^3 = x(x+2)^2(3x+2x+4) = x(x+2)^2(5x+4),$$

so that $x = 0$, $x = -2$ and $x = -\frac{4}{5}$ are critical points. The sign of the first derivative on the intervals surrounding the critical points is indicated in the table below. Based on this information, $f(-2)$ is neither a local maximum nor a local minimum, $f(-\frac{4}{5})$ is a local maximum and $f(0)$ is a local minimum.

Interval	$(-\infty, -2)$	$(-2, -\frac{4}{5})$	$(-\frac{4}{5}, 0)$	$(0, \infty)$
Sign of f'	$+$	$+$	$-$	$+$

28. $f(x) = x^{2/3}(1-x)$

SOLUTION Let $f(x) = x^{2/3}(1-x) = x^{2/3} - x^{5/3}$. Then

$$f'(x) = \frac{2}{3}x^{-1/3} - \frac{5}{3}x^{2/3} = \frac{2-5x}{3x^{1/3}},$$

so that $x = 0$ and $x = \frac{2}{5}$ are critical points. The sign of the first derivative on the intervals surrounding the critical points is indicated in the table below. Based on this information, $f(0)$ is a local minimum and $f(\frac{2}{5})$ is a local maximum.

Interval	$(-\infty, 0)$	$(0, \frac{2}{5})$	$(\frac{2}{5}, \infty)$
Sign of f'	$-$	$+$	$-$

29. $g(\theta) = \sin^2\theta + \theta$

SOLUTION Let $g(\theta) = \sin^2\theta + \theta$. Then

$$g'(\theta) = 2\sin\theta\cos\theta + 1 = 2\sin 2\theta + 1,$$

so the critical points are

$$\theta = \frac{3\pi}{4} + n\pi$$

for all integers n. Because $g'(\theta) \geq 0$ for all θ, it follows that $g\left(\dfrac{3\pi}{4} + n\pi\right)$ is neither a local maximum nor a local minimum for all integers n.

30. $h(\theta) = 2\cos 2\theta + \cos 4\theta$

SOLUTION Let $h(\theta) = 2\cos 2\theta + \cos 4\theta$. Then

$$h'(\theta) = -4\sin 2\theta - 4\sin 4\theta = -4\sin 2\theta(1 + 2\cos 2\theta),$$

so the critical points are

$$\theta = \frac{n\pi}{2}, \quad \theta = \frac{\pi}{3} + \pi n \quad \text{and} \quad \theta = \frac{2\pi}{3} + \pi n$$

for all integers n. Now,

$$h''(\theta) = -8\cos 2\theta - 16\cos 4\theta,$$

so

$$h''\left(\frac{n\pi}{2}\right) = -8\cos n\pi - 16\cos 2n\pi = -8(-1)^n - 16 < 0;$$

$$h''\left(\frac{\pi}{3} + n\pi\right) = -8\cos\frac{2\pi}{3} - 16\cos\frac{4\pi}{3} = 12 > 0; \text{ and}$$

$$h''\left(\frac{2\pi}{3} + n\pi\right) = -8\cos\frac{4\pi}{3} - 16\cos\frac{8\pi}{3} = 12 > 0,$$

for all integers n. Therefore, by the Second Derivative Test, $h\left(\frac{n\pi}{2}\right)$ is a local maximum, and $h\left(\frac{\pi}{3} + n\pi\right)$ and $h\left(\frac{2\pi}{3} + n\pi\right)$ are local minima for all integers n.

In Exercises 31–38, find the extreme values on the interval.

31. $f(x) = x(10 - x), \quad [-1, 3]$

SOLUTION Let $f(x) = x(10 - x) = 10x - x^2$. Then $f'(x) = 10 - 2x$, so that $x = 5$ is the only critical point. As this critical point is not in the interval $[-1, 3]$, we only need to check the value of f at the endpoints to determine the extreme values. Because $f(-1) = -11$ and $f(3) = 21$, the maximum value of $f(x) = x(10 - x)$ on the interval $[-1, 3]$ is 21 while the minimum value is -11.

32. $f(x) = 6x^4 - 4x^6, \quad [-2, 2]$

SOLUTION Let $f(x) = 6x^4 - 4x^6$. Then $f'(x) = 24x^3 - 24x^5 = 24x^3(1 - x^2)$, so that the critical points are $x = -1$, $x = 0$ and $x = 1$. The table below lists the value of f at each of the critical points and the endpoints of the interval $[-2, 2]$. Based on this information, the minimum value of $f(x) = 6x^4 - 4x^6$ on the interval $[-2, 2]$ is -170 and the maximum value is 2.

x	-2	-1	0	1	2
$f(x)$	-170	2	0	2	-170

33. $g(\theta) = \sin^2\theta - \cos\theta, \quad [0, 2\pi]$

SOLUTION Let $g(\theta) = \sin^2\theta - \cos\theta$. Then

$$g'(\theta) = 2\sin\theta\cos\theta + \sin\theta = \sin\theta(2\cos\theta + 1) = 0$$

when $\theta = 0, \frac{2\pi}{3}, \pi, \frac{4\pi}{3}, 2\pi$. The table below lists the value of g at each of the critical points and the endpoints of the interval $[0, 2\pi]$. Based on this information, the minimum value of $g(\theta)$ on the interval $[0, 2\pi]$ is -1 and the maximum value is $\frac{5}{4}$.

θ	0	$2\pi/3$	π	$4\pi/3$	2π
$g(\theta)$	-1	5/4	1	5/4	-1

34. $R(t) = \dfrac{t}{t^2 + t + 1}, \quad [0, 3]$

SOLUTION Let $R(t) = \frac{t}{t^2+t+1}$. Then

$$R'(t) = \frac{t^2 + t + 1 - t(2t + 1)}{(t^2 + t + 1)^2} = \frac{1 - t^2}{(t^2 + t + 1)^2},$$

so that the critical points are $t = \pm 1$. Note that only $t = 1$ is on the interval $[0, 3]$. With $R(0) = 0$, $R(1) = \frac{1}{3}$ and $R(3) = \frac{3}{13}$, it follows that the minimum value of $R(t)$ on the interval $[0, 3]$ is 0 and the maximum value is $\frac{1}{3}$.

35. $f(x) = x^{2/3} - 2x^{1/3}$, $[-1, 3]$

SOLUTION Let $f(x) = x^{2/3} - 2x^{1/3}$. Then $f'(x) = \frac{2}{3}x^{-1/3} - \frac{2}{3}x^{-2/3} = \frac{2}{3}x^{-2/3}(x^{1/3} - 1)$, so that the critical points are $x = 0$ and $x = 1$. With $f(-1) = 3$, $f(0) = 0$, $f(1) = -1$ and $f(3) = \sqrt[3]{9} - 2\sqrt[3]{3} \approx -0.804$, it follows that the minimum value of $f(x)$ on the interval $[-1, 3]$ is -1 and the maximum value is 3.

36. $f(x) = x - \tan x$, $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

SOLUTION Let $f(x) = x - \tan x$. Then $f'(x) = 1 - \sec^2 x$, so that $x = 0$ is the only critical point on $[-1, 1]$. With $f(-1) = -1 - \tan(-1) > 0$, $f(0) = 0$ and $f(1) = 1 - \tan 1 < 0$, it follows that the minimum value of $f(x)$ on the interval $[-1, 1]$ is $1 - \tan 1 \approx -0.557$ and the maximum value is $-1 - \tan(-1) = -1 + \tan 1 \approx 0.557$.

37. $f(x) = x - 12\ln x$, $[5, 40]$

SOLUTION Let $f(x) = x - 12\ln x$. Then $f'(x) = 1 - \frac{12}{x}$, whence $x = 12$ is the only critical point. The minimum value of f is then $12 - 12\ln 12 \approx -17.818880$, and the maximum value is $40 - 12\ln 40 \approx -4.266553$. Note that $f(5) = 5 - 12\ln 5 \approx -14.313255$.

38. $f(x) = e^x - 20x - 1$, $[0, 5]$

SOLUTION Let $f(x) = e^x - 20x - 1$. Then $f'(x) = e^x - 20$, whence $x = \ln 20$ is the only critical point. The minimum value of f is then $20 - 20\ln 20 - 1 \approx --40.914645$, and the maximum value is $e^5 - 101 \approx 47.413159$. Note that $f(0) = 0$.

39. Find the critical points and extreme values of $f(x) = |x - 1| + |2x - 6|$ in $[0, 8]$.

SOLUTION Let

$$f(x) = |x-1| + |2x-6| = \begin{cases} 7 - 3x, & x < 1 \\ 5 - x, & 1 \le x < 3 \\ 3x - 7, & x \ge 3 \end{cases}.$$

The derivative of $f(x)$ is never zero but does not exist at the transition points $x = 1$ and $x = 3$. Thus, the critical points of f are $x = 1$ and $x = 3$. With $f(0) = 7$, $f(1) = 4$, $f(3) = 2$ and $f(8) = 17$, it follows that the minimum value of $f(x)$ on the interval $[0, 8]$ is 2 and the maximum value is 17.

40. Match the description of $f(x)$ with the graph of its *derivative* $f'(x)$ in Figure 1.

(a) $f(x)$ is increasing and concave up.

(b) $f(x)$ is decreasing and concave up.

(c) $f(x)$ is increasing and concave down.

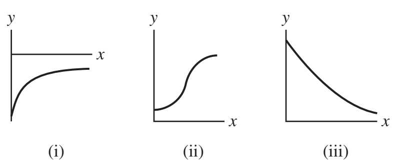

FIGURE 1 Graphs of the derivative.

SOLUTION

(a) If $f(x)$ is increasing and concave up, then $f'(x)$ is positive and increasing. This matches the graph in (ii).

(b) If $f(x)$ is decreasing and concave up, then $f'(x)$ is negative and increasing. This matches the graph in (i).

(c) If $f(x)$ is increasing and concave down, then $f'(x)$ is positive and decreasing. This matches the graph in (iii).

In Exercises 41–46, find the points of inflection.

41. $y = x^3 - 4x^2 + 4x$

SOLUTION Let $y = x^3 - 4x^2 + 4x$. Then $y' = 3x^2 - 8x + 4$ and $y'' = 6x - 8$. Thus, $y'' > 0$ and y is concave up for $x > \frac{4}{3}$, while $y'' < 0$ and y is concave down for $x < \frac{4}{3}$. Hence, there is a point of inflection at $x = \frac{4}{3}$.

42. $y = x - 2\cos x$

SOLUTION Let $y = x - 2\cos x$. Then $y' = 1 + 2\sin x$ and $y'' = 2\cos x$. Thus, $y'' > 0$ and y is concave up on each interval of the form

$$\left(\frac{(4n-1)\pi}{2}, \frac{(4n+1)\pi}{2}\right),$$

while $y'' < 0$ and y is concave down on each interval of the form

$$\left(\frac{(4n+1)\pi}{2}, \frac{(4n+3)\pi}{2}\right),$$

where n is any integer. Hence, there is a point of inflection at

$$x = \frac{(2n+1)\pi}{2}$$

for each integer n.

43. $y = \dfrac{x^2}{x^2+4}$

SOLUTION Let $y = \dfrac{x^2}{x^2+4} = 1 - \dfrac{4}{x^2+4}$. Then $y' = \dfrac{8x}{(x^2+4)^2}$ and

$$y'' = \frac{(x^2+4)^2(8) - 8x(2)(2x)(x^2+4)}{(x^2+4)^4} = \frac{8(4-3x^2)}{(x^2+4)^3}.$$

Thus, $y'' > 0$ and y is concave up for

$$-\frac{2}{\sqrt{3}} < x < \frac{2}{\sqrt{3}},$$

while $y'' < 0$ and y is concave down for

$$|x| \geq \frac{2}{\sqrt{3}}.$$

Hence, there are points of inflection at

$$x = \pm\frac{2}{\sqrt{3}}.$$

44. $y = \dfrac{x}{(x^2-4)^{1/3}}$

SOLUTION Let $y = \dfrac{x}{(x^2-4)^{1/3}}$. Then

$$y' = \frac{(x^2-4)^{1/3} - \frac{1}{3}x(x^2-4)^{-2/3}(2x)}{(x^2-4)^{2/3}} = \frac{1}{3}\frac{x^2-12}{(x^2-4)^{4/3}}$$

and

$$y'' = \frac{1}{3}\frac{(x^2-4)^{4/3}(2x) - (x^2-12)\frac{4}{3}(x^2-4)^{1/3}(2x)}{(x^2-4)^{8/3}} = \frac{2x(36-x^2)}{9(x^2-4)^{7/3}}.$$

Thus, $y'' > 0$ and y is concave up for $x < -6, -2 < x < 0, 2 < x < 6$, while $y'' < 0$ and y is concave down for $-6 < x < -2, 0 < x < 2, x > 6$. Hence, there are points of inflection at $x = \pm 6$ and $x = 0$. Note that $x = \pm 2$ are not points of inflection because these points are not in the domain of the function.

45. $f(x) = (x^2 - x)e^{-x}$

SOLUTION Let $f(x) = (x^2 - x)e^{-x}$. Then

$$y' = -(x^2 - x)e^{-x} + (2x - 1)e^{-x} = -(x^2 - 3x + 1)e^{-x},$$

and

$$y'' = (x^2 - 3x + 1)e^{-x} - (2x - 3)e^{-x} = e^{-x}(x^2 - 5x + 4) = e^{-x}(x - 1)(x - 4).$$

Thus, $y'' > 0$ and y is concave up for $x < 1$ and for $x > 4$, while $y'' < 0$ and y is concave down for $1 < x < 4$. Hence, there are points of inflection at $x = 1$ and $x = 4$.

46. $f(x) = x(\ln x)^2$

SOLUTION Let $f(x) = x(\ln x)^2$. Then

$$y' = x \cdot 2\ln x \cdot \frac{1}{x} + (\ln x)^2 = 2\ln x + (\ln x)^2,$$

and

$$y'' = \frac{2}{x} + \frac{2}{x} \ln x = \frac{2}{x}(1 + \ln x).$$

Thus, $y'' > 0$ and y is concave up for $x > \frac{1}{e}$, while $y'' < 0$ and y is concave down for $0 < x < \frac{1}{e}$. Hence, there is a point of inflection at $x = \frac{1}{e}$.

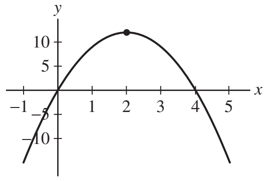
In Exercises 47–56, sketch the graph, noting the transition points and asymptotic behavior.

47. $y = 12x - 3x^2$

SOLUTION Let $y = 12x - 3x^2$. Then $y' = 12 - 6x$ and $y'' = -6$. It follows that the graph of $y = 12x - 3x^2$ is increasing for $x < 2$, decreasing for $x > 2$, has a local maximum at $x = 2$ and is concave down for all x. Because

$$\lim_{x \to \pm\infty} (12x - 3x^2) = -\infty,$$

the graph has no horizontal asymptotes. There are also no vertical asymptotes. The graph is shown below.

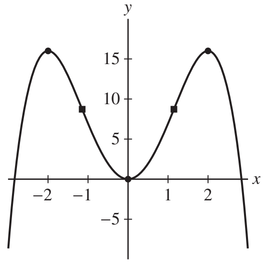


48. $y = 8x^2 - x^4$

SOLUTION Let $y = 8x^2 - x^4$. Then $y' = 16x - 4x^3 = 4x(4 - x^2)$ and $y'' = 16 - 12x^2 = 4(4 - 3x^2)$. It follows that the graph of $y = 8x^2 - x^4$ is increasing for $x < -2$ and $0 < x < 2$, decreasing for $-2 < x < 0$ and $x > 2$, has local maxima at $x = \pm 2$, has a local minimum at $x = 0$, is concave down for $|x| > 2/\sqrt{3}$, is concave up for $|x| < 2/\sqrt{3}$ and has inflection points at $x = \pm 2/\sqrt{3}$. Because

$$\lim_{x \to \pm\infty} (8x^2 - x^4) = -\infty,$$

the graph has no horizontal asymptotes. There are also no vertical asymptotes. The graph is shown below.

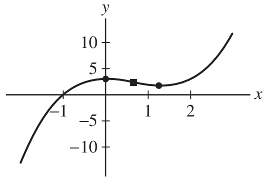


49. $y = x^3 - 2x^2 + 3$

SOLUTION Let $y = x^3 - 2x^2 + 3$. Then $y' = 3x^2 - 4x$ and $y'' = 6x - 4$. It follows that the graph of $y = x^3 - 2x^2 + 3$ is increasing for $x < 0$ and $x > \frac{4}{3}$, is decreasing for $0 < x < \frac{4}{3}$, has a local maximum at $x = 0$, has a local minimum at $x = \frac{4}{3}$, is concave up for $x > \frac{2}{3}$, is concave down for $x < \frac{2}{3}$ and has a point of inflection at $x = \frac{2}{3}$. Because

$$\lim_{x \to -\infty} (x^3 - 2x^2 + 3) = -\infty \qquad \text{and} \qquad \lim_{x \to \infty} (x^3 - 2x^2 + 3) = \infty,$$

the graph has no horizontal asymptotes. There are also no vertical asymptotes. The graph is shown below.

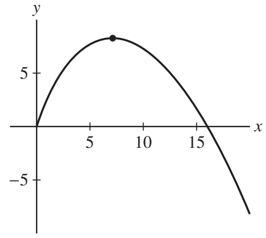


50. $y = 4x - x^{3/2}$

SOLUTION Let $y = 4x - x^{3/2}$. First note that the domain of this function is $x \geq 0$. Now, $y' = 4 - \frac{3}{2}x^{1/2}$ and $y'' = -\frac{3}{4}x^{-1/2}$. It follows that the graph of $y = 4x - x^{3/2}$ is increasing for $0 < x < \frac{64}{9}$, is decreasing for $x > \frac{64}{9}$, has a local maximum at $x = \frac{64}{9}$ and is concave down for all $x > 0$. Because

$$\lim_{x\to\infty}(4x - x^{3/2}) = -\infty,$$

the graph has no horizontal asymptotes. There are also no vertical asymptotes. The graph is shown below.



51. $y = \dfrac{x}{x^3+1}$

SOLUTION Let $y = \dfrac{x}{x^3+1}$. Then

$$y' = \frac{x^3 + 1 - x(3x^2)}{(x^3+1)^2} = \frac{1 - 2x^3}{(x^3+1)^2}$$

and

$$y'' = \frac{(x^3+1)^2(-6x^2) - (1-2x^3)(2)(x^3+1)(3x^2)}{(x^3+1)^4} = -\frac{6x^2(2-x^3)}{(x^3+1)^3}.$$

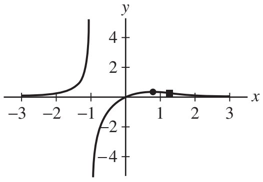
It follows that the graph of $y = \dfrac{x}{x^3+1}$ is increasing for $x < -1$ and $-1 < x < \sqrt[3]{\frac{1}{2}}$, is decreasing for $x > \sqrt[3]{\frac{1}{2}}$, has a local maximum at $x = \sqrt[3]{\frac{1}{2}}$, is concave up for $x < -1$ and $x > \sqrt[3]{2}$, is concave down for $-1 < x < 0$ and $0 < x < \sqrt[3]{2}$ and has a point of inflection at $x = \sqrt[3]{2}$. Note that $x = -1$ is not an inflection point because $x = -1$ is not in the domain of the function. Now,

$$\lim_{x\to\pm\infty}\frac{x}{x^3+1} = 0,$$

so $y = 0$ is a horizontal asymptote. Moreover,

$$\lim_{x\to-1-}\frac{x}{x^3+1} = \infty \qquad \text{and} \qquad \lim_{x\to-1+}\frac{x}{x^3+1} = -\infty,$$

so $x = -1$ is a vertical asymptote. The graph is shown below.



52. $y = \dfrac{x}{(x^2-4)^{2/3}}$

SOLUTION Let $y = \dfrac{x}{(x^2-4)^{2/3}}$. Then

$$y' = \frac{(x^2-4)^{2/3} - \frac{2}{3}x(x^2-4)^{-1/3}(2x)}{(x^2-4)^{4/3}} = -\frac{1}{3}\frac{x^2+12}{(x^2-4)^{5/3}}$$

and

$$y'' = -\frac{1}{3}\frac{(x^2-4)^{5/3}(2x) - (x^2+12)\frac{5}{3}(x^2-4)^{2/3}(2x)}{(x^2-4)^{10/3}} = \frac{4x(x^2+36)}{9(x^2-4)^{8/3}}.$$

It follows that the graph of $y = \dfrac{x}{(x^2-4)^{2/3}}$ is increasing for $-2 < x < 2$, is decreasing for $|x| > 2$, has no local extreme values, is concave up for $0 < x < 2$, $x > 2$, is concave down for $x < -2$, $-2 < x < 0$ and has a point of inflection at $x = 0$. Note that $x = \pm 2$ are neither local extreme values nor inflection points because $x = \pm 2$ are not in the domain of the function. Now,

$$\lim_{x\to\pm\infty} \frac{x}{(x^2-4)^{2/3}} = 0,$$

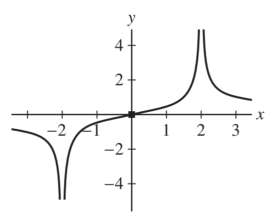
so $y = 0$ is a horizontal asymptote. Moreover,

$$\lim_{x\to -2-} \frac{x}{(x^2-4)^{2/3}} = -\infty \qquad \text{and} \qquad \lim_{x\to -2+} \frac{x}{(x^2-4)^{2/3}} = -\infty$$

while

$$\lim_{x\to 2-} \frac{x}{(x^2-4)^{2/3}} = \infty \qquad \text{and} \qquad \lim_{x\to 2+} \frac{x}{(x^2-4)^{2/3}} = \infty,$$

so $x = \pm 2$ are vertical asymptotes. The graph is shown below.

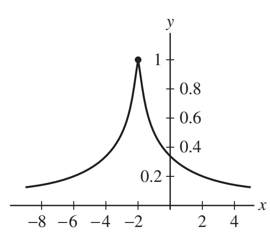


53. $y = \dfrac{1}{|x+2|+1}$

SOLUTION Let $y = \dfrac{1}{|x+2|+1}$. Because

$$\lim_{x\to\pm\infty} \frac{1}{|x+2|+1} = 0,$$

the graph of this function has a horizontal asymptote of $y = 0$. The graph has no vertical asymptotes as $|x+2|+1 \geq 1$ for all x. The graph is shown below. From this graph we see there is a local maximum at $x = -2$.



54. $y = \sqrt{2 - x^3}$

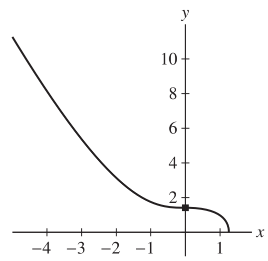
SOLUTION Let $y = \sqrt{2-x^3}$. Note that the domain of this function is $x \leq \sqrt[3]{2}$. Moreover, the graph has no vertical and no horizontal asymptotes. With

$$y' = \frac{1}{2}(2-x^3)^{-1/2}(-3x^2) = -\frac{3x^2}{2\sqrt{2-x^3}}$$

and

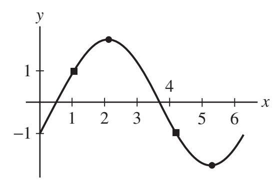
$$y'' = \frac{1}{2}(2-x^3)^{-1/2}(-6x) - \frac{3}{4}x^2(2-x^3)^{-3/2}(3x^2) = \frac{3x(x^3-8)}{4(2-x^3)^{3/2}},$$

it follows that the graph of $y = \sqrt{2-x^3}$ is decreasing over its entire domain, is concave up for $x < 0$, is concave down for $0 < x < \sqrt[3]{2}$ and has a point of inflection at $x = 0$. The graph is shown below.



55. $y = \sqrt{3}\sin x - \cos x$ on $[0, 2\pi]$

SOLUTION Let $y = \sqrt{3}\sin x - \cos x$. Then $y' = \sqrt{3}\cos x + \sin x$ and $y'' = -\sqrt{3}\sin x + \cos x$. It follows that the graph of $y = \sqrt{3}\sin x - \cos x$ is increasing for $0 < x < 5\pi/6$ and $11\pi/6 < x < 2\pi$, is decreasing for $5\pi/6 < x < 11\pi/6$, has a local maximum at $x = 5\pi/6$, has a local minimum at $x = 11\pi/6$, is concave up for $0 < x < \pi/3$ and $4\pi/3 < x < 2\pi$, is concave down for $\pi/3 < x < 4\pi/3$ and has points of inflection at $x = \pi/3$ and $x = 4\pi/3$. The graph is shown below.



56. $y = 2x - \tan x$ on $[0, 2\pi]$

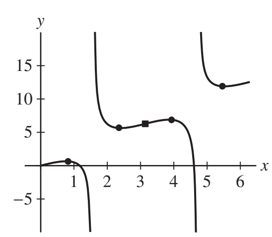
SOLUTION Let $y = 2x - \tan x$. Then $y' = 2 - \sec^2 x$ and $y'' = -2\sec^2 x \tan x$. It follows that the graph of $y = 2x - \tan x$ is increasing for $0 < x < \pi/4, 3\pi/4 < x < 5\pi/4, 7\pi/4 < x < 2\pi$, is decreasing for $\pi/4 < x < \pi/2, \pi/2 < x < 3\pi/4, 5\pi/4 < x < 3\pi/2, 3\pi/2 < x < 7\pi/4$, has local minima at $x = 3\pi/4$ and $x = 7\pi/4$, has local maxima at $x = \pi/4$ and $x = 5\pi/4$, is concave up for $\pi/2 < x < \pi$ and $3\pi/2 < x < 2\pi$, is concave down for $0 < x < \pi/2$ and $\pi < x < 3\pi/2$ and has an inflection point at $x = \pi$. Moreover, because

$$\lim_{x\to\pi/2-} (2x - \tan x) = -\infty \qquad \text{and} \qquad \lim_{x\to\pi/2+} (2x - \tan x) = \infty,$$

while

$$\lim_{x\to 3\pi/2-} (2x - \tan x) = -\infty \qquad \text{and} \qquad \lim_{x\to 3\pi/2+} (2x - \tan x) = \infty,$$

the graph has vertical asymptotes at $x = \pi/2$ and $x = 3\pi/2$. The graph is shown below.



57. Draw a curve $y = f(x)$ for which f' and f'' have signs as indicated in Figure 2.

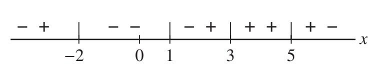


FIGURE 2

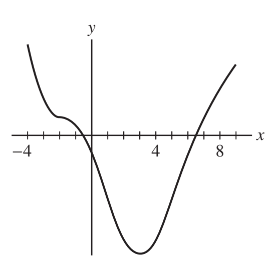
SOLUTION The figure below depicts a curve for which $f'(x)$ and $f''(x)$ have the required signs.



58. Find the dimensions of a cylindrical can with a bottom but no top of volume 4 m^3 that uses the least amount of metal.

SOLUTION Let the cylindrical can have height h and radius r. Then

$$V = \pi r^2 h = 4 \quad \text{so} \quad h = \frac{4}{\pi r^2}.$$

The amount of metal needed to make the can is then

$$M = 2\pi r h + \pi r^2 = \frac{8}{r} + \pi r^2.$$

Now,

$$M'(r) = -\frac{8}{r^2} + 2\pi r = 0 \quad \text{when} \quad r = \sqrt[3]{\frac{4}{\pi}}.$$

Because $M \to \infty$ as $r \to 0+$ and as $r \to \infty$, M must achieve its minimum for

$$r = \sqrt[3]{\frac{4}{\pi}} \text{ m}.$$

The height of the can is

$$h = \frac{4}{\pi r^2} = \sqrt[3]{\frac{4}{\pi}} \text{ m}.$$

59. A rectangular box of height h with square base of side b has volume $V = 4$ m^3. Two of the side faces are made of material costing \$40/m^2. The remaining sides cost \$20/m^2. Which values of b and h minimize the cost of the box?

SOLUTION Because the volume of the box is

$$V = b^2 h = 4 \quad \text{it follows that} \quad h = \frac{4}{b^2}.$$

Now, the cost of the box is

$$C = 40(2bh) + 20(2bh) + 20b^2 = 120bh + 20b^2 = \frac{480}{b} + 20b^2.$$

Thus,

$$C'(b) = -\frac{480}{b^2} + 40b = 0$$

when $b = \sqrt[3]{12}$ meters. Because $C(b) \to \infty$ as $b \to 0+$ and as $b \to \infty$, it follows that cost is minimized when $b = \sqrt[3]{12}$ meters and $h = \frac{1}{3}\sqrt[3]{12}$ meters.

60. The corn yield on a certain farm is

$$Y = -0.118x^2 + 8.5x + 12.9 \quad \text{(bushels per acre)}$$

where x is the number of corn plants per acre (in thousands). Assume that corn seed costs \$1.25 (per thousand seeds) and that corn can be sold for \$1.50/bushel. Let $P(x)$ be the profit (revenue minus the cost of seeds) at planting level x.

(a) Compute $P(x_0)$ for the value x_0 that maximizes yield Y.

(b) Find the maximum value of $P(x)$. Does maximum yield lead to maximum profit?

SOLUTION

(a) Let $Y = -0.118x^2 + 8.5x + 12.9$. Then $Y' = -0.236x + 8.5 = 0$ when

$$x_0 = \frac{8.5}{0.236} = 36.017 \text{ thousand corn plants/acre}.$$

Because $Y'' = -0.236 < 0$ for all x, x_0 corresponds to a maximum value for Y. Thus, yield is maximized for a planting level of 36,017 corn plants per acre. At this planting level, the profit is

$$1.5Y(x_0) - 1.25x_0 = 1.5(165.972) - 1.25(36.017) = \$203.94/\text{acre}.$$

(b) As a function of planting level x, the profit is

$$P(x) = 1.5Y(x) - 1.25x = -0.177x^2 + 11.5x + 19.35.$$

Then, $P'(x) = -0.354x + 11.5 = 0$ when

$$x_1 = \frac{11.5}{0.354} = 32.486 \text{ thousand corn plants/acre.}$$

Because $P''(x) = -0.354 < 0$ for all x, x_1 corresponds to a maximum value for P. Thus, profit is maximized for a planting level of 32,486 corn plants per acre.

(c) Note the planting levels obtained in parts (a) and (b) are different. Thus, a maximum yield does not lead to maximum profit.

61. Let $N(t)$ be the size of a tumor (in units of 10^6 cells) at time t (in days). According to the **Gompertz Model**, $dN/dt = N(a - b\ln N)$ where a, b are positive constants. Show that the maximum value of N is $e^{\frac{a}{b}}$ and that the tumor increases most rapidly when $N = e^{\frac{a}{b}-1}$.

SOLUTION Given $dN/dt = N(a - b\ln N)$, the critical points of N occur when $N = 0$ and when $N = e^{a/b}$. The sign of $N'(t)$ changes from positive to negative at $N = e^{a/b}$ so the maximum value of N is $e^{a/b}$. To determine when N changes most rapidly, we calculate

$$N''(t) = N\left(-\frac{b}{N}\right) + a - b\ln N = (a - b) - b\ln N.$$

Thus, $N'(t)$ is increasing for $N < e^{a/b-1}$, is decreasing for $N > e^{a/b-1}$ and is therefore maximum when $N = e^{a/b-1}$. Therefore, the tumor increases most rapidly when $N = e^{\frac{a}{b}-1}$.

62. A truck gets 10 miles per gallon of diesel fuel traveling along an interstate highway at 50 mph. This mileage decreases by 0.15 mpg for each mile per hour increase above 50 mph.

(a) If the truck driver is paid \$30/hour and diesel fuel costs P = \$3/gal, which speed v between 50 and 70 mph will minimize the cost of a trip along the highway? Notice that the actual cost depends on the length of the trip, but the optimal speed does not.

(b) GU Plot cost as a function of v (choose the length arbitrarily) and verify your answer to part (a).

(c) GU Do you expect the optimal speed v to increase or decrease if fuel costs go down to P = \$2/gal? Plot the graphs of cost as a function of v for $P = 2$ and $P = 3$ on the same axis and verify your conclusion.

SOLUTION

(a) If the truck travels L miles at a speed of v mph, then the time required is L/v, and the wages paid to the driver are $30L/v$. The cost of the fuel is

$$\frac{3L}{10 - 0.15(v - 50)} = \frac{3L}{17.5 - 0.15v};$$

the total cost is therefore

$$C(v) = \frac{30L}{v} + \frac{3L}{17.5 - 0.15v}.$$

Solving

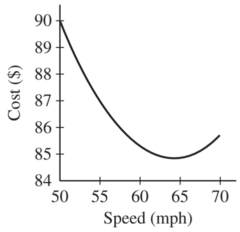
$$C'(v) = L\left(-\frac{30}{v^2} + \frac{0.45}{(17.5 - 0.15v)^2}\right) = 0$$

yields

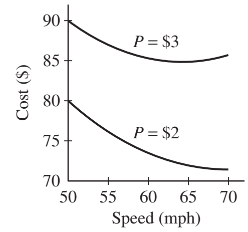
$$v = \frac{175\sqrt{6}}{3 + 1.5\sqrt{6}} \approx 64.2 \text{ mph.}$$

Because $C(50) = 0.9L$, $C(64.2) \approx 0.848L$ and $C(70) \approx 0.857L$, we see that the optimal speed is $v \approx 64.2$ mph.

(b) The cost as a function of speed is shown below for $L = 100$. The optimal speed is clearly around 64 mph.



(c) We expect v to increase if P goes down to \$2 per gallon. When gas is cheaper, it is better to drive faster and thereby save on the driver's wages. The cost as a function of speed for $P = 2$ and $P = 3$ is shown below (with $L = 100$). When $P = 2$, the optimal speed is $v = 70$ mph, which is an increase over the optimal speed when $P = 3$.



63. Find the maximum volume of a right-circular cone placed upside-down in a right-circular cone of radius $R = 3$ and height $H = 4$ as in Figure 3. A cone of radius r and height h has volume $\frac{1}{3}\pi r^2 h$.

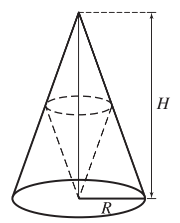


FIGURE 3

SOLUTION Let r denote the radius and h the height of the upside down cone. By similar triangles, we obtain the relation

$$\frac{4-h}{r} = \frac{4}{3} \qquad \text{so} \qquad h = 4\left(1 - \frac{r}{3}\right)$$

and the volume of the upside down cone is

$$V(r) = \frac{1}{3}\pi r^2 h = \frac{4}{3}\pi\left(r^2 - \frac{r^3}{3}\right)$$

for $0 \le r \le 3$. Thus,

$$\frac{dV}{dr} = \frac{4}{3}\pi\left(2r - r^2\right),$$

and the critical points are $r = 0$ and $r = 2$. Because $V(0) = V(3) = 0$ and

$$V(2) = \frac{4}{3}\pi\left(4 - \frac{8}{3}\right) = \frac{16}{9}\pi,$$

the maximum volume of a right-circular cone placed upside down in a right-circular cone of radius 3 and height 4 is

$$\frac{16}{9}\pi.$$

64. Redo Exercise 63 for arbitrary R and H.

SOLUTION Let r denote the radius and h the height of the upside down cone. By similar triangles, we obtain the relation

$$\frac{H-h}{r} = \frac{H}{R} \qquad \text{so} \qquad h = H\left(1 - \frac{r}{R}\right)$$

and the volume of the upside down cone is

$$V(r) = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi H\left(r^2 - \frac{r^3}{R}\right)$$

for $0 \le r \le R$. Thus,

$$\frac{dV}{dr} = \frac{1}{3}\pi H\left(2r - \frac{3r^2}{R}\right),$$

and the critical points are $r = 0$ and $r = 2R/3$. Because $V(0) = V(R) = 0$ and

$$V\left(\frac{2R}{3}\right) = \frac{1}{3}\pi H\left(\frac{4R^2}{9} - \frac{8R^2}{27}\right) = \frac{4}{81}\pi R^2 H,$$

the maximum volume of a right-circular cone placed upside down in a right-circular cone of radius R and height H is

$$\frac{4}{81}\pi R^2 H.$$

65. Show that the maximum area of a parallelogram $ADEF$ that is inscribed in a triangle ABC, as in Figure 4, is equal to one-half the area of $\triangle ABC$.

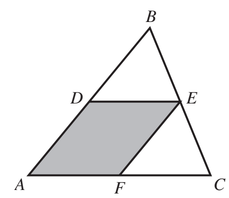

FIGURE 4

SOLUTION Let θ denote the measure of angle BAC. Then the area of the parallelogram is given by $\overline{AD}\cdot\overline{AF}\sin\theta$. Now, suppose that

$$\overline{BE}/\overline{BC} = x.$$

Then, by similar triangles, $\overline{AD} = (1-x)\overline{AB}$, $\overline{AF} = \overline{DE} = x\overline{AC}$, and the area of the parallelogram becomes $\overline{AB}\cdot\overline{AC}x(1-x)\sin\theta$. The function $x(1-x)$ achieves its maximum value of $\frac{1}{4}$ when $x = \frac{1}{2}$. Thus, the maximum area of a parallelogram inscribed in a triangle ΔABC is

$$\frac{1}{4}\overline{AB}\cdot\overline{AC}\sin\theta = \frac{1}{2}\left(\frac{1}{2}\overline{AB}\cdot\overline{AC}\sin\theta\right) = \frac{1}{2}\,(\text{area of }\Delta ABC)\,.$$

66. A box of volume 8 m^3 with a square top and bottom is constructed out of two types of metal. The metal for the top and bottom costs \$50/m^2 and the metal for the sides costs \$30/m^2. Find the dimensions of the box that minimize total cost.

SOLUTION Let the square base have side length s and the box have height h. Then

$$V = s^2 h = 8 \quad\text{so}\quad h = \frac{8}{s^2}.$$

The cost of the box is then

$$C = 100s^2 + 120sh = 100s^2 + \frac{960}{s}.$$

Now,

$$C'(s) = 200s - \frac{960}{s^2} = 0 \quad\text{when}\quad s = \sqrt[3]{4.8}.$$

Because $C(s)\to\infty$ as $s\to 0+$ and as $s\to\infty$, it follows that total cost is minimized when $s = \sqrt[3]{4.8} \approx 1.69$ meters. The height of the box is

$$h = \frac{8}{s^2} \approx 2.81 \text{ meters}.$$

67. Let $f(x)$ be a function whose graph does not pass through the x-axis and let $Q = (a, 0)$. Let $P = (x_0, f(x_0))$ be the point on the graph closest to Q (Figure 5). Prove that $\overline{PQ}$ is perpendicular to the tangent line to the graph of x_0. *Hint:* Find the minimum value of the *square* of the distance from $(x, f(x))$ to $(a, 0)$.

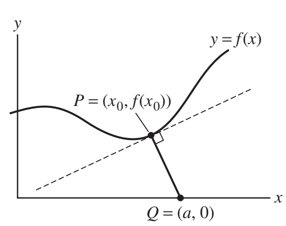

FIGURE 5

SOLUTION Let $P = (a, 0)$ and let $Q = (x_0, f(x_0))$ be the point on the graph of $y = f(x)$ closest to P. The slope of the segment joining P and Q is then

$$\frac{f(x_0)}{x_0 - a}.$$

Now, let

$$q(x) = \sqrt{(x-a)^2 + (f(x))^2},$$

the distance from the arbitrary point $(x, f(x))$ on the graph of $y = f(x)$ to the point P. As $(x_0, f(x_0))$ is the point closest to P, we must have

$$q'(x_0) = \frac{2(x_0 - a) + 2f(x_0)f'(x_0)}{\sqrt{(x_0-a)^2 + (f(x_0))^2}} = 0.$$

Thus,

$$f'(x_0) = -\frac{x_0 - a}{f(x_0)} = -\left(\frac{f(x_0)}{x_0 - a}\right)^{-1}.$$

In other words, the slope of the segment joining P and Q is the negative reciprocal of the slope of the line tangent to the graph of $y = f(x)$ at $x = x_0$; hence; the two lines are perpendicular.

68. Take a circular piece of paper of radius R, remove a sector of angle θ (Figure 6), and fold the remaining piece into a cone-shaped cup. Which angle θ produces the cup of largest volume?

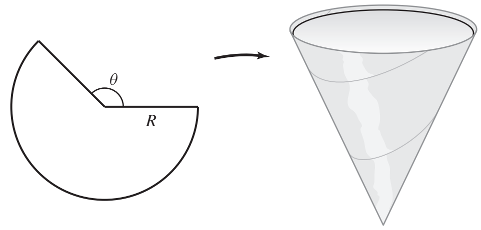

FIGURE 6

SOLUTION Let r denote the radius and h denote the height of the cone-shaped cup. Having removed an angle of θ from the paper, there is an arc of length $(2\pi - \theta)R$ remaining to form the circumference of the cup; hence

$$r = \frac{(2\pi - \theta)R}{2\pi} = \left(1 - \frac{\theta}{2\pi}\right)R.$$

The height of the cup is then

$$h = \sqrt{R^2 - \left(1 - \frac{\theta}{2\pi}\right)^2 R^2} = R\sqrt{1 - \left(1 - \frac{\theta}{2\pi}\right)^2},$$

and the volume of the cup is

$$V(\theta) = \frac{1}{3}\pi R^3 \left(1 - \frac{\theta}{2\pi}\right)^2 \sqrt{1 - \left(1 - \frac{\theta}{2\pi}\right)^2}$$

for $0 \le \theta \le 2\pi$. Now,

$$\begin{aligned}\frac{dV}{d\theta} &= 2\left(1 - \frac{\theta}{2\pi}\right)\left(-\frac{1}{2\pi}\right)\sqrt{1 - \left(1 - \frac{\theta}{2\pi}\right)^2} + \left(1 - \frac{\theta}{2\pi}\right)^2 \frac{(-2)\left(1 - \frac{\theta}{2\pi}\right)\left(-\frac{1}{2\pi}\right)}{\sqrt{1 - \left(1 - \frac{\theta}{2\pi}\right)^2}} \\ &= \left(1 - \frac{\theta}{2\pi}\right)\left(-\frac{1}{2\pi}\right)\frac{2\left(1 - \left(1 - \frac{\theta}{2\pi}\right)^2\right) - \left(1 - \frac{\theta}{2\pi}\right)^2}{\sqrt{1 - \left(1 - \frac{\theta}{2\pi}\right)^2}},\end{aligned}$$

so that $\theta = 2\pi$ and $\theta = 2\pi \pm \frac{2\pi\sqrt{6}}{3}$ are critical points. With $V(0) = V(2\pi) = 0$ and

$$V\left(2\pi - \frac{2\pi\sqrt{6}}{3}\right) = \frac{2\sqrt{3}}{27}\pi R^3,$$

the volume of the cup is maximized when $\theta = 2\pi - \frac{2\pi\sqrt{6}}{3}$.

69. Use Newton's Method to estimate $\sqrt[3]{25}$ to four decimal places.

SOLUTION Let $f(x) = x^3 - 25$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 - 25}{3x_n^2}.$$

With $x_0 = 3$, we find

n	1	2	3
x_n	2.925925926	2.924018982	2.924017738

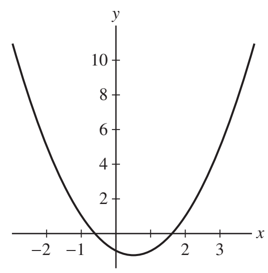
Thus, to four decimal places $\sqrt[3]{25} = 2.9240$.

70. Use Newton's Method to find a root of $f(x) = x^2 - x - 1$ to four decimal places.

SOLUTION Let $f(x) = x^2 - x - 1$ and define

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - x_n - 1}{2x_n - 1}.$$

The graph below suggests the two roots of $f(x)$ are located near $x = -1$ and $x = 2$.



With $x_0 = -1$, we find

n	1	2	3	4
x_n	−0.6666666667	−0.6190476191	−0.6180344477	−0.6180339889

On the other hand, with $x_0 = 2$, we find

n	1	2	3	4
x_n	1.666666667	1.619047619	1.618034448	1.618033989

Thus, to four decimal places, the roots of $f(x) = x^2 - x - 1$ are -0.6180 and 1.6180.

In Exercises 71–84, calculate the indefinite integral.

71. $\int (4x^3 - 2x^2)\,dx$

SOLUTION $\int (4x^3 - 2x^2)\,dx = x^4 - \frac{2}{3}x^3 + C.$

72. $\int x^{9/4}\,dx$

SOLUTION $\int x^{9/4}\,dx = \frac{4}{13}x^{13/4} + C.$

73. $\int \sin(\theta - 8)\,d\theta$

SOLUTION $\int \sin(\theta - 8)\,d\theta = -\cos(\theta - 8) + C.$

74. $\int \cos(5 - 7\theta)\,d\theta$

SOLUTION $\int \cos(5 - 7\theta)\,d\theta = -\frac{1}{7}\sin(5 - 7\theta) + C.$

75. $\int (4t^{-3} - 12t^{-4})\, dt$

SOLUTION $\int (4t^{-3} - 12t^{-4})\, dt = -2t^{-2} + 4t^{-3} + C.$

76. $\int (9t^{-2/3} + 4t^{7/3})\, dt$

SOLUTION $\int (9t^{-2/3} + 4t^{7/3})\, dt = 27t^{1/3} + \frac{6}{5}t^{10/3} + C.$

77. $\int \sec^2 x\, dx$

SOLUTION $\int \sec^2 x\, dx = \tan x + C.$

78. $\int \tan 3\theta \sec 3\theta\, d\theta$

SOLUTION $\int \tan 3\theta \sec 3\theta\, d\theta = \frac{1}{3}\sec 3\theta + C.$

79. $\int (y+2)^4\, dy$

SOLUTION $\int (y+2)^4\, dy = \frac{1}{5}(y+2)^5 + C.$

80. $\int \frac{3x^3 - 9}{x^2}\, dx$

SOLUTION $\int \frac{3x^3 - 9}{x^2}\, dx = \int (3x - 9x^{-2})\, dx = \frac{3}{2}x^2 + 9x^{-1} + C.$

81. $\int (e^x - x)\, dx$

SOLUTION $\int (e^x - x)\, dx = e^x - \frac{1}{2}x^2 + C.$

82. $\int e^{-4x}\, dx$

SOLUTION $\int e^{-4x}\, dx = -\frac{1}{4}e^{-4x} + C.$

83. $\int 4x^{-1}\, dx$

SOLUTION $\int 4x^{-1}\, dx = 4\ln|x| + C.$

84. $\int \sin(4x - 9)\, dx$

SOLUTION $\int \sin(4x - 9)\, dx = -\frac{1}{4}\cos(4x - 9) + C.$

In Exercises 85–90, solve the differential equation with the given initial condition.

85. $\frac{dy}{dx} = 4x^3, \quad y(1) = 4$

SOLUTION Let $\frac{dy}{dx} = 4x^3$. Then

$$y(x) = \int 4x^3\, dx = x^4 + C.$$

Using the initial condition $y(1) = 4$, we find $y(1) = 1^4 + C = 4$, so $C = 3$. Thus, $y(x) = x^4 + 3$.

86. $\dfrac{dy}{dt} = 3t^2 + \cos t, \quad y(0) = 12$

SOLUTION Let $\frac{dy}{dt} = 3t^2 + \cos t$. Then

$$y(t) = \int (3t^2 + \cos t)\,dt = t^3 + \sin t + C.$$

Using the initial condition $y(0) = 12$, we find $y(0) = 0^3 + \sin 0 + C = 12$, so $C = 12$. Thus, $y(t) = t^3 + \sin t + 12$.

87. $\dfrac{dy}{dx} = x^{-1/2}, \quad y(1) = 1$

SOLUTION Let $\frac{dy}{dx} = x^{-1/2}$. Then

$$y(x) = \int x^{-1/2}\,dx = 2x^{1/2} + C.$$

Using the initial condition $y(1) = 1$, we find $y(1) = 2\sqrt{1} + C = 1$, so $C = -1$. Thus, $y(x) = 2x^{1/2} - 1$.

88. $\dfrac{dy}{dx} = \sec^2 x, \quad y\left(\frac{\pi}{4}\right) = 2$

SOLUTION Let $\frac{dy}{dx} = \sec^2 x$. Then

$$y(x) = \int \sec^2 x\,dx = \tan x + C.$$

Using the initial condition $y(\frac{\pi}{4}) = 2$, we find $y(\frac{\pi}{4}) = \tan\frac{\pi}{4} + C = 2$, so $C = 1$. Thus, $y(x) = \tan x + 1$.

89. $\dfrac{dy}{dx} = e^{-x}, \quad y(0) = 3$

SOLUTION Let $\frac{dy}{dx} = e^{-x}$. Then

$$y(x) = \int e^{-x}\,dx = -e^{-x} + C.$$

Using the initial condition $y(0) = 3$, we find $y(0) = -e^0 + C = 3$, so $C = 4$. Thus, $y(x) = 4 - e^{-x}$.

90. $\dfrac{dy}{dx} = e^{4x}, \quad y(1) = 1$

SOLUTION Let $\frac{dy}{dx} = e^{4x}$. Then

$$y(x) = \int e^{4x}\,dx = \frac{1}{4}e^{4x} + C.$$

Using the initial condition $y(1) = 1$, we find $y(1) = \frac{1}{4}e^4 + C = 1$, so $C = 1 - \frac{1}{4}e^4$. Thus, $y(x) = \frac{1}{4}e^{4x} + 1 - \frac{1}{4}e^4$.

91. Find $f(t)$ if $f''(t) = 1 - 2t$, $f(0) = 2$, and $f'(0) = -1$.

SOLUTION Suppose $f''(t) = 1 - 2t$. Then

$$f'(t) = \int f''(t)\,dt = \int (1 - 2t)\,dt = t - t^2 + C.$$

Using the initial condition $f'(0) = -1$, we find $f'(0) = 0 - 0^2 + C = -1$, so $C = -1$. Thus, $f'(t) = t - t^2 - 1$. Now,

$$f(t) = \int f'(t)\,dt = \int (t - t^2 - 1)\,dt = \frac{1}{2}t^2 - \frac{1}{3}t^3 - t + C.$$

Using the initial condition $f(0) = 2$, we find $f(0) = \frac{1}{2}0^2 - \frac{1}{3}0^3 - 0 + C = 2$, so $C = 2$. Thus,

$$f(t) = \frac{1}{2}t^2 - \frac{1}{3}t^3 - t + 2.$$

92. At time $t = 0$, a driver begins decelerating at a constant rate of -10 m/s^2 and comes to a halt after traveling 500 m. Find the velocity at $t = 0$.

SOLUTION From the constant deceleration of -10 m/s^2, we determine

$$v(t) = \int (-10)\,dt = -10t + v_0,$$

where v_0 is the velocity of the automobile at $t = 0$. Note the automobile comes to a halt when $v(t) = 0$, which occurs at

$$t = \frac{v_0}{10}\text{ s}.$$

The distance traveled during the braking process is

$$s(t) = \int v(t)\,dt = -5t^2 + v_0 t + C,$$

for some arbitrary constant C. We are given that the braking distance is 500 meters, so

$$s\left(\frac{v_0}{10}\right) - s(0) = -5\left(\frac{v_0}{10}\right)^2 + v_0\left(\frac{v_0}{10}\right) + C - C = 500,$$

leading to

$$v_0 = 100\text{ m/s}.$$

93. Find the local extrema of $f(x) = \dfrac{e^{2x}+1}{e^{x+1}}$.

SOLUTION To simplify the differentiation, we first rewrite $f(x) = \frac{e^{2x}+1}{e^{x+1}}$ using the Laws of Exponents:

$$f(x) = \frac{e^{2x}}{e^{x+1}} + \frac{1}{e^{x+1}} = e^{2x-(x+1)} + e^{-(x+1)} = e^{x-1} + e^{-x-1}.$$

Now,

$$f'(x) = e^{x-1} - e^{-x-1}.$$

Setting the derivative equal to zero yields

$$e^{x-1} - e^{-x-1} = 0 \quad\text{or}\quad e^{x-1} = e^{-x-1}.$$

Thus,

$$x - 1 = -x - 1 \quad\text{or}\quad x = 0.$$

Next, we use the Second Derivative Test. With $f''(x) = e^{x-1} + e^{-x-1}$, it follows that

$$f''(0) = e^{-1} + e^{-1} = \frac{2}{e} > 0.$$

Hence, $x = 0$ is a local minimum. Since $f(0) = e^{0-1} + e^{-0-1} = \frac{2}{e}$, we conclude that the point $(0, \frac{2}{e})$ is a local minimum.

94. Find the points of inflection of $f(x) = \ln(x^2+1)$, and at each point, determine whether the concavity changes from up to down or from down to up.

SOLUTION With $f(x) = \ln(x^2+1)$, we find

$$f'(x) = \frac{2x}{x^2+1};\ \text{and}$$

$$f''(x) = \frac{2\left(x^2+1\right) - 2x\cdot 2x}{(x^2+1)^2} = \frac{2(1-x^2)}{(x^2+1)^2}$$

Thus, $f''(x) > 0$ for $-1 < x < 1$, whereas $f''(x) < 0$ for $x < -1$ and for $x > 1$. It follows that there are points of inflection at $x = \pm 1$, and that the concavity of f changes from down to up at $x = -1$ and from up to down at $x = 1$.

In Exercises 95–98, find the local extrema and points of inflection, and sketch the graph. Use L'Hôpital's Rule to determine the limits as $x \to 0+$ or $x \to \pm\infty$ if necessary.

95. $y = x\ln x \quad (x > 0)$

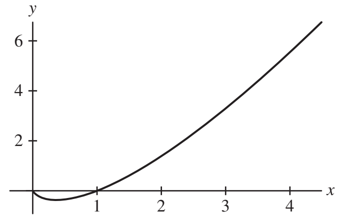
SOLUTION Let $y = x\ln x$. Then

$$y' = \ln x + x\left(\frac{1}{x}\right) = 1 + \ln x,$$

and $y'' = \frac{1}{x}$. Solving $y' = 0$ yields the critical point $x = e^{-1}$. Since $y''(e^{-1}) = e > 0$, the function has a local minimum at $x = e^{-1}$. y'' is positive for $x > 0$, hence the function is concave up for $x > 0$ and there are no points of inflection. As $x \to 0+$ and as $x \to \infty$, we find

$$\lim_{x\to 0+} x \ln x = \lim_{x\to 0+} \frac{\ln x}{x^{-1}} = \lim_{x\to 0+} \frac{x^{-1}}{-x^{-2}} = \lim_{x\to 0+}(-x) = 0;$$
$$\lim_{x\to\infty} x \ln x = \infty.$$

The graph is shown below:



96. $y = e^{x-x^2}$

SOLUTION Let $y = e^{x-x^2}$. Then $y' = (1-2x)e^{x-x^2}$ and

$$y'' = (1-2x)^2 e^{x-x^2} - 2e^{x-x^2} = (4x^2 - 4x - 1)e^{x-x^2}.$$

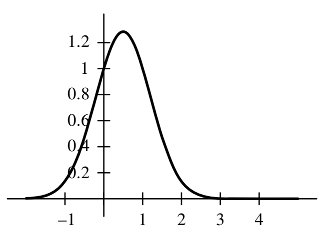
Solving $y' = 0$ yields the critical point $x = \frac{1}{2}$. Since

$$y''\left(\frac{1}{2}\right) = -2e^{1/4} < 0,$$

the function has a local maximum at $x = \frac{1}{2}$. Using the quadratic formula, we find that $y'' = 0$ when $x = \frac{1}{2} \pm \frac{1}{2}\sqrt{2}$. $y'' > 0$ and the function is concave up for $x < \frac{1}{2} - \frac{1}{2}\sqrt{2}$ and for $x > \frac{1}{2} + \frac{1}{2}\sqrt{2}$, whereas $y'' < 0$ and the function is concave down for $\frac{1}{2} - \frac{1}{2}\sqrt{2} < x < \frac{1}{2} + \frac{1}{2}\sqrt{2}$; hence, there are inflection points at $x = \frac{1}{2} \pm \frac{1}{2}\sqrt{2}$. As $x \to \pm\infty$, $x - x^2 \to -\infty$ so

$$\lim_{x\to\pm\infty} e^{x-x^2} = 0.$$

The graph is shown below.



97. $y = x(\ln x)^2 \quad (x > 0)$

SOLUTION Let $y = x(\ln x)^2$. Then

$$y' = x\frac{2\ln x}{x} + (\ln x)^2 = 2\ln x + (\ln x)^2 = \ln x(2 + \ln x),$$

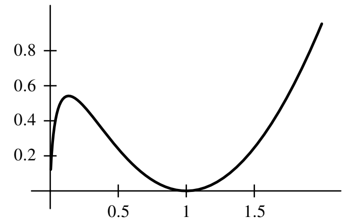
and

$$y'' = \frac{2}{x} + \frac{2\ln x}{x} = \frac{2}{x}(1 + \ln x).$$

Solving $y' = 0$ yields the critical points $x = e^{-2}$ and $x = 1$. Since $y''(e^{-2}) = -2e^2 < 0$ and $y''(1) = 2 > 0$, the function has a local maximum at $x = e^{-2}$ and a local minimum at $x = 1$. $y'' < 0$ and the function is concave down for $x < e^{-1}$, whereas $y'' > 0$ and the function is concave up for $x > e^{-1}$; hence, there is a point of inflection at $x = e^{-1}$. As $x \to 0+$ and as $x \to \infty$, we find

$$\lim_{x\to 0+} x(\ln x)^2 = \lim_{x\to 0+} \frac{(\ln x)^2}{x^{-1}} = \lim_{x\to 0+} \frac{2\ln x \cdot x^{-1}}{-x^{-2}} = \lim_{x\to 0+} \frac{2\ln x}{-x^{-1}} = \lim_{x\to 0+} \frac{2x^{-1}}{x^{-2}} = \lim_{x\to 0+} 2x = 0;$$
$$\lim_{x\to\infty} x(\ln x)^2 = \infty.$$

The graph is shown below:



98. $y = \tan^{-1}\left(\dfrac{x^2}{4}\right)$

SOLUTION Let $y = \tan^{-1}\left(\frac{x^2}{4}\right)$. Then

$$y' = \frac{1}{1+\left(\frac{x^2}{4}\right)^2}\frac{x}{2} = \frac{8x}{x^4+16},$$

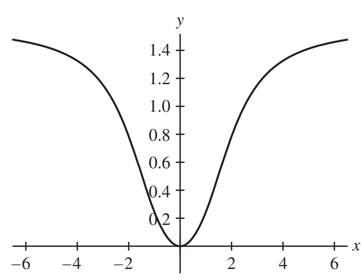
and

$$y'' = \frac{8(x^4+16) - 8x \cdot 4x^3}{(x^4+16)^2} = \frac{128 - 24x^4}{(x^4+16)^2}.$$

Solving $y' = 0$ yields $x = 0$ as the only critical point. Because $y''(0) = \frac{1}{2} > 0$, we conclude the function has a local minimum at $x = 0$. Moreover, $y'' < 0$ for $x < -2 \cdot 3^{-1/4}$ and for $x > 2 \cdot 3^{-1/4}$, whereas $y'' > 0$ for $-2 \cdot 3^{-1/4} < x < 2 \cdot 3^{-1/4}$. Therefore, there are points of inflection at $x = \pm 2 \cdot 3^{-1/4}$. As $x \to \pm\infty$, we find

$$\lim_{x\to\pm\infty} \tan^{-1}\left(\frac{x^2}{4}\right) = \frac{\pi}{2}.$$

The graph is shown below:



99. Explain why L'Hôpital's Rule gives no information about $\lim\limits_{x\to\infty} \dfrac{2x - \sin x}{3x + \cos 2x}$. Evaluate the limit by another method.

SOLUTION As $x \to \infty$, both $2x - \sin x$ and $3x + \cos 2x$ tend toward infinity, so L'Hôpital's Rule applies to $\lim\limits_{x\to\infty} \dfrac{2x - \sin x}{3x + \cos 2x}$; however, the resulting limit, $\lim\limits_{x\to\infty} \dfrac{2 - \cos x}{3 - 2\sin 2x}$, does not exist due to the oscillation of $\sin x$ and $\cos x$ and further applications of L'Hôpital's rule will not change this situation.

To evaluate the limit, we note

$$\lim_{x\to\infty} \frac{2x - \sin x}{3x + \cos 2x} = \lim_{x\to\infty} \frac{2 - \frac{\sin x}{x}}{3 + \frac{\cos 2x}{x}} = \frac{2}{3}.$$

100. Let $f(x)$ be a differentiable function with inverse $g(x)$ such that $f(0) = 0$ and $f'(0) \neq 0$. Prove that

$$\lim_{x\to 0} \frac{f(x)}{g(x)} = f'(0)^2$$

SOLUTION Since g and f are inverse functions, we have $g(f(x)) = x$ for all x in the domain of f. In particular, for $x = 0$ we have

$$g(0) = g(f(0)) = 0.$$

Therefore, the limit is an indeterminate form of type $\frac{0}{0}$, so we may apply L'Hôpital's Rule. By the Theorem on the derivative of the inverse function, we have

$$g'(x) = \frac{1}{f'(g(x))}.$$

Therefore,

$$\lim_{x\to 0} \frac{f(x)}{g(x)} = \lim_{x\to 0} \frac{f'(x)}{\frac{1}{f'(g(x))}} = \lim_{x\to 0} f'(x) f'(g(x)) = f'(0) f'(g(0)) = f'(0) \cdot f'(0) = f'(0)^2.$$

In Exercises 101–112, verify that L'Hôpital's Rule applies and evaluate the limit.

101. $\displaystyle\lim_{x\to 3} \frac{4x-12}{x^2-5x+6}$

SOLUTION The given expression is an indeterminate form of type $\frac{0}{0}$, therefore L'Hôpital's Rule applies. We find

$$\lim_{x\to 3} \frac{4x-12}{x^2-5x+6} = \lim_{x\to 3} \frac{4}{2x-5} = 4.$$

102. $\displaystyle\lim_{x\to -2} \frac{x^3+2x^2-x-2}{x^4+2x^3-4x-8}$

SOLUTION The given expression is an indeterminate form of type $\frac{0}{0}$, therefore L'Hôpital's Rule applies. We find

$$\lim_{x\to -2} \frac{x^3+2x^2-x-2}{x^4+2x^3-4x-8} = \lim_{x\to -2} \frac{3x^2+4x-1}{4x^3+6x^2-4} = -\frac{3}{12} = -\frac{1}{4}.$$

103. $\displaystyle\lim_{x\to 0+} x^{1/2} \ln x$

SOLUTION First rewrite

$$x^{1/2} \ln x \quad \text{as} \quad \frac{\ln x}{x^{-1/2}}.$$

The rewritten expression is an indeterminate form of type $\frac{\infty}{\infty}$, therefore L'Hôpital's Rule applies. We find

$$\lim_{x\to 0+} x^{1/2} \ln x = \lim_{x\to 0+} \frac{\ln x}{x^{-1/2}} = \lim_{x\to 0+} \frac{1/x}{-\frac{1/2}{x}^{-3/2}} = \lim_{x\to 0+} -\frac{x^{1/2}}{2} = 0.$$

104. $\displaystyle\lim_{t\to \infty} \frac{\ln(e^t+1)}{t}$

SOLUTION The given expression is an indeterminate form of type $\frac{\infty}{\infty}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{t\to \infty} \frac{\ln(e^t+1)}{t} = \lim_{t\to \infty} \frac{\frac{e^t}{e^t+1}}{1} = \lim_{t\to \infty} \frac{1}{1+e^{-t}} = 1.$$

105. $\displaystyle\lim_{\theta\to 0} \frac{2\sin\theta - \sin 2\theta}{\sin\theta - \theta\cos\theta}$

SOLUTION The given expression is an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{\theta\to 0} \frac{2\sin\theta - \sin 2\theta}{\sin\theta - \theta\cos\theta} = \lim_{\theta\to 0} \frac{2\cos\theta - 2\cos 2\theta}{\cos\theta - (\cos\theta - \theta\sin\theta)} = \lim_{\theta\to 0} \frac{2\cos\theta - 2\cos 2\theta}{\theta\sin\theta}$$

$$= \lim_{\theta\to 0} \frac{-2\sin\theta + 4\sin 2\theta}{\sin\theta + \theta\cos\theta} = \lim_{\theta\to 0} \frac{-2\cos\theta + 8\cos 2\theta}{\cos\theta + \cos\theta - \theta\sin\theta} = \frac{-2+8}{1+1-0} = 3.$$

106. $\displaystyle\lim_{x\to 0} \frac{\sqrt{4+x} - 2\sqrt[8]{1+x}}{x^2}$

SOLUTION The given expression is an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{x\to 0} \frac{\sqrt{4+x} - 2\sqrt[8]{1+x}}{x^2} = \lim_{x\to 0} \frac{\frac{1}{2}(4+x)^{-1/2} - \frac{1}{4}(1+x)^{-7/8}}{2x}$$

$$= \lim_{x\to 0} \frac{-\frac{1}{4}(4+x)^{-3/2} + \frac{7}{32}(1+x)^{-15/8}}{2} = \frac{-\frac{1}{4}\cdot\frac{1}{8} + \frac{7}{32}}{2} = \frac{3}{32}.$$

107. $\displaystyle\lim_{t\to\infty} \frac{\ln(t+2)}{\log_2 t}$

SOLUTION The limit is an indeterminate form of type $\frac{\infty}{\infty}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{t\to\infty} \frac{\ln(t+2)}{\log_2 t} = \lim_{t\to\infty} \frac{\frac{1}{t+2}}{\frac{1}{t\ln 2}} = \lim_{t\to\infty} \frac{t\ln 2}{t+2} = \lim_{t\to\infty} \frac{\ln 2}{1} = \ln 2.$$

108. $\displaystyle\lim_{x\to 0} \left(\frac{e^x}{e^x-1} - \frac{1}{x}\right)$

SOLUTION First rewrite the function as a quotient:

$$\frac{e^x}{e^x-1} - \frac{1}{x} = \frac{xe^x - e^x + 1}{x(e^x-1)}.$$

The limit is now an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\begin{aligned}\lim_{x\to 0} \left(\frac{e^x}{e^x-1} - \frac{1}{x}\right) &= \lim_{x\to 0} \frac{xe^x + e^x - e^x}{xe^x + e^x - 1} = \lim_{x\to 0} \frac{xe^x}{xe^x + e^x - 1} \\ &= \lim_{x\to 0} \frac{xe^x + e^x}{xe^x + e^x + e^x} = \frac{1}{1+1} = \frac{1}{2}.\end{aligned}$$

109. $\displaystyle\lim_{y\to 0} \frac{\sin^{-1} y - y}{y^3}$

SOLUTION The limit is an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{y\to 0} \frac{\sin^{-1} y - y}{y^3} = \lim_{y\to 0} \frac{\frac{1}{\sqrt{1-y^2}} - 1}{3y^2} = \lim_{y\to 0} \frac{y(1-y^2)^{-3/2}}{6y} = \lim_{y\to 0} \frac{(1-y^2)^{-3/2}}{6} = \frac{1}{6}.$$

110. $\displaystyle\lim_{x\to 1} \frac{\sqrt{1-x^2}}{\cos^{-1} x}$

SOLUTION The limit is an indeterminate form $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{x\to 1} \frac{\sqrt{1-x^2}}{\cos^{-1} x} = \lim_{x\to 1} \frac{-\frac{x}{\sqrt{1-x^2}}}{-\frac{1}{\sqrt{1-x^2}}} = \lim_{x\to 1} x = 1.$$

111. $\displaystyle\lim_{x\to 0} \frac{\sinh(x^2)}{\cosh x - 1}$

SOLUTION The limit is an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\lim_{x\to 0} \frac{\sinh(x^2)}{\cosh x - 1} = \lim_{x\to 0} \frac{2x\cosh(x^2)}{\sinh x} = \lim_{x\to 0} \frac{2\cosh(x^2) + 4x^2\sinh(x^2)}{\cosh x} = \frac{2+0}{1} = 2.$$

112. $\displaystyle\lim_{x\to 0} \frac{\tanh x - \sinh x}{\sin x - x}$

SOLUTION The limit is an indeterminate form of type $\frac{0}{0}$; hence, we may apply L'Hôpital's Rule. We find

$$\begin{aligned}\lim_{x\to 0} \frac{\tanh x - \sinh x}{\sin x - x} &= \lim_{x\to 0} \frac{\operatorname{sech}^2 x - \cosh x}{\cos x - 1} = \lim_{x\to 0} \frac{2\operatorname{sech} x(-\operatorname{sech} x \tanh x) - \sinh x}{-\sin x} \\ &= \lim_{x\to 0} \frac{2\operatorname{sech}^2 x \tanh x + \sinh x}{\sin x} = \lim_{x\to 0} \frac{-4\operatorname{sech}^2 x \tanh^2 x + 2\operatorname{sech}^4 x + \cosh x}{\cos x} \\ &= \frac{-4\cdot 1\cdot 0 + 2\cdot 1 + 1}{1} = 3.\end{aligned}$$

113. Let $f(x) = e^{-Ax^2/2}$, where $A > 0$. Given any n numbers $a_1, a_2, \ldots, a_n$, set

$$\Phi(x) = f(x-a_1)f(x-a_2)\cdots f(x-a_n)$$

(a) Assume $n = 2$ and prove that $\Phi(x)$ attains its maximum value at the average $x = \frac{1}{2}(a_1 + a_2)$. *Hint:* Calculate $\Phi'(x)$ using logarithmic differentiation.

(b) Show that for any n, $\Phi(x)$ attains its maximum value at $x = \frac{1}{n}(a_1 + a_2 + \cdots + a_n)$. This fact is related to the role of $f(x)$ (whose graph is a bell-shaped curve) in statistics.

SOLUTION

(a) For $n = 2$ we have,

$$\Phi(x) = f(x - a_1) f(x - a_2) = e^{-\frac{A}{2}(x-a_1)^2} \cdot e^{-\frac{A}{2}(x-a_2)^2} = e^{-\frac{A}{2}\left((x-a_1)^2+(x-a_2)^2\right)}.$$

Since $e^{-\frac{A}{2}y}$ is a decreasing function of y, it attains its maximum value where y is minimum. Therefore, we must find the minimum value of

$$y = (x - a_1)^2 + (x - a_2)^2 = 2x^2 - 2(a_1 + a_2)x + a_1^2 + a_2^2.$$

Now, $y' = 4x - 2(a_1 + a_2) = 0$ when

$$x = \frac{a_1 + a_2}{2}.$$

We conclude that $\Phi(x)$ attains a maximum value at this point.

(b) We have

$$\Phi(x) = e^{-\frac{A}{2}(x-a_1)^2} \cdot e^{-\frac{A}{2}(x-a_2)^2} \cdot \cdots \cdot e^{-\frac{A}{2}(x-a_n)^2} = e^{-\frac{A}{2}\left((x-a_1)^2+\cdots+(x-a_n)^2\right)}.$$

Since the function $e^{-\frac{A}{2}y}$ is a decreasing function of y, it attains a maximum value where y is minimum. Therefore we must minimize the function

$$y = (x - a_1)^2 + (x - a_2)^2 + \cdots + (x - a_n)^2.$$

We find the critical points by solving:

$$\begin{aligned} y' &= 2(x - a_1) + 2(x - a_2) + \cdots + 2(x - a_n) = 0 \\ 2nx &= 2(a_1 + a_2 + \cdots + a_n) \\ x &= \frac{a_1 + \cdots + a_n}{n}. \end{aligned}$$

We verify that this point corresponds the minimum value of y by examining the sign of y'' at this point: $y'' = 2n > 0$. We conclude that y attains a minimum value at the point $x = \frac{a_1+\cdots+a_n}{n}$, hence $\Phi(x)$ attains a maximum value at this point.

5 THE INTEGRAL

5.1 Approximating and Computing Area

Preliminary Questions

1. What are the right and left endpoints if [2, 5] is divided into six subintervals?

SOLUTION If the interval [2, 5] is divided into six subintervals, the length of each subinterval is $\frac{5-2}{6} = \frac{1}{2}$. The right endpoints of the subintervals are then $\frac{5}{2}, 3, \frac{7}{2}, 4, \frac{9}{2}, 5$, while the left endpoints are $2, \frac{5}{2}, 3, \frac{7}{2}, 4, \frac{9}{2}$.

2. The interval [1, 5] is divided into eight subintervals.

(a) What is the left endpoint of the last subinterval?

(b) What are the right endpoints of the first two subintervals?

SOLUTION Note that each of the 8 subintervals has length $\frac{5-1}{8} = \frac{1}{2}$.

(a) The left endpoint of the last subinterval is $5 - \frac{1}{2} = \frac{9}{2}$.

(b) The right endpoints of the first two subintervals are $1 + \frac{1}{2} = \frac{3}{2}$ and $1 + 2\left(\frac{1}{2}\right) = 2$.

3. Which of the following pairs of sums are *not* equal?

(a) $\displaystyle\sum_{i=1}^{4} i, \quad \sum_{\ell=1}^{4} \ell$

(b) $\displaystyle\sum_{j=1}^{4} j^2, \quad \sum_{k=2}^{5} k^2$

(c) $\displaystyle\sum_{j=1}^{4} j, \quad \sum_{i=2}^{5} (i-1)$

(d) $\displaystyle\sum_{i=1}^{4} i(i+1), \quad \sum_{j=2}^{5} (j-1)j$

SOLUTION

(a) Only the name of the index variable has been changed, so these two sums *are* the same.

(b) These two sums are *not* the same; the second squares the numbers two through five while the first squares the numbers one through four.

(c) These two sums *are* the same. Note that when i ranges from two through five, the expression $i - 1$ ranges from one through four.

(d) These two sums *are* the same. Both sums are $1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + 4 \cdot 5$.

4. Explain: $\sum_{j=1}^{100} j = \sum_{j=0}^{100} j$ but $\sum_{j=1}^{100} 1$ is not equal to $\sum_{j=0}^{100} 1$.

SOLUTION The first term in the sum $\sum_{j=0}^{100} j$ is equal to zero, so it may be dropped. More specifically,

$$\sum_{j=0}^{100} j = 0 + \sum_{j=1}^{100} j = \sum_{j=1}^{100} j.$$

On the other hand, the first term in $\sum_{j=0}^{100} 1$ is not zero, so this term cannot be dropped. In particular,

$$\sum_{j=0}^{100} 1 = 1 + \sum_{j=1}^{100} 1 \neq \sum_{j=1}^{100} 1.$$

5. Explain why $L_{100} \geq R_{100}$ for $f(x) = x^{-2}$ on [3, 7].

SOLUTION On [3, 7], the function $f(x) = x^{-2}$ is a decreasing function; hence, for any subinterval of [3, 7], the function value at the left endpoint is larger than the function value at the right endpoint. Consequently, L_{100} must be larger than R_{100}.

Exercises

1. Figure 15 shows the velocity of an object over a 3-min interval. Determine the distance traveled over the intervals [0, 3] and [1, 2.5] (remember to convert from km/h to km/min).

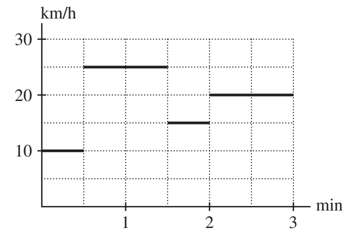


FIGURE 15

SOLUTION The distance traveled by the object can be determined by calculating the area underneath the velocity graph over the specified interval. During the interval [0, 3], the object travels

$$\left(\frac{10}{60}\right)\left(\frac{1}{2}\right)+\left(\frac{25}{60}\right)(1)+\left(\frac{15}{60}\right)\left(\frac{1}{2}\right)+\left(\frac{20}{60}\right)(1)=\frac{23}{24}\approx 0.96 \text{ km}.$$

During the interval [1, 2.5], it travels

$$\left(\frac{25}{60}\right)\left(\frac{1}{2}\right)+\left(\frac{15}{60}\right)\left(\frac{1}{2}\right)+\left(\frac{20}{60}\right)\left(\frac{1}{2}\right)=\frac{1}{2}=0.5 \text{ km}.$$

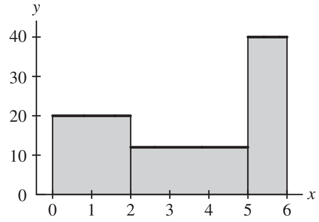
2. An ostrich (Figure 16) runs with velocity 20 km/h for 2 minutes, 12 km/h for 3 minutes, and 40 km/h for another minute. Compute the total distance traveled and indicate with a graph how this quantity can be interpreted as an area.

FIGURE 16 Ostriches can reach speeds as high as 70 km/h.

SOLUTION The total distance traveled by the ostrich is

$$\left(\frac{20}{60}\right)(2)+\left(\frac{12}{60}\right)(3)+\left(\frac{40}{60}\right)(1)=\frac{2}{3}+\frac{3}{5}+\frac{2}{3}=\frac{29}{15}$$

km. This distance is the area under the graph below which shows the ostrich's velocity as a function of time.



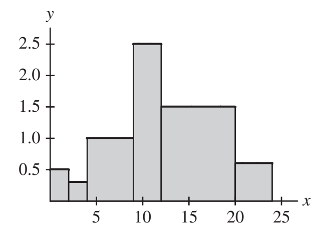
3. A rainstorm hit Portland, Maine, in October 1996, resulting in record rainfall. The rainfall rate $R(t)$ on October 21 is recorded, in centimeters per hour, in the following table, where t is the number of hours since midnight. Compute the total rainfall during this 24-hour period and indicate on a graph how this quantity can be interpreted as an area.

t (h)	0–2	2–4	4–9	9–12	12–20	20–24
$R(t)$ (cm)	0.5	0.3	1.0	2.5	1.5	0.6

SOLUTION Over each interval, the total rainfall is the time interval in hours times the rainfall in centimeters per hour. Thus

$$R=2(0.5)+2(0.3)+5(1.0)+3(2.5)+8(1.5)+4(0.6)=28.5 \text{ cm}.$$

The figure below is a graph of the rainfall as a function of time. The area of the shaded region represents the total rainfall.



4. The velocity of an object is $v(t) = 12t$ m/s. Use Eq. (2) and geometry to find the distance traveled over the time intervals [0, 2] and [2, 5].

SOLUTION By equation Eq. (2), the distance traveled over the time interval $[a, b]$ is

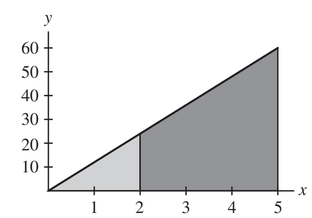
$$\int_a^b v(t)\,dt = \int_a^b 12t\,dt;$$

that is, the distance traveled is the area under the graph of the velocity function over the interval $[a, b]$. The graph below shows the area under the velocity function $v(t) = 12t$ m/s over the intervals [0, 2] and [2, 5]. Over the interval [0, 2], the area is a triangle of base 2 and height 24; therefore, the distance traveled is

$$\frac{1}{2}(2)(24) = 24 \text{ meters.}$$

Over the interval [2, 5], the area is a trapezoid of height 3 and base lengths 24 and 60; therefore, the distance traveled is

$$\frac{1}{2}(3)(24 + 60) = 126 \text{ meters.}$$



5. Compute R_5 and L_5 over [0, 1] using the following values.

x	0	0.2	0.4	0.6	0.8	1
$f(x)$	50	48	46	44	42	40

SOLUTION $\Delta x = \frac{1-0}{5} = 0.2$. Thus,

$$L_5 = 0.2\,(50 + 48 + 46 + 44 + 42) = 0.2(230) = 46,$$

and

$$R_5 = 0.2\,(48 + 46 + 44 + 42 + 40) = 0.2(220) = 44.$$

The average is

$$\frac{46 + 44}{2} = 45.$$

This estimate is frequently referred to as the *Trapezoidal Approximation*.

6. Compute R_6, L_6, and M_3 to estimate the distance traveled over [0, 3] if the velocity at half-second intervals is as follows:

t (s)	0	0.5	1	1.5	2	2.5	3
v (m/s)	0	12	18	25	20	14	20

SOLUTION For R_6 and L_6, $\Delta t = \frac{3-0}{6} = 0.5$. For M_3, $\Delta t = \frac{3-0}{3} = 1$. Then

$$R_6 = 0.5 \text{ s}\,(12 + 18 + 25 + 20 + 14 + 20) \text{ m/s} = 0.5(109) \text{ m} = 54.5 \text{ m},$$

$$L_6 = 0.5\,\text{sec}\,(0 + 12 + 18 + 25 + 20 + 14)\,\text{m/sec} = 0.5(89)\,\text{m} = 44.5\,\text{m},$$

and

$$M_3 = 1\,\text{sec}\,(12 + 25 + 14)\ \text{m/sec} = 51\,\text{m}.$$

7. Let $f(x) = 2x + 3$.
(a) Compute R_6 and L_6 over $[0, 3]$.
(b) Use geometry to find the exact area A and compute the errors $|A - R_6|$ and $|A - L_6|$ in the approximations.

SOLUTION Let $f(x) = 2x + 3$ on $[0, 3]$.

(a) We partition $[0, 3]$ into 6 equally-spaced subintervals. The left endpoints of the subintervals are $\left\{0, \frac{1}{2}, 1, \frac{3}{2}, 2, \frac{5}{2}\right\}$ whereas the right endpoints are $\left\{\frac{1}{2}, 1, \frac{3}{2}, 2, \frac{5}{2}, 3\right\}$.

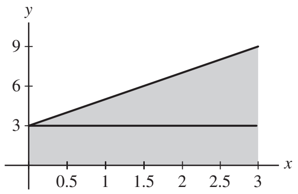
- Let $a = 0$, $b = 3$, $n = 6$, $\Delta x = (b - a)/n = \frac{1}{2}$, and $x_k = a + k\Delta x$, $k = 0, 1, \dots, 5$ (left endpoints). Then

$$L_6 = \sum_{k=0}^{5} f(x_k)\Delta x = \Delta x \sum_{k=0}^{5} f(x_k) = \frac{1}{2}(3 + 4 + 5 + 6 + 7 + 8) = 16.5.$$

- With $x_k = a + k\Delta x$, $k = 1, 2, \dots, 6$ (right endpoints), we have

$$R_6 = \sum_{k=1}^{6} f(x_k)\Delta x = \Delta x \sum_{k=1}^{6} f(x_k) = \frac{1}{2}(4 + 5 + 6 + 7 + 8 + 9) = 19.5.$$

(b) Via geometry (see figure below), the exact area is $A = \frac{1}{2}(3)(6) + 3^2 = 18$. Thus, L_6 underestimates the true area ($L_6 - A = -1.5$), while R_6 overestimates the true area ($R_6 - A = +1.5$).



8. Repeat Exercise 7 for $f(x) = 20 - 3x$ over $[2, 4]$.

SOLUTION Let $f(x) = 20 - 3x$ on $[2, 4]$.

(a) We partition $[2, 4]$ into 6 equally-spaced subintervals. The left endpoints of the subintervals are $\left\{2, \frac{7}{3}, \frac{8}{3}, 3, \frac{10}{3}, \frac{11}{3}\right\}$ whereas the right endpoints are $\left\{\frac{7}{3}, \frac{8}{3}, 3, \frac{10}{3}, \frac{11}{3}, 3\right\}$.

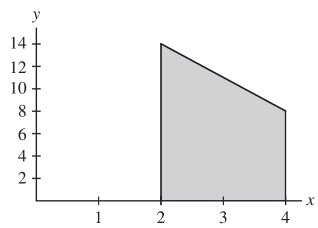
- Let $a = 2$, $b = 4$, $n = 6$, $\Delta x = (b - a)/n = \frac{1}{3}$, and $x_k = a + k\Delta x$, $k = 0, 1, \dots, 5$ (left endpoints). Then

$$L_6 = \sum_{k=0}^{5} f(x_k)\Delta x = \Delta x \sum_{k=0}^{5} f(x_k) = \frac{1}{3}(14 + 13 + 12 + 11 + 10 + 9) = 23.$$

- With $x_k = a + k\Delta x$, $k = 1, 2, \dots, 6$ (right endpoints), we have

$$R_6 = \sum_{k=1}^{6} f(x_k)\Delta x = \Delta x \sum_{k=1}^{6} f(x_k) = \frac{1}{3}(13 + 12 + 11 + 10 + 9 + 8) = 21.$$

(b) Via geometry (see figure below), the exact area is $A = \frac{1}{2}(2)(14 + 8) = 22$. Thus, L_6 overestimates the true area ($L_6 - A = 1$), while R_6 underestimates the true area ($R_6 - A = -1$).



9. Calculate R_3 and L_3

$$\text{for } f(x) = x^2 - x + 4 \quad \text{over } [1, 4]$$

Then sketch the graph of f and the rectangles that make up each approximation. Is the area under the graph larger or smaller than R_3? Is it larger or smaller than L_3?

SOLUTION Let $f(x) = x^2 - x + 4$ and set $a = 1$, $b = 4$, $n = 3$, $\Delta x = (b - a)/n = (4 - 1)/3 = 1$.

(a) Let $x_k = a + k\Delta x$, $k = 0, 1, 2, 3$.

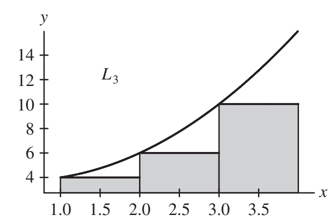
- Selecting the left endpoints of the subintervals, x_k, $k = 0, 1, 2$, or $\{1, 2, 3\}$, we have

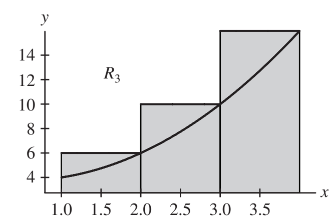
$$L_3 = \sum_{k=0}^{2} f(x_k)\Delta x = \Delta x \sum_{k=0}^{2} f(x_k) = (1)(4 + 6 + 10) = 20.$$

- Selecting the right endpoints of the subintervals, x_k, $k = 1, 2, 3$, or $\{2, 3, 4\}$, we have

$$R_3 = \sum_{k=1}^{3} f(x_k)\Delta x = \Delta x \sum_{k=1}^{3} f(x_k) = (1)(6 + 10 + 16) = 32.$$

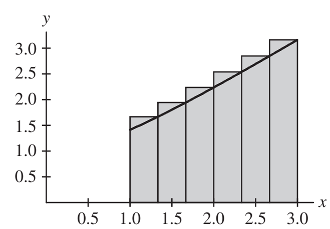
(b) Here are figures of the three rectangles that approximate the area under the curve $f(x)$ over the interval $[1, 4]$. Clearly, the area under the graph is larger than L_3 but smaller than R_3.





10. Let $f(x) = \sqrt{x^2 + 1}$ and $\Delta x = \frac{1}{3}$. Sketch the graph of $f(x)$ and draw the right-endpoint rectangles whose area is represented by the sum $\sum_{i=1}^{6} f(1 + i\Delta x)\Delta x$.

SOLUTION Because $\Delta x = \frac{1}{3}$ and the sum evaluates f at $1 + i\Delta x$ for i from 1 through 6, it follows that the interval over which we are considering f is $[1, 3]$. The sketch of f together with the six rectangles is shown below.



11. Estimate R_3, M_3, and L_6 over $[0, 1.5]$ for the function in Figure 17.

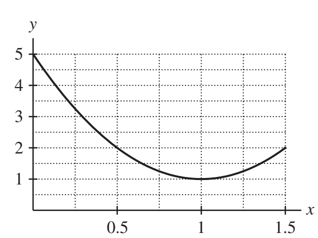


FIGURE 17

SOLUTION Let $f(x)$ on $[0, \frac{3}{2}]$ be given by Figure 17. For $n = 3$, $\Delta x = (\frac{3}{2} - 0)/3 = \frac{1}{2}$, $\{x_k\}_{k=0}^{3} = \left\{0, \frac{1}{2}, 1, \frac{3}{2}\right\}$. Therefore

$$R_3 = \frac{1}{2} \sum_{k=1}^{3} f(x_k) = \frac{1}{2}(2 + 1 + 2) = 2.5,$$

$$M_3 = \frac{1}{2}\sum_{k=1}^{6} f\left(x_k - \frac{1}{2}\Delta x\right) = \frac{1}{2}(3.25 + 1.25 + 1.25) = 2.875.$$

For $n = 6$, $\Delta x = (\frac{3}{2} - 0)/6 = \frac{1}{4}$, $\{x_k\}_{k=0}^{6} = \left\{0, \frac{1}{4}, \frac{1}{2}, \frac{3}{4}, 1, \frac{5}{4}, \frac{3}{2}\right\}$. Therefore

$$L_6 = \frac{1}{4}\sum_{k=0}^{5} f(x_k) = \frac{1}{4}(5 + 3.25 + 2 + 1.25 + 1 + 1.25) = 3.4375.$$

12. Calculate the area of the shaded rectangles in Figure 18. Which approximation do these rectangles represent?

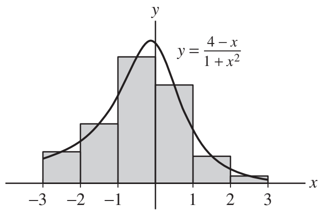

FIGURE 18

SOLUTION Each rectangle in Figure 18 has a width of 1 and the height is taken as the value of the function at the midpoint of the interval. Thus, the area of the shaded rectangles is

$$1\left(\frac{26}{29} + \frac{22}{13} + \frac{18}{5} + \frac{14}{5} + \frac{10}{13} + \frac{6}{29}\right) = \frac{18784}{1885} \approx 9.965.$$

Because there are six rectangles and the height of each rectangle is taken as the value of the function at the midpoint of the interval, the shaded rectangles represent the approximation M_6 to the area under the curve.

In Exercises 13–20, calculate the approximation for the given function and interval.

13. R_3, $f(x) = 7 - x$, $[3, 5]$

SOLUTION Let $f(x) = 7 - x$ on $[3, 5]$. For $n = 3$, $\Delta x = (5 - 3)/3 = \frac{2}{3}$, and $\{x_k\}_{k=0}^{3} = \left\{3, \frac{11}{3}, \frac{13}{3}, 5\right\}$. Therefore

$$R_3 = \frac{2}{3}\sum_{k=1}^{3}(7 - x_k)$$
$$= \frac{2}{3}\left(\frac{10}{3} + \frac{8}{3} + 2\right) = \frac{2}{3}(8) = \frac{16}{3}.$$

14. L_6, $f(x) = \sqrt{6x + 2}$, $[1, 3]$

SOLUTION Let $f(x) = \sqrt{6x + 2}$ on $[1, 3]$. For $n = 6$, $\Delta x = (3 - 1)/6 = \frac{1}{3}$, and $\{x_k\}_{k=0}^{6} = \left\{1, \frac{4}{3}, \frac{5}{3}, 2, \frac{7}{3}, \frac{8}{3}, 3\right\}$. Therefore

$$L_6 = \frac{1}{3}\sum_{k=0}^{5}\sqrt{6x_k + 2}$$
$$= \frac{1}{3}\left(\sqrt{8} + \sqrt{10} + \sqrt{12} + \sqrt{14} + 4 + \sqrt{18}\right) \approx 7.146368.$$

15. M_6, $f(x) = 4x + 3$, $[5, 8]$

SOLUTION Let $f(x) = 4x + 3$ on $[5, 8]$. For $n = 6$, $\Delta x = (8 - 5)/6 = \frac{1}{2}$, and $\{x_k^*\}_{k=0}^{5} = \{5.25, 5.75, 6.25, 6.75, 7.25, 7.75\}$. Therefore,

$$M_6 = \frac{1}{2}\sum_{k=0}^{5}\left(4x_k^* + 3\right)$$
$$= \frac{1}{2}(24 + 26 + 28 + 30 + 32 + 34)$$
$$= \frac{1}{2}(174) = 87.$$

16. R_5, $f(x) = x^2 + x$, $[-1, 1]$

SOLUTION Let $f(x) = x^2 + x$ on $[-1, 1]$. For $n = 5$, $\Delta x = (1 - (-1))/5 = \frac{2}{5}$, and $\{x_k\}_{k=0}^{5} = \left\{-1, -\frac{3}{5}, -\frac{1}{5}, \frac{1}{5}, \frac{3}{5}, 1\right\}$. Therefore

$$R_5 = \frac{2}{5}\sum_{k=1}^{5}(x_k^2 + x_k) = \frac{2}{5}\left(\left(\frac{9}{25} - \frac{3}{5}\right) + \left(\frac{1}{25} - \frac{1}{5}\right) + \left(\frac{1}{25} + \frac{1}{5}\right) + \left(\frac{9}{25} + \frac{3}{5}\right) + 2\right)$$
$$= \frac{2}{5}\left(\frac{14}{5}\right) = \frac{28}{25}.$$

17. L_6, $f(x) = x^2 + 3|x|$, $[-2, 1]$

SOLUTION Let $f(x) = x^2 + 3\,|x|$ on $[-2, 1]$. For $n = 6$, $\Delta x = (1 - (-2))/6 = \frac{1}{2}$, and $\{x_k\}_{k=0}^{6} = \{-2, -1.5, -1, -0.5, 0, 0.5, 1\}$. Therefore

$$L_6 = \frac{1}{2}\sum_{k=0}^{5}(x_k^2 + 3\,|x_k|) = \frac{1}{2}(10 + 6.75 + 4 + 1.75 + 0 + 1.75) = 12.125.$$

18. M_4, $f(x) = \sqrt{x}$, $[3, 5]$

SOLUTION Let $f(x) = \sqrt{x}$ on $[3, 5]$. For $n = 4$, $\Delta x = (5 - 3)/4 = \frac{1}{2}$, and $\{x_k^*\}_{k=0}^{3} = \{\frac{13}{4}, \frac{15}{4}, \frac{17}{4}, \frac{19}{4}\}$. Therefore,

$$M_4 = \frac{1}{2}\sum_{k=0}^{3}\sqrt{x_k^*}$$
$$= \frac{1}{2}\left(\frac{\sqrt{13}}{2} + \frac{\sqrt{15}}{2} + \frac{\sqrt{17}}{2} + \frac{\sqrt{19}}{2}\right) \approx 3.990135.$$

19. L_4, $f(x) = \cos^2 x$, $\left[\frac{\pi}{6}, \frac{\pi}{2}\right]$

SOLUTION Let $f(x) = \cos^2 x$ on $[\frac{\pi}{6}, \frac{\pi}{2}]$. For $n = 4$,

$$\Delta x = \frac{(\pi/2 - \pi/6)}{4} = \frac{\pi}{12} \qquad \text{and} \qquad \{x_k\}_{k=0}^{4} = \left\{\frac{\pi}{6}, \frac{\pi}{4}, \frac{\pi}{3}, \frac{5\pi}{12}, \frac{\pi}{2}\right\}.$$

Therefore

$$L_4 = \frac{\pi}{12}\sum_{k=0}^{3}\cos^2 x_k \approx 0.410236.$$

20. M_5, $f(x) = \ln x$, $[1, 3]$

SOLUTION Let $f(x) = \ln x$ on $[1, 3]$. For $n = 5$, $\Delta x = (3 - 1)/5 = \frac{2}{5}$, and $\{x_k^*\}_{k=0}^{4} = \{\frac{6}{5}, \frac{8}{5}, 2, \frac{12}{5}, \frac{14}{5}\}$. Therefore,

$$M_5 = \frac{2}{5}\sum_{k=0}^{4}\ln x_k^*$$
$$= \frac{2}{5}\left(\ln\frac{6}{5} + \ln\frac{8}{5} + \ln 2 + \ln\frac{12}{5} + \ln\frac{14}{5}\right) \approx 1.300224.$$

In Exercises 21–26, write the sum in summation notation.

21. $4^7 + 5^7 + 6^7 + 7^7 + 8^7$

SOLUTION The first term is 4^7, and the last term is 8^7, so it seems the kth term is k^7. Therefore, the sum is:

$$\sum_{k=4}^{8} k^7.$$

22. $(2^2 + 2) + (3^2 + 3) + (4^2 + 4) + (5^2 + 5)$

SOLUTION The first term is $2^2 + 2$, and the last term is $5^2 + 5$, so it seems that the sum limits are 2 and 5, and the kth term is $k^2 + k$. Therefore, the sum is:

$$\sum_{k=2}^{5}(k^2 + k).$$

23. $(2^2+2)+(2^3+2)+(2^4+2)+(2^5+2)$

SOLUTION The first term is 2^2+2, and the last term is 2^5+2, so it seems the sum limits are 2 and 5, and the kth term is 2^k+2. Therefore, the sum is:

$$\sum_{k=2}^{5}(2^k+2).$$

24. $\sqrt{1+1^3}+\sqrt{2+2^3}+\cdots+\sqrt{n+n^3}$

SOLUTION The first term is $\sqrt{1+1^3}$ and the last term is $\sqrt{n+n^3}$, so it seems the summation limits are 1 through n, and the k-th term is $\sqrt{k+k^3}$. Therefore, the sum is

$$\sum_{k=1}^{n}\sqrt{k+k^3}.$$

25. $\dfrac{1}{2\cdot 3}+\dfrac{2}{3\cdot 4}+\cdots+\dfrac{n}{(n+1)(n+2)}$

SOLUTION The first summand is $\frac{1}{(1+1)\cdot(1+2)}$. This shows us

$$\frac{1}{2\cdot 3}+\frac{2}{3\cdot 4}+\cdots+\frac{n}{(n+1)(n+2)}=\sum_{i=1}^{n}\frac{i}{(i+1)(i+2)}.$$

26. $e^{\pi}+e^{\pi/2}+e^{\pi/3}+\cdots+e^{\pi/n}$

SOLUTION The first term is $e^{\pi/1}$ and the last term is $e^{\pi/n}$, so it seems the sum limits are 1 and n and the kth term is $e^{\pi/k}$. Therefore, the sum is

$$\sum_{k=1}^{n}e^{\pi/k}.$$

27. Calculate the sums:

(a) $\displaystyle\sum_{i=1}^{5}9$ **(b)** $\displaystyle\sum_{i=0}^{5}4$ **(c)** $\displaystyle\sum_{k=2}^{4}k^3$

SOLUTION

(a) $\displaystyle\sum_{i=1}^{5}9=9+9+9+9+9=45$. Alternatively, $\displaystyle\sum_{i=1}^{5}9=9\sum_{i=1}^{5}1=(9)(5)=45$.

(b) $\displaystyle\sum_{i=0}^{5}4=4+4+4+4+4+4=24$. Alternatively, $\displaystyle\sum_{i=0}^{5}4=4\sum_{i=0}^{5}=(4)(6)=24$.

(c) $\displaystyle\sum_{k=2}^{4}k^3=2^3+3^3+4^3=99$. Alternatively,

$$\sum_{k=2}^{4}k^3=\left(\sum_{k=1}^{4}k^3\right)-\left(\sum_{k=1}^{1}k^3\right)=\left(\frac{4^4}{4}+\frac{4^3}{2}+\frac{4^2}{4}\right)-\left(\frac{1^4}{4}+\frac{1^3}{2}+\frac{1^2}{4}\right)=99.$$

28. Calculate the sums:

(a) $\displaystyle\sum_{j=3}^{4}\sin\left(j\frac{\pi}{2}\right)$ **(b)** $\displaystyle\sum_{k=3}^{5}\frac{1}{k-1}$ **(c)** $\displaystyle\sum_{j=0}^{2}3^{j-1}$

SOLUTION

(a) $\displaystyle\sum_{j=3}^{4}\sin\left(\frac{j\pi}{2}\right)=\sin\left(\frac{3\pi}{2}\right)+\sin\left(\frac{4\pi}{2}\right)=-1+0=-1$.

(b) $\displaystyle\sum_{k=3}^{5}\frac{1}{k-1}=\frac{1}{2}+\frac{1}{3}+\frac{1}{4}=\frac{13}{12}$.

(c) $\displaystyle\sum_{j=0}^{2}3^{j-1}=\frac{1}{3}+1+3=\frac{13}{3}$.

29. Let $b_1 = 4$, $b_2 = 1$, $b_3 = 2$, and $b_4 = -4$. Calculate:

(a) $\sum_{i=2}^{4} b_i$ **(b)** $\sum_{j=1}^{2} (2^{b_j} - b_j)$ **(c)** $\sum_{k=1}^{3} kb_k$

SOLUTION

(a) $\sum_{i=2}^{4} b_i = b_2 + b_3 + b_4 = 1 + 2 + (-4) = -1.$

(b) $\sum_{j=1}^{2} \left(2^{b_j} - b_j\right) = (2^4 - 4) + (2^1 - 1) = 13.$

(c) $\sum_{k=1}^{3} kb_k = 1(4) + 2(1) + 3(2) = 12.$

30. Assume that $a_1 = -5$, $\sum_{i=1}^{10} a_i = 20$, and $\sum_{i=1}^{10} b_i = 7$. Calculate:

(a) $\sum_{i=1}^{10} (4a_i + 3)$ **(b)** $\sum_{i=2}^{10} a_i$ **(c)** $\sum_{i=1}^{10} (2a_i - 3b_i)$

SOLUTION

(a) $\sum_{i=1}^{10} (4a_i + 3) = 4\sum_{i=1}^{10} a_i + 3\sum_{i=1}^{10} 1 = 4(20) + 3(10) = 110.$

(b) $\sum_{i=2}^{10} a_i = \sum_{i=1}^{10} a_i - a_1 = 20 - (-5) = 25.$

(c) $\sum_{i=1}^{10} (2a_i - 3b_i) = 2\sum_{i=1}^{10} a_i - 3\sum_{i=1}^{10} b_i = 2(20) - 3(7) = 19.$

31. Calculate $\sum_{j=101}^{200} j$. *Hint:* Write as a difference of two sums and use formula (3).

SOLUTION

$$\sum_{j=101}^{200} j = \sum_{j=1}^{200} j - \sum_{j=1}^{100} j = \left(\frac{200^2}{2} + \frac{200}{2}\right) - \left(\frac{100^2}{2} + \frac{100}{2}\right) = 20100 - 5050 = 15050.$$

32. Calculate $\sum_{j=1}^{30} (2j + 1)^2$. *Hint:* Expand and use formulas (3)–(4).

SOLUTION

$$\begin{aligned}\sum_{j=1}^{30} (2j+1)^2 &= 4\sum_{j=1}^{30} j^2 + 4\sum_{j=1}^{30} j + \sum_{j=1}^{30} 1 \\ &= 4\left(\frac{30^3}{3} + \frac{30^2}{2} + \frac{30}{6}\right) + 4\left(\frac{30^2}{2} + \frac{30}{2}\right) + 30 \\ &= 39{,}710.\end{aligned}$$

In Exercises 33–40, use linearity and formulas (3)–(5) to rewrite and evaluate the sums.

33. $\sum_{j=1}^{20} 8j^3$

SOLUTION $\sum_{j=1}^{20} 8j^3 = 8\sum_{j=1}^{20} j^3 = 8\left(\frac{20^4}{4} + \frac{20^3}{2} + \frac{20^2}{4}\right) = 8(44{,}100) = 352{,}800.$

34. $\sum_{k=1}^{30}(4k-3)$

SOLUTION

$$\begin{aligned}\sum_{k=1}^{30}(4k-3) &= 4\sum_{k=1}^{30}k - 3\sum_{k=1}^{30}1 \\ &= 4\left(\frac{30^2}{2}+\frac{30}{2}\right) - 3(30) = 4(465) - 90 = 1770.\end{aligned}$$

35. $\sum_{n=51}^{150} n^2$

SOLUTION

$$\begin{aligned}\sum_{n=51}^{150} n^2 &= \sum_{n=1}^{150} n^2 - \sum_{n=1}^{50} n^2 \\ &= \left(\frac{150^3}{3}+\frac{150^2}{2}+\frac{150}{6}\right) - \left(\frac{50^3}{3}+\frac{50^2}{2}+\frac{50}{6}\right) \\ &= 1{,}136{,}275 - 42{,}925 = 1{,}093{,}350.\end{aligned}$$

36. $\sum_{k=101}^{200} k^3$

SOLUTION

$$\begin{aligned}\sum_{k=101}^{200} k^3 &= \sum_{k=1}^{200} k^3 - \sum_{k=1}^{100} k^3 \\ &= \left(\frac{200^4}{4}+\frac{200^3}{2}+\frac{200^2}{4}\right) - \left(\frac{100^4}{4}+\frac{100^3}{2}+\frac{100^2}{4}\right) \\ &= 404{,}010{,}000 - 25{,}502{,}500 = 378{,}507{,}500.\end{aligned}$$

37. $\sum_{j=0}^{50} j(j-1)$

SOLUTION

$$\begin{aligned}\sum_{j=0}^{50} j(j-1) &= \sum_{j=0}^{50}(j^2-j) = \sum_{j=0}^{50} j^2 - \sum_{j=0}^{50} j \\ &= \left(\frac{50^3}{3}+\frac{50^2}{2}+\frac{50}{6}\right) - \left(\frac{50^2}{2}+\frac{50}{2}\right) = \frac{50^3}{3} - \frac{50}{3} = \frac{124{,}950}{3} = 41{,}650.\end{aligned}$$

The power sum formula is usable because $\sum_{j=0}^{50} j(j-1) = \sum_{j=1}^{50} j(j-1)$.

38. $\sum_{j=2}^{30}\left(6j+\frac{4j^2}{3}\right)$

SOLUTION

$$\begin{aligned}\sum_{j=2}^{30}\left(6j+\frac{4j^2}{3}\right) &= 6\sum_{j=2}^{30} j + \frac{4}{3}\sum_{j=2}^{30} j^2 = 6\left(\sum_{j=1}^{30} j - \sum_{j=1}^{1} j\right) + \frac{4}{3}\left(\sum_{j=1}^{30} j^2 - \sum_{j=1}^{1} j^2\right) \\ &= 6\left(\frac{30^2}{2}+\frac{30}{2}-1\right) + \frac{4}{3}\left(\frac{30^3}{3}+\frac{30^2}{2}+\frac{30}{6}-1\right) \\ &= 6\,(464) + \frac{4}{3}\,(9454) = 2784 + \frac{37{,}816}{3} = \frac{46{,}168}{3}.\end{aligned}$$

39. $\sum_{m=1}^{30} (4-m)^3$

SOLUTION

$$\begin{aligned}\sum_{m=1}^{30} (4-m)^3 &= \sum_{m=1}^{30} (64 - 48m + 12m^2 - m^3)\\ &= 64\sum_{m=1}^{30} 1 - 48\sum_{m=1}^{30} m + 12\sum_{m=1}^{30} m^2 - \sum_{m=1}^{30} m^3\\ &= 64(30) - 48\frac{(30)(31)}{2} + 12\left(\frac{30^3}{3} + \frac{30^2}{2} + \frac{30}{6}\right) - \left(\frac{30^4}{4} + \frac{30^3}{2} + \frac{30^2}{4}\right)\\ &= 1920 - 22{,}320 + 113{,}460 - 216{,}225 = -123{,}165.\end{aligned}$$

40. $\sum_{m=1}^{20} \left(5 + \frac{3m}{2}\right)^2$

SOLUTION

$$\begin{aligned}\sum_{m=1}^{20} \left(5 + \frac{3m}{2}\right)^2 &= 25\sum_{m=1}^{20} 1 + 15\sum_{m=1}^{20} m + \frac{9}{4}\sum_{m=1}^{20} m^2\\ &= 25(20) + 15\left(\frac{20^2}{2} + \frac{20}{2}\right) + \frac{9}{4}\left(\frac{20^3}{3} + \frac{20^2}{2} + \frac{20}{6}\right)\\ &= 500 + 15(210) + \frac{9}{4}(2870) = 10107.5.\end{aligned}$$

In Exercises 41–44, use formulas (3)–(5) to evaluate the limit.

41. $\lim_{N\to\infty} \sum_{i=1}^{N} \frac{i}{N^2}$

SOLUTION Let $s_N = \sum_{i=1}^{N} \frac{i}{N^2}$. Then,

$$s_N = \sum_{i=1}^{N} \frac{i}{N^2} = \frac{1}{N^2}\sum_{i=1}^{N} i = \frac{1}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) = \frac{1}{2} + \frac{1}{2N}.$$

Therefore, $\lim_{N\to\infty} s_N = \frac{1}{2}$.

42. $\lim_{N\to\infty} \sum_{j=1}^{N} \frac{j^3}{N^4}$

SOLUTION Let $s_N = \sum_{j=1}^{N} \frac{j^3}{N^4}$. Then

$$s_N = \frac{1}{N^4}\sum_{j=1}^{N} j^3 = \frac{1}{N^4}\left(\frac{N^4}{4} + \frac{N^3}{2} + \frac{N^2}{4}\right) = \frac{1}{4} + \frac{1}{2N} + \frac{1}{4N^2}.$$

Therefore, $\lim_{N\to\infty} s_N = \frac{1}{4}$.

43. $\displaystyle\lim_{N\to\infty}\sum_{i=1}^{N}\frac{i^2-i+1}{N^3}$

SOLUTION Let $s_N = \displaystyle\sum_{i=1}^{N}\frac{i^2-i+1}{N^3}$. Then

$$s_N = \sum_{i=1}^{N}\frac{i^2-i+1}{N^3} = \frac{1}{N^3}\left[\left(\sum_{i=1}^{N} i^2\right) - \left(\sum_{i=1}^{N} i\right) + \left(\sum_{i=1}^{N} 1\right)\right]$$
$$= \frac{1}{N^3}\left[\left(\frac{N^3}{3}+\frac{N^2}{2}+\frac{N}{6}\right) - \left(\frac{N^2}{2}+\frac{N}{2}\right) + N\right] = \frac{1}{3} + \frac{2}{3N^2}.$$

Therefore, $\displaystyle\lim_{N\to\infty} s_N = \frac{1}{3}$.

44. $\displaystyle\lim_{N\to\infty}\sum_{i=1}^{N}\left(\frac{i^3}{N^4}-\frac{20}{N}\right)$

SOLUTION Let $s_N = \displaystyle\sum_{i=1}^{N}\left(\frac{i^3}{N^4}-\frac{20}{N}\right)$. Then

$$s_N = \frac{1}{N^4}\sum_{i=1}^{N} i^3 - \frac{20}{N}\sum_{i=1}^{N} 1 = \frac{1}{N^4}\left(\frac{N^4}{4}+\frac{N^3}{2}+\frac{N^2}{4}\right) - 20 = \frac{1}{4} + \frac{1}{2N} + \frac{1}{4N^2} - 20.$$

Therefore, $\displaystyle\lim_{N\to\infty} s_N = \frac{1}{4} - 20 = -\frac{79}{4}$.

In Exercises 45–50, calculate the limit for the given function and interval. Verify your answer by using geometry.

45. $\displaystyle\lim_{N\to\infty} R_N, \quad f(x) = 9x, \quad [0, 2]$

SOLUTION Let $f(x) = 9x$ on $[0, 2]$. Let N be a positive integer and set $a = 0$, $b = 2$, and $\Delta x = (b-a)/N = (2-0)/N = 2/N$. Also, let $x_k = a + k\Delta x = 2k/N$, $k = 1, 2, \ldots, N$ be the right endpoints of the N subintervals of $[0, 2]$. Then

$$R_N = \Delta x \sum_{k=1}^{N} f(x_k) = \frac{2}{N}\sum_{k=1}^{N} 9\left(\frac{2k}{N}\right) = \frac{36}{N^2}\sum_{k=1}^{N} k = \frac{36}{N^2}\left(\frac{N^2}{2}+\frac{N}{2}\right) = 18 + \frac{18}{N}.$$

The area under the graph is

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(18 + \frac{18}{N}\right) = 18.$$

The region under the graph is a triangle with base 2 and height 18. The area of the region is then $\frac{1}{2}(2)(18) = 18$, which agrees with the value obtained from the limit of the right-endpoint approximations.

46. $\displaystyle\lim_{N\to\infty} R_N, \quad f(x) = 3x + 6, \quad [1, 4]$

SOLUTION Let $f(x) = 3x + 6$ on $[1, 4]$. Let N be a positive integer and set $a = 1$, $b = 4$, and $\Delta x = (b-a)/N = (4-1)/N = 3/N$. Also, let $x_k = a + k\Delta x = 1 + 3k/N$, $k = 1, 2, \ldots, N$ be the right endpoints of the N subintervals of $[1, 4]$. Then

$$R_N = \Delta x \sum_{k=1}^{N} f(x_k) = \frac{3}{N}\sum_{k=1}^{N}\left(9 + \frac{9k}{N}\right)$$
$$= \frac{27}{N}\sum_{k=1}^{N} 1 + \frac{27}{N^2}\sum_{k=1}^{N} j = \frac{27}{N}(N) + \frac{27}{N^2}\left(\frac{N^2}{2}+\frac{N}{2}\right)$$
$$= \frac{81}{2} + \frac{27}{2N}.$$

The area under the graph is

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{81}{2} + \frac{27}{2N}\right) = \frac{81}{2}.$$

The region under the graph is a trapezoid with base width 3 and heights 9 and 18. The area of the region is then $\frac{1}{2}(3)(9+18) = \frac{81}{2}$, which agrees with the value obtained from the limit of the right-endpoint approximations.

47. $\lim\limits_{N\to\infty} L_N, \quad f(x) = \frac{1}{2}x + 2, \quad [0, 4]$

SOLUTION Let $f(x) = \frac{1}{2}x + 2$ on $[0, 4]$. Let $N > 0$ be an integer, and set $a = 0$, $b = 4$, and $\Delta x = (4-0)/N = \frac{4}{N}$. Also, let $x_k = 0 + k\Delta x = \frac{4k}{N}$, $k = 0, 1, \ldots, N-1$ be the left endpoints of the N subintervals. Then

$$\begin{aligned} L_N &= \Delta x \sum_{k=0}^{N-1} f(x_k) = \frac{4}{N} \sum_{k=0}^{N-1} \left(\frac{1}{2}\left(\frac{4k}{N}\right) + 2 \right) = \frac{8}{N} \sum_{k=0}^{N-1} 1 + \frac{8}{N^2} \sum_{k=0}^{N-1} k \\ &= 8 + \frac{8}{N^2}\left(\frac{(N-1)^2}{2} + \frac{N-1}{2} \right) = 12 - \frac{4}{N}. \end{aligned}$$

The area under the graph is

$$\lim_{N\to\infty} L_N = 12.$$

The region under the curve over $[0, 4]$ is a trapezoid with base width 4 and heights 2 and 4. From this, we get that the area is $\frac{1}{2}(4)(2+4) = 12$, which agrees with the answer obtained from the limit of the left-endpoint approximations.

48. $\lim\limits_{N\to\infty} L_N, \quad f(x) = 4x - 2, \quad [1, 3]$

SOLUTION Let $f(x) = 4x - 2$ on $[1, 3]$. Let $N > 0$ be an integer, and set $a = 1$, $b = 3$, and $\Delta x = (3-1)/N = \frac{2}{N}$. Also, let $x_k = a + k\Delta x = 1 + \frac{2k}{N}$, $k = 0, 1, \ldots, N-1$ be the left endpoints of the N subintervals. Then

$$\begin{aligned} L_N &= \Delta x \sum_{k=0}^{N-1} f(x_k) = \frac{2}{N} \sum_{k=0}^{N-1} \left(\frac{8k}{N} + 2 \right) = \frac{16}{N^2} \sum_{k=0}^{N-1} k + \frac{4}{N} \sum_{k=0}^{N-1} 1 \\ &= \frac{16}{N^2}\left(\frac{(N-1)^2}{2} + \frac{N-1}{2} \right) + \frac{4}{N}(N-1) \\ &= 12 - \frac{12}{N} \end{aligned}$$

The area under the graph is

$$\lim_{N\to\infty} L_N = 12.$$

The region under the curve over $[1, 3]$ is a trapezoid with base width 2 and heights 2 and 10. From this, we get that the area is $\frac{1}{2}(2)(2+10) = 12$, which agrees with the answer obtained from the limit of the left-endpoint approximations.

49. $\lim\limits_{N\to\infty} M_N, \quad f(x) = x, \quad [0, 2]$

SOLUTION Let $f(x) = x$ on $[0, 2]$. Let $N > 0$ be an integer and set $a = 0$, $b = 2$, and $\Delta x = (b-a)/N = \frac{2}{N}$. Also, let $x_k^* = 0 + (k - \frac{1}{2})\Delta x = \frac{2k-1}{N}$, $k = 1, 2, \ldots N$, be the midpoints of the N subintervals of $[0, 2]$. Then

$$\begin{aligned} M_N &= \Delta x \sum_{k=1}^{N} f(x_k^*) = \frac{2}{N} \sum_{k=1}^{N} \frac{2k-1}{N} = \frac{2}{N^2} \sum_{k=1}^{N} (2k-1) \\ &= \frac{2}{N^2}\left(2\sum_{k=1}^{N} k - N \right) = \frac{4}{N^2}\left(\frac{N^2}{2} + \frac{N}{2} \right) - \frac{2}{N} = 2. \end{aligned}$$

The area under the curve over $[0, 2]$ is

$$\lim_{N\to\infty} M_N = 2.$$

The region under the curve over $[0, 2]$ is a triangle with base and height 2, and thus area 2, which agrees with the answer obtained from the limit of the midpoint approximations.

50. $\lim_{N\to\infty} M_N, \quad f(x) = 12 - 4x, \quad [2, 6]$

SOLUTION Let $f(x) = 12 - 4x$ on $[2, 6]$. Let $N > 0$ be an integer and set $a = 2$, $b = 6$, and $\Delta x = (b-a)/N = \frac{4}{N}$. Also, let $x_k^* = a + (k - \frac{1}{2})\Delta x = 2 + \frac{4k-2}{N}$, $k = 1, 2, \dots N$, be the midpoints of the N subintervals of $[2, 6]$. Then

$$M_N = \Delta x \sum_{k=1}^{N} f(x_k^*) = \frac{4}{N}\sum_{k=1}^{N}\left(4 - \frac{16k-8}{N}\right)$$

$$= \frac{16}{N}\sum_{k=1}^{N} 1 - \frac{64}{N^2}\sum_{k=1}^{N} k + \frac{32}{N^2}\sum_{k=1}^{N} 1$$

$$= \frac{16}{N}(N) - \frac{64}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{32}{N^2}(N) = -16.$$

The area under the curve over $[2, 6]$ is

$$\lim_{N\to\infty} M_N = -16.$$

The region under the curve over $[2, 6]$ consists of a triangle of base 1 and height 4 above the axis and a triangle of base 3 and height 12 below the axis. The area of this region is therefore

$$\frac{1}{2}(1)(4) - \frac{1}{2}(3)(12) = -16,$$

which agrees with the answer obtained from the limit of the midpoint approximations.

51. Show, for $f(x) = 3x^2 + 4x$ over $[0, 2]$, that

$$R_N = \frac{2}{N}\sum_{j=1}^{N}\left(\frac{24j^2}{N^2} + \frac{16j}{N}\right)$$

Then evaluate $\lim_{N\to\infty} R_N$.

SOLUTION Let $f(x) = 3x^2 + 4x$ on $[0, 2]$. Let N be a positive integer and set $a = 0$, $b = 2$, and $\Delta x = (b-a)/N = (2-0)/N = 2/N$. Also, let $x_j = a + j\Delta x = 2j/N$, $j = 1, 2, \dots, N$ be the right endpoints of the N subintervals of $[0, 3]$. Then

$$R_N = \Delta x \sum_{j=1}^{N} f(x_j) = \frac{2}{N}\sum_{j=1}^{N}\left(3\left(\frac{2j}{N}\right)^2 + 4\frac{2j}{N}\right)$$

$$= \frac{2}{N}\sum_{j=1}^{N}\left(\frac{12j^2}{N^2} + \frac{8j}{N}\right)$$

Continuing, we find

$$R_N = \frac{24}{N^3}\sum_{j=1}^{N} j^2 + \frac{16}{N^2}\sum_{j=1}^{N} j$$

$$= \frac{24}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) + \frac{16}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right)$$

$$= 16 + \frac{20}{N} + \frac{4}{N^2}$$

Thus,

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(16 + \frac{20}{N} + \frac{4}{N^2}\right) = 16.$$

52. Show, for $f(x) = 3x^3 - x^2$ over $[1, 5]$, that

$$R_N = \frac{4}{N}\sum_{j=1}^{N}\left(\frac{192j^3}{N^3} + \frac{128j^2}{N^2} + \frac{28j}{N} + 2\right)$$

Then evaluate $\lim_{N\to\infty} R_N$.

SOLUTION Let $f(x) = 3x^3 - x^2$ on $[1, 5]$. Let N be a positive integer and set $a = 1$, $b = 5$, and $\Delta x = (b-a)/N = (5-1)/N = 4/N$. Also, let $x_j = a + j\Delta x = 1 + 4j/N$, $j = 1, 2, \ldots, N$ be the right endpoints of the N subintervals of $[1, 5]$. Then

$$\begin{aligned} f(x_j) &= 3\left(1 + \frac{4j}{N}\right)^3 - \left(1 + \frac{4j}{N}\right)^2 \\ &= 3\left(1 + \frac{12j}{N} + \frac{48j^2}{N^2} + \frac{64j^3}{N^3}\right) - \left(1 + \frac{8j}{N} + \frac{16j^2}{N^2}\right) \\ &= \frac{192j^3}{N^3} + \frac{128j^2}{N^2} + \frac{28j}{N} + 2. \end{aligned}$$

and

$$R_N = \sum_{j=1}^{N} f(x_j)\Delta x = \frac{4}{N}\sum_{j=1}^{N}\left(\frac{192j^3}{N^3} + \frac{128j^2}{N^2} + \frac{28j}{N} + 2\right).$$

Continuing, we find

$$\begin{aligned} R_N &= \frac{768}{N^4}\sum_{j=1}^{N} j^3 + \frac{512}{N^3}\sum_{j=1}^{N} j^2 + \frac{112}{N^2}\sum_{j=1}^{N} j + \frac{8}{N}\sum_{j=1}^{N} 1 \\ &= \frac{768}{N^4}\left(\frac{N^4}{4} + \frac{N^3}{2} + \frac{N^2}{2}\right) + \frac{512}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) \\ &\quad + \frac{112}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{8}{N}(N) \\ &= \frac{1280}{3} + \frac{696}{N} + \frac{832}{3N^2}. \end{aligned}$$

Thus,

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{1280}{3} + \frac{696}{N} + \frac{832}{3N^2}\right) = \frac{1280}{3}.$$

In Exercises 53–60, find a formula for R_N and compute the area under the graph as a limit.

53. $f(x) = x^2$, $[0, 1]$

SOLUTION Let $f(x) = x^2$ on the interval $[0, 1]$. Then $\Delta x = \dfrac{1-0}{N} = \dfrac{1}{N}$ and $a = 0$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(0 + j\Delta x) = \frac{1}{N}\sum_{j=1}^{N} j^2 \frac{1}{N^2} = \frac{1}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) = \frac{1}{3} + \frac{1}{2N} + \frac{1}{6N^2}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{1}{3} + \frac{1}{2N} + \frac{1}{6N^2}\right) = \frac{1}{3}.$$

54. $f(x) = x^2$, $[-1, 5]$

SOLUTION Let $f(x) = x^2$ on the interval $[-1, 5]$. Then $\Delta x = \dfrac{5-(-1)}{N} = \dfrac{6}{N}$ and $a = -1$. Hence,

$$\begin{aligned} R_N &= \Delta x \sum_{j=1}^{N} f(-1 + j\Delta x) = \frac{6}{N}\sum_{j=1}^{N}\left(-1 + \frac{6j}{N}\right)^2 \\ &= \frac{6}{N}\sum_{j=1}^{N} 1 - \frac{72}{N^2}\sum_{j=1}^{N} j + \frac{216}{N^3}\sum_{j=1}^{N} j^2 \\ &= \frac{6}{N}(N) - \frac{72}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{216}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) \\ &= 42 + \frac{72}{N} + \frac{36}{N^2} \end{aligned}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(42 + \frac{72}{N} + \frac{36}{N^2}\right) = 42.$$

55. $f(x) = 6x^2 - 4$, $[2, 5]$

SOLUTION Let $f(x) = 6x^2 - 4$ on the interval $[2, 5]$. Then $\Delta x = \frac{5-2}{N} = \frac{3}{N}$ and $a = 2$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(2 + j\Delta x) = \frac{3}{N}\sum_{j=1}^{N}\left(6\left(2 + \frac{3j}{N}\right)^2 - 4\right) = \frac{3}{N}\sum_{j=1}^{N}\left(20 + \frac{72j}{N} + \frac{54j^2}{N^2}\right)$$

$$= 60 + \frac{216}{N^2}\sum_{j=1}^{N} j + \frac{162}{N^3}\sum_{j=1}^{N} j^2$$

$$= 60 + \frac{216}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{162}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right)$$

$$= 222 + \frac{189}{N} + \frac{27}{N^2}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(222 + \frac{189}{N} + \frac{27}{N^2}\right) = 222.$$

56. $f(x) = x^2 + 7x$, $[6, 11]$

SOLUTION Let $f(x) = x^2 + 7x$ on the interval $[6, 11]$. Then $\Delta x = \frac{11-6}{N} = \frac{5}{N}$ and $a = 6$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(6 + j\Delta x) = \frac{5}{N}\sum_{j=1}^{N}\left[\left(6 + \frac{5j}{N}\right)^2 + 7\left(6 + \frac{5j}{N}\right)\right]$$

$$= \frac{5}{N}\sum_{j=1}^{N}\left(\frac{25j^2}{N^2} + \frac{95j}{N} + 78\right)$$

$$= \frac{125}{N^3}\sum_{j=1}^{N} j^3 + \frac{475}{N^2}\sum_{j=1}^{N} j + \frac{390}{N}\sum_{j=1}^{N} 1$$

$$= \frac{125}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) + \frac{475}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + 390$$

$$= \frac{4015}{6} + \frac{300}{N} + \frac{125}{6N^2}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{4015}{6} + \frac{300}{N} + \frac{125}{6N^2}\right) = \frac{4015}{6}.$$

57. $f(x) = x^3 - x$, $[0, 2]$

SOLUTION Let $f(x) = x^3 - x$ on the interval $[0, 2]$. Then $\Delta x = \frac{2-0}{N} = \frac{2}{N}$ and $a = 0$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(0 + j\Delta x) = \frac{2}{N}\sum_{j=1}^{N}\left(\left(\frac{2j}{N}\right)^3 - \frac{2j}{N}\right) = \frac{2}{N}\sum_{j=1}^{N}\left(\frac{8j^3}{N^3} - \frac{2j}{N}\right)$$

$$= \frac{16}{N^4}\sum_{j=1}^{N} j^3 - \frac{4}{N^2}\sum_{j=1}^{N} j$$

$$= \frac{16}{N^4}\left(\frac{N^4}{4} + \frac{N^3}{2} + \frac{N^2}{2}\right) - \frac{4}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right)$$

$$= 2 + \frac{6}{N} + \frac{8}{N^2}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty} \left(2 + \frac{6}{N} + \frac{8}{N^2}\right) = 2.$$

58. $f(x) = 2x^3 + x^2$, $[-2, 2]$

SOLUTION Let $f(x) = 2x^3 + x^2$ on the interval $[-2, 2]$. Then $\Delta x = \frac{2-(-2)}{N} = \frac{4}{N}$ and $a = -2$. Hence,

$$\begin{aligned} R_N &= \Delta x \sum_{j=1}^{N} f(-2 + j\Delta x) = \frac{4}{N}\sum_{j=1}^{N}\left[2\left(-2+\frac{4j}{N}\right)^3 + \left(-2+\frac{4j}{N}\right)^2\right] \\ &= \frac{4}{N}\sum_{j=1}^{N}\left(\frac{128j^3}{N^3} - \frac{176j^2}{N^2} + \frac{80j}{N} - 12\right) \\ &= \frac{512}{N^4}\left(\frac{N^4}{4} + \frac{N^3}{2} + \frac{N^2}{4}\right) - \frac{704}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) + \frac{320}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) - 48 \\ &= \frac{16}{3} + \frac{64}{N} + \frac{32}{3N^2} \end{aligned}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{16}{3} + \frac{64}{N} + \frac{32}{3N^2}\right) = \frac{16}{3}.$$

59. $f(x) = 2x + 1$, $[a, b]$ (a, b constants with $a < b$)

SOLUTION Let $f(x) = 2x + 1$ on the interval $[a, b]$. Then $\Delta x = \frac{b-a}{N}$. Hence,

$$\begin{aligned} R_N &= \Delta x \sum_{j=1}^{N} f(a + j\Delta x) = \frac{(b-a)}{N}\sum_{j=1}^{N}\left(2\left(a + j\frac{(b-a)}{N}\right) + 1\right) \\ &= \frac{(b-a)}{N}(2a+1)\sum_{j=1}^{N} 1 + \frac{2(b-a)^2}{N^2}\sum_{j=1}^{N} j \\ &= \frac{(b-a)}{N}(2a+1)N + \frac{2(b-a)^2}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) \\ &= (b-a)(2a+1) + (b-a)^2 + \frac{(b-a)^2}{N} \end{aligned}$$

and

$$\begin{aligned} \lim_{N\to\infty} R_N &= \lim_{N\to\infty}\left((b-a)(2a+1) + (b-a)^2 + \frac{(b-a)^2}{N}\right) \\ &= (b-a)(2a+1) + (b-a)^2 = (b^2 + b) - (a^2 + a). \end{aligned}$$

60. $f(x) = x^2$, $[a, b]$ (a, b constants with $a < b$)

SOLUTION Let $f(x) = x^2$ on the interval $[a, b]$. Then $\Delta x = \frac{b-a}{N}$. Hence,

$$\begin{aligned} R_N &= \Delta x \sum_{j=1}^{N} f(a + j\Delta x) = \frac{(b-a)}{N}\sum_{j=1}^{N}\left(a^2 + 2aj\frac{(b-a)}{N} + j^2\frac{(b-a)^2}{N^2}\right) \\ &= \frac{a^2(b-a)}{N}\sum_{j=1}^{N} 1 + \frac{2a(b-a)^2}{N^2}\sum_{j=1}^{N} j + \frac{(b-a)^3}{N^3}\sum_{j=1}^{N} j^2 \\ &= \frac{a^2(b-a)}{N}N + \frac{2a(b-a)^2}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{(b-a)^3}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) \\ &= a^2(b-a) + a(b-a)^2 + \frac{a(b-a)^2}{N} + \frac{(b-a)^3}{3} + \frac{(b-a)^3}{2N} + \frac{(b-a)^3}{6N^2} \end{aligned}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(a^2(b-a)+a(b-a)^2+\frac{a(b-a)^2}{N}+\frac{(b-a)^3}{3}+\frac{(b-a)^3}{2N}+\frac{(b-a)^3}{6N^2}\right)$$

$$= a^2(b-a)+a(b-a)^2+\frac{(b-a)^3}{3} = \frac{1}{3}b^3-\frac{1}{3}a^3.$$

In Exercises 61–64, describe the area represented by the limits.

61. $\lim\limits_{N\to\infty}\frac{1}{N}\sum\limits_{j=1}^{N}\left(\frac{j}{N}\right)^4$

SOLUTION The limit

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\frac{1}{N}\sum_{j=1}^{N}\left(\frac{j}{N}\right)^4$$

represents the area between the graph of $f(x)=x^4$ and the x-axis over the interval [0, 1].

62. $\lim\limits_{N\to\infty}\frac{3}{N}\sum\limits_{j=1}^{N}\left(2+\frac{3j}{N}\right)^4$

SOLUTION The limit

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\frac{3}{N}\sum_{j=1}^{N}\left(2+j\cdot\frac{3}{N}\right)^4$$

represents the area between the graph of $f(x)=x^4$ and the x-axis over the interval [2, 5].

63. $\lim\limits_{N\to\infty}\frac{5}{N}\sum\limits_{j=0}^{N-1}e^{-2+5j/N}$

SOLUTION The limit

$$\lim_{N\to\infty} L_N = \lim_{N\to\infty}\frac{5}{N}\sum_{j=0}^{N-1}e^{-2+5j/N}$$

represents the area between the graph of $y=e^x$ and the x-axis over the interval $[-2, 3]$.

64. $\lim\limits_{N\to\infty}\frac{\pi}{2N}\sum\limits_{j=1}^{N}\sin\left(\frac{\pi}{3}-\frac{\pi}{4N}+\frac{j\pi}{2N}\right)$

SOLUTION The limit

$$\lim_{N\to\infty}\frac{\pi}{2N}\sum_{j=1}^{N}\sin\left(\frac{\pi}{3}-\frac{\pi}{4N}+\frac{j\pi}{2N}\right)$$

represents the area between the graph of $y=\sin x$ and the x-axis over the interval $[\frac{\pi}{3}, \frac{5\pi}{6}]$.

In Exercises 65–70, express the area under the graph as a limit using the approximation indicated (in summation notation), but do not evaluate.

65. R_N, $f(x)=\sin x$ over $[0,\pi]$

SOLUTION Let $f(x)=\sin x$ over $[0,\pi]$ and set $a=0$, $b=\pi$, and $\Delta x=(b-a)/N=\pi/N$. Then

$$R_N=\Delta x\sum_{k=1}^{N}f(x_k)=\frac{\pi}{N}\sum_{k=1}^{N}\sin\left(\frac{k\pi}{N}\right).$$

Hence

$$\lim_{N\to\infty} R_N=\lim_{N\to\infty}\frac{\pi}{N}\sum_{k=1}^{N}\sin\left(\frac{k\pi}{N}\right)$$

is the area between the graph of $f(x)=\sin x$ and the x-axis over $[0,\pi]$.

66. R_N, $f(x) = x^{-1}$ over $[1, 7]$

SOLUTION Let $f(x) = x^{-1}$ over the interval $[1, 7]$. Then $\Delta x = \dfrac{7-1}{N} = \dfrac{6}{N}$ and $a = 1$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(1 + j\Delta x) = \frac{6}{N} \sum_{j=1}^{N} \left(1 + j\frac{6}{N}\right)^{-1}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty} \frac{6}{N} \sum_{j=1}^{N} \left(1 + j\frac{6}{N}\right)^{-1}$$

is the area between the graph of $f(x) = x^{-1}$ and the x-axis over $[1, 7]$.

67. L_N, $f(x) = \sqrt{2x+1}$ over $[7, 11]$

SOLUTION Let $f(x) = \sqrt{2x+1}$ over the interval $[7, 11]$. Then $\Delta x = \dfrac{11-7}{N} = \dfrac{4}{N}$ and $a = 7$. Hence,

$$L_N = \Delta x \sum_{j=0}^{N-1} f(7 + j\Delta x) = \frac{4}{N} \sum_{j=0}^{N-1} \sqrt{2(7 + j\frac{4}{N}) + 1}$$

and

$$\lim_{N\to\infty} L_N = \lim_{N\to\infty} \frac{4}{N} \sum_{j=0}^{N-1} \sqrt{15 + \frac{8j}{N}}$$

is the area between the graph of $f(x) = \sqrt{2x+1}$ and the x-axis over $[7, 11]$.

68. L_N, $f(x) = \cos x$ over $\left[\frac{\pi}{8}, \frac{\pi}{4}\right]$

SOLUTION Let $f(x) = \cos x$ over the interval $\left[\frac{\pi}{8}, \frac{\pi}{4}\right]$. Then $\Delta x = \dfrac{\frac{\pi}{4} - \frac{\pi}{8}}{N} = \dfrac{\frac{\pi}{8}}{N} = \dfrac{\pi}{8N}$ and $a = \frac{\pi}{8}$, Hence:

$$L_N = \Delta x \sum_{j=0}^{N-1} f\left(\frac{\pi}{8} + j\Delta x\right) = \frac{\pi}{8N} \sum_{j=0}^{N-1} \cos\left(\frac{\pi}{8} + j\frac{\pi}{8N}\right)$$

and

$$\lim_{N\to\infty} L_N = \lim_{N\to\infty} \frac{\pi}{8N} \sum_{j=0}^{N-1} \cos\left(\frac{\pi}{8} + j\frac{\pi}{8N}\right)$$

is the area between the graph of $f(x) = \cos x$ and the x-axis over $[\frac{\pi}{8}, \frac{\pi}{4}]$.

69. M_N, $f(x) = \tan x$ over $\left[\frac{1}{2}, 1\right]$

SOLUTION Let $f(x) = \tan x$ over the interval $[\frac{1}{2}, 1]$. Then $\Delta x = \frac{1-\frac{1}{2}}{N} = \frac{1}{2N}$ and $a = \frac{1}{2}$. Hence

$$M_N = \Delta x \sum_{j=1}^{N} f\left(\frac{1}{2} + \left(j - \frac{1}{2}\right)\Delta x\right) = \frac{1}{2N} \sum_{j=1}^{N} \tan\left(\frac{1}{2} + \frac{1}{2N}\left(j - \frac{1}{2}\right)\right)$$

and so

$$\lim_{N\to\infty} M_N = \lim_{N\to\infty} \frac{1}{2N} \sum_{j=1}^{N} \tan\left(\frac{1}{2} + \frac{1}{2N}\left(j - \frac{1}{2}\right)\right)$$

is the area between the graph of $f(x) = \tan x$ and the x-axis over $[\frac{1}{2}, 1]$.

70. M_N, $f(x) = x^{-2}$ over $[3, 5]$

SOLUTION Let $f(x) = x^{-2}$ over the interval $[3, 5]$. Then $\Delta x = \frac{5-3}{N} = \frac{2}{N}$ and $a = 3$. Hence

$$M_N = \Delta x \sum_{j=1}^{N} f\left(3 + \left(j - \frac{1}{2}\right)\Delta x\right) = \frac{2}{N} \sum_{j=1}^{N} \left(3 + \frac{2}{N}\left(j - \frac{1}{2}\right)\right)^{-2}$$

and so

$$\lim_{N\to\infty} M_N = \lim_{N\to\infty} \frac{2}{N}\sum_{j=1}^{N}\left(3+\frac{2}{N}\left(j-\frac{1}{2}\right)\right)^{-2}$$

is the area between the graph of $f(x) = x^{-2}$ and the x-axis over [3, 5].

71. Evaluate $\lim_{N\to\infty} \frac{1}{N}\sum_{j=1}^{N}\sqrt{1-\left(\frac{j}{N}\right)^2}$ by interpreting it as the area of part of a familiar geometric figure.

SOLUTION The limit

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty} \frac{1}{N}\sum_{j=1}^{N}\sqrt{1-\left(\frac{j}{N}\right)^2}$$

represents the area between the graph of $y = f(x) = \sqrt{1-x^2}$ and the x-axis over the interval [0, 1]. This is the portion of the circular disk $x^2 + y^2 \le 1$ that lies in the first quadrant. Accordingly, its area is $\frac{1}{4}\pi\,(1)^2 = \frac{\pi}{4}$.

In Exercises 72–74, let $f(x) = x^2$ and let R_N, L_N, and M_N be the approximations for the interval [0, 1].

72. Show that $R_N = \frac{1}{3} + \frac{1}{2N} + \frac{1}{6N^2}$. Interpret the quantity $\frac{1}{2N} + \frac{1}{6N^2}$ as the area of a region.

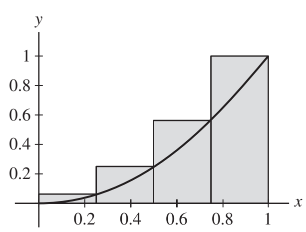
SOLUTION Let $f(x) = x^2$ on [0, 1]. Let $N > 0$ be an integer and set $a = 0$, $b = 1$ and $\Delta x = \frac{1-0}{N} = \frac{1}{N}$. Then

$$R_N = \Delta x \sum_{j=1}^{N} f(0 + j\Delta x) = \frac{1}{N}\sum_{j=1}^{N} j^2 \frac{1}{N^2} = \frac{1}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right) = \frac{1}{3} + \frac{1}{2N} + \frac{1}{6N^2}.$$

The quantity

$$\frac{1}{2N} + \frac{6}{N^2} \quad \text{in} \quad R_N = \frac{1}{3} + \frac{1}{2N} + \frac{1}{6N^2}$$

represents the collective area of the parts of the rectangles that lie above the graph of $f(x)$. It is the error between R_N and the true area $A = \frac{1}{3}$.



73. Show that

$$L_N = \frac{1}{3} - \frac{1}{2N} + \frac{1}{6N^2}, \qquad M_N = \frac{1}{3} - \frac{1}{12N^2}$$

Then rank the three approximations R_N, L_N, and M_N in order of increasing accuracy (use Exercise 72).

SOLUTION Let $f(x) = x^2$ on [0, 1]. Let N be a positive integer and set $a = 0$, $b = 1$, and $\Delta x = (b-a)/N = 1/N$. Let $x_k = a + k\Delta x = k/N$, $k = 0, 1, \dots, N$ and let $x_k^* = a + (k + \frac{1}{2})\Delta x = (k + \frac{1}{2})/N$, $k = 0, 1, \dots, N-1$. Then

$$L_N = \Delta x \sum_{k=0}^{N-1} f(x_k) = \frac{1}{N}\sum_{k=0}^{N-1}\left(\frac{k}{N}\right)^2 = \frac{1}{N^3}\sum_{k=1}^{N-1} k^2$$
$$= \frac{1}{N^3}\left(\frac{(N-1)^3}{3} + \frac{(N-1)^2}{2} + \frac{N-1}{6}\right) = \frac{1}{3} - \frac{1}{2N} + \frac{1}{6N^2}$$

$$M_N = \Delta x \sum_{k=0}^{N-1} f(x_k^*) = \frac{1}{N}\sum_{k=0}^{N-1}\left(\frac{k+\frac{1}{2}}{N}\right)^2 = \frac{1}{N^3}\sum_{k=0}^{N-1}\left(k^2+k+\frac{1}{4}\right)$$
$$= \frac{1}{N^3}\left(\left(\sum_{k=1}^{N-1} k^2\right)+\left(\sum_{k=1}^{N-1} k\right)+\frac{1}{4}\left(\sum_{k=0}^{N-1} 1\right)\right)$$
$$= \frac{1}{N^3}\left(\left(\frac{(N-1)^3}{3}+\frac{(N-1)^2}{2}+\frac{N-1}{6}\right)+\left(\frac{(N-1)^2}{2}+\frac{N-1}{2}\right)+\frac{1}{4}N\right) = \frac{1}{3}-\frac{1}{12N^2}$$

The error of R_N is given by $\frac{1}{2N}+\frac{1}{6N^2}$, the error of L_N is given by $-\frac{1}{2N}+\frac{1}{6N^2}$ and the error of M_N is given by $-\frac{1}{12N^2}$. Of the three approximations, R_N is the least accurate, then L_N and finally M_N is the most accurate.

74. For each of R_N, L_N, and M_N, find the smallest integer N for which the error is less than 0.001.

SOLUTION

- For R_N, the error is less than 0.001 when:

$$\frac{1}{2N}+\frac{1}{6N^2} < 0.001.$$

We find an adequate solution in N:

$$\frac{1}{2N}+\frac{1}{6N^2} < 0.001$$
$$3N+1 < 0.006(N^2)$$
$$0 < 0.006N^2-3N-1,$$

in particular, if $N > \frac{3+\sqrt{9.024}}{0.012} = 500.333$. Hence R_{501} is within 0.001 of A.

- For L_N, the error is less than 0.001 if

$$\left|-\frac{1}{2N}+\frac{1}{6N^2}\right| < 0.001.$$

We solve this equation for N:

$$\left|\frac{1}{2N}-\frac{1}{6N^2}\right| < 0.001$$
$$\left|\frac{3N-1}{6N^2}\right| < 0.001$$
$$3N-1 < 0.006N^2$$
$$0 < 0.006N^2-3N+1,$$

which is satisfied if $N > \frac{3+\sqrt{9-0.024}}{0.012} = 499.666$. Therefore, L_{500} is within 0.001 units of A.

- For M_N, the error is given by $-\frac{1}{12N^2}$, so the error is less than 0.001 if

$$\frac{1}{12N^2} < 0.001$$
$$1000 < 12N^2$$
$$9.13 < N$$

Therefore, M_{10} is within 0.001 units of the correct answer.

In Exercises 75–80, use the Graphical Insight on page 291 to obtain bounds on the area.

75. Let A be the area under $f(x)=\sqrt{x}$ over [0, 1]. Prove that $0.51 \le A \le 0.77$ by computing R_4 and L_4. Explain your reasoning.

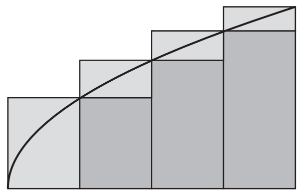
SOLUTION For $n=4$, $\Delta x = \frac{1-0}{4} = \frac{1}{4}$ and $\{x_i\}_{i=0}^{4} = \{0 + i\Delta x\} = \{0, \frac{1}{4}, \frac{1}{2}, \frac{3}{4}, 1\}$. Therefore,

$$R_4 = \Delta x \sum_{i=1}^{4} f(x_i) = \frac{1}{4}\left(\frac{1}{2}+\frac{\sqrt{2}}{2}+\frac{\sqrt{3}}{2}+1\right) \approx 0.768$$

$$L_4 = \Delta x \sum_{i=0}^{3} f(x_i) = \frac{1}{4}\left(0 + \frac{1}{2} + \frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2}\right) \approx 0.518.$$

In the plot below, you can see the rectangles whose area is represented by L_4 under the graph and the top of those whose area is represented by R_4 above the graph. The area A under the curve is somewhere between L_4 and R_4, so

$$0.518 \le A \le 0.768.$$



L_4, R_4 and the graph of $f(x)$.

76. Use R_5 and L_5 to show that the area A under $y = x^{-2}$ over [10, 13] satisfies $0.0218 \le A \le 0.0244$.

SOLUTION Let $f(x) = x^{-2}$ over the interval [10, 13]. Because f is a decreasing function over this interval, it follows that $R_N \le A \le L_N$ for all N. Taking $N = 5$, we have $\Delta x = 3/5$ and

$$R_5 = \frac{3}{5}\left(\frac{1}{10.6^2} + \frac{1}{11.2^2} + \frac{1}{11.8^2} + \frac{1}{12.4^2} + \frac{1}{13^2}\right) = 0.021885.$$

Moreover,

$$L_5 = \frac{3}{5}\left(\frac{1}{10^2} + \frac{1}{10.6^2} + \frac{1}{11.2^2} + \frac{1}{11.8^2} + \frac{1}{12.4^2}\right) = 0.0243344.$$

Thus,

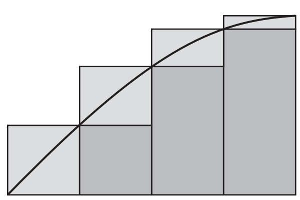
$$0.0218 < R_5 \le A \le L_5 < 0.0244.$$

77. Use R_4 and L_4 to show that the area A under the graph of $y = \sin x$ over $\left[0, \frac{\pi}{2}\right]$ satisfies $0.79 \le A \le 1.19$.

SOLUTION Let $f(x) = \sin x$. $f(x)$ is increasing over the interval $[0, \pi/2]$, so the Insight on page 291 applies, which indicates that $L_4 \le A \le R_4$. For $n = 4$, $\Delta x = \frac{\pi/2-0}{4} = \frac{\pi}{8}$ and $\{x_i\}_{i=0}^{4} = \{0 + i\Delta x\}_{i=0}^{4} = \{0, \frac{\pi}{8}, \frac{\pi}{4}, \frac{3\pi}{8}, \frac{\pi}{2}\}$. From this,

$$L_4 = \frac{\pi}{8}\sum_{i=0}^{3} f(x_i) \approx 0.79, \qquad R_4 = \frac{\pi}{8}\sum_{i=1}^{4} f(x_i) \approx 1.18.$$

Hence A is between 0.79 and 1.19.



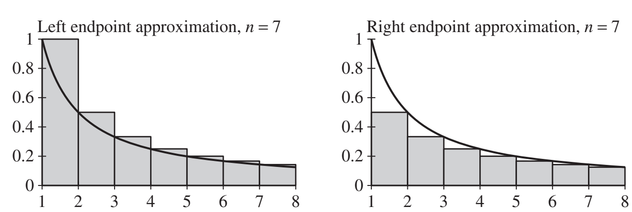
Left and Right endpoint approximations to A.

78. Show that the area A under $f(x) = x^{-1}$ over [1, 8] satisfies

$$\tfrac{1}{2} + \tfrac{1}{3} + \tfrac{1}{4} + \tfrac{1}{5} + \tfrac{1}{6} + \tfrac{1}{7} + \tfrac{1}{8} \le A \le 1 + \tfrac{1}{2} + \tfrac{1}{3} + \tfrac{1}{4} + \tfrac{1}{5} + \tfrac{1}{6} + \tfrac{1}{7}$$

SOLUTION Let $f(x) = x^{-1}$, $1 \le x \le 8$. Since f is decreasing, the left endpoint approximation L_7 overestimates the true area between the graph of f and the x-axis, whereas the right endpoint approximation R_7 underestimates it. Accordingly,

$$\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} = R_7 < A < L_7 = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7}$$



79. CAS Show that the area A under $y = x^{1/4}$ over [0, 1] satisfies $L_N \le A \le R_N$ for all N. Use a computer algebra system to calculate L_N and R_N for $N = 100$ and 200, and determine A to two decimal places.

SOLUTION On [0, 1], $f(x) = x^{1/4}$ is an increasing function; therefore, $L_N \le A \le R_N$ for all N. We find

$$L_{100} = 0.793988 \quad \text{and} \quad R_{100} = 0.80399,$$

while

$$L_{200} = 0.797074 \quad \text{and} \quad R_{200} = 0.802075.$$

Thus, $A = 0.80$ to two decimal places.

80. CAS Show that the area A under $y = 4/(x^2 + 1)$ over [0, 1] satisfies $R_N \le A \le L_N$ for all N. Determine A to at least three decimal places using a computer algebra system. Can you guess the exact value of A?

SOLUTION On [0, 1], the function $f(x) = 4/(x^2 + 1)$ is decreasing, so $R_N \le A \le L_N$ for all N. From the values in the table below, we find $A = 3.142$ to three decimal places. It appears that the exact value of A is π.

N	R_N	L_N
10	3.03993	3.23992
100	3.13158	3.15158
1000	3.14059	3.14259
10000	3.14149	3.14169
100000	3.14158	3.14160

81. In this exercise, we evaluate the area A under the graph of $y = e^x$ over [0, 1] [Figure 19(A)] using the formula for a geometric sum (valid for $r \ne 1$):

$$1 + r + r^2 + \cdots + r^{N-1} = \sum_{j=0}^{N-1} r^j = \frac{r^N - 1}{r - 1} \tag{8}$$

(a) Show that $L_N = \dfrac{1}{N} \displaystyle\sum_{j=0}^{N-1} e^{j/N}$.

(b) Apply Eq. (8) with $r = e^{1/N}$ to prove $L_N = \dfrac{e - 1}{N(e^{1/N} - 1)}$.

(c) Compute $A = \displaystyle\lim_{N\to\infty} L_N$ using L'Hôpital's Rule.

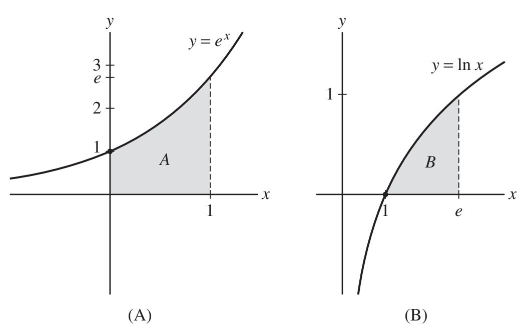


FIGURE 19

SOLUTION

(a) Let $f(x) = e^x$ on [0, 1]. With $n = N$, $\Delta x = (1 - 0)/N = 1/N$ and

$$x_j = a + j\Delta x = \frac{j}{N}$$

for $j = 0, 1, 2, \ldots, N$. Therefore,

$$L_N = \Delta x \sum_{j=0}^{N-1} f(x_j) = \frac{1}{N} \sum_{j=0}^{N-1} e^{j/N}.$$

(b) Applying Eq. (8) with $r = e^{1/N}$, we have

$$L_N = \frac{1}{N} \frac{(e^{1/N})^N - 1}{e^{1/N} - 1} = \frac{e - 1}{N(e^{1/N} - 1)}.$$

Therefore,

$$A = \lim_{N\to\infty} L_N = (e-1)\lim_{N\to\infty} \frac{1}{N(e^{1/N}-1)}.$$

(c) Using L'Hôpital's Rule,

$$A = (e-1)\lim_{N\to\infty} \frac{N^{-1}}{e^{1/N}-1} = (e-1)\lim_{N\to\infty} \frac{-N^{-2}}{-N^{-2}e^{1/N}} = (e-1)\lim_{N\to\infty} e^{-1/N} = e-1.$$

82. Use the result of Exercise 81 to show that the area B under the graph of $f(x) = \ln x$ over $[1, e]$ is equal to 1. *Hint:* Relate B in Figure 19(B) to the area A computed in Exercise 81.

SOLUTION Because $y = \ln x$ and $y = e^x$ are inverse functions, we note that if the area B is reflected across the line $y = x$ and then combined with the area A, we create a rectangle of width 1 and height e. The area of this rectangle is therefore e, and it follows that the area B is equal to e minus the area A. Using the result of Exercise 81, the area B is equal to

$$e - (e-1) = 1.$$

Further Insights and Challenges

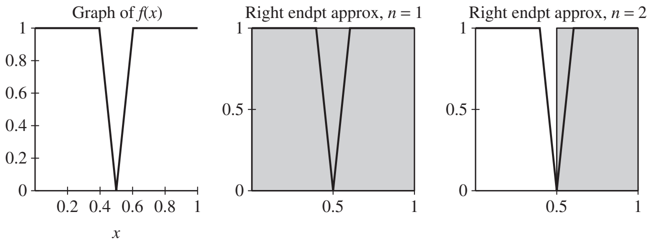
83. Although the accuracy of R_N generally improves as N increases, this need not be true for small values of N. Draw the graph of a positive continuous function $f(x)$ on an interval such that R_1 is closer than R_2 to the exact area under the graph. Can such a function be monotonic?

SOLUTION Let δ be a small positive number less than $\frac{1}{4}$. (In the figures below, $\delta = \frac{1}{10}$. But imagine δ being *very* tiny.) Define $f(x)$ on $[0, 1]$ by

$$f(x) = \begin{cases} 1 & \text{if } 0 \le x < \frac{1}{2} - \delta \\ \frac{1}{2\delta} - \frac{x}{\delta} & \text{if } \frac{1}{2} - \delta \le x < \frac{1}{2} \\ \frac{x}{\delta} - \frac{1}{2\delta} & \text{if } \frac{1}{2} \le x < \frac{1}{2} + \delta \\ 1 & \text{if } \frac{1}{2} + \delta \le x \le 1 \end{cases}$$

Then f is continuous on $[0, 1]$. (Again, just look at the figures.)

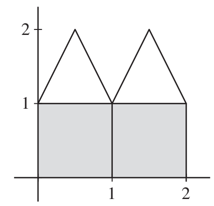
- The exact area between f and the x-axis is $A = 1 - \frac{1}{2}bh = 1 - \frac{1}{2}(2\delta)(1) = 1 - \delta$. (For $\delta = \frac{1}{10}$, we have $A = \frac{9}{10}$.)
- With $R_1 = 1$, the absolute error is $|E_1| = |R_1 - A| = |1 - (1-\delta)| = \delta$. (For $\delta = \frac{1}{10}$, this absolute error is $|E_1| = \frac{1}{10}$.)
- With $R_2 = \frac{1}{2}$, the absolute error is $|E_2| = |R_2 - A| = \left|\frac{1}{2} - (1-\delta)\right| = \left|\delta - \frac{1}{2}\right| = \frac{1}{2} - \delta$. (For $\delta = \frac{1}{10}$, we have $|E_2| = \frac{2}{5}$.)
- Accordingly, R_1 is closer to the exact area A than is R_2. Indeed, the tinier δ is, the more dramatic the effect.
- For a monotonic function, this phenomenon cannot occur. Successive approximations from either side get progressively more accurate.



84. Draw the graph of a positive continuous function on an interval such that R_2 and L_2 are both smaller than the exact area under the graph. Can such a function be monotonic?

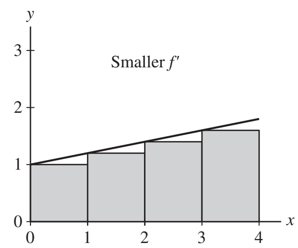
SOLUTION In the plot below, the area under the saw-tooth function $f(x)$ is 3, whereas $L_2 = R_2 = 2$. Thus L_2 and R_2 are both smaller than the exact area. Such a function cannot be monotonic; if $f(x)$ is increasing, then L_N underestimates and R_N overestimates the area for all N, and, if $f(x)$ is decreasing, then L_N overestimates and R_N underestimates the area for all N.

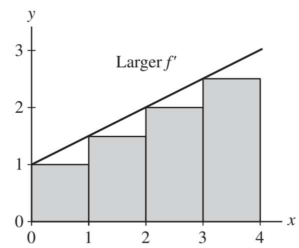
Left/right-endpoint approximation, $n = 2$



85. Explain graphically: *The endpoint approximations are less accurate when $f'(x)$ is large.*

SOLUTION When f' is large, the graph of f is steeper and hence there is more gap between f and L_N or R_N. Recall that the top line segments of the rectangles involved in an endpoint approximation constitute a piecewise constant function. If f' is large, then f is increasing more rapidly and hence is less like a constant function.





86. Prove that for any function $f(x)$ on $[a, b]$,

$$R_N - L_N = \frac{b-a}{N}(f(b) - f(a)) \qquad \boxed{9}$$

SOLUTION For any f (continuous or not) on $I = [a, b]$, partition I into N equal subintervals. Let $\Delta x = (b - a)/N$ and set $x_k = a + k\Delta x$, $k = 0, 1, \dots N$. Then we have the following approximations to the area between the graph of f and the x-axis: the left endpoint approximation $L_N = \Delta x \sum_{k=0}^{N-1} f(x_k)$ and right endpoint approximation $R_N = \Delta x \sum_{k=1}^{N} f(x_k)$. Accordingly,

$$\begin{aligned} R_N - L_N &= \left(\Delta x \sum_{k=1}^{N} f(x_k)\right) - \left(\Delta x \sum_{k=0}^{N-1} f(x_k)\right) \\ &= \Delta x \left(f(x_N) + \left(\sum_{k=1}^{N-1} f(x_k)\right) - f(x_0) - \left(\sum_{k=1}^{N-1} f(x_k)\right)\right) \\ &= \Delta x \left(f(x_N) - f(x_0)\right) = \frac{b-a}{N}\left(f(b) - f(a)\right). \end{aligned}$$

In other words, $R_N - L_N = \dfrac{b-a}{N}(f(b) - f(a))$.

87. In this exercise, we prove that $\lim_{N\to\infty} R_N$ and $\lim_{N\to\infty} L_N$ exist and are equal if $f(x)$ is increasing [the case of $f(x)$ decreasing is similar]. We use the concept of a least upper bound discussed in Appendix B.

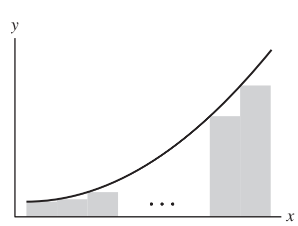
(a) Explain with a graph why $L_N \le R_M$ for all $N, M \ge 1$.

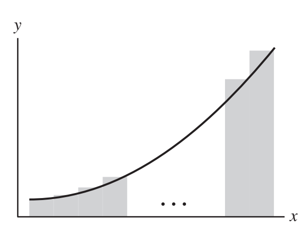
(b) By (a), the sequence $\{L_N\}$ is bounded, so it has a least upper bound L. By definition, L is the smallest number such that $L_N \le L$ for all N. Show that $L \le R_M$ for all M.

(c) According to (b), $L_N \le L \le R_N$ for all N. Use Eq. (9) to show that $\lim_{N\to\infty} L_N = L$ and $\lim_{N\to\infty} R_N = L$.

SOLUTION

(a) Let $f(x)$ be positive and increasing, and let N and M be positive integers. From the figure below at the left, we see that L_N underestimates the area under the graph of $y = f(x)$, while from the figure below at the right, we see that R_M overestimates the area under the graph. Thus, for all $N, M \ge 1$, $L_N \le R_M$.





(b) Because the sequence $\{L_N\}$ is bounded above by R_M for any M, each R_M is an upper bound for the sequence. Furthermore, the sequence $\{L_N\}$ must have a least upper bound, call it L. By definition, the least upper bound must be no greater than any other upper bound; consequently, $L \le R_M$ for all M.

(c) Since $L_N \le L \le R_N$, $R_N - L \le R_N - L_N$, so $|R_N - L| \le |R_N - L_N|$. From this,

$$\lim_{N\to\infty} |R_N - L| \le \lim_{N\to\infty} |R_N - L_N|.$$

By Eq. (9),

$$\lim_{N\to\infty} |R_N - L_N| = \lim_{N\to\infty} \frac{1}{N}|(b-a)(f(b)-f(a))| = 0,$$

so $\lim_{N\to\infty} |R_N - L| \le |R_N - L_N| = 0$, hence $\lim_{N\to\infty} R_N = L$.

Similarly, $|L_N - L| = L - L_N \le R_N - L_N$, so

$$|L_N - L| \le |R_N - L_N| = \frac{(b-a)}{N}(f(b) - f(a)).$$

This gives us that

$$\lim_{N\to\infty} |L_N - L| \le \lim_{N\to\infty} \frac{1}{N}|(b-a)(f(b)-f(a))| = 0,$$

so $\lim_{N\to\infty} L_N = L$.

This proves $\lim_{N\to\infty} L_N = \lim_{N\to\infty} R_N = L$.

88. Use Eq. (9) to show that if $f(x)$ is positive and monotonic, then the area A under its graph over $[a, b]$ satisfies

$$|R_N - A| \le \frac{b-a}{N}|f(b) - f(a)| \qquad \boxed{10}$$

SOLUTION Let $f(x)$ be continuous, positive, and monotonic on $[a, b]$. Let A be the area between the graph of f and the x-axis over $[a, b]$. For specificity, say f is increasing. (The case for f decreasing on $[a, b]$ is similar.) As noted in the text, we have $L_N \le A \le R_N$. By Exercise 86 and the fact that A lies between L_N and R_N, we therefore have

$$0 \le R_N - A \le R_N - L_N = \frac{b-a}{N}(f(b) - f(a)).$$

Hence

$$|R_N - A| \le \frac{b-a}{N}(f(b) - f(a)) = \frac{b-a}{N}|f(b) - f(a)|,$$

where $f(b) - f(a) = |f(b) - f(a)|$ because f is increasing on $[a, b]$.

In Exercises 89 and 90, use Eq. (10) to find a value of N such that $|R_N - A| < 10^{-4}$ for the given function and interval.

89. $f(x) = \sqrt{x}$, $[1, 4]$

SOLUTION Let $f(x) = \sqrt{x}$ on $[1, 4]$. Then $b = 4$, $a = 1$, and

$$|R_N - A| \le \frac{4-1}{N}(f(4) - f(1)) = \frac{3}{N}(2-1) = \frac{3}{N}.$$

We need $\frac{3}{N} < 10^{-4}$, which gives $N > 30{,}000$. Thus $|R_{30{,}001} - A| < 10^{-4}$ for $f(x) = \sqrt{x}$ on $[1, 4]$.

90. $f(x) = \sqrt{9 - x^2}$, $[0, 3]$

SOLUTION Let $f(x) = \sqrt{9 - x^2}$ on $[0, 3]$. Then $b = 3$, $a = 0$, and

$$|R_N - A| \le \frac{b-a}{N}|f(b) - f(a)| = \frac{3}{N}(3) = \frac{9}{N}.$$

We need $\frac{9}{N} < 10^{-4}$, which gives $N > 90{,}000$. Thus $|R_{90{,}001} - A| < 10^{-4}$ for $f(x) = \sqrt{9 - x^2}$ on $[0, 3]$.

91. Prove that if $f(x)$ is positive and monotonic, then M_N lies between R_N and L_N and is closer to the actual area under the graph than both R_N and L_N. *Hint:* In the case that $f(x)$ is increasing, Figure 20 shows that the part of the error in R_N due to the ith rectangle is the sum of the areas $A + B + D$, and for M_N it is $|B - E|$. On the other hand, $A \ge E$.

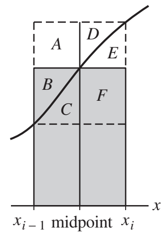


FIGURE 20

SOLUTION Suppose $f(x)$ is monotonic increasing on the interval $[a, b]$, $\Delta x = \dfrac{b-a}{N}$,

$$\{x_k\}_{k=0}^{N} = \{a, a + \Delta x, a + 2\Delta x, \ldots, a + (N-1)\Delta x, b\}$$

and

$$\{x_k^*\}_{k=0}^{N-1} = \left\{\frac{a + (a + \Delta x)}{2}, \frac{(a + \Delta x) + (a + 2\Delta x)}{2}, \ldots, \frac{(a + (N-1)\Delta x) + b}{2}\right\}.$$

Note that $x_i < x_i^* < x_{i+1}$ implies $f(x_i) < f(x_i^*) < f(x_{i+1})$ for all $0 \le i < N$ because $f(x)$ is monotone increasing. Then

$$\left(L_N = \frac{b-a}{N}\sum_{k=0}^{N-1} f(x_k)\right) < \left(M_N = \frac{b-a}{N}\sum_{k=0}^{N-1} f(x_k^*)\right) < \left(R_N = \frac{b-a}{N}\sum_{k=1}^{N} f(x_k)\right)$$

Similarly, if $f(x)$ is monotone decreasing,

$$\left(L_N = \frac{b-a}{N}\sum_{k=0}^{N-1} f(x_k)\right) > \left(M_N = \frac{b-a}{N}\sum_{k=0}^{N-1} f(x_k^*)\right) > \left(R_N = \frac{b-a}{N}\sum_{k=1}^{N} f(x_k)\right)$$

Thus, if $f(x)$ is monotonic, then M_N always lies in between R_N and L_N.

Now, as in Figure 20, consider the typical subinterval $[x_{i-1}, x_i]$ and its midpoint x_i^*. We let A, B, C, D, E, and F be the areas as shown in Figure 20. Note that, by the fact that x_i^* is the midpoint of the interval, $A = D + E$ and $F = B + C$. Let E_R represent the right endpoint approximation error $(= A + B + D)$, let E_L represent the left endpoint approximation error $(= C + F + E)$ and let E_M represent the midpoint approximation error $(= |B - E|)$.

- If $B > E$, then $E_M = B - E$. In this case,

  $$E_R - E_M = A + B + D - (B - E) = A + D + E > 0,$$

  so $E_R > E_M$, while

  $$E_L - E_M = C + F + E - (B - E) = C + (B + C) + E - (B - E) = 2C + 2E > 0,$$

  so $E_L > E_M$. Therefore, the midpoint approximation is more accurate than either the left or the right endpoint approximation.
- If $B < E$, then $E_M = E - B$. In this case,

  $$E_R - E_M = A + B + D - (E - B) = D + E + D - (E - B) = 2D + B > 0,$$

  so that $E_R > E_M$ while

  $$E_L - E_M = C + F + E - (E - B) = C + F + B > 0,$$

  so $E_L > E_M$. Therefore, the midpoint approximation is more accurate than either the right or the left endpoint approximation.
- If $B = E$, the midpoint approximation is exactly equal to the area.

Hence, for $B < E$, $B > E$, or $B = E$, the midpoint approximation is more accurate than either the left endpoint or the right endpoint approximation.

5.2 The Definite Integral

Preliminary Questions

1. What is $\int_3^5 dx$ [the function is $f(x) = 1$]?

SOLUTION $\int_3^5 dx = \int_3^5 1 \cdot dx = 1(5-3) = 2.$

2. Let $I = \int_2^7 f(x)\,dx$, where $f(x)$ is continuous. State whether true or false:

(a) I is the area between the graph and the x-axis over $[2, 7]$.
(b) If $f(x) \geq 0$, then I is the area between the graph and the x-axis over $[2, 7]$.
(c) If $f(x) \leq 0$, then $-I$ is the area between the graph of $f(x)$ and the x-axis over $[2, 7]$.

SOLUTION

(a) False. $\int_a^b f(x)\,dx$ is the *signed* area between the graph and the x-axis.
(b) True.
(c) True.

3. Explain graphically: $\int_0^\pi \cos x\,dx = 0$.

SOLUTION Because $\cos(\pi - x) = -\cos x$, the "negative" area between the graph of $y = \cos x$ and the x-axis over $[\frac{\pi}{2}, \pi]$ exactly cancels the "positive" area between the graph and the x-axis over $[0, \frac{\pi}{2}]$.

4. Which is negative, $\int_{-1}^{-5} 8\,dx$ or $\int_{-5}^{-1} 8\,dx$?

SOLUTION Because $-5-(-1) = -4$, $\int_{-1}^{-5} 8\,dx$ is negative.

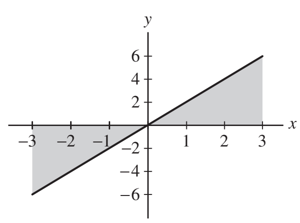
Exercises

In Exercises 1–10, draw a graph of the signed area represented by the integral and compute it using geometry.

1. $\int_{-3}^{3} 2x\,dx$

SOLUTION The region bounded by the graph of $y = 2x$ and the x-axis over the interval $[-3, 3]$ consists of two right triangles. One has area $\frac{1}{2}(3)(6) = 9$ below the axis, and the other has area $\frac{1}{2}(3)(6) = 9$ above the axis. Hence,

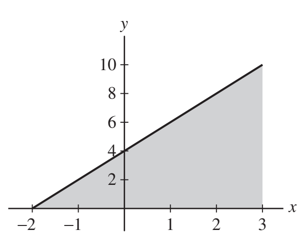
$$\int_{-3}^{3} 2x\,dx = 9 - 9 = 0.$$



2. $\int_{-2}^{3} (2x+4)\,dx$

SOLUTION The region bounded by the graph of $y = 2x + 4$ and the x-axis over the interval $[-2, 3]$ consists of a single right triangle of area $\frac{1}{2}(5)(10) = 25$ above the axis. Hence,

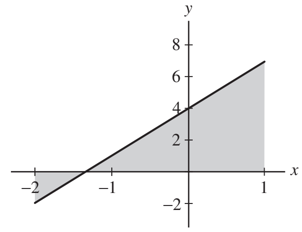
$$\int_{-2}^{3} (2x+4)\,dx = 25.$$



3. $\int_{-2}^{1}(3x+4)\,dx$

SOLUTION The region bounded by the graph of $y = 3x + 4$ and the x-axis over the interval $[-2, 1]$ consists of two right triangles. One has area $\frac{1}{2}(\frac{2}{3})(2) = \frac{2}{3}$ below the axis, and the other has area $\frac{1}{2}(\frac{7}{3})(7) = \frac{49}{6}$ above the axis. Hence,

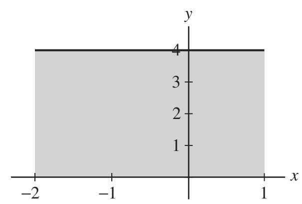
$$\int_{-2}^{1}(3x+4)\,dx = \frac{49}{6} - \frac{2}{3} = \frac{15}{2}.$$



4. $\int_{-2}^{1} 4\,dx$

SOLUTION The region bounded by the graph of $y = 4$ and the x-axis over the interval $[-2, 1]$ is a rectangle of area $(3)(4) = 12$ above the axis. Hence,

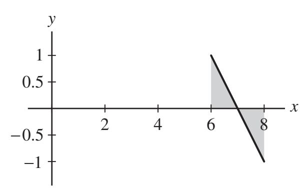
$$\int_{-2}^{1} 4\,dx = 12.$$



5. $\int_{6}^{8}(7-x)\,dx$

SOLUTION The region bounded by the graph of $y = 7 - x$ and the x-axis over the interval $[6, 8]$ consists of two right triangles. One triangle has area $\frac{1}{2}(1)(1) = \frac{1}{2}$ above the axis, and the other has area $\frac{1}{2}(1)(1) = \frac{1}{2}$ below the axis. Hence,

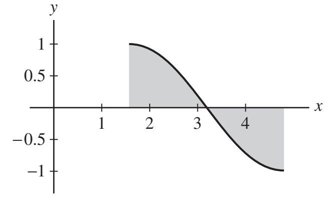
$$\int_{6}^{8}(7-x)\,dx = \frac{1}{2} - \frac{1}{2} = 0.$$



6. $\int_{\pi/2}^{3\pi/2} \sin x\,dx$

SOLUTION The region bounded by the graph of $y = \sin x$ and the x-axis over the interval $[\frac{\pi}{2}, \frac{3\pi}{2}]$ consists of two parts of equal area, one above the axis and the other below the axis. Hence,

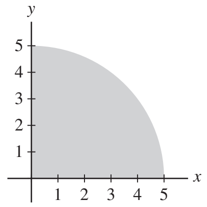
$$\int_{\pi/2}^{3\pi/2} \sin x\,dx = 0.$$



7. $\int_0^5 \sqrt{25 - x^2}\, dx$

SOLUTION The region bounded by the graph of $y = \sqrt{25 - x^2}$ and the x-axis over the interval $[0, 5]$ is one-quarter of a circle of radius 5. Hence,

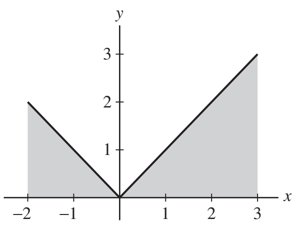
$$\int_0^5 \sqrt{25 - x^2}\, dx = \frac{1}{4}\pi(5)^2 = \frac{25\pi}{4}.$$



8. $\int_{-2}^3 |x|\, dx$

SOLUTION The region bounded by the graph of $y = |x|$ and the x-axis over the interval $[-2, 3]$ consists of two right triangles, both above the axis. One triangle has area $\frac{1}{2}(2)(2) = 2$, and the other has area $\frac{1}{2}(3)(3) = \frac{9}{2}$. Hence,

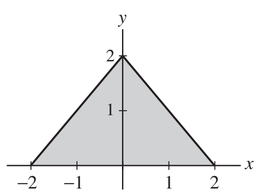
$$\int_{-2}^3 |x|\, dx = \frac{9}{2} + 2 = \frac{13}{2}.$$



9. $\int_{-2}^2 (2 - |x|)\, dx$

SOLUTION The region bounded by the graph of $y = 2 - |x|$ and the x-axis over the interval $[-2, 2]$ is a triangle above the axis with base 4 and height 2. Consequently,

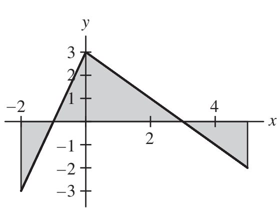
$$\int_{-2}^2 (2 - |x|)\, dx = \frac{1}{2}(2)(4) = 4.$$



10. $\int_{-2}^5 (3 + x - 2|x|)\, dx$

SOLUTION The region bounded by the graph of $y = 3 + x - 2|x|$ and the x-axis over the interval $[-2, 5]$ consists of a triangle below the axis with base 1 and height 3, a triangle above the axis of base 4 and height 3 and a triangle below the axis of base 2 and height 2. Consequently,

$$\int_{-2}^5 (3 + x - 2|x|)\, dx = -\frac{1}{2}(1)(3) + \frac{1}{2}(4)(3) - \frac{1}{2}(2)(2) = \frac{5}{2}.$$



11. Calculate $\int_0^{10} (8-x)\,dx$ in two ways:

(a) As the limit $\lim_{N\to\infty} R_N$

(b) By sketching the relevant signed area and using geometry

SOLUTION Let $f(x) = 8 - x$ over [0, 10]. Consider the integral $\int_0^{10} f(x)\,dx = \int_0^{10} (8-x)\,dx$.

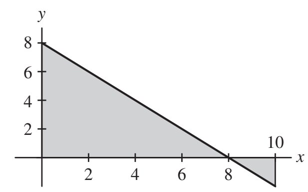
(a) Let N be a positive integer and set $a = 0$, $b = 10$, $\Delta x = (b-a)/N = 10/N$. Also, let $x_k = a + k\Delta x = 10k/N$, $k = 1, 2, \ldots, N$ be the right endpoints of the N subintervals of [0, 10]. Then

$$R_N = \Delta x \sum_{k=1}^{N} f(x_k) = \frac{10}{N} \sum_{k=1}^{N} \left(8 - \frac{10k}{N}\right) = \frac{10}{N}\left(8\left(\sum_{k=1}^{N} 1\right) - \frac{10}{N}\left(\sum_{k=1}^{N} k\right)\right)$$
$$= \frac{10}{N}\left(8N - \frac{10}{N}\left(\frac{N^2}{2} + \frac{N}{2}\right)\right) = 30 - \frac{50}{N}.$$

Hence $\lim_{N\to\infty} R_N = \lim_{N\to\infty} \left(30 - \frac{50}{N}\right) = 30.$

(b) The region bounded by the graph of $y = 8 - x$ and the x-axis over the interval [0, 10] consists of two right triangles. One triangle has area $\frac{1}{2}(8)(8) = 32$ above the axis, and the other has area $\frac{1}{2}(2)(2) = 2$ below the axis. Hence,

$$\int_0^{10} (8-x)\,dx = 32 - 2 = 30.$$



12. Calculate $\int_{-1}^{4} (4x-8)\,dx$ in two ways: As the limit $\lim_{N\to\infty} R_N$ and using geometry.

SOLUTION Let $f(x) = 4x - 8$ over $[-1, 4]$. Consider the integral $\int_{-1}^{4} f(x)\,dx = \int_{-1}^{4} (4x-8)\,dx$.

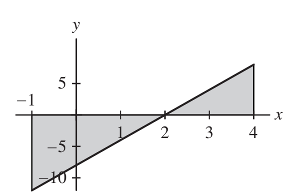
- Let N be a positive integer and set $a = -1$, $b = 4$, $\Delta x = (b-a)/N = 5/N$. Then $x_k = a + k\Delta x = -1 + 5k/N$, $k = 1, 2, \ldots, N$ are the right endpoints of the N subintervals of $[-1, 4]$. Then

$$R_N = \Delta x \sum_{k=1}^{N} f(x_k) = \frac{5}{N} \sum_{k=1}^{N} \left(-4 + \frac{20k}{N} - 8\right) = -\frac{60}{N}\left(\sum_{k=1}^{N} 1\right) + \frac{100}{N^2}\left(\sum_{k=1}^{N} k\right)$$
$$= -\frac{60}{N}(N) + \frac{100}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right)$$
$$= -60 + 50 + \frac{50}{N} = -10 + \frac{50}{N}.$$

  Hence $\lim_{N\to\infty} R_N = \lim_{N\to\infty} \left(-10 + \frac{50}{N}\right) = -10.$

- The region bounded by the graph of $y = 4x - 8$ and the x-axis over the interval $[-1, 4]$ consists of a triangle below the axis with base 3 and height 12 and a triangle above the axis with base 2 and height 8. Hence,

$$\int_{-1}^{4} (4x-8)\,dx = -\frac{1}{2}(3)(12) + \frac{1}{2}(2)(8) = -10.$$



In Exercises 13 and 14, refer to Figure 14.

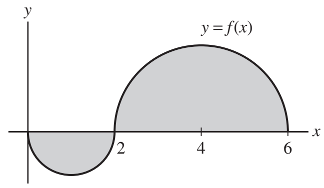


FIGURE 14 The two parts of the graph are semicircles.

13. Evaluate: (a) $\displaystyle\int_0^2 f(x)\,dx$ (b) $\displaystyle\int_0^6 f(x)\,dx$

SOLUTION Let $f(x)$ be given by Figure 14.

(a) The definite integral $\int_0^2 f(x)\,dx$ is the signed area of a semicircle of radius 1 which lies below the x-axis. Therefore,

$$\int_0^2 f(x)\,dx = -\frac{1}{2}\pi\,(1)^2 = -\frac{\pi}{2}.$$

(b) The definite integral $\int_0^6 f(x)\,dx$ is the signed area of a semicircle of radius 1 which lies below the x-axis and a semicircle of radius 2 which lies above the x-axis. Therefore,

$$\int_0^6 f(x)\,dx = \frac{1}{2}\pi\,(2)^2 - \frac{1}{2}\pi\,(1)^2 = \frac{3\pi}{2}.$$

14. Evaluate: (a) $\displaystyle\int_1^4 f(x)\,dx$ (b) $\displaystyle\int_1^6 |f(x)|\,dx$

SOLUTION Let $f(x)$ be given by Figure 14.

(a) The definite integral $\int_1^4 f(x)\,dx$ is the signed area of one-quarter of a circle of radius 1 which lies below the x-axis and one-quarter of a circle of radius 2 which lies above the x-axis. Therefore,

$$\int_1^4 f(x)\,dx = \frac{1}{4}\pi\,(2)^2 - \frac{1}{4}\pi\,(1)^2 = \frac{3}{4}\pi.$$

(b) The definite integral $\int_1^6 |f(x)|\,dx$ is the signed area of one-quarter of a circle of radius 1 and a semicircle of radius 2, both of which lie above the x-axis. Therefore,

$$\int_1^6 |f(x)|\,dx = \frac{1}{2}\pi\,(2)^2 + \frac{1}{4}\pi\,(1)^2 = \frac{9\pi}{4}.$$

In Exercises 15 and 16, refer to Figure 15.

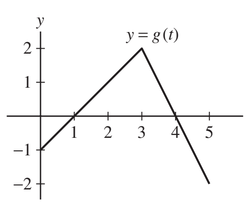

FIGURE 15

15. Evaluate $\displaystyle\int_0^3 g(t)\,dt$ and $\displaystyle\int_3^5 g(t)\,dt$.

SOLUTION

- The region bounded by the curve $y = g(x)$ and the x-axis over the interval $[0, 3]$ is comprised of two right triangles, one with area $\frac{1}{2}$ below the axis, and one with area 2 above the axis. The definite integral is therefore equal to $2 - \frac{1}{2} = \frac{3}{2}$.
- The region bounded by the curve $y = g(x)$ and the x-axis over the interval $[3, 5]$ is comprised of another two right triangles, one with area 1 above the axis and one with area 1 below the axis. The definite integral is therefore equal to 0.

16. Find a, b, and c such that $\int_0^a g(t)\,dt$ and $\int_b^c g(t)\,dt$ are as large as possible.

SOLUTION To make the value of $\int_0^a g(t)\,dt$ as large as possible, we want to include as much positive area as possible. This happens when we take $a = 4$. Now, to make the value of $\int_b^c g(t)\,dt$ as large as possible, we want to make sure to include all of the positive area and only the positive area. This happens when we take $b = 1$ and $c = 4$.

17. Describe the partition P and the set of sample points C for the Riemann sum shown in Figure 16. Compute the value of the Riemann sum.

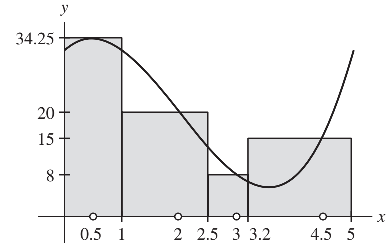

FIGURE 16

SOLUTION The partition P is defined by

$$x_0 = 0 \quad < \quad x_1 = 1 \quad < \quad x_2 = 2.5 \quad < \quad x_3 = 3.2 \quad < \quad x_4 = 5$$

The set of sample points is given by $C = \{c_1 = 0.5, c_2 = 2, c_3 = 3, c_4 = 4.5\}$. Finally, the value of the Riemann sum is

$$34.25(1-0) + 20(2.5-1) + 8(3.2-2.5) + 15(5-3.2) = 96.85.$$

18. Compute $R(f, P, C)$ for $f(x) = x^2 + x$ for the partition P and the set of sample points C in Figure 16.

SOLUTION

$$\begin{aligned} R(f, P, C) &= f(0.5)(1-0) + f(2)(2.5-1) + f(3)(3.2-2.5) + f(4.5)(5-3.2) \\ &= 34.25(1) + 20(1.5) + 8(0.7) + 15(1.8) = 96.85 \end{aligned}$$

In Exercises 19–22, calculate the Riemann sum $R(f, P, C)$ for the given function, partition, and choice of sample points. Also, sketch the graph of f and the rectangles corresponding to $R(f, P, C)$.

19. $f(x) = x, \quad P = \{1, 1.2, 1.5, 2\}, \quad C = \{1.1, 1.4, 1.9\}$

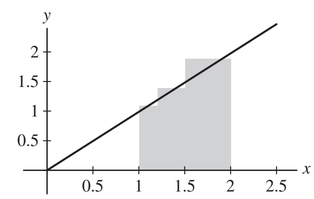
SOLUTION Let $f(x) = x$. With

$$P = \{x_0 = 1, x_1 = 1.2, x_2 = 1.5, x_3 = 2\} \qquad \text{and} \qquad C = \{c_1 = 1.1, c_2 = 1.4, c_3 = 1.9\},$$

we get

$$\begin{aligned} R(f, P, C) &= \Delta x_1 f(c_1) + \Delta x_2 f(c_2) + \Delta x_3 f(c_3) \\ &= (1.2-1)(1.1) + (1.5-1.2)(1.4) + (2-1.5)(1.9) = 1.59. \end{aligned}$$

Here is a sketch of the graph of f and the rectangles.



20. $f(x) = 2x + 3, \quad P = \{-4, -1, 1, 4, 8\}, \quad C = \{-3, 0, 2, 5\}$

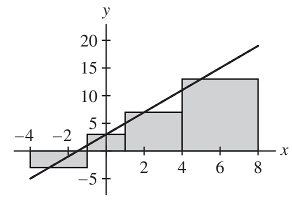
SOLUTION Let $f(x) = 2x + 3$. With

$$P = \{x_0 = -4, x_1 = -1, x_2 = 1, x_3 = 4, x_4 = 8\} \qquad \text{and} \qquad C = \{c_1 = -3, c_2 = 0, c_3 = 2, c_4 = 5\},$$

we get

$$\begin{aligned} R(f, P, C) &= \Delta x_1 f(c_1) + \Delta x_2 f(c_2) + \Delta x_3 f(c_3) + \Delta x_4 f(c_4) \\ &= (-1-(-4))(-3) + (1-(-1))(3) + (4-1)(7) + (8-4)(13) = 70. \end{aligned}$$

Here is a sketch of the graph of f and the rectangles.



21. $f(x) = x^2 + x, \quad P = \{2, 3, 4.5, 5\}, \quad C = \{2, 3.5, 5\}$

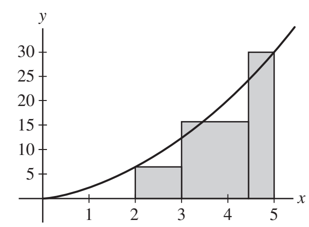
SOLUTION Let $f(x) = x^2 + x$. With

$$P = \{x_0 = 2, x_1 = 3, x_3 = 4.5, x_4 = 5\} \qquad \text{and} \qquad C = \{c_1 = 2, c_2 = 3.5, c_3 = 5\},$$

we get

$$\begin{aligned} R(f, P, C) &= \Delta x_1 f(c_1) + \Delta x_2 f(c_2) + \Delta x_3 f(c_3) \\ &= (3-2)(6) + (4.5-3)(15.75) + (5-4.5)(30) = 44.625. \end{aligned}$$

Here is a sketch of the graph of f and the rectangles.



22. $f(x) = \sin x, \quad P = \left\{0, \frac{\pi}{6}, \frac{\pi}{3}, \frac{\pi}{2}\right\}, \quad C = \{0.4, 0.7, 1.2\}$

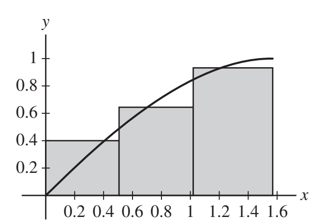
SOLUTION Let $f(x) = \sin x$. With

$$P = \left\{x_0 = 0, x_1 = \frac{\pi}{6}, x_3 = \frac{\pi}{3}, x_4 = \frac{\pi}{2}\right\} \qquad \text{and} \qquad C = \{c_1 = 0.4, c_2 = 0.7, c_3 = 1.2\},$$

we get

$$\begin{aligned} R(f, P, C) &= \Delta x_1 f(c_1) + \Delta x_2 f(c_2) + \Delta x_3 f(c_3) \\ &= \left(\frac{\pi}{6} - 0\right)(\sin 0.4) + \left(\frac{\pi}{3} - \frac{\pi}{6}\right)(\sin 0.7) + \left(\frac{\pi}{2} - \frac{\pi}{3}\right)(\sin 1.2) = 1.029225. \end{aligned}$$

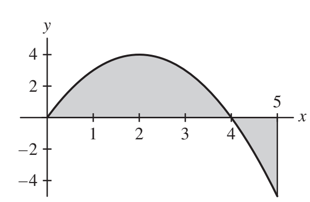
Here is a sketch of the graph of f and the rectangles.



In Exercises 23–28, sketch the signed area represented by the integral. Indicate the regions of positive and negative area.

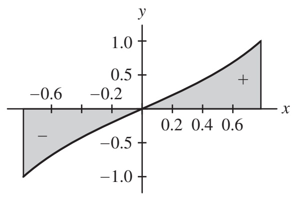
23. $\displaystyle\int_0^5 (4x - x^2)\, dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_0^5 (4x - x^2)\, dx$.



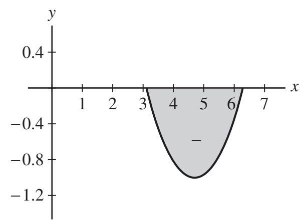
24. $\int_{-\pi/4}^{\pi/4} \tan x\,dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_{-\pi/4}^{\pi/4} \tan x\,dx$.



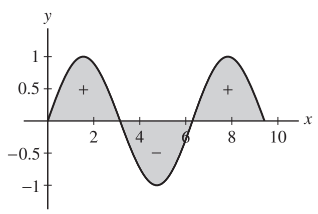
25. $\int_{\pi}^{2\pi} \sin x\,dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_{\pi}^{2\pi} \sin x\,dx$.



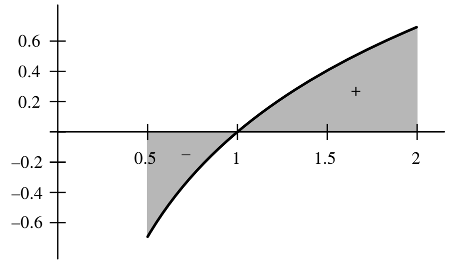
26. $\int_{0}^{3\pi} \sin x\,dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_{0}^{3\pi} \sin x\,dx$.



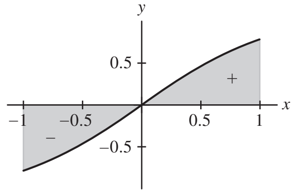
27. $\int_{1/2}^{2} \ln x\,dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_{1/2}^{2} \ln x\,dx$.



28. $\int_{-1}^{1} \tan^{-1} x\,dx$

SOLUTION Here is a sketch of the signed area represented by the integral $\int_{-1}^{1} \tan^{-1} x\,dx$.



In Exercises 29–32, determine the sign of the integral without calculating it. Draw a graph if necessary.

29. $\int_{-2}^{1} x^4\,dx$

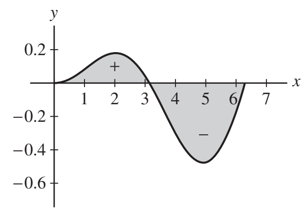
SOLUTION The integrand is always positive. The integral must therefore be positive, since the signed area has only positive part.

30. $\int_{-2}^{1} x^3\,dx$

SOLUTION By symmetry, the positive area from the interval $[0, 1]$ is cancelled by the negative area from $[-1, 0]$. With the interval $[-2, -1]$ contributing more negative area, the definite integral must be negative.

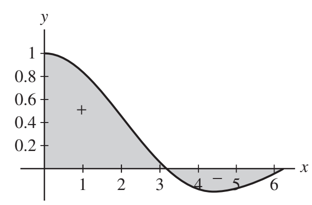
31. GU $\int_{0}^{2\pi} x \sin x\,dx$

SOLUTION As you can see from the graph below, the area below the axis is greater than the area above the axis. Thus, the definite integral is negative.



32. GU $\int_{0}^{2\pi} \frac{\sin x}{x}\,dx$

SOLUTION From the plot below, you can see that the area above the axis is bigger than the area below the axis, hence the integral is positive.



In Exercises 33–42, use properties of the integral and the formulas in the summary to calculate the integrals.

33. $\int_{0}^{4} (6t - 3)\,dt$

SOLUTION $\int_{0}^{4} (6t - 3)\,dt = 6\int_{0}^{4} t\,dt - 3\int_{0}^{4} 1\,dt = 6 \cdot \frac{1}{2}(4)^2 - 3(4 - 0) = 36.$

34. $\int_{-3}^{2} (4x + 7)\,dx$

SOLUTION

$$\begin{aligned}
\int_{-3}^{2} (4x + 7)\,dx &= 4\int_{-3}^{2} x\,dx + 7\int_{-3}^{2} dx \\
&= 4\left(\int_{-3}^{0} x\,dx + \int_{0}^{2} x\,dx\right) + 7(2 - (-3)) \\
&= 4\left(\int_{0}^{2} x\,dx - \int_{0}^{-3} x\,dx\right) + 35 \\
&= 4\left(\frac{1}{2}2^2 - \frac{1}{2}(-3)^2\right) + 35 = 25.
\end{aligned}$$

35. $\int_{0}^{9} x^2\,dx$

SOLUTION By formula (5), $\int_{0}^{9} x^2\,dx = \frac{1}{3}(9)^3 = 243.$

36. $\int_2^5 x^2\,dx$

SOLUTION $\int_2^5 x^2\,dx = \int_0^5 x^2\,dx - \int_0^2 x^2 dx = \frac{1}{3}(5)^3 - \frac{1}{3}(2)^3 = 39.$

37. $\int_0^1 (u^2 - 2u)\,du$

SOLUTION

$$\int_0^1 (u^2 - 2u)\,du = \int_0^1 u^2\,du - 2\int_0^1 u\,du = \frac{1}{3}(1)^3 - 2\left(\frac{1}{2}\right)(1)^2 = \frac{1}{3} - 1 = -\frac{2}{3}.$$

38. $\int_0^{1/2} (12y^2 + 6y)\,dy$

SOLUTION

$$\begin{aligned}\int_0^{1/2} (12y^2 + 6y)\,dy &= 12\int_0^{1/2} y^2\,dy + 6\int_0^{1/2} y\,dy \\ &= 12\cdot\frac{1}{3}\left(\frac{1}{2}\right)^3 + 6\cdot\frac{1}{2}\left(\frac{1}{2}\right)^2 \\ &= \frac{1}{2} + \frac{3}{4} = \frac{5}{4}.\end{aligned}$$

39. $\int_{-3}^1 (7t^2 + t + 1)\,dt$

SOLUTION First, write

$$\begin{aligned}\int_{-3}^1 (7t^2 + t + 1)\,dt &= \int_{-3}^0 (7t^2 + t + 1)\,dt + \int_0^1 (7t^2 + t + 1)\,dt \\ &= -\int_0^{-3} (7t^2 + t + 1)\,dt + \int_0^1 (7t^2 + t + 1)\,dt\end{aligned}$$

Then,

$$\begin{aligned}\int_{-3}^1 (7t^2 + t + 1)\,dt &= -\left(7\cdot\frac{1}{3}(-3)^3 + \frac{1}{2}(-3)^2 - 3\right) + \left(7\cdot\frac{1}{3}1^3 + \frac{1}{2}1^2 + 1\right) \\ &= -\left(-63 + \frac{9}{2} - 3\right) + \left(\frac{7}{3} + \frac{1}{2} + 1\right) = \frac{196}{3}.\end{aligned}$$

40. $\int_{-3}^3 (9x - 4x^2)\,dx$

SOLUTION First write

$$\begin{aligned}\int_{-3}^3 (9x - 4x^2)\,dx &= \int_{-3}^0 (9x - 4x^2)\,dx + \int_0^3 (9x - 4x^2)\,dx \\ &= -\int_0^{-3} (9x - 4x^2)\,dx + \int_0^3 (9x - 4x^2)\,dx.\end{aligned}$$

Then,

$$\begin{aligned}\int_{-3}^3 (9x - 4x^2)\,dx &= -\left(9\cdot\frac{1}{2}(-3)^2 - 4\cdot\frac{1}{3}(-3)^3\right) + \left(9\cdot\frac{1}{2}(3)^2 - 4\cdot\frac{1}{3}(3)^3\right) \\ &= -\left(\frac{81}{2} + 36\right) + \left(\frac{81}{2} - 36\right) = -72.\end{aligned}$$

41. $\int_{-a}^1 (x^2 + x)\,dx$

SOLUTION First, $\int_0^b (x^2 + x)\,dx = \int_0^b x^2\,dx + \int_0^b x\,dx = \frac{1}{3}b^3 + \frac{1}{2}b^2$. Therefore

$$\begin{aligned}\int_{-a}^1 (x^2 + x)\,dx &= \int_{-a}^0 (x^2 + x)\,dx + \int_0^1 (x^2 + x)\,dx = \int_0^1 (x^2 + x)\,dx - \int_0^{-a} (x^2 + x)\,dx \\ &= \left(\frac{1}{3}\cdot 1^3 + \frac{1}{2}\cdot 1^2\right) - \left(\frac{1}{3}(-a)^3 + \frac{1}{2}(-a)^2\right) = \frac{1}{3}a^3 - \frac{1}{2}a^2 + \frac{5}{6}.\end{aligned}$$

42. $\int_a^{a^2} x^2\,dx$

SOLUTION

$$\int_a^{a^2} x^2\,dx = \int_0^{a^2} x^2\,dx - \int_0^a x^2\,dx = \frac{1}{3}\left(a^2\right)^3 - \frac{1}{3}(a)^3 = \frac{1}{3}a^6 - \frac{1}{3}a^3.$$

In Exercises 43–47, calculate the integral, assuming that

$$\int_0^5 f(x)\,dx = 5, \qquad \int_0^5 g(x)\,dx = 12$$

43. $\int_0^5 (f(x) + g(x))\,dx$

SOLUTION $\int_0^5 (f(x) + g(x))\,dx = \int_0^5 f(x)\,dx + \int_0^5 g(x)\,dx = 5 + 12 = 17.$

44. $\int_0^5 \left(2f(x) - \frac{1}{3}g(x)\right)\,dx$

SOLUTION $\int_0^5 \left(2f(x) - \frac{1}{3}g(x)\right)\,dx = 2\int_0^5 f(x)\,dx - \frac{1}{3}\int_0^5 g(x)\,dx = 2(5) - \frac{1}{3}(12) = 6.$

45. $\int_5^0 g(x)\,dx$

SOLUTION $\int_5^0 g(x)\,dx = -\int_0^5 g(x)\,dx = -12.$

46. $\int_0^5 (f(x) - x)\,dx$

SOLUTION $\int_0^5 (f(x) - x)\,dx = \int_0^5 f(x)\,dx - \int_0^5 x\,dx = 5 - \frac{1}{2}(5)^2 = -\frac{15}{2}.$

47. Is it possible to calculate $\int_0^5 g(x)f(x)\,dx$ from the information given?

SOLUTION It is not possible to calculate $\int_0^5 g(x)f(x)\,dx$ from the information given.

48. Prove by computing the limit of right-endpoint approximations:

$$\boxed{\int_0^b x^3\,dx = \frac{b^4}{4}} \qquad \boxed{9}$$

SOLUTION Let $f(x) = x^3$, $a = 0$ and $\Delta x = (b - a)/N = b/N$. Then

$$R_N = \Delta x \sum_{k=1}^{N} f(x_k) = \frac{b}{N}\sum_{k=1}^{N}\left(k^3 \cdot \frac{b^3}{N^3}\right) = \frac{b^4}{N^4}\left(\sum_{k=1}^{N} k^3\right) = \frac{b^4}{N^4}\left(\frac{N^4}{4} + \frac{N^3}{2} + \frac{N^2}{4}\right) = \frac{b^4}{4} + \frac{b^4}{2N} + \frac{b^4}{4N^2}.$$

Hence $\int_0^b x^3\,dx = \lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{b^4}{4} + \frac{b^4}{2N} + \frac{b^4}{4N^2}\right) = \frac{b^4}{4}.$

In Exercises 49–54, evaluate the integral using the formulas in the summary and Eq. (9).

49. $\int_0^3 x^3\,dx$

SOLUTION By Eq. (9), $\int_0^3 x^3\,dx = \frac{3^4}{4} = \frac{81}{4}.$

50. $\int_1^3 x^3\,dx$

SOLUTION $\int_1^3 x^3\,dx = \int_0^3 x^3\,dx - \int_0^1 x^3\,dx = \frac{1}{4}(3)^4 - \frac{1}{4}(1)^4 = 20.$

51. $\int_0^3 (x - x^3)\,dx$

SOLUTION $\int_0^3 (x - x^3)\,dx = \int_0^3 x\,dx - \int_0^3 x^3\,dx = \frac{1}{2}3^2 - \frac{1}{4}3^4 = -\frac{63}{4}.$

52. $\int_0^1 (2x^3 - x + 4)\,dx$

SOLUTION Applying the linearity of the definite integral, Eq. (9), the formula from Example 4 and the formula for the definite integral of a constant:

$$\int_0^1 (2x^3 - x + 4)\,dx = 2\int_0^1 x^3\,dx - \int_0^1 x\,dx + \int_0^1 4\,dx = 2 \cdot \frac{1}{4}(1)^4 - \frac{1}{2}(1)^2 + 4 = 4.$$

53. $\int_0^1 (12x^3 + 24x^2 - 8x)\,dx$

SOLUTION

$$\begin{aligned}\int_0^1 (12x^3 + 24x^2 - 8x)\,dx &= 12\int_0^1 x^3\,dx + 24\int_0^1 x^2 - 8\int_0^1 x\,dx \\ &= 12 \cdot \frac{1}{4}1^4 + 24 \cdot \frac{1}{3}1^3 - 8 \cdot \frac{1}{2}1^2 \\ &= 3 + 8 - 4 = 7\end{aligned}$$

54. $\int_{-2}^2 (2x^3 - 3x^2)\,dx$

SOLUTION

$$\begin{aligned}\int_{-2}^2 (2x^3 - 3x^2)\,dx &= \int_{-2}^0 (2x^3 - 3x^2)\,dx + \int_0^2 (2x^3 - 3x^2)\,dx \\ &= \int_0^2 (2x^3 - 3x^2)\,dx - \int_0^{-2} (2x^3 - 3x^2)\,dx \\ &= 2\int_0^2 x^3\,dx - 3\int_0^2 x^2\,dx - 2\int_0^{-2} x^3\,dx + 3\int_0^{-2} x^2\,dx \\ &= 2 \cdot \frac{1}{4}(2)^4 - 3 \cdot \frac{1}{3}(2)^3 - 2 \cdot \frac{1}{4}(-2)^4 + 3 \cdot \frac{1}{3}(-2)^3 \\ &= 8 - 8 - 8 - 8 = -16.\end{aligned}$$

In Exercises 55–58, calculate the integral, assuming that

$$\int_0^1 f(x)\,dx = 1, \qquad \int_0^2 f(x)\,dx = 4, \qquad \int_1^4 f(x)\,dx = 7$$

55. $\int_0^4 f(x)\,dx$

SOLUTION $\int_0^4 f(x)\,dx = \int_0^1 f(x)\,dx + \int_1^4 f(x)\,dx = 1 + 7 = 8.$

56. $\int_1^2 f(x)\,dx$

SOLUTION $\int_1^2 f(x)\,dx = \int_0^2 f(x)\,dx - \int_0^1 f(x)\,dx = 4 - 1 = 3.$

57. $\int_4^1 f(x)\,dx$

SOLUTION $\int_4^1 f(x)\,dx = -\int_1^4 f(x)\,dx = -7.$

58. $\int_2^4 f(x)\,dx$

SOLUTION From Exercise 55, $\int_0^4 f(x)\,dx = 8$. Accordingly,

$$\int_2^4 f(x)\,dx = \int_0^4 f(x)\,dx - \int_0^2 f(x)\,dx = 8 - 4 = 4.$$

In Exercises 59–62, express each integral as a single integral.

59. $\int_0^3 f(x)\,dx + \int_3^7 f(x)\,dx$

SOLUTION $\int_0^3 f(x)\,dx + \int_3^7 f(x)\,dx = \int_0^7 f(x)\,dx.$

60. $\int_2^9 f(x)\,dx - \int_4^9 f(x)\,dx$

SOLUTION $\int_2^9 f(x)\,dx - \int_4^9 f(x)\,dx = \left(\int_2^4 f(x)\,dx + \int_4^9 f(x)\,dx\right) - \int_4^9 f(x)\,dx = \int_2^4 f(x)\,dx.$

61. $\int_2^9 f(x)\,dx - \int_2^5 f(x)\,dx$

SOLUTION $\int_2^9 f(x)\,dx - \int_2^5 f(x)\,dx = \left(\int_2^5 f(x)\,dx + \int_5^9 f(x)\,dx\right) - \int_2^5 f(x)\,dx = \int_5^9 f(x)\,dx.$

62. $\int_7^3 f(x)\,dx + \int_3^9 f(x)\,dx$

SOLUTION $\int_7^3 f(x)\,dx + \int_3^9 f(x)\,dx = -\int_3^7 f(x)\,dx + \left(\int_3^7 f(x)\,dx + \int_7^9 f(x)\,dx\right) = \int_7^9 f(x)\,dx.$

In Exercises 63–66, calculate the integral, assuming that f is integrable and $\int_1^b f(x)\,dx = 1 - b^{-1}$ for all $b > 0$.

63. $\int_1^5 f(x)\,dx$

SOLUTION $\int_1^5 f(x)\,dx = 1 - 5^{-1} = \frac{4}{5}.$

64. $\int_3^5 f(x)\,dx$

SOLUTION $\int_3^5 f(x)\,dx = \int_1^5 f(x)\,dx - \int_1^3 f(x)\,dx = \left(1 - \frac{1}{5}\right) - \left(1 - \frac{1}{3}\right) = \frac{2}{15}.$

65. $\int_1^6 (3f(x) - 4)\,dx$

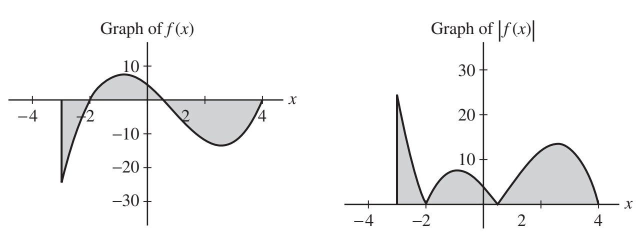
SOLUTION $\int_1^6 (3f(x) - 4)\,dx = 3\int_1^6 f(x)\,dx - 4\int_1^6 1\,dx = 3(1 - 6^{-1}) - 4(6 - 1) = -\frac{35}{2}.$

66. $\int_{1/2}^1 f(x)\,dx$

SOLUTION $\int_{1/2}^1 f(x)\,dx = -\int_1^{1/2} f(x)\,dx = -\left(1 - \left(\frac{1}{2}\right)^{-1}\right) = 1.$

67. Explain the difference in graphical interpretation between $\int_a^b f(x)\,dx$ and $\int_a^b |f(x)|\,dx$.

SOLUTION When $f(x)$ takes on both positive and negative values on $[a, b]$, $\int_a^b f(x)\,dx$ represents the signed area between $f(x)$ and the x-axis, whereas $\int_a^b |f(x)|\,dx$ represents the total (unsigned) area between $f(x)$ and the x-axis. Any negatively signed areas that were part of $\int_a^b f(x)\,dx$ are regarded as positive areas in $\int_a^b |f(x)|\,dx$. Here is a graphical example of this phenomenon.



68. Use the graphical interpretation of the definite integral to explain the inequality

$$\left|\int_a^b f(x)\,dx\right| \le \int_a^b |f(x)|\,dx$$

where $f(x)$ is continuous. Explain also why equality holds if and only if either $f(x) \ge 0$ for all x or $f(x) \le 0$ for all x.

SOLUTION Let A_+ denote the unsigned area under the graph of $y = f(x)$ over the interval $[a, b]$ where $f(x) \ge 0$. Similarly, let A_- denote the unsigned area when $f(x) < 0$. Then

$$\int_a^b f(x)\,dx = A_+ - A_-.$$

Moreover,

$$\left|\int_a^b f(x)\,dx\right| \le A_+ + A_- = \int_a^b |f(x)|\,dx.$$

Equality holds if and only if one of the unsigned areas is equal to zero; in other words, if and only if either $f(x) \ge 0$ for all x or $f(x) \le 0$ for all x.

69. Let $f(x) = x$. Find an interval $[a, b]$ such that

$$\left|\int_a^b f(x)\,dx\right| = \frac{1}{2} \qquad \text{and} \qquad \int_a^b |f(x)|\,dx = \frac{3}{2}$$

SOLUTION If $a > 0$, then $f(x) \ge 0$ for all $x \in [a, b]$, so

$$\left|\int_a^b f(x)\,dx\right| = \int_a^b |f(x)|\,dx$$

by the previous exercise. We find a similar result if $b < 0$. Thus, we must have $a < 0$ and $b > 0$. Now,

$$\int_a^b |f(x)|\,dx = \frac{1}{2}a^2 + \frac{1}{2}b^2.$$

Because

$$\int_a^b f(x)\,dx = \frac{1}{2}b^2 - \frac{1}{2}a^2,$$

then

$$\left|\int_a^b f(x)\,dx\right| = \frac{1}{2}|b^2 - a^2|.$$

If $b^2 > a^2$, then

$$\frac{1}{2}a^2 + \frac{1}{2}b^2 = \frac{3}{2} \quad \text{and} \quad \frac{1}{2}(b^2 - a^2) = \frac{1}{2}$$

yield $a = -1$ and $b = \sqrt{2}$. On the other hand, if $b^2 < a^2$, then

$$\frac{1}{2}a^2 + \frac{1}{2}b^2 = \frac{3}{2} \quad \text{and} \quad \frac{1}{2}(a^2 - b^2) = \frac{1}{2}$$

yield $a = -\sqrt{2}$ and $b = 1$.

70. Evaluate $I = \int_0^{2\pi} \sin^2 x\,dx$ and $J = \int_0^{2\pi} \cos^2 x\,dx$ as follows. First show with a graph that $I = J$. Then prove that $I + J = 2\pi$.

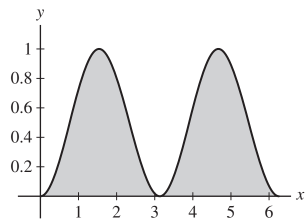
SOLUTION The graphs of $f(x) = \sin^2 x$ and $g(x) = \cos^2 x$ are shown below at the left and right, respectively. It is clear that the shaded areas in the two graphs are equal, thus

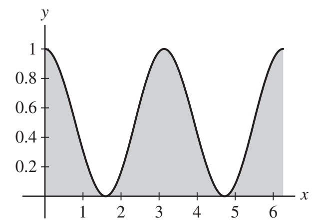
$$I = \int_0^{2\pi} \sin^2 x\,dx = \int_0^{2\pi} \cos^2 x\,dx = J.$$

Now, using the fundamental trigonometric identity, we find

$$I + J = \int_0^{2\pi} (\sin^2 x + \cos^2 x)\,dx = \int_0^{2\pi} 1 \cdot dx = 2\pi.$$

Combining this last result with $I = J$ yields $I = J = \pi$.

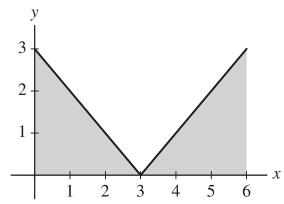




In Exercises 71–74, calculate the integral.

71. $\int_0^6 |3 - x|\, dx$

SOLUTION Over the interval, the region between the curve and the interval [0, 6] consists of two triangles above the x axis, each of which has height 3 and width 3, and so area $\frac{9}{2}$. The total area, hence the definite integral, is 9.

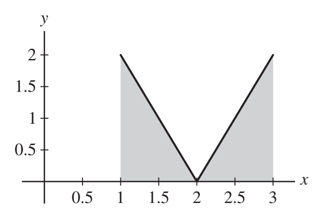


Alternately,

$$\begin{aligned}\int_0^6 |3 - x|\, dx &= \int_0^3 (3 - x)\, dx + \int_3^6 (x - 3)\, dx \\ &= 3\int_0^3 dx - \int_0^3 x\, dx + \left(\int_0^6 x\, dx - \int_0^3 x\, dx\right) - 3\int_3^6 dx \\ &= 9 - \frac{1}{2}3^2 + \frac{1}{2}6^2 - \frac{1}{2}3^2 - 9 = 9.\end{aligned}$$

72. $\int_1^3 |2x - 4|\, dx$

SOLUTION The area between $|2x - 4|$ and the x axis consists of two triangles above the x-axis, each with width 1 and height 2, and hence with area 1. The total area, and hence the definite integral, is 2.



Alternately,

$$\begin{aligned}\int_1^3 |2x - 4|\, dx &= \int_1^2 (4 - 2x)\, dx + \int_2^3 (2x - 4)\, dx \\ &= 4\int_1^2 dx - 2\left(\int_0^2 x\, dx - \int_0^1 x\, dx\right) + 2\left(\int_0^3 x\, dx - \int_0^2 x\, dx\right) - 4\int_2^3 dx \\ &= 4 - 2\left(\frac{1}{2}2^2 - \frac{1}{2}1^2\right) + 2\left(\frac{1}{2}3^2 - \frac{1}{2}2^2\right) - 4 = 2.\end{aligned}$$

73. $\int_{-1}^1 |x^3|\, dx$

SOLUTION

$$|x^3| = \begin{cases} x^3 & x \ge 0 \\ -x^3 & x < 0. \end{cases}$$

Therefore,

$$\int_{-1}^{1} |x^3|\,dx = \int_{-1}^{0} -x^3\,dx + \int_0^1 x^3\,dx = \int_0^{-1} x^3\,dx + \int_0^1 x^3\,dx = \frac{1}{4}(-1)^4 + \frac{1}{4}(1)^4 = \frac{1}{2}.$$

74. $\displaystyle\int_0^2 |x^2 - 1|\,dx$

SOLUTION

$$|x^2 - 1| = \begin{cases} x^2 - 1 & 1 \le x \le 2 \\ -(x^2 - 1) & 0 \le x < 1. \end{cases}$$

Therefore,

$$\begin{aligned}\int_0^2 |x^2 - 1|\,dx &= \int_0^1 (1 - x^2)\,dx + \int_1^2 (x^2 - 1)\,dx \\ &= \int_0^1 dx - \int_0^1 x^2\,dx + \left(\int_0^2 x^2\,dx - \int_0^1 x^2\,dx\right) - \int_1^2 1\,dx \\ &= 1 - \frac{1}{3}(1) + \left(\frac{1}{3}(8) - \frac{1}{3}(1)\right) - 1 = 2.\end{aligned}$$

75. Use the Comparison Theorem to show that

$$\int_0^1 x^5\,dx \le \int_0^1 x^4\,dx, \qquad \int_1^2 x^4\,dx \le \int_1^2 x^5\,dx$$

SOLUTION On the interval $[0, 1]$, $x^5 \le x^4$, so, by Theorem 5,

$$\int_0^1 x^5\,dx \le \int_0^1 x^4\,dx.$$

On the other hand, $x^4 \le x^5$ for $x \in [1, 2]$, so, by the same Theorem,

$$\int_1^2 x^4\,dx \le \int_1^2 x^5\,dx.$$

76. Prove that $\displaystyle\frac{1}{3} \le \int_4^6 \frac{1}{x}\,dx \le \frac{1}{2}$.

SOLUTION On the interval $[4, 6]$, $\frac{1}{6} \le \frac{1}{x}$, so, by Theorem 5,

$$\frac{1}{3} = \int_4^6 \frac{1}{6}\,dx \le \int_4^6 \frac{1}{x}\,dx.$$

On the other hand, $\frac{1}{x} \le \frac{1}{4}$ on the interval $[4, 6]$, so

$$\int_4^6 \frac{1}{x}\,dx \le \int_4^6 \frac{1}{4}\,dx = \frac{1}{4}(6 - 4) = \frac{1}{2}.$$

Therefore $\frac{1}{3} \le \int_4^6 \frac{1}{x}\,dx \le \frac{1}{2}$, as desired.

77. Prove that $0.0198 \le \int_{0.2}^{0.3} \sin x\,dx \le 0.0296$. *Hint:* Show that $0.198 \le \sin x \le 0.296$ for x in $[0.2, 0.3]$.

SOLUTION For $0 \le x \le \frac{\pi}{6} \approx 0.52$, we have $\frac{d}{dx}(\sin x) = \cos x > 0$. Hence $\sin x$ is increasing on $[0.2, 0.3]$. Accordingly, for $0.2 \le x \le 0.3$, we have

$$m = 0.198 \le 0.19867 \approx \sin 0.2 \le \sin x \le \sin 0.3 \approx 0.29552 \le 0.296 = M$$

Therefore, by the Comparison Theorem, we have

$$0.0198 = m(0.3 - 0.2) = \int_{0.2}^{0.3} m\,dx \le \int_{0.2}^{0.3} \sin x\,dx \le \int_{0.2}^{0.3} M\,dx = M(0.3 - 0.2) = 0.0296.$$

78. Prove that $0.277 \le \int_{\pi/8}^{\pi/4} \cos x\, dx \le 0.363$.

SOLUTION $\cos x$ is decreasing on the interval $[\pi/8, \pi/4]$. Hence, for $\pi/8 \le x \le \pi/4$,

$$\cos(\pi/4) \le \cos x \le \cos(\pi/8).$$

Since $\cos(\pi/4) = \sqrt{2}/2$,

$$0.277 \le \frac{\pi}{8} \cdot \frac{\sqrt{2}}{2} = \int_{\pi/8}^{\pi/4} \frac{\sqrt{2}}{2}\, dx \le \int_{\pi/8}^{\pi/4} \cos x\, dx.$$

Since $\cos(\pi/8) \le 0.924$,

$$\int_{\pi/8}^{\pi/4} \cos x\, dx \le \int_{\pi/8}^{\pi/4} 0.924\, dx = \frac{\pi}{8}(0.924) \le 0.363.$$

Therefore $0.277 \le \int_{\pi/8}^{\pi/4} \cos x \le 0.363$.

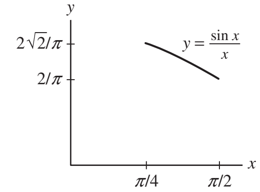
79. Prove that $0 \le \int_{\pi/4}^{\pi/2} \frac{\sin x}{x}\, dx \le \frac{\sqrt{2}}{2}$.

SOLUTION Let

$$f(x) = \frac{\sin x}{x}.$$

As we can see in the sketch below, $f(x)$ is decreasing on the interval $[\pi/4, \pi/2]$. Therefore $f(x) \le f(\pi/4)$ for all x in $[\pi/4, \pi/2]$. $f(\pi/4) = \frac{2\sqrt{2}}{\pi}$, so:

$$\int_{\pi/4}^{\pi/2} \frac{\sin x}{x}\, dx \le \int_{\pi/4}^{\pi/2} \frac{2\sqrt{2}}{\pi}\, dx = \frac{\pi}{4}\frac{2\sqrt{2}}{\pi} = \frac{\sqrt{2}}{2}.$$



80. Find upper and lower bounds for $\int_0^1 \frac{dx}{\sqrt{5x^3+4}}$.

SOLUTION Let

$$f(x) = \frac{1}{\sqrt{5x^3+4}}.$$

$f(x)$ is decreasing for x on the interval $[0, 1]$, so $f(1) \le f(x) \le f(0)$ for all x in $[0, 1]$. $f(0) = \frac{1}{2}$ and $f(1) = \frac{1}{3}$, so

$$\int_0^1 \frac{1}{3}\, dx \le \int_0^1 f(x)\, dx \le \int_0^1 \frac{1}{2}\, dx$$
$$\frac{1}{3} \le \int_0^1 f(x)\, dx \le \frac{1}{2}.$$

81. Suppose that $f(x) \le g(x)$ on $[a, b]$. By the Comparison Theorem, $\int_a^b f(x)\, dx \le \int_a^b g(x)\, dx$. Is it also true that $f'(x) \le g'(x)$ for $x \in [a, b]$? If not, give a counterexample.

SOLUTION The assertion $f'(x) \le g'(x)$ is false. Consider $a = 0$, $b = 1$, $f(x) = x$, $g(x) = 2$. $f(x) \le g(x)$ for all x in the interval $[0, 1]$, but $f'(x) = 1$ while $g'(x) = 0$ for all x.

82. State whether true or false. If false, sketch the graph of a counterexample.

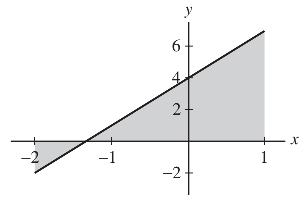
(a) If $f(x) > 0$, then $\int_a^b f(x)\, dx > 0$.

(b) If $\int_a^b f(x)\, dx > 0$, then $f(x) > 0$.

SOLUTION

(a) It is true that if $f(x) > 0$ for $x \in [a, b]$, then $\int_a^b f(x)\,dx > 0$.

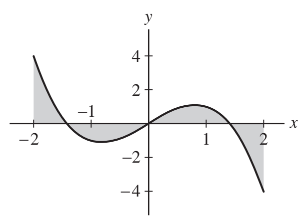
(b) It is *false* that if $\int_a^b f(x)\,dx > 0$, then $f(x) > 0$ for $x \in [a, b]$. Indeed, in Exercise 3, we saw that $\int_{-2}^{1}(3x+4)\,dx = 7.5 > 0$, yet $f(-2) = -2 < 0$. Here is the graph from that exercise.



Further Insights and Challenges

83. Explain graphically: If $f(x)$ is an odd function, then
$$\int_{-a}^{a} f(x)\,dx = 0.$$

SOLUTION If f is an odd function, then $f(-x) = -f(x)$ for all x. Accordingly, for every positively signed area in the right half-plane where f is above the x-axis, there is a corresponding negatively signed area in the left half-plane where f is below the x-axis. Similarly, for every negatively signed area in the right half-plane where f is below the x-axis, there is a corresponding positively signed area in the left half-plane where f is above the x-axis. We conclude that the net area between the graph of f and the x-axis over $[-a, a]$ is 0, since the positively signed areas and negatively signed areas cancel each other out exactly.



84. Compute $\displaystyle\int_{-1}^{1} \sin(\sin(x))(\sin^2(x)+1)\,dx$.

SOLUTION Let $f(x) = \sin(\sin(x))(\sin^2(x)+1))$. $\sin x$ is an odd function, while $\sin^2 x$ is an even function, so:

$$\begin{aligned} f(-x) &= \sin(\sin(-x))(\sin^2(-x)+1) = \sin(-\sin(x))(\sin^2(x)+1) \\ &= -\sin(\sin(x))(\sin^2(x)+1) = -f(x). \end{aligned}$$

Therefore, $f(x)$ is an odd function. The function is odd and the interval is symmetric around the origin so, by the previous exercise, the integral must be zero.

85. Let k and b be positive. Show, by comparing the right-endpoint approximations, that

$$\int_0^b x^k\,dx = b^{k+1}\int_0^1 x^k\,dx$$

SOLUTION Let k and b be any positive numbers. Let $f(x) = x^k$ on $[0, b]$. Since f is continuous, both $\int_0^b f(x)\,dx$ and $\int_0^1 f(x)\,dx$ exist. Let N be a positive integer and set $\Delta x = (b-0)/N = b/N$. Let $x_j = a + j\Delta x = bj/N$, $j = 1, 2, \ldots, N$ be the right endpoints of the N subintervals of $[0, b]$. Then the right-endpoint approximation to $\int_0^b f(x)\,dx = \int_0^b x^k\,dx$ is

$$R_N = \Delta x \sum_{j=1}^{N} f(x_j) = \frac{b}{N}\sum_{j=1}^{N}\left(\frac{bj}{N}\right)^k = b^{k+1}\left(\frac{1}{N^{k+1}}\sum_{j=1}^{N} j^k\right).$$

In particular, if $b = 1$ above, then the right-endpoint approximation to $\int_0^1 f(x)\,dx = \int_0^1 x^k\,dx$ is

$$S_N = \Delta x \sum_{j=1}^{N} f(x_j) = \frac{1}{N}\sum_{j=1}^{N}\left(\frac{j}{N}\right)^k = \frac{1}{N^{k+1}}\sum_{j=1}^{N} j^k = \frac{1}{b^{k+1}} R_N$$

In other words, $R_N = b^{k+1} S_N$. Therefore,

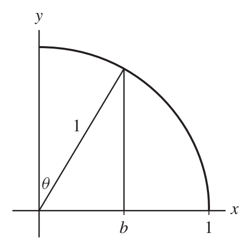
$$\int_0^b x^k\,dx = \lim_{N\to\infty} R_N = \lim_{N\to\infty} b^{k+1} S_N = b^{k+1} \lim_{N\to\infty} S_N = b^{k+1} \int_0^1 x^k\,dx.$$

86. Verify for $0 \le b \le 1$ by interpreting in terms of area:

$$\int_0^b \sqrt{1-x^2}\,dx = \frac{1}{2} b\sqrt{1-b^2} + \frac{1}{2}\sin^{-1} b$$

SOLUTION The function $f(x) = \sqrt{1-x^2}$ is the quarter circle of radius 1 in the first quadrant. For $0 \le b \le 1$, the area represented by the integral $\int_0^b \sqrt{1-x^2}\,dx$ can be divided into two parts. The area of the triangular part is $\frac{1}{2}(b)\sqrt{1-b^2}$ using the Pythagorean Theorem. The area of the sector with angle θ where $\sin\theta = b$, is given by $\frac{1}{2}(1)^2(\theta)$. Thus

$$\int_0^b \sqrt{1-x^2}\,dx = \frac{1}{2} b\sqrt{1-b^2} + \frac{1}{2}\theta = \frac{1}{2} b\sqrt{1-b^2} + \frac{1}{2}\sin^{-1} b.$$



87. Suppose that f and g are continuous functions such that, *for all* a,

$$\int_{-a}^{a} f(x)\,dx = \int_{-a}^{a} g(x)\,dx$$

Give an *intuitive* argument showing that $f(0) = g(0)$. Explain your idea with a graph.

SOLUTION Let $c = -b$. Since $b < 0$, $c > 0$, so by Eq. (5),

$$\int_0^c x^2\,dx = \frac{1}{3}c^3.$$

Furthermore, x^2 is an even function, so symmetry of the areas gives

$$\int_{-c}^0 x^2\,dx = \int_0^c x^2\,dx.$$

Finally,

$$\int_0^b x^2\,dx = \int_0^{-c} x^2\,dx = -\int_{-c}^0 x^2\,dx = -\int_0^c x^2\,dx = -\frac{1}{3}c^3 = \frac{1}{3}b^3.$$

88. Theorem 4 remains true without the assumption $a \le b \le c$. Verify this for the cases $b < a < c$ and $c < a < b$.

SOLUTION The additivity property of definite integrals states for $a \le b \le c$, we have $\int_a^c f(x)\,dx = \int_a^b f(x)\,dx + \int_b^c f(x)\,dx$.

- Suppose that we have $b < a < c$. By the additivity property, we have $\int_b^c f(x)\,dx = \int_b^a f(x)\,dx + \int_a^c f(x)\,dx$. Therefore, $\int_a^c f(x)\,dx = \int_b^c f(x)\,dx - \int_b^a f(x)\,dx = \int_a^b f(x)\,dx + \int_b^c f(x)\,dx$.
- Now suppose that we have $c < a < b$. By the additivity property, we have $\int_c^b f(x)\,dx = \int_c^a f(x)\,dx + \int_a^b f(x)\,dx$. Therefore, $\int_a^c f(x)\,dx = -\int_c^a f(x)\,dx = \int_a^b f(x)\,dx - \int_c^b f(x)\,dx = \int_a^b f(x)\,dx + \int_b^c f(x)\,dx$.
- Hence the additivity property holds for all real numbers a, b, and c, regardless of their relationship amongst each other.

5.3 The Fundamental Theorem of Calculus, Part I

Preliminary Questions

1. Suppose that $F'(x) = f(x)$ and $F(0) = 3$, $F(2) = 7$.

(a) What is the area under $y = f(x)$ over $[0, 2]$ if $f(x) \geq 0$?

(b) What is the graphical interpretation of $F(2) - F(0)$ if $f(x)$ takes on both positive and negative values?

SOLUTION

(a) If $f(x) \geq 0$ over $[0, 2]$, then the area under $y = f(x)$ is $F(2) - F(0) = 7 - 3 = 4$.

(b) If $f(x)$ takes on both positive and negative values, then $F(2) - F(0)$ gives the signed area between $y = f(x)$ and the x-axis.

2. Suppose that $f(x)$ is a *negative* function with antiderivative F such that $F(1) = 7$ and $F(3) = 4$. What is the area (a positive number) between the x-axis and the graph of $f(x)$ over $[1, 3]$?

SOLUTION $\int_1^3 f(x)\,dx$ represents the *signed* area bounded by the curve and the interval $[1, 3]$. Since $f(x)$ is negative on $[1, 3]$, $\int_1^3 f(x)\,dx$ is the negative of the area. Therefore, if A is the area between the x-axis and the graph of $f(x)$, we have:

$$A = -\int_1^3 f(x)\,dx = -(F(3) - F(1)) = -(4 - 7) = -(-3) = 3.$$

3. Are the following statements true or false? Explain.

(a) FTC I is valid only for positive functions.

(b) To use FTC I, you have to choose the right antiderivative.

(c) If you cannot find an antiderivative of $f(x)$, then the definite integral does not exist.

SOLUTION

(a) False. The FTC I is valid for continuous functions.

(b) False. The FTC I works for any antiderivative of the integrand.

(c) False. If you cannot find an antiderivative of the integrand, you cannot use the FTC I to evaluate the definite integral, but the definite integral may still exist.

4. Evaluate $\int_2^9 f'(x)\,dx$ where $f(x)$ is differentiable and $f(2) = f(9) = 4$.

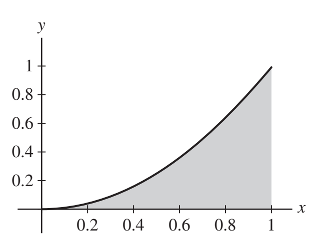
SOLUTION Because f is differentiable, $\int_2^9 f'(x)\,dx = f(9) - f(2) = 4 - 4 = 0$.

Exercises

In Exercises 1–4, sketch the region under the graph of the function and find its area using FTC I.

1. $f(x) = x^2$, $[0, 1]$

SOLUTION

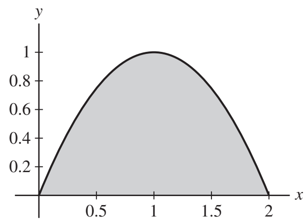


We have the area

$$A = \int_0^1 x^2\,dx = \left.\frac{1}{3}x^3\right|_0^1 = \frac{1}{3}.$$

2. $f(x) = 2x - x^2$, $[0, 2]$

SOLUTION

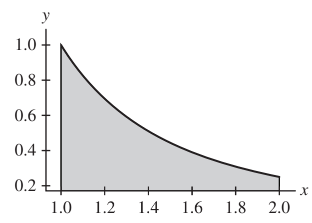


Let A be the area indicated. Then:

$$A = \int_0^2 (2x - x^2)\, dx = \int_0^2 2x\, dx - \int_0^2 x^2\, dx = x^2\Big|_0^2 - \frac{1}{3}x^3\Big|_0^2 = (4-0) - \left(\frac{8}{3} - 0\right) = \frac{4}{3}.$$

3. $f(x) = x^{-2}$, $[1, 2]$

SOLUTION

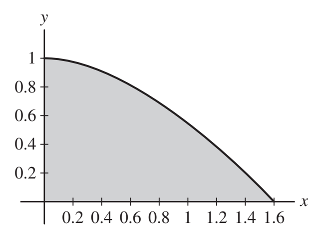


We have the area

$$A = \int_1^2 x^{-2}\, dx = \frac{x^{-1}}{-1}\Big|_1^2 = -\frac{1}{2} + 1 = \frac{1}{2}.$$

4. $f(x) = \cos x$, $\left[0, \frac{\pi}{2}\right]$

SOLUTION



Let A be the shaded area. Then

$$A = \int_0^{\pi/2} \cos x\, dx = \sin x\Big|_0^{\pi/2} = 1 - 0 = 1.$$

In Exercises 5–42, evaluate the integral using FTC I.

5. $\displaystyle\int_3^6 x\, dx$

SOLUTION $\displaystyle\int_3^6 x\, dx = \frac{1}{2}x^2\Big|_3^6 = \frac{1}{2}(6)^2 - \frac{1}{2}(3)^2 = \frac{27}{2}.$

6. $\displaystyle\int_0^9 2\, dx$

SOLUTION $\displaystyle\int_0^9 2\, dx = 2x\Big|_0^9 = 2(9) - 2(0) = 18.$

7. $\displaystyle\int_0^1 (4x - 9x^2)\, dx$

SOLUTION $\displaystyle\int_0^1 (4x - 9x^2)\, dx = (2x^2 - 3x^3)\Big|_0^1 = (2-3) - (0-0) = -1.$

8. $\int_{-3}^{2} u^2\,du$

SOLUTION $\int_{-3}^{2} u^2\,du = \frac{1}{3}u^3\Big|_{-3}^{2} = \frac{1}{3}(2)^3 - \frac{1}{3}(-3)^3 = \frac{35}{3}.$

9. $\int_{0}^{2} (12x^5 + 3x^2 - 4x)\,dx$

SOLUTION $\int_{0}^{2} (12x^5 + 3x^2 - 4x)\,dx = (2x^6 + x^3 - 2x^2)\Big|_{0}^{2} = (128 + 8 - 8) - (0 + 0 - 0) = 128.$

10. $\int_{-2}^{2} (10x^9 + 3x^5)\,dx$

SOLUTION $\int_{-2}^{2} (10x^9 + 3x^5)\,dx = \left(x^{10} + \frac{1}{2}x^6\right)\Big|_{-2}^{2} = \left(2^{10} + \frac{1}{2}2^6\right) - \left(2^{10} + \frac{1}{2}2^6\right) = 0.$

11. $\int_{3}^{0} (2t^3 - 6t^2)\,dt$

SOLUTION $\int_{3}^{0} (2t^3 - 6t^2)\,dt = \left(\frac{1}{2}t^4 - 2t^3\right)\Big|_{3}^{0} = (0 - 0) - \left(\frac{81}{2} - 54\right) = \frac{27}{2}.$

12. $\int_{-1}^{1} (5u^4 + u^2 - u)\,du$

SOLUTION $\int_{-1}^{1} (5u^4 + u^2 - u)\,du = \left(u^5 + \frac{1}{3}u^3 - \frac{1}{2}u^2\right)\Big|_{-1}^{1} = \left(1 + \frac{1}{3} - \frac{1}{2}\right) - \left(-1 - \frac{1}{3} - \frac{1}{2}\right) = \frac{8}{3}.$

13. $\int_{0}^{4} \sqrt{y}\,dy$

SOLUTION $\int_{0}^{4} \sqrt{y}\,dy = \int_{0}^{4} y^{1/2}\,dy = \frac{2}{3}y^{3/2}\Big|_{0}^{4} = \frac{2}{3}(4)^{3/2} - \frac{2}{3}(0)^{3/2} = \frac{16}{3}.$

14. $\int_{1}^{8} x^{4/3}\,dx$

SOLUTION $\int_{1}^{8} x^{4/3}\,dx = \frac{3}{7}x^{7/3}\Big|_{1}^{8} = \frac{3}{7}(128 - 1) = \frac{381}{7}.$

15. $\int_{1/16}^{1} t^{1/4}\,dt$

SOLUTION $\int_{1/16}^{1} t^{1/4}\,dt = \frac{4}{5}t^{5/4}\Big|_{1/16}^{1} = \frac{4}{5} - \frac{1}{40} = \frac{31}{40}.$

16. $\int_{4}^{1} t^{5/2}\,dt$

SOLUTION $\int_{4}^{1} t^{5/2}\,dt = \frac{2}{7}t^{7/2}\Big|_{4}^{1} = \frac{2}{7}(1 - 128) = -\frac{254}{7}.$

17. $\int_{1}^{3} \frac{dt}{t^2}$

SOLUTION $\int_{1}^{3} \frac{dt}{t^2} = \int_{1}^{3} t^{-2}\,dt = -t^{-1}\Big|_{1}^{3} = -\frac{1}{3} + 1 = \frac{2}{3}.$

18. $\int_{1}^{4} x^{-4}\,dx$

SOLUTION $\int_{1}^{4} x^{-4}\,dx = -\frac{1}{3}x^{-3}\Big|_{1}^{4} = -\frac{1}{3}(4)^{-3} + \frac{1}{3} = \frac{21}{64}.$

19. $\int_{1/2}^{1} \frac{8}{x^3}\,dx$

SOLUTION $\int_{1/2}^{1} \frac{8}{x^3}\,dx = \int_{1/2}^{1} 8x^{-3}\,dx = -4x^{-2}\Big|_{1/2}^{1} = -4 + 16 = 12.$

20. $\int_{-2}^{-1} \frac{1}{x^3}\,dx$

SOLUTION $\int_{-2}^{-1} \frac{1}{x^3}\,dx = -\frac{1}{2}x^{-2}\Big|_{-2}^{-1} = -\frac{1}{2}(-1)^{-2} + \frac{1}{2}(-2)^{-2} = -\frac{3}{8}.$

21. $\int_1^2 (x^2 - x^{-2})\,dx$

SOLUTION $\int_1^2 (x^2 - x^{-2})\,dx = \left(\frac{1}{3}x^3 + x^{-1}\right)\Big|_1^2 = \left(\frac{8}{3} + \frac{1}{2}\right) - \left(\frac{1}{3} + 1\right) = \frac{11}{6}.$

22. $\int_1^9 t^{-1/2}\,dt$

SOLUTION $\int_1^9 t^{-1/2}\,dt = 2t^{1/2}\Big|_1^9 = 2(9)^{1/2} - 2(1)^{1/2} = 4.$

23. $\int_1^{27} \frac{t+1}{\sqrt{t}}\,dt$

SOLUTION

$$\int_1^{27} \frac{t+1}{\sqrt{t}}\,dt = \int_1^{27} (t^{1/2} + t^{-1/2})\,dt = \left(\frac{2}{3}t^{3/2} + 2t^{1/2}\right)\Big|_1^{27}$$
$$= \left(\frac{2}{3}(81\sqrt{3}) + 6\sqrt{3}\right) - \left(\frac{2}{3} + 2\right) = 60\sqrt{3} - \frac{8}{3}.$$

24. $\int_{8/27}^{1} \frac{10t^{4/3} - 8t^{1/3}}{t^2}\,dt$

SOLUTION

$$\int_{8/27}^{1} \frac{10t^{4/3} - 8t^{1/3}}{t^2}\,dt = \int_{8/27}^{1} (10t^{-2/3} - 8t^{-5/3})\,dt$$
$$= (30t^{1/3} + 12t^{-2/3})\Big|_{8/27}^{1} = (30 + 12) - (20 + 27) = -5.$$

25. $\int_{\pi/4}^{3\pi/4} \sin\theta\,d\theta$

SOLUTION $\int_{\pi/4}^{3\pi/4} \sin\theta\,d\theta = -\cos\theta\Big|_{\pi/4}^{3\pi/4} = \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2} = \sqrt{2}.$

26. $\int_{2\pi}^{4\pi} \sin x\,dx$

SOLUTION $\int_{2\pi}^{4\pi} \sin x\,dx = -\cos x\Big|_{2\pi}^{4\pi} = -1 - (-1) = 0.$

27. $\int_0^{\pi/2} \cos\left(\frac{1}{3}\theta\right)d\theta$

SOLUTION $\int_0^{\pi/2} \cos\left(\frac{1}{3}\theta\right)d\theta = 3\sin\left(\frac{1}{3}\theta\right)\Big|_0^{\pi/2} = \frac{3}{2}.$

28. $\int_{\pi/4}^{5\pi/8} \cos 2x\,dx$

SOLUTION $\int_{\pi/4}^{5\pi/8} \cos 2x\,dx = \frac{1}{2}\sin 2x\Big|_{\pi/4}^{5\pi/8} = \frac{1}{2}\sin\frac{5\pi}{4} - \frac{1}{2}\sin\frac{\pi}{2} = -\frac{\sqrt{2}}{4} - \frac{1}{2}.$

29. $\int_0^{\pi/6} \sec^2\left(3t - \frac{\pi}{6}\right)dt$

SOLUTION $\int_0^{\pi/6} \sec^2\left(3t - \frac{\pi}{6}\right)dt = \frac{1}{3}\tan\left(3t - \frac{\pi}{6}\right)\Big|_0^{\pi/6} = \frac{1}{3}\left(\sqrt{3} + \frac{1}{\sqrt{3}}\right) = \frac{4}{3\sqrt{3}}.$

30. $\int_0^{\pi/6} \sec\theta \tan\theta \, d\theta$

SOLUTION $\int_0^{\pi/6} \sec\theta \tan\theta \, d\theta = \sec\theta \Big|_0^{\pi/6} = \sec\frac{\pi}{6} - \sec 0 = \frac{2\sqrt{3}}{3} - 1.$

31. $\int_{\pi/20}^{\pi/10} \csc 5x \cot 5x \, dx$

SOLUTION $\int_{\pi/20}^{\pi/10} \csc 5x \cot 5x \, dx = -\frac{1}{5}\csc 5x \Big|_{\pi/20}^{\pi/10} = -\frac{1}{5}\left(1 - \sqrt{2}\right) = \frac{1}{5}(\sqrt{2} - 1).$

32. $\int_{\pi/28}^{\pi/14} \csc^2 7y \, dy$

SOLUTION $\int_{\pi/28}^{\pi/14} \csc^2 7y \, dy = -\frac{1}{7}\cot 7y \Big|_{\pi/28}^{\pi/14} = -\frac{1}{7}\cot\frac{\pi}{2} + \frac{1}{7}\cot\frac{\pi}{4} = \frac{1}{7}.$

33. $\int_0^1 e^x \, dx$

SOLUTION $\int_0^1 e^x \, dx = e^x \Big|_0^1 = e - 1.$

34. $\int_3^5 e^{-4x} \, dx$

SOLUTION $\int_3^5 e^{-4x} \, dx = -\frac{1}{4}e^{-4x} \Big|_3^5 = -\frac{1}{4}e^{-20} + \frac{1}{4}e^{-12}.$

35. $\int_0^3 e^{1-6t} \, dt$

SOLUTION $\int_0^3 e^{1-6t} \, dt = -\frac{1}{6}e^{1-6t} \Big|_0^3 = -\frac{1}{6}e^{-17} + \frac{1}{6}e = \frac{1}{6}(e - e^{-17}).$

36. $\int_2^3 e^{4t-3} \, dt$

SOLUTION $\int_2^3 e^{4t-3} \, dt = \frac{1}{4}e^{4t-3} \Big|_2^3 = \frac{1}{4}e^9 - \frac{1}{4}e^5.$

37. $\int_2^{10} \frac{dx}{x}$

SOLUTION $\int_2^{10} \frac{dx}{x} = \ln|x| \Big|_2^{10} = \ln 10 - \ln 2 = \ln 5.$

38. $\int_{-12}^{-4} \frac{dx}{x}$

SOLUTION $\int_{-12}^{-4} \frac{dx}{x} = \ln|x| \Big|_{-12}^{-4} = \ln|-4| - \ln|-12| = \ln\frac{1}{3} = -\ln 3.$

39. $\int_0^1 \frac{dt}{t+1}$

SOLUTION $\int_0^1 \frac{dt}{t+1} = \ln|t+1| \Big|_0^1 = \ln 2 - \ln 1 = \ln 2.$

40. $\int_1^4 \frac{dt}{5t+4}$

SOLUTION $\int_1^4 \frac{dt}{5t+4} = \frac{1}{5}\ln|5t+4| \Big|_1^4 = \frac{1}{5}\ln 24 - \frac{1}{5}\ln 9 = \frac{1}{5}\ln\frac{24}{9}.$

41. $\int_{-2}^0 (3x - 9e^{3x}) \, dx$

SOLUTION $\int_{-2}^0 (3x - 9e^{3x}) \, dx = \left(\frac{3}{2}x^2 - 3e^{3x}\right)\Big|_{-2}^0 = (0 - 3) - (6 - 3e^{-6}) = 3e^{-6} - 9.$

42. $\int_2^6 \left(x + \frac{1}{x}\right) dx$

SOLUTION $\int_2^6 \left(x + \frac{1}{x}\right) dx = \left(\frac{1}{2}x^2 + \ln|x|\right)\Big|_2^6 = (18 + \ln 6) - (2 + \ln 2) = 16 + \ln 3.$

In Exercises 43–48, write the integral as a sum of integrals without absolute values and evaluate.

43. $\int_{-2}^1 |x|\, dx$

SOLUTION

$$\int_{-2}^1 |x|\, dx = \int_{-2}^0 (-x)\, dx + \int_0^1 x\, dx = -\frac{1}{2}x^2\Big|_{-2}^0 + \frac{1}{2}x^2\Big|_0^1 = 0 - \left(-\frac{1}{2}(4)\right) + \frac{1}{2} = \frac{5}{2}.$$

44. $\int_0^5 |3 - x|\, dx$

SOLUTION

$$\begin{aligned}\int_0^5 |3 - x|\, dx &= \int_0^3 (3 - x)\, dx + \int_3^5 (x - 3)\, dx = \left(3x - \frac{1}{2}x^2\right)\Big|_0^3 + \left(\frac{1}{2}x^2 - 3x\right)\Big|_3^5 \\ &= \left(9 - \frac{9}{2}\right) - 0 + \left(\frac{25}{2} - 15\right) - \left(\frac{9}{2} - 9\right) = \frac{13}{2}.\end{aligned}$$

45. $\int_{-2}^3 |x^3|\, dx$

SOLUTION

$$\begin{aligned}\int_{-2}^3 |x^3|\, dx &= \int_{-2}^0 (-x^3)\, dx + \int_0^3 x^3\, dx = -\frac{1}{4}x^4\Big|_{-2}^0 + \frac{1}{4}x^4\Big|_0^3 \\ &= 0 + \frac{1}{4}(-2)^4 + \frac{1}{4}3^4 - 0 = \frac{97}{4}.\end{aligned}$$

46. $\int_0^3 |x^2 - 1|\, dx$

SOLUTION

$$\begin{aligned}\int_0^3 |x^2 - 1|\, dx &= \int_0^1 (1 - x^2)\, dx + \int_1^3 (x^2 - 1)\, dx = \left(x - \frac{1}{3}x^3\right)\Big|_0^1 + \left(\frac{1}{3}x^3 - x\right)\Big|_1^3 \\ &= \left(1 - \frac{1}{3}\right) - 0 + (9 - 3) - \left(\frac{1}{3} - 1\right) = \frac{22}{3}.\end{aligned}$$

47. $\int_0^\pi |\cos x|\, dx$

SOLUTION

$$\int_0^\pi |\cos x|\, dx = \int_0^{\pi/2} \cos x\, dx + \int_{\pi/2}^\pi (-\cos x)\, dx = \sin x\Big|_0^{\pi/2} - \sin x\Big|_{\pi/2}^\pi = 1 - 0 - (-1 - 0) = 2.$$

48. $\int_0^5 |x^2 - 4x + 3|\, dx$

SOLUTION

$$\begin{aligned}\int_0^5 |x^2 - 4x + 3|\, dx &= \int_0^5 |(x - 3)(x - 1)|\, dx \\ &= \int_0^1 (x^2 - 4x + 3)\, dx + \int_1^3 -(x^2 - 4x + 3)\, dx + \int_3^5 (x^2 - 4x + 3)\, dx\end{aligned}$$

$$= \left(\frac{1}{3}x^3 - 2x^2 + 3x\right)\Big|_0^1 - \left(\frac{1}{3}x^3 - 2x^2 + 3x\right)\Big|_1^3 + \left(\frac{1}{3}x^3 - 2x^2 + 3x\right)\Big|_3^5$$
$$= \left(\frac{1}{3} - 2 + 3\right) - 0 - (9 - 18 + 9) + \left(\frac{1}{3} - 2 + 3\right) + \left(\frac{125}{3} - 50 + 15\right) - (9 - 18 + 9)$$
$$= \frac{28}{3}.$$

In Exercises 49–54, evaluate the integral in terms of the constants.

49. $\int_1^b x^3\,dx$

SOLUTION $\int_1^b x^3\,dx = \frac{1}{4}x^4\Big|_1^b = \frac{1}{4}b^4 - \frac{1}{4}(1)^4 = \frac{1}{4}\left(b^4 - 1\right)$ for any number b.

50. $\int_b^a x^4\,dx$

SOLUTION $\int_b^a x^4\,dx = \frac{1}{5}x^5\Big|_b^a = \frac{1}{5}a^5 - \frac{1}{5}b^5$ for any numbers a, b.

51. $\int_1^b x^5\,dx$

SOLUTION $\int_1^b x^5\,dx = \frac{1}{6}x^6\Big|_1^b = \frac{1}{6}b^6 - \frac{1}{6}(1)^6 = \frac{1}{6}(b^6 - 1)$ for any number b.

52. $\int_{-x}^x (t^3 + t)\,dt$

SOLUTION

$$\int_{-x}^x (t^3 + t)\,dt = \left(\frac{1}{4}t^4 + \frac{1}{2}t^2\right)\Big|_{-x}^x = \left(\frac{1}{4}x^4 + \frac{1}{2}x^2\right) - \left(\frac{1}{4}x^4 + \frac{1}{2}x^2\right) = 0.$$

53. $\int_a^{5a} \frac{dx}{x}$

SOLUTION $\int_a^{5a} \frac{dx}{x} = \ln|x|\Big|_a^{5a} = \ln|5a| - \ln|a| = \ln 5.$

54. $\int_b^{b^2} \frac{dx}{x}$

SOLUTION $\int_b^{b^2} \frac{dx}{x} = \ln|x|\Big|_b^{b^2} = \ln|b^2| - \ln|b| = \ln|b|.$

55. Calculate $\int_{-2}^3 f(x)\,dx$, where

$$f(x) = \begin{cases} 12 - x^2 & \text{for } x \le 2 \\ x^3 & \text{for } x > 2 \end{cases}$$

SOLUTION

$$\int_{-2}^3 f(x)\,dx = \int_{-2}^2 f(x)\,dx + \int_2^3 f(x)\,dx = \int_{-2}^2 (12 - x^2)\,dx + \int_2^3 x^3\,dx$$
$$= \left(12x - \frac{1}{3}x^3\right)\Big|_{-2}^2 + \frac{1}{4}x^4\Big|_2^3$$
$$= \left(12(2) - \frac{1}{3}2^3\right) - \left(12(-2) - \frac{1}{3}(-2)^3\right) + \frac{1}{4}3^4 - \frac{1}{4}2^4$$
$$= \frac{128}{3} + \frac{65}{4} = \frac{707}{12}.$$

56. Calculate $\int_0^{2\pi} f(x)\,dx$, where

$$f(x) = \begin{cases} \cos x & \text{for } x \le \pi \\ \cos x - \sin 2x & \text{for } x > \pi \end{cases}$$

SOLUTION

$$\int_0^{2\pi} f(x)\,dx = \int_0^{\pi} f(x)\,dx + \int_{\pi}^{2\pi} f(x)\,dx = \int_0^{\pi} \cos x\,dx + \int_{\pi}^{2\pi} (\cos x - \sin 2x)\,dx$$
$$= \sin x\Big|_0^{\pi} + \left(\sin x + \frac{1}{2}\cos 2x\right)\Big|_{\pi}^{2\pi}$$
$$= (0-0) + \left(\left(0+\frac{1}{2}\right) - \left(0+\frac{1}{2}\right)\right) = 0.$$

57. Use FTC I to show that $\int_{-1}^{1} x^n\,dx = 0$ if n is an odd whole number. Explain graphically.

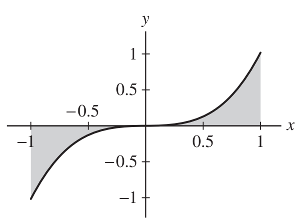
SOLUTION We have

$$\int_{-1}^{1} x^n\,dx = \frac{x^{n+1}}{n+1}\Big|_{-1}^{1} = \frac{(1)^{n+1}}{n+1} - \frac{(-1)^{n+1}}{n+1}.$$

Because n is odd, $n+1$ is even, which means that $(-1)^{n+1} = (1)^{n+1} = 1$. Hence

$$\frac{(1)^{n+1}}{n+1} - \frac{(-1)^{n+1}}{n+1} = \frac{1}{n+1} - \frac{1}{n+1} = 0.$$

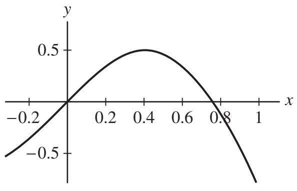
Graphically speaking, for an odd function such as x^3 shown here, the positively signed area from $x=0$ to $x=1$ cancels the negatively signed area from $x=-1$ to $x=0$.

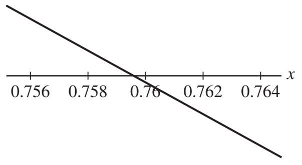


58. CAS Plot the function $f(x) = \sin 3x - x$. Find the positive root of $f(x)$ to three places and use it to find the area under the graph of $f(x)$ in the first quadrant.

SOLUTION The graph of $f(x) = \sin 3x - x$ is shown below at the left. In the figure below at the right, we zoom in on the positive root of $f(x)$ and find that, to three decimal places, this root is approximately $x = 0.760$. The area under the graph of $f(x)$ in the first quadrant is then

$$\int_0^{0.760} (\sin 3x - x)\,dx = \left(-\frac{1}{3}\cos 3x - \frac{1}{2}x^2\right)\Big|_0^{0.760}$$
$$= -\frac{1}{3}\cos(2.28) - \frac{1}{2}(0.760)^2 + \frac{1}{3} \approx 0.262$$





59. Calculate $F(4)$ given that $F(1) = 3$ and $F'(x) = x^2$. *Hint:* Express $F(4) - F(1)$ as a definite integral.

SOLUTION By FTC I,

$$F(4) - F(1) = \int_1^4 x^2\,dx = \frac{4^3 - 1^3}{3} = 21$$

Therefore $F(4) = F(1) + 21 = 3 + 21 = 24$.

60. Calculate $G(16)$, where $dG/dt = t^{-1/2}$ and $G(9) = -5$.

SOLUTION By FTC I,

$$G(16) - G(9) = \int_9^{16} t^{-1/2}\,dt = 2(16^{1/2}) - 2(9^{1/2}) = 2$$

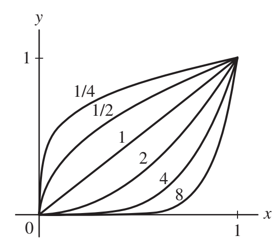
Therefore $G(16) = -5 + 2 = -3$.

61. Does $\int_0^1 x^n\,dx$ get larger or smaller as n increases? Explain graphically.

SOLUTION Let $n \geq 0$ and consider $\int_0^1 x^n\,dx$. (Note: for $n < 0$ the integrand $x^n \to \infty$ as $x \to 0+$, so we exclude this possibility.) Now

$$\int_0^1 x^n\,dx = \left(\frac{1}{n+1}x^{n+1}\right)\bigg|_0^1 = \left(\frac{1}{n+1}(1)^{n+1}\right) - \left(\frac{1}{n+1}(0)^{n+1}\right) = \frac{1}{n+1},$$

which decreases as n increases. Recall that $\int_0^1 x^n\,dx$ represents the area between the positive curve $f(x) = x^n$ and the x-axis over the interval [0, 1]. Accordingly, this area gets smaller as n gets larger. This is readily evident in the following graph, which shows curves for several values of n.



62. Show that the area of the shaded parabolic arch in Figure 8 is equal to four-thirds the area of the triangle shown.

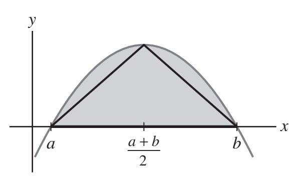


FIGURE 8 Graph of $y = (x - a)(b - x)$.

SOLUTION We first calculate the area of the parabolic arch:

$$\begin{aligned}
\int_a^b (x-a)(b-x)\,dx &= -\int_a^b (x-a)(x-b)\,dx = -\int_a^b (x^2 - ax - bx + ab)\,dx \\
&= -\left(\frac{1}{3}x^3 - \frac{a}{2}x^2 - \frac{b}{2}x^2 + abx\right)\bigg|_a^b \\
&= -\frac{1}{6}\left(2x^3 - 3ax^2 - 3bx^2 + 6abx\right)\bigg|_a^b \\
&= -\frac{1}{6}\left((2b^3 - 3ab^2 - 3b^3 + 6ab^2) - (2a^3 - 3a^3 - 3ba^2 + 6a^2b)\right) \\
&= -\frac{1}{6}\left((-b^3 + 3ab^2) - (-a^3 + 3a^2b)\right) \\
&= -\frac{1}{6}\left(a^3 + 3ab^2 - 3a^2b - b^3\right) = \frac{1}{6}(b-a)^3.
\end{aligned}$$

The indicated triangle has a base of length $b - a$ and a height of

$$\left(\frac{a+b}{2} - a\right)\left(b - \frac{a+b}{2}\right) = \left(\frac{b-a}{2}\right)^2.$$

Thus, the area of the triangle is

$$\frac{1}{2}(b-a)\left(\frac{b-a}{2}\right)^2 = \frac{1}{8}(b-a)^3.$$

Finally, we note that

$$\frac{1}{6}(b-a)^3 = \frac{4}{3}\cdot\frac{1}{8}(b-a)^3,$$

as required.

Further Insights and Challenges

63. Prove a famous result of Archimedes (generalizing Exercise 62): For $r < s$, the area of the shaded region in Figure 9 is equal to four-thirds the area of triangle $\triangle ACE$, where C is the point on the parabola at which the tangent line is parallel to secant line $\overline{AE}$.

(a) Show that C has x-coordinate $(r+s)/2$.

(b) Show that $ABDE$ has area $(s-r)^3/4$ by viewing it as a parallelogram of height $s-r$ and base of length $\overline{CF}$.

(c) Show that $\triangle ACE$ has area $(s-r)^3/8$ by observing that it has the same base and height as the parallelogram.

(d) Compute the shaded area as the area under the graph minus the area of a trapezoid, and prove Archimedes' result.

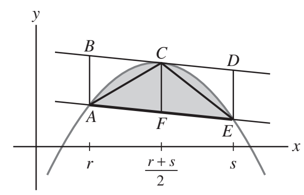

FIGURE 9 Graph of $f(x) = (x-a)(b-x)$.

SOLUTION

(a) The slope of the secant line $\overline{AE}$ is

$$\frac{f(s)-f(r)}{s-r} = \frac{(s-a)(b-s)-(r-a)(b-r)}{s-r} = a+b-(r+s)$$

and the slope of the tangent line along the parabola is

$$f'(x) = a+b-2x.$$

If C is the point on the parabola at which the tangent line is parallel to the secant line $\overline{AE}$, then its x-coordinate must satisfy

$$a+b-2x = a+b-(r+s) \qquad \text{or} \qquad x = \frac{r+s}{2}.$$

(b) Parallelogram $ABDE$ has height $s-r$ and base of length $\overline{CF}$. Since the equation of the secant line $\overline{AE}$ is

$$y = [a+b-(r+s)]\,(x-r) + (r-a)(b-r),$$

the length of the segment $\overline{CF}$ is

$$\left(\frac{r+s}{2}-a\right)\left(b-\frac{r+s}{2}\right) - [a+b-(r+s)]\left(\frac{r+s}{2}-r\right) - (r-a)(b-r) = \frac{(s-r)^2}{4}.$$

Thus, the area of $ABDE$ is $\frac{(s-r)^3}{4}$.

(c) Triangle ACE is comprised of ΔACF and ΔCEF. Each of these smaller triangles has height $\frac{s-r}{2}$ and base of length $\frac{(s-r)^2}{4}$. Thus, the area of ΔACE is

$$\frac{1}{2}\frac{s-r}{2}\cdot\frac{(s-r)^2}{4} + \frac{1}{2}\frac{s-r}{2}\cdot\frac{(s-r)^2}{4} = \frac{(s-r)^3}{8}.$$

(d) The area under the graph of the parabola between $x=r$ and $x=s$ is

$$\begin{aligned}\int_r^s (x-a)(b-x)\,dx &= \left(-abx + \frac{1}{2}(a+b)x^2 - \frac{1}{3}x^3\right)\bigg|_r^s \\ &= -abs + \frac{1}{2}(a+b)s^2 - \frac{1}{3}s^3 + abr - \frac{1}{2}(a+b)r^2 + \frac{1}{3}r^3 \\ &= ab(r-s) + \frac{1}{2}(a+b)(s-r)(s+r) + \frac{1}{3}(r-s)(r^2+rs+s^2),\end{aligned}$$

while the area of the trapezoid under the shaded region is

$$\begin{aligned}&\frac{1}{2}(s-r)\left[(s-a)(b-s)+(r-a)(b-r)\right]\\&\quad=\frac{1}{2}(s-r)\left[-2ab+(a+b)(r+s)-r^2-s^2\right]\\&\quad=ab(r-s)+\frac{1}{2}(a+b)(s-r)(r+s)+\frac{1}{2}(r-s)(r^2+s^2).\end{aligned}$$

Thus, the area of the shaded region is

$$(r-s)\left(\frac{1}{3}r^2+\frac{1}{3}rs+\frac{1}{3}s^2-\frac{1}{2}r^2-\frac{1}{2}s^2\right)=(s-r)\left(\frac{1}{6}r^2-\frac{1}{3}rs+\frac{1}{6}s^2\right)=\frac{1}{6}(s-r)^3,$$

which is four-thirds the area of the triangle ACE.

64. **(a)** Apply the Comparison Theorem (Theorem 5 in Section 5.2) to the inequality $\sin x \le x$ (valid for $x \ge 0$) to prove that

$$1-\frac{x^2}{2}\le \cos x \le 1$$

(b) Apply it again to prove that

$$x-\frac{x^3}{6}\le \sin x \le x \quad (\text{for } x \ge 0)$$

(c) Verify these inequalities for $x = 0.3$.

SOLUTION

(a) We have $\int_0^x \sin t\,dt = -\cos t\Big|_0^x = -\cos x + 1$ and $\int_0^x t\,dt = \frac{1}{2}t^2\Big|_0^x = \frac{1}{2}x^2$. Hence

$$-\cos x + 1 \le \frac{x^2}{2}.$$

Solving, this gives $\cos x \ge 1-\frac{x^2}{2}$. $\cos x \le 1$ follows automatically.

(b) The previous part gives us $1-\frac{t^2}{2}\le \cos t \le 1$, for $t > 0$. Theorem 5 gives us, after integrating over the interval $[0, x]$,

$$x-\frac{x^3}{6}\le \sin x \le x.$$

(c) Substituting $x = 0.3$ into the inequalities obtained in (a) and (b) yields

$$0.955 \le 0.955336489 \le 1 \qquad \text{and} \qquad 0.2955 \le 0.2955202069 \le 0.3,$$

respectively.

65. Use the method of Exercise 64 to prove that

$$\begin{aligned}1-\frac{x^2}{2}&\le \cos x \le 1-\frac{x^2}{2}+\frac{x^4}{24}\\ x-\frac{x^3}{6}&\le \sin x \le x-\frac{x^3}{6}+\frac{x^5}{120} \quad (\text{for } x \ge 0)\end{aligned}$$

Verify these inequalities for $x = 0.1$. Why have we specified $x \ge 0$ for $\sin x$ but not for $\cos x$?

SOLUTION By Exercise 64, $t-\frac{1}{6}t^3 \le \sin t \le t$ for $t > 0$. Integrating this inequality over the interval $[0, x]$, and then solving for $\cos x$, yields:

$$\begin{aligned}\frac{1}{2}x^2-\frac{1}{24}x^4 &\le 1-\cos x \le \frac{1}{2}x^2\\ 1-\frac{1}{2}x^2 &\le \cos x \le 1-\frac{1}{2}x^2+\frac{1}{24}x^4.\end{aligned}$$

These inequalities apply for $x \ge 0$. Since $\cos x$, $1-\frac{x^2}{2}$, and $1-\frac{x^2}{2}+\frac{x^4}{24}$ are all even functions, they also apply for $x \le 0$.

Having established that

$$1-\frac{t^2}{2}\le \cos t\le 1-\frac{t^2}{2}+\frac{t^4}{24},$$

for all $t \ge 0$, we integrate over the interval $[0, x]$, to obtain:

$$x-\frac{x^3}{6}\le \sin x\le x-\frac{x^3}{6}+\frac{x^5}{120}.$$

The functions $\sin x$, $x-\frac{1}{6}x^3$ and $x-\frac{1}{6}x^3+\frac{1}{120}x^5$ are all odd functions, so the inequalities are reversed for $x < 0$.
Evaluating these inequalities at $x = 0.1$ yields

$$0.995000000 \le 0.995004165 \le 0.995004167$$

$$0.0998333333 \le 0.0998334166 \le 0.0998334167,$$

both of which are true.

66. Calculate the next pair of inequalities for $\sin x$ and $\cos x$ by integrating the results of Exercise 65. Can you guess the general pattern?

SOLUTION Integrating

$$t-\frac{t^3}{6}\le \sin t\le t-\frac{t^3}{6}+\frac{t^5}{120} \qquad (\text{for } t\ge 0)$$

over the interval $[0, x]$ yields

$$\frac{x^2}{2}-\frac{x^4}{24}\le 1-\cos x\le \frac{x^2}{2}-\frac{x^4}{24}+\frac{x^6}{720}.$$

Solving for $\cos x$ and yields

$$1-\frac{x^2}{2}+\frac{x^4}{24}-\frac{x^6}{720}\le \cos x\le 1-\frac{x^2}{2}+\frac{x^4}{24}.$$

Replacing each x by t and integrating over the interval $[0, x]$ produces

$$x-\frac{x^3}{6}+\frac{x^5}{120}-\frac{x^7}{5040}\le \sin x\le x-\frac{x^3}{6}+\frac{x^5}{120}.$$

To see the pattern, it is best to compare consecutive inequalities for $\sin x$ and those for $\cos x$:

$$0 \le \sin x \le x$$

$$x-\frac{x^3}{6}\le \sin x\le x$$

$$x-\frac{x^3}{6}\le \sin x\le x-\frac{x^3}{6}+\frac{x^5}{120}.$$

Each iteration adds an additional term. Looking at the highest order terms, we get the following pattern:

$$0$$

$$x$$

$$-\frac{x^3}{6}=-\frac{x^3}{3!}$$

$$\frac{x^5}{5!}$$

We guess that the leading term of the polynomials are of the form

$$(-1)^n\frac{x^{2n+1}}{(2n+1)!}.$$

Similarly, for $\cos x$, the leading terms of the polynomials in the inequality are of the form

$$(-1)^n\frac{x^{2n}}{(2n)!}.$$

67. Use FTC I to prove that if $|f'(x)| \le K$ for $x \in [a, b]$, then $|f(x) - f(a)| \le K|x - a|$ for $x \in [a, b]$.

SOLUTION Let $a > b$ be real numbers, and let $f(x)$ be such that $|f'(x)| \le K$ for $x \in [a, b]$. By FTC,

$$\int_a^x f'(t)\,dt = f(x) - f(a).$$

Since $f'(x) \geq -K$ for all $x \in [a, b]$, we get:

$$f(x) - f(a) = \int_a^x f'(t)\,dt \geq -K(x - a).$$

Since $f'(x) \leq K$ for all $x \in [a, b]$, we get:

$$f(x) - f(a) = \int_a^x f'(t)\,dt \leq K(x - a).$$

Combining these two inequalities yields

$$-K(x - a) \leq f(x) - f(a) \leq K(x - a),$$

so that, by definition,

$$|f(x) - f(a)| \leq K|x - a|.$$

68. **(a)** Use Exercise 67 to prove that $|\sin a - \sin b| \leq |a - b|$ for all a, b.
(b) Let $f(x) = \sin(x + a) - \sin x$. Use part (a) to show that the graph of $f(x)$ lies between the horizontal lines $y = \pm a$.
(c) GU Plot $f(x)$ and the lines $y = \pm a$ to verify (b) for $a = 0.5$ and $a = 0.2$.

SOLUTION

(a) Let $f(x) = \sin x$, so that $f'(x) = \cos x$, and

$$|f'(x)| \leq 1$$

for all x. From Exercise 67, we get:

$$|\sin a - \sin b| \leq |a - b|.$$

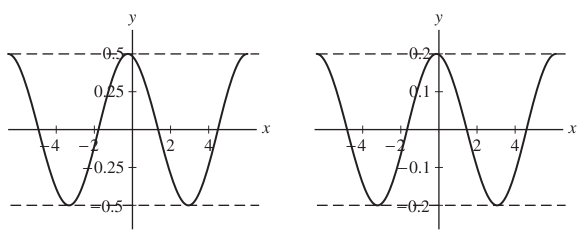
(b) Let $f(x) = \sin(x + a) - \sin(x)$. Applying (a), we get the inequality:

$$|f(x)| = |\sin(x + a) - \sin(x)| \leq |(x + a - x)| = |a|.$$

This is equivalent, by definition, to the two inequalities:

$$-a \leq \sin(x + a) - \sin(x) \leq a.$$

(c) The plots of $y = \sin(x + 0.5) - \sin(x)$ and of $y = \sin(x + 0.2) - \sin(x)$ are shown below. The inequality is satisfied in both plots.



5.4 The Fundamental Theorem of Calculus, Part II

Preliminary Questions

1. Let $G(x) = \int_4^x \sqrt{t^3 + 1}\,dt$.
(a) Is the FTC needed to calculate $G(4)$?
(b) Is the FTC needed to calculate $G'(4)$?

SOLUTION

(a) No. $G(4) = \int_4^4 \sqrt{t^3 + 1}\,dt = 0$.
(b) Yes. By the FTC II, $G'(x) = \sqrt{x^3 + 1}$, so $G'(4) = \sqrt{65}$.

2. Which of the following is an antiderivative $F(x)$ of $f(x) = x^2$ satisfying $F(2) = 0$?

(a) $\int_2^x 2t\,dt$ **(b)** $\int_0^2 t^2\,dt$ **(c)** $\int_2^x t^2\,dt$

SOLUTION The correct answer is **(c)**: $\int_2^x t^2\,dt$.

3. Does every continuous function have an antiderivative? Explain.

SOLUTION Yes. All continuous functions have an antiderivative, namely $\int_a^x f(t)\,dt$.

4. Let $G(x) = \int_4^{x^3} \sin t\,dt$. Which of the following statements are correct?

(a) $G(x)$ is the composite function $\sin(x^3)$.
(b) $G(x)$ is the composite function $A(x^3)$, where

$$A(x) = \int_4^x \sin(t)\,dt$$

(c) $G(x)$ is too complicated to differentiate.
(d) The Product Rule is used to differentiate $G(x)$.
(e) The Chain Rule is used to differentiate $G(x)$.
(f) $G'(x) = 3x^2 \sin(x^3)$.

SOLUTION Statements **(b)**, **(e)**, and **(f)** are correct.

Exercises

1. Write the area function of $f(x) = 2x + 4$ with lower limit $a = -2$ as an integral and find a formula for it.

SOLUTION Let $f(x) = 2x + 4$. The area function with lower limit $a = -2$ is

$$A(x) = \int_a^x f(t)\,dt = \int_{-2}^x (2t + 4)\,dt.$$

Carrying out the integration, we find

$$\int_{-2}^x (2t+4)\,dt = (t^2 + 4t)\Big|_{-2}^x = (x^2 + 4x) - ((-2)^2 + 4(-2)) = x^2 + 4x + 4$$

or $(x+2)^2$. Therefore, $A(x) = (x+2)^2$.

2. Find a formula for the area function of $f(x) = 2x + 4$ with lower limit $a = 0$.

SOLUTION The area function for $f(x) = 2x + 4$ with lower limit $a = 0$ is given by

$$A(x) = \int_0^x (2t+4)\,dt = (t^2 + 4t)\Big|_0^x = x^2 + 4x.$$

3. Let $G(x) = \int_1^x (t^2 - 2)\,dt$. Calculate $G(1)$, $G'(1)$ and $G'(2)$. Then find a formula for $G(x)$.

SOLUTION Let $G(x) = \int_1^x (t^2 - 2)\,dt$. Then $G(1) = \int_1^1 (t^2 - 2)\,dt = 0$. Moreover, $G'(x) = x^2 - 2$, so that $G'(1) = -1$ and $G'(2) = 2$. Finally,

$$G(x) = \int_1^x (t^2 - 2)\,dt = \left(\frac{1}{3}t^3 - 2t\right)\Big|_1^x = \left(\frac{1}{3}x^3 - 2x\right) - \left(\frac{1}{3}(1)^3 - 2(1)\right) = \frac{1}{3}x^3 - 2x + \frac{5}{3}.$$

4. Find $F(0)$, $F'(0)$, and $F'(3)$, where $F(x) = \int_0^x \sqrt{t^2 + t}\,dt$.

SOLUTION By definition, $F(0) = \int_0^0 \sqrt{t^2 + t}\,dt = 0$. By FTC, $F'(x) = \sqrt{x^2 + x}$, so that $F'(0) = \sqrt{0^2 + 0} = 0$ and $F'(3) = \sqrt{3^2 + 3} = \sqrt{12} = 2\sqrt{3}$.

5. Find $G(1)$, $G'(0)$, and $G'(\pi/4)$, where $G(x) = \int_1^x \tan t\,dt$.

SOLUTION By definition, $G(1) = \int_1^1 \tan t\,dt = 0$. By FTC, $G'(x) = \tan x$, so that $G'(0) = \tan 0 = 0$ and $G'(\frac{\pi}{4}) = \tan \frac{\pi}{4} = 1$.

6. Find $H(-2)$ and $H'(-2)$, where $H(x) = \int_{-2}^x \frac{du}{u^2 + 1}$.

SOLUTION By definition, $H(-2) = \int_{-2}^{-2} \frac{du}{u^2+1} = 0$. By FTC, $H'(x) = \frac{1}{x^2+1}$, so $H'(-2) = \frac{1}{5}$.

In Exercises 7–16, find formulas for the functions represented by the integrals.

7. $\int_2^x u^4\,du$

SOLUTION $F(x) = \int_2^x u^4\,du = \frac{1}{5}u^5\Big|_2^x = \frac{1}{5}x^5 - \frac{32}{5}.$

8. $\int_2^x (12t^2 - 8t)\,dt$

SOLUTION $F(x) = \int_2^x (12t^2 - 8t)\,dt = (4t^3 - 4t^2)\Big|_2^x = 4x^3 - 4x^2 - 16.$

9. $\int_0^x \sin u\,du$

SOLUTION $F(x) = \int_0^x \sin u\,du = (-\cos u)\Big|_0^x = 1 - \cos x.$

10. $\int_{-\pi/4}^x \sec^2\theta\,d\theta$

SOLUTION $F(x) = \int_{-\pi/4}^x \sec^2\theta\,d\theta = \tan\theta\Big|_{-\pi/4}^x = \tan x - \tan(-\pi/4) = \tan x + 1.$

11. $\int_4^x e^{3u}\,du$

SOLUTION $F(x) = \int_4^x e^{3u}\,du = \frac{1}{3}e^{3u}\Big|_4^x = \frac{1}{3}e^{3x} - \frac{1}{3}e^{12}.$

12. $\int_x^0 e^{-t}\,dt$

SOLUTION $F(x) = \int_x^0 e^{-t}\,dt = -e^{-t}\Big|_x^0 = -1 + e^{-x}.$

13. $\int_1^{x^2} t\,dt$

SOLUTION $F(x) = \int_1^{x^2} t\,dt = \frac{1}{2}t^2\Big|_1^{x^2} = \frac{1}{2}x^4 - \frac{1}{2}.$

14. $\int_{x/2}^{x/4} \sec^2 u\,du$

SOLUTION $F(x) = \int_{x/2}^{x/4} \sec^2 u\,du = \tan u\Big|_{x/2}^{x/4} = \tan\frac{x}{4} - \tan\frac{x}{2}.$

15. $\int_{3x}^{9x+2} e^{-u}\,du$

SOLUTION $F(x) = \int_{3x}^{9x+2} e^{-u}\,du = -e^{-u}\Big|_{3x}^{9x+2} = -e^{-9x-2} + e^{-3x}.$

16. $\int_2^{\sqrt{x}} \frac{dt}{t}$

SOLUTION $\int_2^{\sqrt{x}} \frac{dt}{t} = \ln|t|\Big|_2^{\sqrt{x}} = \ln\sqrt{x} - \ln 2 = \frac{1}{2}\ln x - \ln 2.$

In Exercises 17–20, express the antiderivative $F(x)$ of $f(x)$ satisfying the given initial condition as an integral.

17. $f(x) = \sqrt{x^3+1}, \quad F(5) = 0$

SOLUTION The antiderivative $F(x)$ of $\sqrt{x^3+1}$ satisfying $F(5) = 0$ is $F(x) = \int_5^x \sqrt{t^3+1}\,dt.$

18. $f(x) = \frac{x+1}{x^2+9}, \quad F(7) = 0$

SOLUTION The antiderivative $F(x)$ of $f(x) = \frac{x+1}{x^2+9}$ satisfying $F(7) = 0$ is $F(x) = \int_7^x \frac{t+1}{t^2+9}\,dt.$

19. $f(x) = \sec x, \quad F(0) = 0$

SOLUTION The antiderivative $F(x)$ of $f(x) = \sec x$ satisfying $F(0) = 0$ is $F(x) = \int_0^x \sec t\,dt.$

20. $f(x) = e^{-x^2}, \quad F(-4) = 0$

SOLUTION The antiderivative $F(x)$ of $f(x) = e^{-x^2}$ satisfying $F(-4) = 0$ is

$$F(x) = \int_{-4}^x e^{-t^2}\,dt.$$

In Exercises 21–24, calculate the derivative.

21. $\dfrac{d}{dx}\displaystyle\int_0^x (t^5 - 9t^3)\,dt$

SOLUTION By FTC II, $\dfrac{d}{dx}\displaystyle\int_0^x (t^5 - 9t^3)\,dt = x^5 - 9x^3$.

22. $\dfrac{d}{d\theta}\displaystyle\int_1^\theta \cot u\,du$

SOLUTION By FTC II, $\dfrac{d}{d\theta}\displaystyle\int_1^\theta \cot u\,du = \cot\theta$.

23. $\dfrac{d}{dt}\displaystyle\int_{100}^t \sec(5x - 9)\,dx$

SOLUTION By FTC II, $\dfrac{d}{dt}\displaystyle\int_{100}^t \sec(5x - 9)\,dx = \sec(5t - 9)$.

24. $\dfrac{d}{ds}\displaystyle\int_{-2}^s \tan\left(\frac{1}{1+u^2}\right)du$

SOLUTION By FTC II, $\dfrac{d}{ds}\displaystyle\int_{-2}^s \tan\left(\frac{1}{1+u^2}\right)du = \tan\left(\frac{1}{1+s^2}\right)$.

25. Let $A(x) = \displaystyle\int_0^x f(t)\,dt$ for $f(x)$ in Figure 8.

(a) Calculate $A(2)$, $A(3)$, $A'(2)$, and $A'(3)$.

(b) Find formulas for $A(x)$ on $[0, 2]$ and $[2, 4]$ and sketch the graph of $A(x)$.

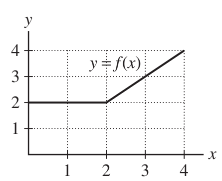


FIGURE 8

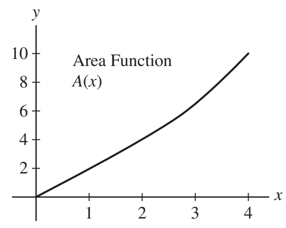
SOLUTION

(a) $A(2) = 2 \cdot 2 = 4$, the area under $f(x)$ from $x = 0$ to $x = 2$, while $A(3) = 2 \cdot 3 + \frac{1}{2} = 6.5$, the area under $f(x)$ from $x = 0$ to $x = 3$. By the FTC, $A'(x) = f(x)$ so $A'(2) = f(2) = 2$ and $A'(3) = f(3) = 3$.

(b) For each $x \in [0, 2]$, the region under the graph of $y = f(x)$ is a rectangle of length x and height 2; for each $x \in [2, 4]$, the region is comprised of a square of side length 2 and a trapezoid of height $x - 2$ and bases 2 and x. Hence,

$$A(x) = \begin{cases} 2x, & 0 \le x < 2 \\ \frac{1}{2}x^2 + 2, & 2 \le x \le 4 \end{cases}$$

A graph of the area function $A(x)$ is shown below.



26. Make a rough sketch of the graph of $A(x) = \displaystyle\int_0^x g(t)\,dt$ for $g(x)$ in Figure 9.

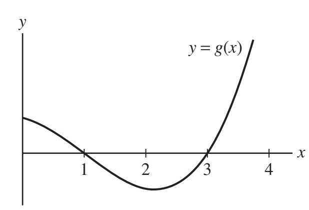


FIGURE 9

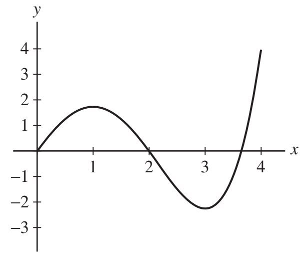
SOLUTION The graph of $y = g(x)$ lies above the x-axis over the interval [0, 1], below the x-axis over [1, 3], and above the x-axis over [3, 4]. The corresponding area function should therefore be increasing on (0, 1), decreasing on (1, 3) and increasing on (3, 4). Further, it appears from Figure 9 that the local minimum of the area function at $x = 3$ should be negative. One possible graph of the area function is the following.



27. Verify: $\int_0^x |t|\,dt = \frac{1}{2}x|x|$. *Hint:* Consider $x \geq 0$ and $x \leq 0$ separately.

SOLUTION Let $f(t) = |t| = \begin{cases} t & \text{for } t \geq 0 \\ -t & \text{for } t < 0 \end{cases}$. Then

$$F(x) = \int_0^x f(t)\,dt = \begin{cases} \int_0^x t\,dt & \text{for } x \geq 0 \\ \int_0^x -t\,dt & \text{for } x < 0 \end{cases} = \begin{cases} \frac{1}{2}t^2\Big|_0^x = \frac{1}{2}x^2 & \text{for } x \geq 0 \\ \left(-\frac{1}{2}t^2\right)\Big|_0^x = -\frac{1}{2}x^2 & \text{for } x < 0 \end{cases}$$

For $x \geq 0$, we have $F(x) = \frac{1}{2}x^2 = \frac{1}{2}x\,|x|$ since $|x| = x$, while for $x < 0$, we have $F(x) = -\frac{1}{2}x^2 = \frac{1}{2}x\,|x|$ since $|x| = -x$. Therefore, for all real x we have $F(x) = \frac{1}{2}x\,|x|$.

28. Find $G'(1)$, where $G(x) = \int_0^{x^2} \sqrt{t^3 + 3}\,dt$.

SOLUTION By combining the Chain Rule and FTC, $G'(x) = \sqrt{x^6 + 3} \cdot 2x$, so $G'(1) = \sqrt{1 + 3} \cdot 2 = 4$.

In Exercises 29–34, calculate the derivative.

29. $\frac{d}{dx}\int_0^{x^2} \frac{t\,dt}{t+1}$

SOLUTION By the Chain Rule and the FTC, $\frac{d}{dx}\int_0^{x^2} \frac{t\,dt}{t+1} = \frac{x^2}{x^2+1} \cdot 2x = \frac{2x^3}{x^2+1}$.

30. $\frac{d}{dx}\int_1^{1/x} \cos^3 t\,dt$

SOLUTION By the Chain Rule and the FTC, $\frac{d}{dx}\int_1^{1/x} \cos^3 t\,dt = \cos^3\left(\frac{1}{x}\right) \cdot \left(-\frac{1}{x^2}\right) = -\frac{1}{x^2}\cos^3\left(\frac{1}{x}\right)$.

31. $\frac{d}{ds}\int_{-6}^{\cos s} u^4\,du$

SOLUTION By the Chain Rule and the FTC, $\frac{d}{ds}\int_{-6}^{\cos s} u^4\,du = \cos^4 s(-\sin s) = -\cos^4 s \sin s$.

32. $\frac{d}{dx}\int_{x^2}^{x^4} \sqrt{t}\,dt$

Hint for Exercise 32: $F(x) = A(x^4) - A(x^2)$.

SOLUTION Let

$$F(x) = \int_{x^2}^{x^4} \sqrt{t}\,dt = \int_0^{x^4} \sqrt{t}\,dt - \int_0^{x^2} \sqrt{t}\,dt.$$

Applying the Chain Rule combined with FTC, we have

$$F'(x) = \sqrt{x^4} \cdot 4x^3 - \sqrt{x^2} \cdot 2x = 4x^5 - 2x\,|x|.$$

33. $\dfrac{d}{dx}\displaystyle\int_{\sqrt{x}}^{x^2} \tan t\,dt$

SOLUTION Let

$$G(x) = \int_{\sqrt{x}}^{x^2} \tan t\,dt = \int_0^{x^2} \tan t\,dt - \int_0^{\sqrt{x}} \tan t\,dt.$$

Applying the Chain Rule combined with FTC twice, we have

$$G'(x) = \tan(x^2)\cdot 2x - \tan(\sqrt{x})\cdot \frac{1}{2}x^{-1/2} = 2x\tan(x^2) - \frac{\tan(\sqrt{x})}{2\sqrt{x}}.$$

34. $\dfrac{d}{du}\displaystyle\int_{-u}^{3u} \sqrt{x^2+1}\,dx$

SOLUTION Let

$$G(x) = \int_{-u}^{3u} \sqrt{x^2+1}\,dx = \int_0^{3u} \sqrt{x^2+1}\,dx - \int_0^{-u} \sqrt{x^2+1}\,dx.$$

Applying the Chain Rule combined with FTC twice, we have

$$G'(x) = 3\sqrt{9u^2+1} + \sqrt{u^2+1}.$$

In Exercises 35–38, with $f(x)$ as in Figure 10 let

$$A(x) = \int_0^x f(t)\,dt \qquad \textit{and} \qquad B(x) = \int_2^x f(t)\,dt.$$

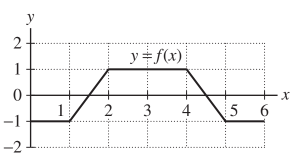


FIGURE 10

35. Find the min and max of $A(x)$ on $[0, 6]$.

SOLUTION The minimum values of $A(x)$ on $[0, 6]$ occur where $A'(x) = f(x)$ goes from negative to positive. This occurs at one place, where $x = 1.5$. The minimum value of $A(x)$ is therefore $A(1.5) = -1.25$. The maximum values of $A(x)$ on $[0, 6]$ occur where $A'(x) = f(x)$ goes from positive to negative. This occurs at one place, where $x = 4.5$. The maximum value of $A(x)$ is therefore $A(4.5) = 1.25$.

36. Find the min and max of $B(x)$ on $[0, 6]$.

SOLUTION The minimum values of $B(x)$ on $[0, 6]$ occur where $B'(x) = f(x)$ goes from negative to positive. This occurs at one place, where $x = 1.5$. The minimum value of $A(x)$ is therefore $B(1.5) = -0.25$. The maximum values of $B(x)$ on $[0, 6]$ occur where $B'(x) = f(x)$ goes from positive to negative. This occurs at one place, where $x = 4.5$. The maximum value of $B(x)$ is therefore $B(4.5) = 2.25$.

37. Find formulas for $A(x)$ and $B(x)$ valid on $[2, 4]$.

SOLUTION On the interval $[2, 4]$, $A'(x) = B'(x) = f(x) = 1$. $A(2) = \displaystyle\int_0^2 f(t)\,dt = -1$ and $B(2) = \displaystyle\int_2^2 f(t)\,dt = 0$. Hence $A(x) = (x-2) - 1$ and $B(x) = (x-2)$.

38. Find formulas for $A(x)$ and $B(x)$ valid on $[4, 5]$.

SOLUTION On the interval $[4, 5]$, $A'(x) = B'(x) = f(x) = -2(x-4.5) = 9-2x$. $A(4) = \displaystyle\int_0^4 f(t)\,dt = 1$ and $B(4) = \displaystyle\int_2^4 f(t)\,dt = 2$. Hence $A(x) = 9x - x^2 - 19$ and $B(x) = 9x - x^2 - 18$.

39. Let $A(x) = \displaystyle\int_0^x f(t)\,dt$, with $f(x)$ as in Figure 11.

(a) Does $A(x)$ have a local maximum at P?

(b) Where does $A(x)$ have a local minimum?

(c) Where does $A(x)$ have a local maximum?
(d) True or false? $A(x) < 0$ for all x in the interval shown.

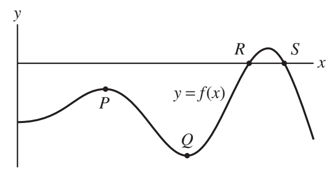

FIGURE 11 Graph of $f(x)$.

SOLUTION

(a) In order for $A(x)$ to have a local maximum, $A'(x) = f(x)$ must transition from positive to negative. As this does not happen at P, $A(x)$ does not have a local maximum at P.
(b) $A(x)$ will have a local minimum when $A'(x) = f(x)$ transitions from negative to positive. This happens at R, so $A(x)$ has a local minimum at R.
(c) $A(x)$ will have a local maximum when $A'(x) = f(x)$ transitions from positive to negative. This happens at S, so $A(x)$ has a local maximum at S.
(d) It is true that $A(x) < 0$ on I since the signed area from 0 to x is clearly always negative from the figure.

40. Determine $f(x)$, assuming that $\int_0^x f(t)\,dt = x^2 + x$.

SOLUTION Let $F(x) = \int_0^x f(t)\,dt = x^2 + x$. Then $F'(x) = f(x) = 2x + 1$.

41. Determine the function $g(x)$ and all values of c such that

$$\int_c^x g(t)\,dt = x^2 + x - 6$$

SOLUTION By the FTC II we have

$$g(x) = \frac{d}{dx}(x^2 + x - 6) = 2x + 1$$

and therefore,

$$\int_c^x g(t)\,dt = x^2 + x - (c^2 + c)$$

We must choose c so that $c^2 + c = 6$. We can take $c = 2$ or $c = -3$.

42. Find $a \le b$ such that $\int_a^b (x^2 - 9)\,dx$ has minimal value.

SOLUTION Let a be given, and let $F_a(x) = \int_a^x (t^2 - 9)\,dt$. Then $F_a'(x) = x^2 - 9$, and the critical points are $x = \pm 3$. Because $F_a''(-3) = -6$ and $F_a''(3) = 6$, we see that $F_a(x)$ has a minimum at $x = 3$. Now, we find a minimizing $\int_a^3 (x^2 - 9)\,dx$. Let $G(x) = \int_x^3 (x^2 - 9)\,dx$. Then $G'(x) = -(x^2 - 9)$, yielding critical points $x = 3$ or $x = -3$. With $x = -3$,

$$G(-3) = \int_{-3}^3 (x^2 - 9)\,dx = \left(\frac{1}{3}x^3 - 9x\right)\Big|_{-3}^3 = -36.$$

With $x = 3$,

$$G(3) = \int_3^3 (x^2 - 9)\,dx = 0.$$

Hence $a = -3$ and $b = 3$ are the values minimizing $\int_a^b (x^2 - 9)\,dx$.

In Exercises 43 and 44, let $A(x) = \int_a^x f(t)\,dt$.

43. **Area Functions and Concavity** Explain why the following statements are true. Assume $f(x)$ is differentiable.
(a) If c is an inflection point of $A(x)$, then $f'(c) = 0$.
(b) $A(x)$ is concave up if $f(x)$ is increasing.
(c) $A(x)$ is concave down if $f(x)$ is decreasing.

SOLUTION

(a) If $x = c$ is an inflection point of $A(x)$, then $A''(c) = f'(c) = 0$.

(b) If $A(x)$ is concave up, then $A''(x) > 0$. Since $A(x)$ is the area function associated with $f(x)$, $A'(x) = f(x)$ by FTC II, so $A''(x) = f'(x)$. Therefore $f'(x) > 0$, so $f(x)$ is increasing.

(c) If $A(x)$ is concave down, then $A''(x) < 0$. Since $A(x)$ is the area function associated with $f(x)$, $A'(x) = f(x)$ by FTC II, so $A''(x) = f'(x)$. Therefore, $f'(x) < 0$ and so $f(x)$ is decreasing.

44. Match the property of $A(x)$ with the corresponding property of the graph of $f(x)$. Assume $f(x)$ is differentiable.

Area function $A(x)$

(a) $A(x)$ is decreasing.

(b) $A(x)$ has a local maximum.

(c) $A(x)$ is concave up.

(d) $A(x)$ goes from concave up to concave down.

Graph of $f(x)$

(i) Lies below the x-axis.

(ii) Crosses the x-axis from positive to negative.

(iii) Has a local maximum.

(iv) $f(x)$ is increasing.

SOLUTION Let $A(x) = \int_a^x f(t)\,dt$ be an area function of $f(x)$. Then $A'(x) = f(x)$ and $A''(x) = f'(x)$.

(a) $A(x)$ is decreasing when $A'(x) = f(x) < 0$, i.e., when $f(x)$ lies below the x-axis. This is choice **(i)**.

(b) $A(x)$ has a local maximum (at x_0) when $A'(x) = f(x)$ changes sign from $+$ to 0 to $-$ as x increases through x_0, i.e., when $f(x)$ crosses the x-axis from positive to negative. This is choice **(ii)**.

(c) $A(x)$ is concave up when $A''(x) = f'(x) > 0$, i.e., when $f(x)$ is increasing. This corresponds to choice **(iv)**.

(d) $A(x)$ goes from concave up to concave down (at x_0) when $A''(x) = f'(x)$ changes sign from $+$ to 0 to $-$ as x increases through x_0, i.e., when $f(x)$ has a local maximum at x_0. This is choice **(iii)**.

45. Let $A(x) = \displaystyle\int_0^x f(t)\,dt$, with $f(x)$ as in Figure 12. Determine:

(a) The intervals on which $A(x)$ is increasing and decreasing

(b) The values x where $A(x)$ has a local min or max

(c) The inflection points of $A(x)$

(d) The intervals where $A(x)$ is concave up or concave down

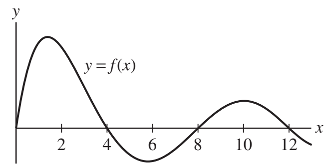

FIGURE 12

SOLUTION

(a) $A(x)$ is increasing when $A'(x) = f(x) > 0$, which corresponds to the intervals $(0, 4)$ and $(8, 12)$. $A(x)$ is decreasing when $A'(x) = f(x) < 0$, which corresponds to the intervals $(4, 8)$ and $(12, \infty)$.

(b) $A(x)$ has a local minimum when $A'(x) = f(x)$ changes from $-$ to $+$, corresponding to $x = 8$. $A(x)$ has a local maximum when $A'(x) = f(x)$ changes from $+$ to $-$, corresponding to $x = 4$ and $x = 12$.

(c) Inflection points of $A(x)$ occur where $A''(x) = f'(x)$ changes sign, or where f changes from increasing to decreasing or vice versa. Consequently, $A(x)$ has inflection points at $x = 2$, $x = 6$, and $x = 10$.

(d) $A(x)$ is concave up when $A''(x) = f'(x)$ is positive or $f(x)$ is increasing, which corresponds to the intervals $(0, 2)$ and $(6, 10)$. Similarly, $A(x)$ is concave down when $f(x)$ is decreasing, which corresponds to the intervals $(2, 6)$ and $(10, \infty)$.

46. Let $f(x) = x^2 - 5x - 6$ and $F(x) = \displaystyle\int_0^x f(t)\,dt$.

(a) Find the critical points of $F(x)$ and determine whether they are local minima or local maxima.

(b) Find the points of inflection of $F(x)$ and determine whether the concavity changes from up to down or from down to up.

(c) $\boxed{\text{GU}}$ Plot $f(x)$ and $F(x)$ on the same set of axes and confirm your answers to (a) and (b).

SOLUTION

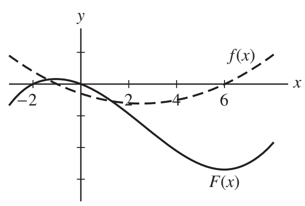
(a) If $F(x) = \int_0^x (t^2 - 5t - 6)\,dt$, then $F'(x) = x^2 - 5x - 6$ and $F''(x) = 2x - 5$. Solving $F'(x) = x^2 - 5x - 6 = 0$ yields critical points $x = -1$ and $x = 6$. Since $F''(-1) = -7 < 0$, there is a local maximum value of F at $x = -1$. Moreover, since $F''(6) = 7 > 0$, there is a local minimum value of F at $x = 6$.

(b) As noted in part (a),

$$F'(x) = x^2 - 5x - 6 \qquad \text{and} \qquad F''(x) = 2x - 5.$$

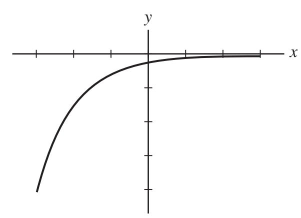
A candidate point of inflection occurs where $F''(x) = 2x - 5 = 0$. Thus $x = \frac{5}{2}$. $F''(x)$ changes from negative to positive at this point, so there is a point of inflection at $x = \frac{5}{2}$ and concavity changes from down to up.

(c) From the graph below, we clearly note that $F(x)$ has a local maximum at $x = -1$, a local minimum at $x = 6$ and a point of inflection at $x = \frac{5}{2}$.



47. Sketch the graph of an increasing function $f(x)$ such that both $f'(x)$ and $A(x) = \int_0^x f(t)\,dt$ are decreasing.

SOLUTION If $f'(x)$ is decreasing, then $f''(x)$ must be negative. Furthermore, if $A(x) = \displaystyle\int_0^x f(t)\,dt$ is decreasing, then $A'(x) = f(x)$ must also be negative. Thus, we need a function which is negative but increasing and concave down. The graph of one such function is shown below.



48. Figure 13 shows the graph of $f(x) = x \sin x$. Let $F(x) = \displaystyle\int_0^x t \sin t\,dt$.

(a) Locate the local max and absolute max of $F(x)$ on $[0, 3\pi]$.

(b) Justify graphically: $F(x)$ has precisely one zero in $[\pi, 2\pi]$.

(c) How many zeros does $F(x)$ have in $[0, 3\pi]$?

(d) Find the inflection points of $F(x)$ on $[0, 3\pi]$. For each one, state whether the concavity changes from up to down or from down to up.

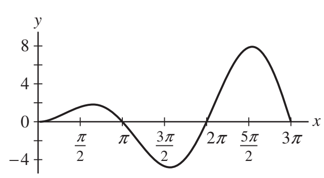


FIGURE 13 Graph of $f(x) = x \sin x$.

SOLUTION Let $F(x) = \int_0^x t \sin t\,dt$. A graph of $f(x) = x \sin x$ is depicted in Figure 13. Note that $F'(x) = f(x)$ and $F''(x) = f'(x)$.

(a) For F to have a local maximum at $x_0 \in (0, 3\pi)$ we must have $F'(x_0) = f(x_0) = 0$ and $F' = f$ must change sign from $+$ to 0 to $-$ as x increases through x_0. This occurs at $x = \pi$. The absolute maximum of $F(x)$ on $[0, 3\pi]$ occurs at $x = 3\pi$ since (from the figure) the signed area between $x = 0$ and $x = c$ is greatest for $x = c = 3\pi$.

(b) At $x = \pi$, the value of F is positive since $f(x) > 0$ on $(0, \pi)$. As x increases along the interval $[\pi, 2\pi]$, we see that F decreases as the negatively signed area accumulates. Eventually the additional negatively signed area "outweighs" the prior positively signed area and F attains the value 0, say at $b \in (\pi, 2\pi)$. Thereafter, on $(b, 2\pi)$, we see that f is negative and thus F becomes and continues to be negative as the negatively signed area accumulates. Therefore, $F(x)$ takes the value 0 exactly once in the interval $[\pi, 2\pi]$.

(c) $F(x)$ has two zeroes in $[0, 3\pi]$. One is described in part (b) and the other must occur in the interval $[2\pi, 3\pi]$ because $F(x) < 0$ at $x = 2\pi$ but clearly the positively signed area over $[2\pi, 3\pi]$ is greater than the previous negatively signed area.

(d) Since f is differentiable, we have that F is twice differentiable on I. Thus $F(x)$ has an inflection point at x_0 provided $F''(x_0) = f'(x_0) = 0$ *and* $F''(x) = f'(x)$ changes sign at x_0. If $F'' = f'$ changes sign from $+$ to 0 to $-$ at x_0, then f has a local maximum at x_0. There is clearly such a value x_0 in the figure in the interval $[\pi/2, \pi]$ and another around $5\pi/2$. Accordingly, F has two inflection points where $F(x)$ changes from concave up to concave down. If $F'' = f'$ changes sign from $-$ to 0 to $+$ at x_0, then f has a local minimum at x_0. From the figure, there is such an x_0 around $3\pi/2$; so F has one inflection point where $F(x)$ changes from concave down to concave up.

49. GU Find the smallest positive critical point of

$$F(x) = \int_0^x \cos(t^{3/2})\,dt$$

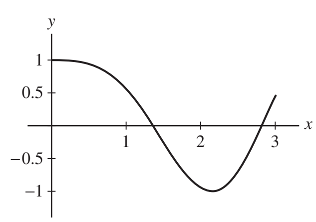
and determine whether it is a local min or max. Then find the smallest positive inflection point of $F(x)$ and use a graph of $y = \cos(x^{3/2})$ to determine whether the concavity changes from up to down or from down to up.

SOLUTION A critical point of $F(x)$ occurs where $F'(x) = \cos(x^{3/2}) = 0$. The smallest positive critical points occurs where $x^{3/2} = \pi/2$, so that $x = (\pi/2)^{2/3}$. $F'(x)$ goes from positive to negative at this point, so $x = (\pi/2)^{2/3}$ corresponds to a local maximum..

Candidate inflection points of $F(x)$ occur where $F''(x) = 0$. By FTC, $F'(x) = \cos(x^{3/2})$, so $F''(x) = -(3/2)x^{1/2}\sin(x^{3/2})$. Finding the smallest positive solution of $F''(x) = 0$, we get:

$$\begin{aligned} -(3/2)x^{1/2}\sin(x^{3/2}) &= 0 \\ \sin(x^{3/2}) &= 0 \qquad \text{(since } x > 0\text{)} \\ x^{3/2} &= \pi \\ x &= \pi^{2/3} \approx 2.14503. \end{aligned}$$

From the plot below, we see that $F'(x) = \cos(x^{3/2})$ changes from decreasing to increasing at $\pi^{2/3}$, so $F(x)$ changes from concave down to concave up at that point.



Further Insights and Challenges

50. Proof of FTC II The proof in the text assumes that $f(x)$ is increasing. To prove it for all continuous functions, let $m(h)$ and $M(h)$ denote the *minimum* and *maximum* of $f(t)$ on $[x, x+h]$ (Figure 14). The continuity of $f(x)$ implies that $\lim_{h\to 0} m(h) = \lim_{h\to 0} M(h) = f(x)$. Show that for $h > 0$,

$$hm(h) \le A(x+h) - A(x) \le hM(h)$$

For $h < 0$, the inequalities are reversed. Prove that $A'(x) = f(x)$.

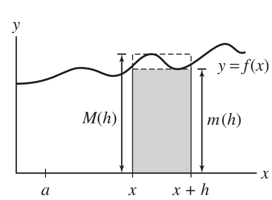


FIGURE 14 Graphical interpretation of $A(x+h) - A(x)$.

SOLUTION Let $f(x)$ be continuous on $[a, b]$. For $h > 0$, let $m(h)$ and $M(h)$ denote the minimum and maximum values of f on $[x, x+h]$. Since f is continuous, we have $\lim_{h\to 0+} m(h) = \lim_{h\to 0+} M(h) = f(x)$. If $h > 0$, then since $m(h) \le f(x) \le M(h)$ on $[x, x+h]$, we have

$$hm(h) = \int_x^{x+h} m(h)\,dt \le \int_x^{x+h} f(t)\,dt = A(x+h) - A(x) = \int_x^{x+h} f(t)\,dt \le \int_x^{x+h} M(h)\,dt = hM(h).$$

In other words, $hm(h) \le A(x+h) - A(x) \le hM(h)$. Since $h > 0$, it follows that $m(h) \le \dfrac{A(x+h) - A(x)}{h} \le M(h)$. Letting $h \to 0+$ yields

$$f(x) \le \lim_{h\to 0+} \frac{A(x+h) - A(x)}{h} \le f(x),$$

whence

$$\lim_{h\to 0+} \frac{A(x+h) - A(x)}{h} = f(x)$$

by the Squeeze Theorem. If $h < 0$, then

$$-hm(h) = \int_{x+h}^{x} m(h)\,dt \le \int_{x+h}^{x} f(t)\,dt = A(x) - A(x+h) = \int_{x+h}^{x} f(t)\,dt \le \int_{x+h}^{x} M(h)\,dt = -hM(h).$$

Since $h < 0$, we have $-h > 0$ and thus

$$m(h) \le \frac{A(x) - A(x+h)}{-h} \le M(h)$$

or

$$m(h) \le \frac{A(x+h) - A(x)}{h} \le M(h).$$

Letting $h \to 0-$ gives

$$f(x) \le \lim_{h\to 0-} \frac{A(x+h) - A(x)}{h} \le f(x),$$

so that

$$\lim_{h\to 0-} \frac{A(x+h) - A(x)}{h} = f(x)$$

by the Squeeze Theorem. Since the one-sided limits agree, we therefore have

$$A'(x) = \lim_{h\to 0} \frac{A(x+h) - A(x)}{h} = f(x).$$

51. Proof of FTC I FTC I asserts that $\int_a^b f(t)\,dt = F(b) - F(a)$ if $F'(x) = f(x)$. Use FTC II to give a new proof of FTC I as follows. Set $A(x) = \int_a^x f(t)\,dt$.

(a) Show that $F(x) = A(x) + C$ for some constant.

(b) Show that $F(b) - F(a) = A(b) - A(a) = \displaystyle\int_a^b f(t)\,dt$.

SOLUTION Let $F'(x) = f(x)$ and $A(x) = \int_a^x f(t)\,dt$.

(a) Then by the FTC, Part II, $A'(x) = f(x)$ and thus $A(x)$ and $F(x)$ are both antiderivatives of $f(x)$. Hence $F(x) = A(x) + C$ for some constant C.

(b)

$$\begin{aligned} F(b) - F(a) &= (A(b) + C) - (A(a) + C) = A(b) - A(a) \\ &= \int_a^b f(t)\,dt - \int_a^a f(t)\,dt = \int_a^b f(t)\,dt - 0 = \int_a^b f(t)\,dt \end{aligned}$$

which proves the FTC, Part I.

52. Can Every Antiderivative Be Expressed as an Integral? The area function $\int_a^x f(t)\,dt$ is an antiderivative of $f(x)$ for every value of a. However, not all antiderivatives are obtained in this way. The general antiderivative of $f(x) = x$ is $F(x) = \frac{1}{2}x^2 + C$. Show that $F(x)$ is an area function if $C \le 0$ but not if $C > 0$.

SOLUTION Let $f(x) = x$. The general antiderivative of $f(x)$ is $F(x) = \frac{1}{2}x^2 + C$. Let $A(x) = \int_a^x f(t)\,dt = \int_a^x t\,dt = \frac{1}{2}t^2\Big|_a^x = \frac{1}{2}x^2 - \frac{1}{2}a^2$ be an area function of $f(x) = x$. To express $F(x)$ as an area function, we must find a value for a such that $\frac{1}{2}x^2 - \frac{1}{2}a^2 = \frac{1}{2}x^2 + C$, whence $a = \pm\sqrt{-2C}$. If $C \le 0$, then $-2C \ge 0$ and we may choose either $a = \sqrt{-2C}$ or $a = -\sqrt{-2C}$. However, if $C > 0$, then there is no real solution for a and $F(x)$ cannot be expressed as an area function.

53. Prove the formula

$$\frac{d}{dx}\int_{u(x)}^{v(x)} f(t)\,dt = f(v(x))v'(x) - f(u(x))u'(x)$$

SOLUTION Write

$$\int_{u(x)}^{v(x)} f(x)\,dx = \int_{u(x)}^{0} f(x)\,dx + \int_{0}^{v(x)} f(x)\,dx = \int_{0}^{v(x)} f(x)\,dx - \int_{0}^{u(x)} f(x)\,dx.$$

Then, by the Chain Rule and the FTC,

$$\begin{aligned}\frac{d}{dx}\int_{u(x)}^{v(x)} f(x)\,dx &= \frac{d}{dx}\int_{0}^{v(x)} f(x)\,dx - \frac{d}{dx}\int_{0}^{u(x)} f(x)\,dx \\ &= f(v(x))v'(x) - f(u(x))u'(x).\end{aligned}$$

54. Use the result of Exercise 53 to calculate

$$\frac{d}{dx}\int_{\ln x}^{e^x} \sin t\,dt$$

SOLUTION By Exercise 53,

$$\frac{d}{dx}\int_{\ln x}^{e^x} \sin t\,dt = e^x \sin e^x - \frac{1}{x}\sin \ln x.$$

5.5 Net Change as the Integral of a Rate

Preliminary Questions

1. A hot metal object is submerged in cold water. The rate at which the object cools (in degrees per minute) is a function $f(t)$ of time. Which quantity is represented by the integral $\int_0^T f(t)\,dt$?

SOLUTION The definite integral $\int_0^T f(t)\,dt$ represents the total drop in temperature of the metal object in the first T minutes after being submerged in the cold water.

2. A plane travels 560 km from Los Angeles to San Francisco in 1 hour. If the plane's velocity at time t is $v(t)$ km/h, what is the value of $\int_0^1 v(t)\,dt$?

SOLUTION The definite integral $\int_0^1 v(t)\,dt$ represents the total distance traveled by the airplane during the one hour flight from Los Angeles to San Francisco. Therefore the value of $\int_0^1 v(t)\,dt$ is 560 km.

3. Which of the following quantities would be naturally represented as derivatives and which as integrals?

(a) Velocity of a train

(b) Rainfall during a 6-month period

(c) Mileage per gallon of an automobile

(d) Increase in the U.S. population from 1990 to 2010

SOLUTION Quantities **(a)** and **(c)** involve rates of change, so these would naturally be represented as derivatives. Quantities **(b)** and **(d)** involve an accumulation, so these would naturally be represented as integrals.

Exercises

1. Water flows into an empty reservoir at a rate of $3000 + 20t$ liters per hour. What is the quantity of water in the reservoir after 5 hours?

SOLUTION The quantity of water in the reservoir after five hours is

$$\int_0^5 (3000 + 20t)\,dt = \left(3000t + 10t^2\right)\Big|_0^5 = 15{,}250 \text{ gallons}.$$

2. A population of insects increases at a rate of $200 + 10t + 0.25t^2$ insects per day. Find the insect population after 3 days, assuming that there are 35 insects at $t = 0$.

SOLUTION The increase in the insect population over three days is

$$\int_0^3 \left(200 + 10t + \frac{1}{4}t^2\right)dt = \left(200t + 5t^2 + \frac{1}{12}t^3\right)\Big|_0^3 = \frac{2589}{4} = 647.25.$$

Accordingly, the population after 3 days is $35 + 647.25 = 682.25$ or 682 insects.

3. A survey shows that a mayoral candidate is gaining votes at a rate of $2000t + 1000$ votes per day, where t is the number of days since she announced her candidacy. How many supporters will the candidate have after 60 days, assuming that she had no supporters at $t = 0$?

SOLUTION The number of supporters the candidate has after 60 days is

$$\int_0^{60} (2000t + 1000)\,dt = (1000t^2 + 1000t)\Big|_0^{60} = 3{,}660{,}000.$$

4. A factory produces bicycles at a rate of $95 + 3t^2 - t$ bicycles per week. How many bicycles were produced from the beginning of week 2 to the end of week 3?

SOLUTION The rate of production is $r(t) = 95 + 3t^2 - t$ bicycles per week and the period from the beginning of week 2 to the end of week 3 corresponds to the second and third weeks of production. Accordingly, the number of bikes produced from the beginning of week 2 to the end of week 3 is

$$\int_1^3 r(t)\,dt = \int_1^3 \left(95 + 3t^2 - t\right)\,dt = \left(95t + t^3 - \frac{1}{2}t^2\right)\Big|_1^3 = 212$$

bicycles.

5. Find the displacement of a particle moving in a straight line with velocity $v(t) = 4t - 3$ m/s over the time interval $[2, 5]$.

SOLUTION The displacement is given by

$$\int_2^5 (4t - 3)\,dt = (2t^2 - 3t)\Big|_2^5 = (50 - 15) - (8 - 6) = 33\text{m}.$$

6. Find the displacement over the time interval $[1, 6]$ of a helicopter whose (vertical) velocity at time t is $v(t) = 0.02t^2 + t$ m/s.

SOLUTION Given $v(t) = \frac{1}{50}t^2 + t$ m/s, the change in height over $[1, 6]$ is

$$\int_1^6 v(t)\,dt = \int_1^6 \left(\frac{1}{50}t^2 + t\right)\,dt = \left(\frac{1}{150}t^3 + \frac{1}{2}t^2\right)\Big|_1^6 = \frac{284}{15} \approx 18.93 \text{ m}.$$

7. A cat falls from a tree (with zero initial velocity) at time $t = 0$. How far does the cat fall between $t = 0.5$ and $t = 1$ s? Use Galileo's formula $v(t) = -9.8t$ m/s.

SOLUTION Given $v(t) = -9.8t$ m/s, the total distance the cat falls during the interval $[\frac{1}{2}, 1]$ is

$$\int_{1/2}^1 |v(t)|\,dt = \int_{1/2}^1 9.8t\,dt = 4.9t^2\Big|_{1/2}^1 = 4.9 - 1.225 = 3.675 \text{ m}.$$

8. A projectile is released with an initial (vertical) velocity of 100 m/s. Use the formula $v(t) = 100 - 9.8t$ for velocity to determine the distance traveled during the first 15 seconds.

SOLUTION The distance traveled is given by

$$\begin{aligned}\int_0^{15} |100 - 9.8t|\,dt &= \int_0^{100/9.8} (100 - 9.8t)\,dt + \int_{100/9.8}^{15} (9.8t - 100)\,dt \\ &= \left(100t - 4.9t^2\right)\Big|_0^{100/9.8} + \left(4.9t^2 - 100t\right)\Big|_{100/9.8}^{15} \approx 622.9 \text{ m}.\end{aligned}$$

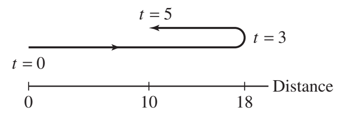
In Exercises 9–12, a particle moves in a straight line with the given velocity (in m/s). Find the displacement and distance traveled over the time interval, and draw a motion diagram like Figure 3 (with distance and time labels).

9. $v(t) = 12 - 4t, \quad [0, 5]$

SOLUTION Displacement is given by $\int_0^5 (12 - 4t)\,dt = (12t - 2t^2)\Big|_0^5 = 10$ ft, while total distance is given by

$$\int_0^5 |12 - 4t|\,dt = \int_0^3 (12 - 4t)\,dt + \int_3^5 (4t - 12)\,dt = (12t - 2t^2)\Big|_0^3 + (2t^2 - 12t)\Big|_3^5 = 26 \text{ ft}.$$

The displacement diagram is given here.



10. $v(t) = 36 - 24t + 3t^2, \quad [0, 10]$

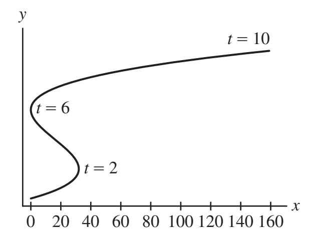
SOLUTION Let $v(t) = 36 - 24t + 3t^2 = 3(t-2)(t-6)$. Displacement is given by

$$\int_0^{10} (36 - 24t + 3t^2)\, dt = (36t - 12t^2 + t^3)\Big|_0^{10} = 160$$

meters. Total distance traveled is given by

$$\begin{aligned}\int_0^{10} |36 - 24t + 3t^2|\, dt &= \int_0^2 (36 - 24t + 3t^2)\, dt + \int_2^6 (24t - 36 - 3t^2)\, dt + \int_6^{10} (36 - 24t + 3t^2)\, dt \\ &= (36t - 12t^2 + t^3)\Big|_0^2 + (12t^2 - 36t - t^3)\Big|_0^{10} + (36t - 12t^2 + t^3)\Big|_6^{10} \\ &= 224 \text{ meters.}\end{aligned}$$

The displacement diagram is given here.

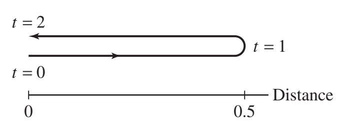


11. $v(t) = t^{-2} - 1, \quad [0.5, 2]$

SOLUTION Displacement is given by $\int_{0.5}^{2} (t^{-2} - 1)\, dt = (-t^{-1} - t)\Big|_{0.5}^{2} = 0$ m, while total distance is given by

$$\int_{0.5}^{2} \left|t^{-2} - 1\right|\, dt = \int_{0.5}^{1} (t^{-2} - 1)\, dt + \int_1^2 (1 - t^{-2})\, dt = (-t^{-1} - t)\Big|_{0.5}^{1} + (t + t^{-1})\Big|_1^2 = 1 \text{ m.}$$

The displacement diagram is given here.

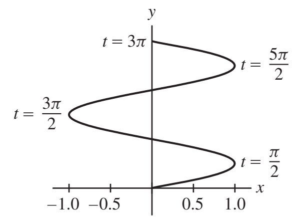


12. $v(t) = \cos t, \quad [0, 3\pi]$

SOLUTION Displacement is given by $\int_0^{3\pi} \cos t\, dt = \sin t\Big|_0^{3\pi} = 0$ meters, while the total distance traveled is given by

$$\begin{aligned}\int_0^{3\pi} |\cos t|\, dt &= \int_0^{\pi/2} \cos t\, dt - \int_{\pi/2}^{3\pi/2} \cos t\, dt + \int_{3\pi/2}^{5\pi/2} \cos t\, dt - \int_{5\pi/2}^{3\pi} \cos t\ , dt \\ &= \sin t\Big|_0^{\pi/2} - \sin t\Big|_{\pi/2}^{3\pi/2} + \sin t\Big|_{3\pi/2}^{5\pi/2} - \sin t\Big|_{5\pi/2}^{3\pi} \\ &= 6 \text{ meters.}\end{aligned}$$

The displacement diagram is given here.



13. Find the net change in velocity over [1, 4] of an object with $a(t) = 8t - t^2$ m/s^2.

SOLUTION The net change in velocity is

$$\int_1^4 a(t)\,dt = \int_1^4 (8t - t^2)\,dt = \left(4t^2 - \frac{1}{3}t^3\right)\Big|_1^4 = 39 \text{ m/s}.$$

14. Show that if acceleration is constant, then the change in velocity is proportional to the length of the time interval.

SOLUTION Let $a(t) = a$ be the constant acceleration. Let $v(t)$ be the velocity. Let $[t_1, t_2]$ be the time interval concerned. We know that $v'(t) = a$, and, by FTC,

$$v(t_2) - v(t_1) = \int_{t_1}^{t_2} a\,dt = a(t_2 - t_1),$$

So the net change in velocity is proportional to the length of the time interval with constant of proportionality a.

15. The traffic flow rate past a certain point on a highway is $q(t) = 3000 + 2000t - 300t^2$ (t in hours), where $t = 0$ is 8 AM. How many cars pass by in the time interval from 8 to 10 AM?

SOLUTION The number of cars is given by

$$\int_0^2 q(t)\,dt = \int_0^2 (3000 + 2000t - 300t^2)\,dt = \left(3000t + 1000t^2 - 100t^3\right)\Big|_0^2$$
$$= 3000(2) + 1000(4) - 100(8) = 9200 \text{ cars}.$$

16. The marginal cost of producing x tablet computers is $C'(x) = 120 - 0.06x + 0.00001x^2$ What is the cost of producing 3000 units if the setup cost is \$90,000? If production is set at 3000 units, what is the cost of producing 200 additional units?

SOLUTION The production coot for producing 3000 units is

$$\int_0^{3000} (120 - 0.06x + 0.00001x^2)\,dx = \left(120x - 0.03x^2 + \frac{1}{3}0.00001x^3\right)\Big|_0^{3000}$$
$$= 360{,}000 - 270{,}000 + 90{,}000 = 180{,}000$$

dollars. Adding in the setup cost, we find the total cost of producing 3000 units is \$270,000. If production is set at 3000 units, the cost of producing an additional 200 units is

$$\int_{3000}^{3200} (120 - 0.06x + 0.00001x^2)\,dx = \left(120x - 0.03x^2 + \frac{1}{3}0.00001x^3\right)\Big|_{3000}^{3200}$$
$$= 384{,}000 - 307{,}200 + 109{,}226.67 - 180{,}000$$

or \$6026.67.

17. A small boutique produces wool sweaters at a marginal cost of $40 - 5[[x/5]]$ for $0 \le x \le 20$, where $[[x]]$ is the greatest integer function. Find the cost of producing 20 sweaters. Then compute the average cost of the first 10 sweaters and the last 10 sweaters.

SOLUTION The total cost of producing 20 sweaters is

$$\int_0^{20} (40 - 5[[x/5]])\,dx = \int_0^5 40\,dx + \int_5^{10} 35\,dx + \int_{10}^{15} 30\,dx + \int_{15}^{20} 25\,dx$$
$$= 40(5) + 35(5) + 30(5) + 25(5) = 650 \text{ dollars}.$$

From this calculation, we see that the cost of the first 10 sweaters is \$375 and the cost of the last ten sweaters is \$275; thus, the average cost of the first ten sweaters is \$37.50 and the average cost of the last ten sweaters is \$27.50.

18. The rate (in liters per minute) at which water drains from a tank is recorded at half-minute intervals. Compute the average of the left- and right-endpoint approximations to estimate the total amount of water drained during the first 3 minutes.

t (min)	0	0.5	1	1.5	2	2.5	3
r (l/min)	50	48	46	44	42	40	38

SOLUTION Let $\Delta t = 0.5$. Then

$$R_N = 0.5(48 + 46 + 44 + 42 + 40 + 38) = 129.0 \text{ liters}$$
$$L_N = 0.5(50 + 48 + 46 + 44 + 42 + 40) = 135.0 \text{ liters}$$

The average of R_N and L_N is $\frac{1}{2}(129 + 135) = 132$ liters.

19. The velocity of a car is recorded at half-second intervals (in feet per second). Use the average of the left- and right-endpoint approximations to estimate the total distance traveled during the first 4 seconds.

t	0	0.5	1	1.5	2	2.5	3	3.5	4
$v(t)$	0	12	20	29	38	44	32	35	30

SOLUTION Let $\Delta t = .5$. Then

$$R_N = 0.5 \cdot (12 + 20 + 29 + 38 + 44 + 32 + 35 + 30) = 120 \text{ ft.}$$
$$L_N = 0.5 \cdot (0 + 12 + 20 + 29 + 38 + 44 + 32 + 35) = 105 \text{ ft.}$$

The average of R_N and L_N is 112.5 ft.

20. To model the effects of a **carbon tax** on CO_2 emissions, policymakers study the *marginal cost of abatement* $B(x)$, defined as the cost of increasing CO_2 reduction from x to $x + 1$ tons (in units of ten thousand tons—Figure 4). Which quantity is represented by the area under the curve over [0, 3] in Figure 4?

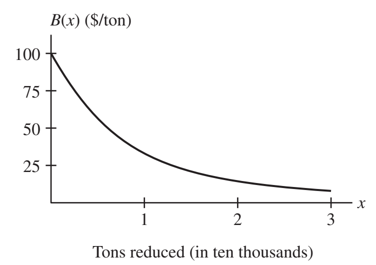


FIGURE 4 Marginal cost of abatement $B(x)$.

SOLUTION The area under the curve over [0, 3] represents the total cost of reducing the amount of CO_2 released into the atmosphere by 3 tons.

21. A megawatt of power is 10^6 W, or 3.6×10^9 J/hour. Which quantity is represented by the area under the graph in Figure 5? Estimate the energy (in joules) consumed during the period 4 PM to 8 PM.

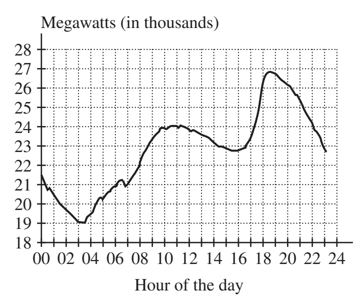

FIGURE 5 Power consumption over 1-day period in California (February 2010).

SOLUTION The area under the graph in Figure 5 represents the total power consumption over one day in California. Assuming $t = 0$ corresponds to midnight, the period 4 PM to 8 PM corresponds to $t = 16$ to $t = 20$. The left and right endpoint approximations are

$$L = 1(22.8 + 23.5 + 26.1 + 26.7) = 99.1 \text{megawatt} \cdot \text{hours}$$
$$R = 1(23.5 + 26.1 + 26.7 + 26.1) = 102.4 \text{megawatt} \cdot \text{hours}$$

The average of these values is

$$100.75 \text{megawatt} \cdot \text{hours} = 3.627 \times 10^{11} \text{ joules.}$$

22. Figure 6 shows the migration rate $M(t)$ of Ireland in the period 1988–1998. This is the rate at which people (in thousands per year) move into or out of the country.

(a) Is the following integral positive or negative? What does this quantity represent?

$$\int_{1988}^{1998} M(t)\,dt$$

(b) Did migration in the period 1988–1998 result in a net influx of people into Ireland or a net outflow of people from Ireland?

(c) During which two years could the Irish prime minister announce, "We've hit an inflection point. We are still losing population, but the trend is now improving."

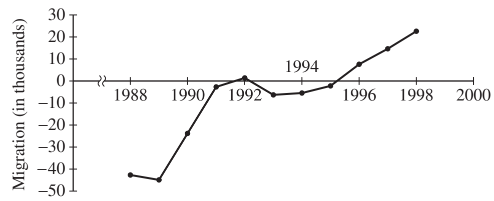

FIGURE 6 Irish migration rate (in thousands per year).

SOLUTION

(a) Because there appears to be more area below the t-axis than above in Figure 6,

$$\int_{1988}^{1998} M(t)\,dt$$

is negative. This quantity represents the net migration from Ireland during the period 1988–1998.

(b) As noted in part (a), there appears to be more area below the t-axis than above in Figure 6, so migration in the period 1988–1998 resulted in a net outflow of people from Ireland.

(c) The prime minister can make this statement when the graph of M is at a local minimum, which appears to be in the years 1989 and 1993.

23. Let $N(d)$ be the number of asteroids of diameter $\le d$ kilometers. Data suggest that the diameters are distributed according to a piecewise power law:

$$N'(d) = \begin{cases} 1.9 \times 10^9 d^{-2.3} & \text{for } d < 70 \\ 2.6 \times 10^{12} d^{-4} & \text{for } d \ge 70 \end{cases}$$

(a) Compute the number of asteroids with diameter between 0.1 and 100 km.

(b) Using the approximation $N(d+1) - N(d) \approx N'(d)$, estimate the number of asteroids of diameter 50 km.

SOLUTION

(a) The number of asteroids with diameter between 0.1 and 100 km is

$$\begin{aligned} \int_{0.1}^{100} N'(d)\,dd &= \int_{0.1}^{70} 1.9 \times 10^9 d^{-2.3}\,dd + \int_{70}^{100} 2.6 \times 10^{12} d^{-4}\,dd \\ &= -\frac{1.9 \times 10^9}{1.3} d^{-1.3}\bigg|_{0.1}^{70} - \frac{2.6 \times 10^{12}}{3} d^{-3}\bigg|_{70}^{100} \\ &= 2.916 \times 10^{10} + 1.66 \times 10^6 \approx 2.916 \times 10^{10}. \end{aligned}$$

(b) Taking $d = 49.5$,

$$N(50.5) - N(49.5) \approx N'(49.5) = 1.9 \times 10^9 49.5^{-2.3} = 240{,}525.79.$$

Thus, there are approximately 240,526 asteroids of diameter 50 km.

24. Heat Capacity The heat capacity $C(T)$ of a substance is the amount of energy (in joules) required to raise the temperature of 1 g by 1°C at temperature T.

(a) Explain why the energy required to raise the temperature from T_1 to T_2 is the area under the graph of $C(T)$ over $[T_1, T_2]$.

(b) How much energy is required to raise the temperature from 50 to 100°C if $C(T) = 6 + 0.2\sqrt{T}$?

SOLUTION

(a) Since $C(T)$ is the energy required to raise the temperature of one gram of a substance by one degree when its temperature is T, the total energy required to raise the temperature from T_1 to T_2 is given by the definite integral $\int_{T_1}^{T_2} C(T)\,dT$. As $C(T) > 0$, the definite integral also represents the area under the graph of $C(T)$.

(b) If $C(T) = 6 + .2\sqrt{T} = 6 + \frac{1}{5}T^{1/2}$, then the energy required to raise the temperature from 50°C to 100°C is $\int_{50}^{100} C(T)\,dT$ or

$$\int_{50}^{100}\left(6+\frac{1}{5}T^{1/2}\right)dT = \left(6T + \frac{2}{15}T^{3/2}\right)\Big|_{50}^{100} = \left(6(100) + \frac{2}{15}(100)^{3/2}\right) - \left(6(50) + \frac{2}{15}(50)^{3/2}\right)$$

$$= \frac{1300 - 100\sqrt{2}}{3} \approx 386.19 \text{ Joules}$$

25. Figure 7 shows the rate $R(t)$ of natural gas consumption (in billions of cubic feet per day) in the mid-Atlantic states (New York, New Jersey, Pennsylvania). Express the total quantity of natural gas consumed in 2009 as an integral (with respect to time t in days). Then estimate this quantity, given the following monthly values of $R(t)$:

3.18, 2.86, 2.39, 1.49, 1.08, 0.80,
1.01, 0.89, 0.89, 1.20, 1.64, 2.52

Keep in mind that the number of days in a month varies with the month.

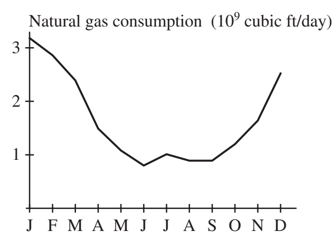

FIGURE 7 Natural gas consumption in 2009 in the mid-Atlantic states

SOLUTION The total quantity of natural gas consumed is given by

$$\int_0^{365} R(t)\,dt.$$

With the given data, we find

$$\int_0^{365} R(t)\,dt \approx 31(3.18) + 28(2.86) + 31(2.39) + 30(1.49) + 31(1.08) + 30(0.80)$$
$$+31(1.01) + 31(0.89) + 30(0.89) + 31(1.20) + 30(1.64) + 31(2.52)$$
$$= 605.05 \text{ billion cubic feet.}$$

26. Cardiac output is the rate R of volume of blood pumped by the heart per unit time (in liters per minute). Doctors measure R by injecting A mg of dye into a vein leading into the heart at $t = 0$ and recording the concentration $c(t)$ of dye (in milligrams per liter) pumped out at short regular time intervals (Figure 8).

(a) Explain: The quantity of dye pumped out in a small time interval $[t, t + \Delta t]$ is approximately $Rc(t)\Delta t$.

(b) Show that $A = R\int_0^T c(t)\,dt$, where T is large enough that all of the dye is pumped through the heart but not so large that the dye returns by recirculation.

(c) Assume $A = 5$ mg. Estimate R using the following values of $c(t)$ recorded at 1-second intervals from $t = 0$ to $t = 10$:

0, 0.4, 2.8, 6.5, 9.8, 8.9,
6.1, 4, 2.3, 1.1, 0

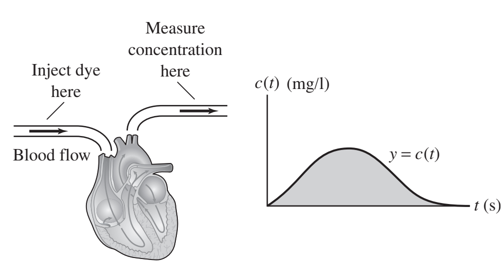

FIGURE 8

SOLUTION

(a) Over a short time interval, $c(t)$ is nearly constant. $Rc(t)$ is the rate of volume of dye (amount of fluid $\times$ concentration of dye in fluid) flowing out of the heart (in mg per minute). Over the short time interval $[t, t + \Delta t]$, the rate of flow of dye is approximately constant at $Rc(t)$ mg/minute. Therefore, the flow of dye over the interval is approximately $Rc(t)\Delta t$ mg.

(b) The rate of flow of dye is $Rc(t)$. Therefore the net flow between time $t = 0$ and time $t = T$ is

$$\int_0^T Rc(t)\,dt = R\int_0^T c(t)\,dt.$$

If T is great enough that all of the dye is pumped through the heart, the net flow is equal to all of the dye, so

$$A = R\int_0^T c(t)\,dt.$$

(c) In the table, $\Delta t = \frac{1}{60}$ minute, and $N = 10$. The right and left hand approximations of $\int_0^T c(t)\,dt$ are:

$$R_{10} = \frac{1}{60}(0.4 + 2.8 + 6.5 + 9.8 + 8.9 + 6.1 + 4 + 2.3 + 1.1 + 0) = 0.6983\ \frac{\text{mg}\cdot\text{minute}}{\text{liter}}$$
$$L_{10} = \frac{1}{60}(0 + 0.4 + 2.8 + 6.5 + 9.8 + 8.9 + 6.1 + 4 + 2.3 + 1.1) = 0.6983\ \frac{\text{mg}\cdot\text{minute}}{\text{liter}}$$

Both L_N and R_N are the same, so the average of L_N and R_N is 0.6983. Hence,

$$A = R\int_0^T c(t)dt$$
$$5\text{ mg} = R\left(0.6983\ \frac{\text{mg}\cdot\text{minute}}{\text{liter}}\right)$$
$$R = \frac{5}{0.6983}\ \frac{\text{liters}}{\text{minute}} = 7.16\ \frac{\text{liters}}{\text{minute}}.$$

Exercises 27 and 28: A study suggests that the extinction rate $r(t)$ of marine animal families during the Phanerozoic Eon can be modeled by the function $r(t) = 3130/(t + 262)$ for $0 \le t \le 544$, where t is time elapsed (in millions of years) since the beginning of the eon 544 million years ago. Thus, $t = 544$ refers to the present time, $t = 540$ is 4 million years ago, and so on.

27. Compute the average of R_N and L_N with $N = 5$ to estimate the total number of families that became extinct in the periods $100 \le t \le 150$ and $350 \le t \le 400$.

SOLUTION

- $(100 \le t \le 150)$ For $N = 5$,

$$\Delta t = \frac{150 - 100}{5} = 10.$$

  The table of values $\{r(t_i)\}_{i=0\ldots5}$ is given below:

t_i	100	110	120	130	140	150
$r(t_i)$	8.64641	8.41398	8.19372	7.98469	7.78607	7.59709

  The endpoint approximations are:

$$R_N = 10(8.41398 + 8.19372 + 7.98469 + 7.78607 + 7.59709) \approx 399.756 \text{ families}$$
$$L_N = 10(8.64641 + 8.41398 + 8.19372 + 7.98469 + 7.78607) \approx 410.249 \text{ families}$$

  The right endpoint approximation estimates 399.756 families became extinct in the period $100 \le t \le 150$, the left endpoint approximation estimates 410.249 families became extinct during this time. The average of the two is 405.362 families.

- $(350 \le t \le 400)$ For $N = 10$,

$$\Delta t = \frac{400 - 350}{5} = 19.$$

The table of values $\{r(t_i)\}_{i=0\ldots5}$ is given below:

t_i	350	360	370	380	390	400
$r(t_i)$	5.11438	5.03215	4.95253	4.87539	4.80061	4.72810

The endpoint approximations are:

$$R_N = 10(5.03215 + 4.95253 + 4.87539 + 4.80061 + 4.72810) \approx 243.888 \text{ families}$$

$$L_N = 10(5.11438 + 5.03215 + 4.95253 + 4.87539 + 4.80061) \approx 247.751 \text{ families}$$

The right endpoint approximation estimates 243.888 families became extinct in the period $350 \le t \le 400$, the left endpoint approximation estimates 247.751 families became extinct during this time. The average of the two is 245.820 families.

28. CAS Estimate the total number of extinct families from $t = 0$ to the present, using M_N with $N = 544$.

SOLUTION We are estimating

$$\int_0^{544} \frac{3130}{(t+262)}\, dt$$

using M_N with $N = 544$. If $N = 544$, $\Delta t = \dfrac{544-0}{544} = 1$ and $\{t_i^*\}_{i=1,\ldots N} = i\Delta t - (\Delta t/2) = i - \frac{1}{2}$.

$$M_N = \Delta t \sum_{i=1}^{N} r(t_i^*) = 1 \cdot \sum_{i=1}^{544} \frac{3130}{261.5+i} = 3517.3021.$$

Thus, we estimate that 3517 families have become extinct over the past 544 million years.

Further Insights and Challenges

29. Show that a particle, located at the origin at $t = 1$ and moving along the x-axis with velocity $v(t) = t^{-2}$, will never pass the point $x = 2$.

SOLUTION The particle's velocity is $v(t) = s'(t) = t^{-2}$, an antiderivative for which is $F(t) = -t^{-1}$. Hence, the particle's position at time t is

$$s(t) = \int_1^t s'(u)\, du = F(u)\Big|_1^t = F(t) - F(1) = 1 - \frac{1}{t} < 1$$

for all $t \ge 1$. Thus, the particle will never pass $x = 1$, which implies it will never pass $x = 2$ either.

30. Show that a particle, located at the origin at $t = 1$ and moving along the x-axis with velocity $v(t) = t^{-1/2}$ moves arbitrarily far from the origin after sufficient time has elapsed.

SOLUTION The particle's velocity is $v(t) = s'(t) = t^{-1/2}$, an antiderivative for which is $F(t) = 2t^{1/2}$. Hence, the particle's position at time t is

$$s(t) = \int_1^t s'(u)\, du = F(u)\Big|_1^t = F(t) - F(1) = 2\sqrt{t} - 1$$

for all $t \ge 1$. Let $S > 0$ denote an arbitrarily large distance from the origin. We see that for

$$t > \left(\frac{S+1}{2}\right)^2,$$

the particle will be more than S units from the origin. In other words, the particle moves arbitrarily far from the origin after sufficient time has elapsed.

5.6 Substitution Method

Preliminary Questions

1. Which of the following integrals is a candidate for the Substitution Method?

(a) $\int 5x^4 \sin(x^5)\, dx$ **(b)** $\int \sin^5 x \cos x\, dx$ **(c)** $\int x^5 \sin x\, dx$

SOLUTION The function in **(c)**: $x^5 \sin x$ is not of the form $g(u(x))u'(x)$. The function in **(a)** meets the prescribed pattern with $g(u) = \sin u$ and $u(x) = x^5$. Similarly, the function in **(b)** meets the prescribed pattern with $g(u) = u^5$ and $u(x) = \sin x$.

2. Find an appropriate choice of u for evaluating the following integrals by substitution:

(a) $\int x(x^2+9)^4\,dx$ **(b)** $\int x^2 \sin(x^3)\,dx$ **(c)** $\int \sin x \cos^2 x\,dx$

SOLUTION

(a) $x(x^2+9)^4 = \frac{1}{2}(2x)(x^2+9)^4$; hence, $c = \frac{1}{2}$, $f(u) = u^4$, and $u(x) = x^2+9$.

(b) $x^2\sin(x^3) = \frac{1}{3}(3x^2)\sin(x^3)$; hence, $c = \frac{1}{3}$, $f(u) = \sin u$, and $u(x) = x^3$.

(c) $\sin x \cos^2 x = -(-\sin x)\cos^2 x$; hence, $c = -1$, $f(u) = u^2$, and $u(x) = \cos x$.

3. Which of the following is equal to $\int_0^2 x^2(x^3+1)\,dx$ for a suitable substitution?

(a) $\frac{1}{3}\int_0^2 u\,du$ **(b)** $\int_0^9 u\,du$ **(c)** $\frac{1}{3}\int_1^9 u\,du$

SOLUTION With the substitution $u = x^3+1$, the definite integral $\int_0^2 x^2(x^3+1)\,dx$ becomes $\frac{1}{3}\int_1^9 u\,du$. The correct answer is **(c)**.

Exercises

In Exercises 1–6, calculate du.

1. $u = x^3 - x^2$

SOLUTION Let $u = x^3 - x^2$. Then $du = (3x^2 - 2x)\,dx$.

2. $u = 2x^4 + 8x^{-1}$

SOLUTION Let $u = 2x^4 + 8x^{-1}$. Then $du = (8x^3 - 8x^{-2})\,dx$.

3. $u = \cos(x^2)$

SOLUTION Let $u = \cos(x^2)$. Then $du = -\sin(x^2)\cdot 2x\,dx = -2x\sin(x^2)\,dx$.

4. $u = \tan x$

SOLUTION Let $u = \tan x$. Then $du = \sec^2 x\,dx$.

5. $u = e^{4x+1}$

SOLUTION Let $u = e^{4x+1}$. Then $du = 4e^{4x+1}\,dx$.

6. $u = \ln(x^4+1)$

SOLUTION Let $u = \ln(x^4+1)$. Then $du = \dfrac{4x^3}{x^4+1}\,dx$.

In Exercises 7–22, write the integral in terms of u and du. Then evaluate.

7. $\int (x-7)^3\,dx, \quad u = x-7$

SOLUTION Let $u = x - 7$. Then $du = dx$. Hence

$$\int (x-7)^3\,dx = \int u^3\,du = \frac{1}{4}u^4 + C = \frac{1}{4}(x-7)^4 + C.$$

8. $\int (x+25)^{-2}\,dx, \quad u = x+25$

SOLUTION Let $u = x+25$. Then $du = dx$ and

$$\int (x+25)^{-2}\,dx = \int u^{-2}\,du = -u^{-1} + C = -\frac{1}{x+25} + C.$$

9. $\int t\sqrt{t^2+1}\,dt, \quad u = t^2+1$

SOLUTION Let $u = t^2+1$. Then $du = 2t\,dt$. Hence,

$$\int t\sqrt{t^2+1}\,dt = \frac{1}{2}\int u^{1/2}\,du = \frac{1}{3}u^{3/2} + C = \frac{1}{3}(t^2+1)^{3/2} + C.$$

10. $\int (x^3+1)\cos(x^4+4x)\,dx, \quad u = x^4+4x$

SOLUTION Let $u = x^4+4x$. Then $du = (4x^3+4)\,dx = 4(x^3+1)\,dx$ and

$$\int (x^3+1)\cos(x^4+4x)\,dx = \frac{1}{4}\int \cos u\,du = \frac{1}{4}\sin u + C = \frac{1}{4}\sin(x^4+4x) + C.$$

11. $\int \frac{t^3}{(4-2t^4)^{11}}\,dt, \quad u = 4-2t^4$

SOLUTION Let $u = 4-2t^4$. Then $du = -8t^3\,dt$. Hence,

$$\int \frac{t^3}{(4-2t^4)^{11}}\,dt = -\frac{1}{8}\int u^{-11}\,du = \frac{1}{80}u^{-10} + C = \frac{1}{80}(4-2t^4)^{-10} + C.$$

12. $\int \sqrt{4x-1}\,dx, \quad u = 4x-1$

SOLUTION Let $u = 4x-1$. Then $du = 4\,dx$ or $\frac{1}{4}du = dx$. Hence

$$\int \sqrt{4u-1}\,dx = \frac{1}{4}\int u^{1/2}\,du = \frac{1}{4}\left(\frac{2}{3}u^{3/2}\right) + C = \frac{1}{6}(4x-1)^{3/2} + C.$$

13. $\int x(x+1)^9\,dx, \quad u = x+1$

SOLUTION Let $u = x+1$. Then $x = u-1$ and $du = dx$. Hence

$$\begin{aligned}\int x(x+1)^9\,dx &= \int (u-1)u^9\,du = \int (u^{10}-u^9)\,du\\ &= \frac{1}{11}u^{11} - \frac{1}{10}u^{10} + C = \frac{1}{11}(x+1)^{11} - \frac{1}{10}(x+1)^{10} + C.\end{aligned}$$

14. $\int x\sqrt{4x-1}\,dx, \quad u = 4x-1$

SOLUTION Let $u = 4x-1$. Then $x = \frac{1}{4}(u+1)$ and $du = 4\,dx$ or $\frac{1}{4}\,du = dx$. Hence,

$$\begin{aligned}\int x\sqrt{4x-1}\,dx &= \frac{1}{16}\int (u+1)u^{1/2}\,du = \frac{1}{16}\int (u^{3/2}+u^{1/2})\,du\\ &= \frac{1}{16}\left(\frac{2}{5}u^{5/2}\right) + \frac{1}{16}\left(\frac{2}{3}u^{3/2}\right) + C\\ &= \frac{1}{40}(4x-1)^{5/2} + \frac{1}{24}(4x-1)^{3/2} + C.\end{aligned}$$

15. $\int x^2\sqrt{x+1}\,dx, \quad u = x+1$

SOLUTION Let $u = x+1$. Then $x = u-1$ and $du = dx$. Hence

$$\begin{aligned}\int x^2\sqrt{x+1}\,dx &= \int (u-1)^2u^{1/2}\,du = \int (u^{5/2}-2u^{3/2}+u^{1/2})\,du\\ &= \frac{2}{7}u^{7/2} - \frac{4}{5}u^{5/2} + \frac{2}{3}u^{3/2} + C\\ &= \frac{2}{7}(x+1)^{7/2} - \frac{4}{5}(x+1)^{5/2} + \frac{2}{3}(x+1)^{3/2} + C.\end{aligned}$$

16. $\int \sin(4\theta-7)\,d\theta, \quad u = 4\theta-7$

SOLUTION Let $u = 4\theta-7$. Then $du = 4\,d\theta$ and

$$\int \sin(4\theta-7)\,d\theta = \frac{1}{4}\int \sin u\,du = -\frac{1}{4}\cos u + C = -\frac{1}{4}\cos(4\theta-7) + C.$$

17. $\int \sin^2\theta\cos\theta\,d\theta, \quad u = \sin\theta$

SOLUTION Let $u = \sin\theta$. Then $du = \cos\theta\,d\theta$. Hence,

$$\int \sin^2\theta\cos\theta\,d\theta = \int u^2\,du = \frac{1}{3}u^3 + C = \frac{1}{3}\sin^3\theta + C.$$

18. $\int \sec^2 x\tan x\,dx, \quad u = \tan x$

SOLUTION Let $u = \tan x$. Then $du = \sec^2 x\,dx$. Hence

$$\int \sec^2 x\tan x\,dx = \int u\,du = \frac{1}{2}u^2 + C = \frac{1}{2}\tan^2 x + C.$$

19. $\int xe^{-x^2}\,dx, \quad u = -x^2$

SOLUTION Let $u = -x^2$. Then $du = -2x\,dx$ or $-\frac{1}{2}\,du = x\,dx$. Hence,

$$\int xe^{-x^2}\,dx = -\frac{1}{2}\int e^u\,du = -\frac{1}{2}e^u + C = -\frac{1}{2}e^{-x^2} + C.$$

20. $\int (\sec^2 t)e^{\tan t}\,dt, \quad u = \tan t$

SOLUTION Let $u = \tan t$. Then $du = \sec^2 t\,dt$ and

$$\int (\sec^2 t)e^{\tan t}\,dt = \int e^u\,du = e^u + C = e^{\tan t} + C.$$

21. $\int \frac{(\ln x)^2\,dx}{x}, \quad u = \ln x$

SOLUTION Let $u = \ln x$. Then $du = \frac{1}{x}\,dx$, and

$$\int \frac{(\ln x)^2}{x}\,dx = \int u^2\,du = \frac{1}{3}u^3 + C = \frac{1}{3}(\ln x)^3 + C.$$

22. $\int \frac{(\tan^{-1}x)^2\,dx}{x^2+1}, \quad u = \tan^{-1}x$

SOLUTION Let $u = \tan^{-1}x$. Then $du = \frac{1}{1+x^2}\,dx$, and

$$\int \frac{(\tan^{-1}x)^2}{x^2+1}\,dx = \int u^2\,du = \frac{1}{3}u^3 + C = \frac{1}{3}(\tan^{-1}x)^3 + C.$$

In Exercises 23–26, evaluate the integral in the form $a\sin(u(x)) + C$ for an appropriate choice of $u(x)$ and constant a.

23. $\int x^3\cos(x^4)\,dx$

SOLUTION Let $u = x^4$. Then $du = 4x^3\,dx$ or $\frac{1}{4}\,du = x^3 dx$. Hence

$$\int x^3\cos(x^4)\,dx = \frac{1}{4}\int \cos u\,du = \frac{1}{4}\sin u + C = \frac{1}{4}\sin(x^4) + C.$$

24. $\int x^2\cos(x^3+1)\,dx$

SOLUTION Let $u = x^3 + 1$. Then $du = 3x^2\,dx$ or $\frac{1}{3}\,du = x^2\,dx$. Hence

$$\int x^2\cos(x^3+1)\,dx = \frac{1}{3}\int \cos u\,du = \frac{1}{3}\sin u + C.$$

25. $\int x^{1/2}\cos(x^{3/2})\,dx$

SOLUTION Let $u = x^{3/2}$. Then $du = \frac{3}{2}x^{1/2}\,dx$ or $\frac{2}{3}\,du = x^{1/2}\,dx$. Hence

$$\int x^{1/2}\cos(x^{3/2})\,dx = \frac{2}{3}\int \cos u\,du = \frac{2}{3}\sin u + C = \frac{2}{3}\sin(x^{3/2}) + C.$$

26. $\int \cos x \cos(\sin x)\, dx$

SOLUTION Let $u = \sin x$. Then $du = \cos x\, dx$. Hence

$$\int \cos x \cos(\sin x)\, dx = \int \cos u\, du = \sin u + C.$$

In Exercises 27–72, evaluate the indefinite integral.

27. $\int (4x+5)^9\, dx$

SOLUTION Let $u = 4x+5$. Then $du = 4\, dx$ and

$$\int (4x+5)^9\, dx = \frac{1}{4}\int u^9\, du = \frac{1}{40}u^{10} + C = \frac{1}{40}(4x+5)^{10} + C.$$

28. $\int \frac{dx}{(x-9)^5}$

SOLUTION Let $u = x-9$. Then $du = dx$ and

$$\int \frac{dx}{(x-9)^5} = \int u^{-5}\, du = -\frac{1}{4}u^{-4} + C = -\frac{1}{4(x-9)^4} + C.$$

29. $\int \frac{dt}{\sqrt{t+12}}$

SOLUTION Let $u = t+12$. Then $du = dt$ and

$$\int \frac{dt}{\sqrt{t+12}} = \int u^{-1/2}\, du = 2u^{1/2} + C = 2\sqrt{t+12} + C.$$

30. $\int (9t+2)^{2/3}\, dt$

SOLUTION Let $u = 9t+2$. Then $du = 9\, dt$ and

$$\int (9t+2)^{2/3}\, dt = \frac{1}{9}\int u^{2/3}\, du = \frac{1}{9}\cdot\frac{3}{5}u^{5/3} + C = \frac{1}{15}(9t+2)^{5/3} + C.$$

31. $\int \frac{x+1}{(x^2+2x)^3}\, dx$

SOLUTION Let $u = x^2+2x$. Then $du = (2x+2)\, dx$ or $\frac{1}{2}du = (x+1)\, dx$. Hence

$$\int \frac{x+1}{(x^2+2x)^3}\, dx = \frac{1}{2}\int \frac{1}{u^3}\, du = \frac{1}{2}\left(-\frac{1}{2}u^{-2}\right) + C = -\frac{1}{4}(x^2+2x)^{-2} + C = \frac{-1}{4(x^2+2x)^2} + C.$$

32. $\int (x+1)(x^2+2x)^{3/4}\, dx$

SOLUTION Let $u = x^2+2x$. Then $du = (2x+2)\, dx = 2(x+1)\, dx$ and

$$\begin{aligned}\int (x+1)(x^2+2x)^{3/4}\, dx &= \frac{1}{2}\int u^{3/4}\, du = \frac{1}{2}\cdot\frac{4}{7}u^{7/4} + C\\ &= \frac{2}{7}(x^2+2x)^{7/4} + C.\end{aligned}$$

33. $\int \frac{x}{\sqrt{x^2+9}}\, dx$

SOLUTION Let $u = x^2+9$. Then $du = 2x\, dx$ or $\frac{1}{2}du = x\, dx$. Hence

$$\int \frac{x}{\sqrt{x^2+9}}\, dx = \frac{1}{2}\int \frac{1}{\sqrt{u}}\, du = \frac{1}{2}\frac{\sqrt{u}}{\frac{1}{2}} + C = \sqrt{x^2+9} + C.$$

34. $\int \frac{2x^2+x}{(4x^3+3x^2)^2}\,dx$

SOLUTION Let $u = 4x^3+3x^2$. Then $du = (12x^2+6x)\,dx$ or $\frac{1}{6}du = (2x^2+x)\,dx$. Hence

$$\int (4x^3+3x^2)^{-2}(2x^2+x)\,dx = \frac{1}{6}\int u^{-2}\,du = -\frac{1}{6}u^{-1} + C = -\frac{1}{6}(4x^3+3x^2)^{-1} + C.$$

35. $\int (3x^2+1)(x^3+x)^2\,dx$

SOLUTION Let $u = x^3+x$. Then $du = (3x^2+1)\,dx$. Hence

$$\int (3x^2+1)(x^3+x)^2\,dx = \int u^2\,du = \frac{1}{3}u^3 + C = \frac{1}{3}(x^3+x)^3 + C.$$

36. $\int \frac{5x^4+2x}{(x^5+x^2)^3}\,dx$

SOLUTION Let $u = x^5+x^2$. Then $du = (5x^4+2x)\,dx$. Hence

$$\int \frac{5x^4+2x}{(x^5+x^2)^3}\,dx = \int \frac{1}{u^3}\,du = -\frac{1}{2}\frac{1}{u^2} + C = -\frac{1}{2}\frac{1}{(x^5+x^2)^2} + C.$$

37. $\int (3x+8)^{11}\,dx$

SOLUTION Let $u = 3x+8$. Then $du = 3\,dx$ and

$$\int (3x+8)^{11}\,dx = \frac{1}{3}\int u^{11}\,du = \frac{1}{36}u^{12} + C = \frac{1}{36}(3x+8)^{12} + C.$$

38. $\int x(3x+8)^{11}\,dx$

SOLUTION Let $u = 3x+8$. Then $du = 3\,dx$, $x = \frac{u-8}{3}$, and

$$\begin{aligned}\int x(3x+8)^{11}\,dx &= \frac{1}{9}\int (u-8)u^{11}\,du = \frac{1}{9}\int (u^{12}-8u^{11})\,du\\ &= \frac{1}{9}\left(\frac{1}{13}u^{13} - \frac{2}{3}u^{12}\right) + C\\ &= \frac{1}{117}(3x+8)^{13} - \frac{2}{27}(3x+8)^{12} + C.\end{aligned}$$

39. $\int x^2\sqrt{x^3+1}\,dx$

SOLUTION Let $u = x^3+1$. Then $du = 3x^2\,dx$ and

$$\int x^2\sqrt{x^3+1}\,dx = \frac{1}{3}\int u^{1/2}\,du = \frac{2}{9}u^{3/2} + C = \frac{2}{9}(x^3+1)^{3/2} + C.$$

40. $\int x^5\sqrt{x^3+1}\,dx$

SOLUTION Let $u = x^3+1$. Then $du = 3x^2\,dx$, $x^3 = u-1$ and

$$\begin{aligned}\int x^5\sqrt{x^3+1}\,dx &= \frac{1}{3}\int (u-1)\sqrt{u}\,du = \frac{1}{3}\int (u^{3/2}-u^{1/2})\,du\\ &= \frac{1}{3}\left(\frac{2}{5}u^{5/2} - \frac{2}{3}u^{3/2}\right) + C\\ &= \frac{2}{15}(x^3+1)^{5/2} - \frac{2}{9}(x^3+1)^{3/2} + C.\end{aligned}$$

41. $\int \frac{dx}{(x+5)^3}$

SOLUTION Let $u = x+5$. Then $du = dx$ and

$$\int \frac{dx}{(x+5)^3} = \int u^{-3}\,du = -\frac{1}{2}u^{-2} + C = -\frac{1}{2}(x+5)^{-2} + C.$$

42. $\int \frac{x^2\,dx}{(x+5)^3}$

SOLUTION Let $u = x + 5$. Then $du = dx$, $x = u - 5$ and

$$\int \frac{x^2\,dx}{(x+5)^3} = \int \frac{(u-5)^2}{u^3}\,du = \int (u^{-1} - 10u^{-2} + 25u^{-3})\,du$$
$$= \ln|u| + 10u^{-1} - \frac{25}{2}u^{-2} + C$$
$$= \ln|x+5| + \frac{10}{x+5} - \frac{25}{2(x+5)^2} + C.$$

43. $\int z^2(z^3+1)^{12}\,dz$

SOLUTION Let $u = z^3 + 1$. Then $du = 3z^2\,dz$ and

$$\int z^2(z^3+1)^{12}\,dz = \frac{1}{3}\int u^{12}\,du = \frac{1}{39}u^{13} + C = \frac{1}{39}(z^3+1)^{13} + C.$$

44. $\int (z^5 + 4z^2)(z^3+1)^{12}\,dz$

SOLUTION Let $u = z^3 + 1$. Then $du = 3z^2\,dz$, $z^3 = u - 1$ and

$$\int (z^5+4z^2)(z^3+1)^{12}\,dz = \frac{1}{3}\int (u+3)u^{12}\,du = \frac{1}{3}\int (u^{13} + 3u^{12})\,du$$
$$= \frac{1}{3}\left(\frac{1}{14}u^{14} + \frac{3}{13}u^{13}\right) + C$$
$$= \frac{1}{42}(z^3+1)^{14} + \frac{1}{13}(z^3+1)^{13} + C.$$

45. $\int (x+2)(x+1)^{1/4}\,dx$

SOLUTION Let $u = x + 1$. Then $x = u - 1$, $du = dx$ and

$$\int (x+2)(x+1)^{1/4}\,dx = \int (u+1)u^{1/4}\,du = \int (u^{5/4} + u^{1/4})\,du$$
$$= \frac{4}{9}u^{9/4} + \frac{4}{5}u^{5/4} + C$$
$$= \frac{4}{9}(x+1)^{9/4} + \frac{4}{5}(x+1)^{5/4} + C.$$

46. $\int x^3(x^2-1)^{3/2}\,dx$

SOLUTION Let $u = x^2 - 1$. Then $u + 1 = x^2$ and $du = 2x\,dx$ or $\frac{1}{2}\,du = x\,dx$. Hence

$$\int x^3(x^2-1)^{3/2}\,dx = \int x^2 \cdot x(x^2-1)^{3/2}\,dx$$
$$= \frac{1}{2}\int (u+1)u^{3/2}\,du = \frac{1}{2}\int (u^{5/2} + u^{3/2})\,du$$
$$= \frac{1}{2}\left(\frac{2}{7}u^{7/2}\right) + \frac{1}{2}\left(\frac{2}{5}u^{5/2}\right) + C = \frac{1}{7}(x^2-1)^{7/2} + \frac{1}{5}(x^2-1)^{5/2} + C.$$

47. $\int \sin(8 - 3\theta)\,d\theta$

SOLUTION Let $u = 8 - 3\theta$. Then $du = -3\,d\theta$ and

$$\int \sin(8-3\theta)\,d\theta = -\frac{1}{3}\int \sin u\,du = \frac{1}{3}\cos u + C = \frac{1}{3}\cos(8-3\theta) + C.$$

48. $\int \theta \sin(\theta^2)\, d\theta$

SOLUTION Let $u = \theta^2$. Then $du = 2\theta\, d\theta$ and

$$\int \theta \sin(\theta^2)\, d\theta = \frac{1}{2}\int \sin u\, du = -\frac{1}{2}\cos u + C = -\frac{1}{2}\cos(\theta^2) + C.$$

49. $\int \frac{\cos\sqrt{t}}{\sqrt{t}}\, dt$

SOLUTION Let $u = \sqrt{t} = t^{1/2}$. Then $du = \frac{1}{2}t^{-1/2}\, dt$ and

$$\int \frac{\cos\sqrt{t}}{\sqrt{t}}\, dt = 2\int \cos u\, du = 2\sin u + C = 2\sin\sqrt{t} + C.$$

50. $\int x^2 \sin(x^3 + 1)\, dx$

SOLUTION Let $u = x^3 + 1$. Then $du = 3x^2\, dx$ or $\frac{1}{3}du = x^2\, dx$. Hence

$$\int x^2 \sin(x^3 + 1)\, dx = \frac{1}{3}\int \sin u\, du = -\frac{1}{3}\cos u + C = -\frac{1}{3}\cos(x^3 + 1) + C.$$

51. $\int \tan(4\theta + 9)\, d\theta$

SOLUTION Let $u = 4\theta + 9$. Then $du = 4\, d\theta$ and

$$\int \tan(4\theta + 9)\, d\theta = \frac{1}{4}\int \tan u\, du = \frac{1}{4}\ln|\sec u| + C = \frac{1}{4}\ln|\sec(4\theta + 9)| + C.$$

52. $\int \sin^8\theta \cos\theta\, d\theta$

SOLUTION Let $u = \sin\theta$. Then $du = \cos\theta\, d\theta$ and

$$\int \sin^8\theta \cos\theta\, d\theta = \int u^8\, du = \frac{1}{9}u^9 + C = \frac{1}{9}\sin^9\theta + C.$$

53. $\int \cot x\, dx$

SOLUTION Let $u = \sin x$. Then $du = \cos x\, dx$, and

$$\int \cot x\, dx = \int \frac{\cos x}{\sin x}\, dx = \int \frac{du}{u} = \ln|u| + C = \ln|\sin x| + C.$$

54. $\int x^{-1/5} \tan x^{4/5}\, dx$

SOLUTION Let $u = x^{4/5}$. Then $du = \frac{4}{5}x^{-1/5}\, dx$ and

$$\int x^{-1/5} \tan x^{4/5}\, dx = \frac{5}{4}\int \tan u\, du = \frac{5}{4}\ln|\sec u| + C = \frac{5}{4}\ln|\sec x^{4/5}| + C.$$

55. $\int \sec^2(4x + 9)\, dx$

SOLUTION Let $u = 4x + 9$. Then $du = 4\, dx$ or $\frac{1}{4}\, du = dx$. Hence

$$\int \sec^2(4x + 9)\, dx = \frac{1}{4}\int \sec^2 u\, du = \frac{1}{4}\tan u + C = \frac{1}{4}\tan(4x + 9) + C.$$

56. $\int \sec^2 x \tan^4 x\, dx$

SOLUTION Let $u = \tan x$. Then $du = \sec^2 x\, dx$. Hence

$$\int \sec^2 x \tan^4 x\, dx = \int u^4\, du = \frac{1}{5}u^5 + C = \frac{1}{5}\tan^5 x + C.$$

57. $\displaystyle\int \frac{\sec^2(\sqrt{x})\,dx}{\sqrt{x}}$

SOLUTION Let $u = \sqrt{x}$. Then $du = \frac{1}{2\sqrt{x}}\,dx$ or $2\,du = \frac{1}{\sqrt{x}}\,dx$. Hence,

$$\int \frac{\sec^2(\sqrt{x})\,dx}{\sqrt{x}} = 2\int \sec^2 u\,dx = 2\tan u + C = 2\tan(\sqrt{x}) + C.$$

58. $\displaystyle\int \frac{\cos 2x}{(1+\sin 2x)^2}\,dx$

SOLUTION Let $u = 1 + \sin 2x$. Then $du = 2\cos 2x$ or $\frac{1}{2}du = \cos 2x\,dx$. Hence

$$\int (1+\sin 2x)^{-2}\cos 2x\,dx = \frac{1}{2}\int u^{-2}\,du = -\frac{1}{2}u^{-1} + C = -\frac{1}{2}(1+\sin 2x)^{-1} + C.$$

59. $\displaystyle\int \sin 4x\sqrt{\cos 4x + 1}\,dx$

SOLUTION Let $u = \cos 4x + 1$. Then $du = -4\sin 4x$ or $-\frac{1}{4}du = \sin 4x$. Hence

$$\int \sin 4x\sqrt{\cos 4x + 1}\,dx = -\frac{1}{4}\int u^{1/2}\,du = -\frac{1}{4}\left(\frac{2}{3}u^{3/2}\right) + C = -\frac{1}{6}(\cos 4x + 1)^{3/2} + C.$$

60. $\displaystyle\int \cos x(3\sin x - 1)\,dx$

SOLUTION Let $u = 3\sin x - 1$. Then $du = 3\cos x\,dx$ or $\frac{1}{3}du = \cos x\,dx$. Hence

$$\int (3\sin x - 1)\cos x\,dx = \frac{1}{3}\int u\,du = \frac{1}{3}\left(\frac{1}{2}u^2\right) + C = \frac{1}{6}(3\sin x - 1)^2 + C.$$

61. $\displaystyle\int \sec\theta\tan\theta(\sec\theta - 1)\,d\theta$

SOLUTION Let $u = \sec\theta - 1$. Then $du = \sec\theta\tan\theta\,d\theta$ and

$$\int \sec\theta\tan\theta(\sec\theta - 1)\,d\theta = \int u\,du = \frac{1}{2}u^2 + C = \frac{1}{2}(\sec\theta - 1)^2 + C.$$

62. $\displaystyle\int \cos t\cos(\sin t)\,dt$

SOLUTION Let $u = \sin t$. Then $du = \cos t\,dt$ and

$$\int \cos t\cos(\sin t)\,dt = \int \cos u\,du = \sin u + C = \sin(\sin t) + C.$$

63. $\displaystyle\int e^{14x-7}\,dx$

SOLUTION Let $u = 14x - 7$. Then $du = 14\,dx$ or $\frac{1}{14}\,du = dx$. Hence,

$$\int e^{14x-7}\,dx = \frac{1}{14}\int e^u\,du = \frac{1}{14}e^u + C = \frac{1}{14}e^{14x-7} + C.$$

64. $\displaystyle\int (x+1)e^{x^2+2x}\,dx$

SOLUTION Let $u = x^2 + 2x$. Then $du = (2x+2)\,dx$ or $\frac{1}{2}\,du = (x+1)\,dx$. Hence,

$$\int (x+1)e^{x^2+2x}\,dx = \frac{1}{2}\int e^u\,du = \frac{1}{2}e^u + C = \frac{1}{2}e^{x^2+2x} + C.$$

65. $\displaystyle\int \frac{e^x\,dx}{(e^x+1)^4}$

SOLUTION Let $u = e^x + 1$. Then $du = e^x\,dx$, and

$$\int \frac{e^x}{(e^x+1)^4}\,dx = \int u^{-4}\,du = -\frac{1}{3u^3} + C = -\frac{1}{3(e^x+1)^3} + C.$$

66. $\int (\sec^2\theta)\, e^{\tan\theta}\, d\theta$

SOLUTION Let $u = \tan\theta$. Then $du = \sec^2\theta\, d\theta$, and

$$\int (\sec^2\theta)\, e^{\tan\theta}\, d\theta = \int e^u\, du = e^u + C = e^{\tan\theta} + C.$$

67. $\int \frac{e^t\, dt}{e^{2t} + 2e^t + 1}$

SOLUTION Let $u = e^t$. Then $du = e^t\, dt$, and

$$\int \frac{e^t\, dt}{e^{2t} + 2e^t + 1} = \int \frac{du}{u^2 + 2u + 1} = \int \frac{du}{(u+1)^2} = -\frac{1}{u+1} + C = -\frac{1}{e^t + 1} + C.$$

68. $\int \frac{dx}{x(\ln x)^2}$

SOLUTION Let $u = \ln x$. Then $du = \frac{1}{x}\, dx$, and

$$\int \frac{dx}{x(\ln x)^2} = \int u^{-2}\, du = -\frac{1}{u} + C = -\frac{1}{\ln x} + C.$$

69. $\int \frac{(\ln x)^4\, dx}{x}$

SOLUTION Let $u = \ln x$. Then $du = \frac{1}{x}\, dx$, and

$$\int \frac{(\ln x)^4}{x}\, dx = \int u^4\, du = \frac{1}{5}u^5 + C = \frac{1}{5}(\ln x)^5 + C.$$

70. $\int \frac{dx}{x \ln x}$

SOLUTION Let $u = \ln x$. Then $du = \frac{1}{x}\, dx$, and

$$\int \frac{dx}{x \ln x} = \int \frac{du}{u} = \ln|u| + C = \ln|\ln x| + C.$$

71. $\int \frac{\tan(\ln x)}{x}\, dx$

SOLUTION Let $u = \cos(\ln x)$. Then $du = -\frac{1}{x}\sin(\ln x)\, dx$ or $-du = \frac{1}{x}\sin(\ln x)\, dx$. Hence,

$$\int \frac{\tan(\ln x)}{x}\, dx = \int \frac{\sin(\ln x)}{x\cos(\ln x)}\, dx = -\int \frac{du}{u} = -\ln|u| + C = -\ln|\cos(\ln x)| + C.$$

72. $\int (\cot x)\ln(\sin x)\, dx$

SOLUTION Let $u = \ln(\sin x)$. Then

$$du = \frac{1}{\sin x}\cos x = \cot x,$$

and

$$\int (\cot x)\ln(\sin x)\, dx = \int u\, du = \frac{1}{2}u^2 + C = \frac{1}{2}(\ln(\sin x))^2 + C.$$

73. Evaluate $\int \frac{dx}{(1+\sqrt{x})^3}$ using $u = 1 + \sqrt{x}$. *Hint:* Show that $dx = 2(u-1)du$.

SOLUTION Let $u = 1 + \sqrt{x}$. Then

$$du = \frac{1}{2\sqrt{x}}\, dx \quad \text{or} \quad dx = 2\sqrt{x}\, du = 2(u-1)\, du.$$

Hence,

$$\int \frac{dx}{(1+\sqrt{x})^3} = 2\int \frac{u-1}{u^3}\,du = 2\int (u^{-2} - u^{-3})\,du$$

$$= -2u^{-1} + u^{-2} + C = -\frac{2}{1+\sqrt{x}} + \frac{1}{(1+\sqrt{x})^2} + C.$$

74. Can They Both Be Right? Hannah uses the substitution $u = \tan x$ and Akiva uses $u = \sec x$ to evaluate $\int \tan x \sec^2 x\,dx$. Show that they obtain different answers, and explain the apparent contradiction.

SOLUTION With the substitution $u = \tan x$, Hannah finds $du = \sec^2 x\,dx$ and

$$\int \tan x \sec^2 x\,dx = \int u\,du = \frac{1}{2}u^2 + C_1 = \frac{1}{2}\tan^2 x + C_1.$$

On the other hand, with the substitution $u = \sec x$, Akiva finds $du = \sec x \tan x\,dx$ and

$$\int \tan x \sec^2 x\,dx = \int \sec x(\tan x \sec x)\,dx = \frac{1}{2}\sec^2 x + C_2$$

Hannah and Akiva have each found a correct antiderivative. To resolve what appears to be a contradiction, recall that any two antiderivatives of a specified function differ by a constant. To show that this is true in their case, note that

$$\left(\frac{1}{2}\sec^2 x + C_2\right) - \left(\frac{1}{2}\tan^2 x + C_1\right) = \frac{1}{2}(\sec^2 x - \tan^2 x) + C_2 - C_1$$

$$= \frac{1}{2}(1) + C_2 - C_1 = \frac{1}{2} + C_2 - C_1, \text{ a constant}$$

Here we used the trigonometric identity $\tan^2 x + 1 = \sec^2 x$.

75. Evaluate $\int \sin x \cos x\,dx$ using substitution in two different ways: first using $u = \sin x$ and then using $u = \cos x$. Reconcile the two different answers.

SOLUTION First, let $u = \sin x$. Then $du = \cos x\,dx$ and

$$\int \sin x \cos x\,dx = \int u\,du = \frac{1}{2}u^2 + C_1 = \frac{1}{2}\sin^2 x + C_1.$$

Next, let $u = \cos x$. Then $du = -\sin x\,dx$ or $-du = \sin x\,dx$. Hence,

$$\int \sin x \cos x\,dx = -\int u\,du = -\frac{1}{2}u^2 + C_2 = -\frac{1}{2}\cos^2 x + C_2.$$

To reconcile these two seemingly different answers, recall that any two antiderivatives of a specified function differ by a constant. To show that this is true here, note that $(\frac{1}{2}\sin^2 x + C_1) - (-\frac{1}{2}\cos^2 x + C_2) = \frac{1}{2} + C_1 - C_2$, a constant. Here we used the trigonometric identity $\sin^2 x + \cos^2 x = 1$.

76. Some Choices Are Better Than Others Evaluate

$$\int \sin x\ \cos^2 x\,dx$$

twice. First use $u = \sin x$ to show that

$$\int \sin x\ \cos^2 x\,dx = \int u\sqrt{1-u^2}\,du$$

and evaluate the integral on the right by a further substitution. Then show that $u = \cos x$ is a better choice.

SOLUTION Consider the integral $\int \sin x \cos^2 x\,dx$. If we let $u = \sin x$, then $\cos x = \sqrt{1-u^2}$ and $du = \cos x\,dx$. Hence

$$\int \sin x \cos^2 x\,dx = \int u\sqrt{1-u^2}\,du.$$

Now let $w = 1 - u^2$. Then $dw = -2u\,du$ or $-\frac{1}{2}dw = u\,du$. Therefore,

$$\int u\sqrt{1-u^2}\,du = -\frac{1}{2}\int w^{1/2}\,dw = -\frac{1}{2}\left(\frac{2}{3}w^{3/2}\right) + C$$

$$= -\frac{1}{3}w^{3/2} + C = -\frac{1}{3}(1-u^2)^{3/2} + C$$

$$= -\frac{1}{3}(1-\sin^2 x)^{3/2} + C = -\frac{1}{3}\cos^3 x + C.$$

A better substitution choice is $u = \cos x$. Then $du = -\sin x\,dx$ or $-du = \sin x\,dx$. Hence

$$\int \sin x \cos^2 x\,dx = -\int u^2\,du = -\frac{1}{3}u^3 + C = -\frac{1}{3}\cos^3 x + C.$$

77. What are the new limits of integration if we apply the substitution $u = 3x + \pi$ to the integral $\int_0^{\pi} \sin(3x+\pi)\,dx$?

SOLUTION The new limits of integration are $u(0) = 3\cdot 0 + \pi = \pi$ and $u(\pi) = 3\pi + \pi = 4\pi$.

78. Which of the following is the result of applying the substitution $u = 4x - 9$ to the integral $\int_2^8 (4x-9)^{20}\,dx$?

(a) $\displaystyle\int_2^8 u^{20}\,du$ **(b)** $\displaystyle\frac{1}{4}\int_2^8 u^{20}\,du$

(c) $\displaystyle 4\int_{-1}^{23} u^{20}\,du$ **(d)** $\displaystyle\frac{1}{4}\int_{-1}^{23} u^{20}\,du$

SOLUTION Let $u = 4x - 9$. Then $du = 4\,dx$ or $\frac{1}{4}\,du = dx$. Furthermore, when $x = 2$, $u = -1$, and when $x = 8$, $u = 23$. Hence

$$\int_2^8 (4x-9)^{20}\,dx = \frac{1}{4}\int_{-1}^{23} u^{20}\,du.$$

The answer is therefore **(d)**.

In Exercises 79–90, use the Change-of-Variables Formula to evaluate the definite integral.

79. $\displaystyle\int_1^3 (x+2)^3\,dx$

SOLUTION Let $u = x + 2$. Then $du = dx$. Hence

$$\int_1^3 (x+2)^3\,dx = \int_3^5 u^3\,du = \left.\frac{1}{4}u^4\right|_3^5 = \frac{5^4}{4} - \frac{3^4}{4} = 136.$$

80. $\displaystyle\int_1^6 \sqrt{x+3}\,dx$

SOLUTION Let $u = x + 3$. Then $du = dx$. Hence

$$\int_1^6 \sqrt{x+3}\,dx = \int_4^9 \sqrt{u}\,du = \left.\frac{2}{3}u^{3/2}\right|_4^9 = \frac{2}{3}(27-8) = \frac{38}{3}.$$

81. $\displaystyle\int_0^1 \frac{x}{(x^2+1)^3}\,dx$

SOLUTION Let $u = x^2 + 1$. Then $du = 2x\,dx$ or $\frac{1}{2}\,du = x\,dx$. Hence

$$\int_0^1 \frac{x}{(x^2+1)^3}\,dx = \frac{1}{2}\int_1^2 \frac{1}{u^3}\,du = \left.\frac{1}{2}\left(-\frac{1}{2}u^{-2}\right)\right|_1^2 = -\frac{1}{16} + \frac{1}{4} = \frac{3}{16} = 0.1875.$$

82. $\displaystyle\int_{-1}^2 \sqrt{5x+6}\,dx$

SOLUTION Let $u = 5x + 6$. Then $du = 5\,dx$ or $\frac{1}{5}\,du = dx$. Hence

$$\int_{-1}^2 \sqrt{5x+6}\,dx = \frac{1}{5}\int_1^{16} \sqrt{u}\,du = \left.\frac{1}{5}\left(\frac{2}{3}u^{3/2}\right)\right|_1^{16} = \frac{2}{15}(64-1) = \frac{42}{5}.$$

83. $\displaystyle\int_0^4 x\sqrt{x^2+9}\,dx$

SOLUTION Let $u = x^2 + 9$. Then $du = 2x\,dx$ or $\frac{1}{2}\,du = x\,dx$. Hence

$$\int_0^4 \sqrt{x^2+9}\,dx = \frac{1}{2}\int_9^{25} \sqrt{u}\,du = \left.\frac{1}{2}\left(\frac{2}{3}u^{3/2}\right)\right|_9^{25} = \frac{1}{3}(125-27) = \frac{98}{3}.$$

84. $\displaystyle\int_1^2 \frac{4x+12}{(x^2+6x+1)^2}\,dx$

SOLUTION Let $u = x^2 + 6x + 1$. Then $du = (2x+6)\,dx$ and

$$\int_1^2 \frac{4x+12}{(x^2+6x+1)^2}\,dx = 2\int_8^{17} u^{-2}\,du = -\frac{2}{u}\bigg|_8^{17}$$
$$= -\frac{2}{17} + \frac{1}{4} = \frac{9}{68}.$$

85. $\displaystyle\int_0^1 (x+1)(x^2+2x)^5\,dx$

SOLUTION Let $u = x^2 + 2x$. Then $du = (2x+2)\,dx = 2(x+1)\,dx$, and

$$\int_0^1 (x+1)(x^2+2x)^5\,dx = \frac{1}{2}\int_0^3 u^5\,du = \frac{1}{12}u^6\bigg|_0^3 = \frac{729}{12} = \frac{243}{4}.$$

86. $\displaystyle\int_{10}^{17} (x-9)^{-2/3}\,dx$

SOLUTION Let $u = x - 9$. Then $du = dx$. Hence

$$\int_{10}^{17} (x-9)^{-2/3}\,dx = \int_1^8 u^{-2/3}\,dx = 3u^{1/3}\bigg|_1^8 = 3\,(2-1) = 3.$$

87. $\displaystyle\int_0^1 \theta\tan(\theta^2)\,d\theta$

SOLUTION Let $u = \cos\theta^2$. Then $du = -2\theta\sin\theta^2\,d\theta$ or $-\frac{1}{2}du = \theta\sin\theta^2\,d\theta$. Hence,

$$\int_0^1 \theta\tan(\theta^2)\,d\theta = \int_0^1 \frac{\theta\sin(\theta^2)}{\cos(\theta^2)}\,d\theta = -\frac{1}{2}\int_1^{\cos 1}\frac{du}{u} = -\frac{1}{2}\ln|u|\bigg|_1^{\cos 1} = -\frac{1}{2}\left[\ln(\cos 1) + \ln 1\right] = \frac{1}{2}\ln(\sec 1).$$

88. $\displaystyle\int_0^{\pi/6} \sec^2\left(2x - \frac{\pi}{6}\right)\,dx$

SOLUTION Let $u = 2x - \dfrac{\pi}{6}$. Then $du = 2\,dx$ and

$$\int_0^{\pi/6} \sec^2\left(2x - \frac{\pi}{6}\right)\,dx = \frac{1}{2}\int_{-\pi/6}^{\pi/6}\sec^2 u\,du = \frac{1}{2}\tan u\bigg|_{-\pi/6}^{\pi/6}$$
$$= \frac{1}{2}\left(\frac{\sqrt{3}}{3} + \frac{\sqrt{3}}{3}\right) = \frac{\sqrt{3}}{3}.$$

89. $\displaystyle\int_0^{\pi/2} \cos^3 x\sin x\,dx$

SOLUTION Let $u = \cos x$. Then $du = -\sin x\,dx$. Hence

$$\int_0^{\pi/2}\cos^3 x\sin x\,dx = -\int_1^0 u^3\,du = \int_0^1 u^3\,du = \frac{1}{4}u^4\bigg|_0^1 = \frac{1}{4} - 0 = \frac{1}{4}.$$

90. $\displaystyle\int_{\pi/3}^{\pi/2} \cot^2\frac{x}{2}\csc^2\frac{x}{2}\,dx$

SOLUTION Let $u = \cot\dfrac{x}{2}$. Then $du = -\dfrac{1}{2}\csc^2\dfrac{x}{2}$ and

$$\int_{\pi/3}^{\pi/2}\cot^2\frac{x}{2}\csc^2\frac{x}{2}\,dx = -2\int_{\sqrt{3}}^1 u^2\,du$$
$$= -\frac{2}{3}u^3\bigg|_{\sqrt{3}}^1 = \frac{2}{3}(3\sqrt{3} - 1).$$

91. Evaluate $\displaystyle\int_0^2 r\sqrt{5-\sqrt{4-r^2}}\,dr$.

SOLUTION Let $u = 5 - \sqrt{4-r^2}$. Then

$$du = \frac{r\,dr}{\sqrt{4-r^2}} = \frac{r\,dr}{5-u}$$

so that

$$r\,dr = (5-u)\,du.$$

Hence, the integral becomes:

$$\int_0^2 r\sqrt{5-\sqrt{4-r^2}}\,dr = \int_3^5 \sqrt{u}(5-u)\,du = \int_3^5 \left(5u^{1/2} - u^{3/2}\right)\,du = \left(\frac{10}{3}u^{3/2} - \frac{2}{5}u^{5/2}\right)\Big|_3^5$$

$$= \left(\frac{50}{3}\sqrt{5} - 10\sqrt{5}\right) - \left(10\sqrt{3} - \frac{18}{5}\sqrt{3}\right) = \frac{20}{3}\sqrt{5} - \frac{32}{5}\sqrt{3}.$$

92. Find numbers a and b such that

$$\int_a^b (u^2+1)\,du = \int_{-\pi/4}^{\pi/4} \sec^4\theta\,d\theta$$

and evaluate. *Hint:* Use the identity $\sec^2\theta = \tan^2\theta + 1$.

SOLUTION Let $u = \tan\theta$. Then $u^2 + 1 = \tan^2\theta + 1 = \sec^2\theta$ and $du = \sec^2\theta\,d\theta$. Moreover, because

$$\tan\left(-\frac{\pi}{4}\right) = -1 \quad \text{and} \quad \tan\frac{\pi}{4} = 1,$$

it follows that $a = -1$ and $b = 1$. Thus,

$$\int_{-\pi/4}^{\pi/4} \sec^4\theta\,d\theta = \int_{-1}^{1} (u^2+1)\,du = \left(\frac{1}{3}u^3 + u\right)\Big|_{-1}^{1} = \frac{8}{3}.$$

93. Wind engineers have found that wind speed v (in meters/second) at a given location follows a **Rayleigh distribution** of the type

$$W(v) = \frac{1}{32}ve^{-v^2/64}$$

This means that at a given moment in time, the probability that v lies between a and b is equal to the shaded area in Figure 4.

(a) Show that the probability that $v \in [0, b]$ is $1 - e^{-b^2/64}$.

(b) Calculate the probability that $v \in [2, 5]$.

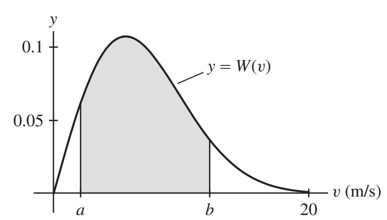

FIGURE 4 The shaded area is the probability that v lies between a and b.

SOLUTION

(a) The probability that $v \in [0, b]$ is

$$\int_0^b \frac{1}{32}ve^{-v^2/64}\,dv.$$

Let $u = -v^2/64$. Then $du = -v/32\,dv$ and

$$\int_0^b \frac{1}{32}ve^{-v^2/64}\,dv = -\int_0^{-b^2/64} e^u\,du = -e^u\Big|_0^{-b^2/64} = -e^{-b^2/64} + 1.$$

(b) The probability that $v \in [2, 5]$ is the probability that $v \in [0, 5]$ minus the probability that $v \in [0, 2]$. By part (a), the probability that $v \in [2, 5]$ is

$$\left(1 - e^{-25/64}\right) - \left(1 - e^{-1/16}\right) = e^{-1/16} - e^{-25/64}.$$

94. Evaluate $\int_0^{\pi/2} \sin^n x \cos x\, dx$ for $n \geq 0$.

SOLUTION Let $u = \sin x$. Then $du = \cos x\, dx$. Hence

$$\int_0^{\pi/2} \sin^n x \, \cos x\, dx = \int_0^1 u^n\, du = \left.\frac{u^{n+1}}{n+1}\right|_0^1 = \frac{1}{n+1}.$$

In Exercises 95–96, use substitution to evaluate the integral in terms of $f(x)$.

95. $\int f(x)^3 f'(x)\, dx$

SOLUTION Let $u = f(x)$. Then $du = f'(x)\, dx$. Hence

$$\int f(x)^3 f'(x)\, dx = \int u^3\, du = \frac{1}{4}u^4 + C = \frac{1}{4}f(x)^4 + C.$$

96. $\int \frac{f'(x)}{f(x)^2}\, dx$

SOLUTION Let $u = f(x)$. Then $du = f'(x)\, dx$. Hence

$$\int \frac{f'(x)}{f(x)^2}\, dx = \int u^{-2}\, du = -u^{-1} + C = \frac{-1}{f(x)} + C.$$

97. Show that $\int_0^{\pi/6} f(\sin\theta)\, d\theta = \int_0^{1/2} f(u) \frac{1}{\sqrt{1-u^2}}\, du$.

SOLUTION Let $u = \sin\theta$. Then $u(\pi/6) = 1/2$ and $u(0) = 0$, as required. Furthermore, $du = \cos\theta\, d\theta$, so that

$$d\theta = \frac{du}{\cos\theta}.$$

If $\sin\theta = u$, then $u^2 + \cos^2\theta = 1$, so that $\cos\theta = \sqrt{1-u^2}$. Therefore $d\theta = du/\sqrt{1-u^2}$. This gives

$$\int_0^{\pi/6} f(\sin\theta)\, d\theta = \int_0^{1/2} f(u)\frac{1}{\sqrt{1-u^2}}\, du.$$

Further Insights and Challenges

98. Use the substitution $u = 1 + x^{1/n}$ to show that

$$\int \sqrt{1 + x^{1/n}}\, dx = n \int u^{1/2}(u-1)^{n-1}\, du$$

Evaluate for $n = 2, 3$.

SOLUTION Let $u = 1 + x^{1/n}$. Then $x = (u-1)^n$ and $dx = n(u-1)^{n-1}\, du$. Accordingly, $\int \sqrt{1 + x^{1/n}}\, dx = n \int u^{1/2}(u-1)^{n-1}\, du$.

For $n = 2$, we have

$$\int \sqrt{1 + x^{1/2}}\, dx = 2\int u^{1/2}(u-1)^1\, du = 2\int (u^{3/2} - u^{1/2})\, du$$
$$= 2\left(\frac{2}{5}u^{5/2} - \frac{2}{3}u^{3/2}\right) + C = \frac{4}{5}(1 + x^{1/2})^{5/2} - \frac{4}{3}(1 + x^{1/2})^{3/2} + C.$$

For $n = 3$, we have

$$\int \sqrt{1 + x^{1/3}}\, dx = 3\int u^{1/2}(u-1)^2\, du = 3\int (u^{5/2} - 2u^{3/2} + u^{1/2})\, du$$

$$= 3\left(\frac{2}{7}u^{7/2} - (2)\left(\frac{2}{5}\right)u^{5/2} + \frac{2}{3}u^{3/2}\right) + C$$
$$= \frac{6}{7}(1+x^{1/3})^{7/2} - \frac{12}{5}(1+x^{1/3})^{5/2} + 2(1+x^{1/3})^{3/2} + C.$$

99. Evaluate $I = \int_0^{\pi/2} \frac{d\theta}{1+\tan^{6,000}\theta}$. *Hint:* Use substitution to show that I is equal to $J = \int_0^{\pi/2} \frac{d\theta}{1+\cot^{6,000}\theta}$ and then check that $I + J = \int_0^{\pi/2} d\theta$.

SOLUTION To evaluate

$$I = \int_0^{\pi/2} \frac{dx}{1+\tan^{6000} x},$$

we substitute $t = \pi/2 - x$. Then $dt = -dx$, $x = \pi/2 - t$, $t(0) = \pi/2$, and $t(\pi/2) = 0$. Hence,

$$I = \int_0^{\pi/2} \frac{dx}{1+\tan^{6000} x} = -\int_{\pi/2}^{0} \frac{dt}{1+\tan^{6000}(\pi/2 - t)} = \int_0^{\pi/2} \frac{dt}{1+\cot^{6000} t}.$$

Let $J = \int_0^{\pi/2} \frac{dt}{1+\cot^{6000}(t)}$. We know $I = J$, so $I + J = 2I$. On the other hand, by the definition of I and J and the linearity of the integral,

$$\begin{aligned} I + J &= \int_0^{\pi/2} \frac{dx}{1+\tan^{6000} x} + \frac{dx}{1+\cot^{6000} x} = \int_0^{\pi/2} \left(\frac{1}{1+\tan^{6000} x} + \frac{1}{1+\cot^{6000} x}\right) dx \\ &= \int_0^{\pi/2} \left(\frac{1}{1+\tan^{6000} x} + \frac{1}{1+(1/\tan^{6000} x)}\right) dx \\ &= \int_0^{\pi/2} \left(\frac{1}{1+\tan^{6000} x} + \frac{1}{(\tan^{6000} x + 1)/\tan^{6000} x}\right) dx \\ &= \int_0^{\pi/2} \left(\frac{1}{1+\tan^{6000} x} + \frac{\tan^{6000} x}{1+\tan^{6000} x}\right) dx \\ &= \int_0^{\pi/2} \left(\frac{1+\tan^{6000} x}{1+\tan^{6000} x}\right) dx = \int_0^{\pi/2} 1\, dx = \pi/2. \end{aligned}$$

Hence, $I + J = 2I = \pi/2$, so $I = \pi/4$.

100. Use substitution to prove that $\int_{-a}^{a} f(x)\, dx = 0$ if f is an odd function.

SOLUTION We assume that f is continuous. If $f(x)$ is an odd function, then $f(-x) = -f(x)$. Let $u = -x$. Then $x = -u$ and $du = -dx$ or $-du = dx$. Accordingly,

$$\begin{aligned} \int_{-a}^{a} f(x)\, dx &= \int_{-a}^{0} f(x)\, dx + \int_0^a f(x)\, dx = -\int_a^0 f(-u)\, du + \int_0^a f(x)\, dx \\ &= \int_0^a f(x)\, dx - \int_0^a f(u)\, du = 0. \end{aligned}$$

101. Prove that $\int_a^b \frac{1}{x}\, dx = \int_1^{b/a} \frac{1}{x}\, dx$ for $a, b > 0$. Then show that the regions under the hyperbola over the intervals [1, 2], [2, 4], [4, 8], ... all have the same area (Figure 5).

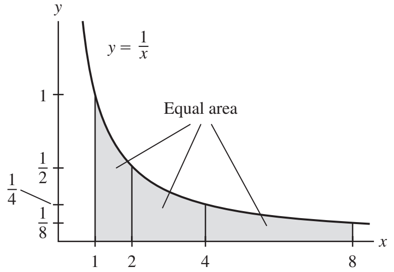

FIGURE 5 The area under $y = \frac{1}{x}$ over $[2^n, 2^{n+1}]$ is the same for all $n = 0, 1, 2, \ldots$.

SOLUTION

(a) Let $u = \frac{x}{a}$. Then $au = x$ and $du = \frac{1}{a}\,dx$ or $a\,du = dx$. Hence

$$\int_a^b \frac{1}{x}\,dx = \int_1^{b/a} \frac{a}{au}\,du = \int_1^{b/a} \frac{1}{u}\,du.$$

Note that $\displaystyle\int_1^{b/a} \frac{1}{u}\,du = \int_1^{b/a} \frac{1}{x}\,dx$ after the substitution $x = u$.

(b) The area under the hyperbola over the interval $[1, 2]$ is given by the definite integral $\int_1^2 \frac{1}{x}\,dx$. Denote this definite integral by A. Using the result from part (a), we find the area under the hyperbola over the interval $[2, 4]$ is

$$\int_2^4 \frac{1}{x}\,dx = \int_1^{4/2} \frac{1}{x}\,dx = \int_1^2 \frac{1}{x}\,dx = A.$$

Similarly, the area under the hyperbola over the interval $[4, 8]$ is

$$\int_4^8 \frac{1}{x}\,dx = \int_1^{8/4} \frac{1}{x}\,dx = \int_1^2 \frac{1}{x}\,dx = A.$$

In general, the area under the hyperbola over the interval $[2^n, 2^{n+1}]$ is

$$\int_{2^n}^{2^{n+1}} \frac{1}{x}\,dx = \int_1^{2^{n+1}/2^n} \frac{1}{x}\,dx = \int_1^2 \frac{1}{x}\,dx = A.$$

102. Show that the two regions in Figure 6 have the same area. Then use the identity $\cos^2 u = \frac{1}{2}(1 + \cos 2u)$ to compute the second area.

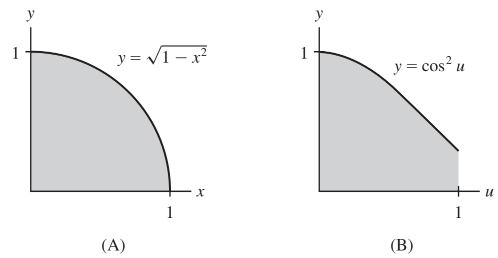

FIGURE 6

SOLUTION The area of the region in Figure 6(A) is given by $\int_0^1 \sqrt{1 - x^2}\,dx$. Let $x = \sin u$. Then $dx = \cos u\,du$ and $\sqrt{1 - x^2} = \sqrt{1 - \sin^2 u} = \cos u$. Hence,

$$\int_0^1 \sqrt{1 - x^2}\,dx = \int_0^{\pi/2} \cos u \cdot \cos u\,du = \int_0^{\pi/2} \cos^2 u\,du.$$

This last integral represents the area of the region in Figure 6(B). The two regions in Figure 6 therefore have the same area.

Let's now focus on the definite integral $\int_0^{\pi/2} \cos^2 u\,du$. Using the trigonometric identity $\cos^2 u = \frac{1}{2}(1 + \cos 2u)$, we have

$$\int_0^{\pi/2} \cos^2 u\,du = \frac{1}{2}\int_0^{\pi/2} 1 + \cos 2u\,du = \frac{1}{2}\left(u + \frac{1}{2}\sin 2u\right)\bigg|_0^{\pi/2} = \frac{1}{2} \cdot \frac{\pi}{2} - 0 = \frac{\pi}{4}.$$

103. Area of an Ellipse Prove the formula $A = \pi ab$ for the area of the ellipse with equation (Figure 7)

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Hint: Use a change of variables to show that A is equal to ab times the area of the unit circle.

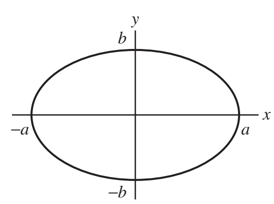

FIGURE 7 Graph of $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$.

SOLUTION Consider the ellipse with equation $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$; here $a, b > 0$. The area between the part of the ellipse in the upper half-plane, $y = f(x) = \sqrt{b^2\left(1 - \frac{x^2}{a^2}\right)}$, and the x-axis is $\int_{-a}^{a} f(x)\,dx$. By symmetry, the part of the elliptical region in the lower half-plane has the same area. Accordingly, the area enclosed by the ellipse is

$$2\int_{-a}^{a} f(x)\,dx = 2\int_{-a}^{a}\sqrt{b^2\left(1 - \frac{x^2}{a^2}\right)}\,dx = 2b\int_{-a}^{a}\sqrt{1-(x/a)^2}\,dx$$

Now, let $u = x/a$. Then $x = au$ and $a\,du = dx$. Accordingly,

$$2b\int_{-a}^{a}\sqrt{1-\left(\frac{x}{a}\right)^2}\,dx = 2ab\int_{-1}^{1}\sqrt{1-u^2}\,du = 2ab\left(\frac{\pi}{2}\right) = \pi ab$$

Here we recognized that $\int_{-1}^{1}\sqrt{1-u^2}\,du$ represents the area of the upper unit semicircular disk, which by Exercise 102 is $2(\frac{\pi}{4}) = \frac{\pi}{2}$.

5.7 Further Transcendental Functions

Preliminary Questions

1. Find b such that $\int_1^b \frac{dx}{x}$ is equal to

(a) $\ln 3$ **(b)** 3

SOLUTION For $b > 0$,

$$\int_1^b \frac{dx}{x} = \ln|x|\Big|_1^b = \ln b - \ln 1 = \ln b.$$

(a) For the value of the definite integral to equal $\ln 3$, we must have $b = 3$.
(b) For the value of the definite integral to equal 3, we must have $b = e^3$.

2. Find b such that $\int_0^b \frac{dx}{1+x^2} = \frac{\pi}{3}$.

SOLUTION In general,

$$\int_0^b \frac{dx}{1+x^2} = \tan^{-1} x\Big|_0^b = \tan^{-1} b - \tan^{-1} 0 = \tan^{-1} b.$$

For the value of the definite integral to equal $\frac{\pi}{3}$, we must have

$$\tan^{-1} b = \frac{\pi}{3} \quad \text{or} \quad b = \tan\frac{\pi}{3} = \sqrt{3}.$$

3. Which integral should be evaluated using substitution?

(a) $\displaystyle\int \frac{9\,dx}{1+x^2}$ **(b)** $\displaystyle\int \frac{dx}{1+9x^2}$

SOLUTION Use the substitution $u = 3x$ on the integral in **(b)**.

4. Which relation between x and u yields $\sqrt{16+x^2} = 4\sqrt{1+u^2}$?

SOLUTION To transform $\sqrt{16+x^2}$ into $4\sqrt{1+u^2}$, make the substitution $x = 4u$.

Exercises

In Exercises 1–10, evaluate the definite integral.

1. $\displaystyle\int_1^9 \frac{dx}{x}$

SOLUTION $\displaystyle\int_1^9 \frac{1}{x}\,dx = \ln|x|\Big|_1^9 = \ln 9 - \ln 1 = \ln 9.$

2. $\displaystyle\int_4^{20} \frac{dx}{x}$

SOLUTION $\displaystyle\int_4^{20} \frac{1}{x}\,dx = \ln|x|\Big|_4^{20} = \ln 20 - \ln 4 = \ln 5.$

3. $\int_1^{e^3} \frac{1}{t}\,dt$

SOLUTION $\int_1^{e^3} \frac{1}{t}\,dt = \ln|t|\Big|_1^{e^3} = \ln e^3 - \ln 1 = 3.$

4. $\int_{-e^2}^{-e} \frac{1}{t}\,dt$

SOLUTION $\int_{-e^2}^{-e} \frac{1}{t}\,dt = \ln|t|\Big|_{-e^2}^{-e} = \ln|-e| - \ln|-e^2| = \ln\frac{e}{e^2} = \ln(1/e) = -1.$

5. $\int_2^{12} \frac{dt}{3t+4}$

SOLUTION Let $u = 3t+4$. Then $du = 3\,dt$ and

$$\int_2^{12} \frac{dt}{3t+4} = \frac{1}{3}\int_{10}^{40} \frac{du}{u} = \frac{1}{3}\ln|u|\Big|_{10}^{40} = \frac{1}{3}(\ln 40 - \ln 10) = \frac{1}{3}\ln 4.$$

6. $\int_e^{e^3} \frac{dt}{t\ln t}$

SOLUTION Let $u = \ln t$. Then $du = (1/t)dt$ and

$$\int_e^{e^3} \frac{1}{t\ln t}\,dt = \int_1^3 \frac{du}{u} = \ln|u|\Big|_1^3 = \ln 3 - \ln 1 = \ln 3.$$

7. $\int_{\tan 1}^{\tan 8} \frac{dx}{x^2+1}$

SOLUTION $\int_{\tan 1}^{\tan 8} \frac{dx}{1+x^2} = \tan^{-1} x\Big|_{\tan 1}^{\tan 8} = \tan^{-1}(\tan 8) - \tan^{-1}(\tan 1) = 8 - 1 = 7.$

8. $\int_2^7 \frac{x\,dx}{x^2+1}$

SOLUTION Let $u = x^2+1$. Then $du = 2x\,dx$ and

$$\int_2^7 \frac{x\,dx}{x^2+1} = \frac{1}{2}\int_5^{50} \frac{du}{u} = \frac{1}{2}\ln|u|\Big|_5^{50} = \frac{1}{2}(\ln 50 - \ln 5) = \frac{1}{2}\ln 10.$$

9. $\int_0^{1/2} \frac{dx}{\sqrt{1-x^2}}$

SOLUTION $\int_0^{1/2} \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x\Big|_0^{1/2} = \sin^{-1}\frac{1}{2} - \sin^{-1} 0 = \frac{\pi}{6}.$

10. $\int_{-2}^{-2/\sqrt{3}} \frac{dx}{|x|\sqrt{x^2-1}}$

SOLUTION $\int_{-2}^{-2/\sqrt{3}} \frac{dx}{|x|\sqrt{x^2-1}} = \sec^{-1} x\Big|_{-2}^{-2/\sqrt{3}} = \sec^{-1}\left(-\frac{2}{\sqrt{3}}\right) - \sec^{-1}(-2) = \frac{5\pi}{6} - \frac{2\pi}{3} = \frac{\pi}{6}.$

11. Use the substitution $u = x/3$ to prove

$$\int \frac{dx}{9+x^2} = \frac{1}{3}\tan^{-1}\frac{x}{3} + C$$

SOLUTION Let $u = x/3$. Then, $x = 3u$, $dx = 3\,du$, $9 + x^2 = 9(1+u^2)$, and

$$\int \frac{dx}{9+x^2} = \int \frac{3\,du}{9(1+u^2)} = \frac{1}{3}\int \frac{du}{1+u^2} = \frac{1}{3}\tan^{-1} u + C = \frac{1}{3}\tan^{-1}\frac{x}{3} + C.$$

12. Use the substitution $u = 2x$ to evaluate $\int \frac{dx}{4x^2+1}$.

SOLUTION Let $u = 2x$. Then, $x = u/2$, $dx = \frac{1}{2}\,du$, $4x^2 + 1 = u^2 + 1$, and

$$\int \frac{dx}{4x^2+1} = \frac{1}{2}\int \frac{du}{u^2+1} = \frac{1}{2}\tan^{-1} u + C = \frac{1}{2}\tan^{-1} 2x + C.$$

In Exercises 13–32, calculate the integral.

13. $\displaystyle\int_0^3 \frac{dx}{x^2+3}$

SOLUTION Let $x = \sqrt{3}u$. Then $dx = \sqrt{3}\,du$ and

$$\int_0^3 \frac{dx}{x^2+3} = \frac{1}{\sqrt{3}}\int_0^{\sqrt{3}} \frac{du}{u^2+1} = \frac{1}{\sqrt{3}}\tan^{-1} u\Big|_0^{\sqrt{3}} = \frac{1}{\sqrt{3}}(\tan^{-1}\sqrt{3} - \tan^{-1} 0) = \frac{\pi}{3\sqrt{3}}.$$

14. $\displaystyle\int_0^4 \frac{dt}{4t^2+9}$

SOLUTION Let $t = (3/2)u$. Then $dt = (3/2)\,du$, $4t^2+9 = 9t^2+9 = 9(t^2+1)$, and

$$\int_0^4 \frac{dt}{4t^2+9} = \frac{1}{6}\int_0^{8/3} \frac{du}{u^2+1} = \frac{1}{6}\tan^{-1} u\Big|_0^{8/3} = \frac{1}{6}\tan^{-1}\frac{8}{3}.$$

15. $\displaystyle\int \frac{dt}{\sqrt{1-16t^2}}$

SOLUTION Let $u = 4t$. Then $du = 4\,dt$, and

$$\int \frac{dt}{\sqrt{1-16t^2}} = \int \frac{du}{4\sqrt{1-u^2}} = \frac{1}{4}\sin^{-1} u + C = \frac{1}{4}\sin^{-1}(4t) + C.$$

16. $\displaystyle\int_{-1/5}^{1/5} \frac{dx}{\sqrt{4-25x^2}}$

SOLUTION Let $x = 2u/5$. Then

$$dx = \frac{2}{5}\,du, \quad 4 - 25x^2 = 4(1-u^2),$$

and

$$\begin{aligned}\int_{-1/5}^{1/5} \frac{dx}{\sqrt{4-25x^2}} &= \frac{2}{5}\int_{-1/2}^{1/2} \frac{1}{\sqrt{4(1-u^2)}}\,du\\ &= \frac{1}{5}\sin^{-1} u\Big|_{-1/2}^{1/2}\\ &= \frac{1}{5}\left(\sin^{-1}\frac{1}{2} - \sin^{-1}\left(-\frac{1}{2}\right)\right) = \frac{\pi}{15}.\end{aligned}$$

17. $\displaystyle\int \frac{dt}{\sqrt{5-3t^2}}$

SOLUTION Let $t = \sqrt{5/3}u$. Then $dt = \sqrt{5/3}\,du$ and

$$\int \frac{dt}{\sqrt{5-3t^2}} = \int \frac{\sqrt{5/3}\,du}{\sqrt{5}\sqrt{1-t^2}} = \frac{1}{\sqrt{3}}\int \frac{du}{\sqrt{1-u^2}} = \frac{1}{\sqrt{3}}\sin^{-1} u + C = \frac{1}{\sqrt{3}}\sin^{-1}\sqrt{\frac{3}{5}}t + C.$$

18. $\displaystyle\int_{1/2\sqrt{2}}^{1/2} \frac{dx}{x\sqrt{16x^2-1}}$

SOLUTION Let $x = u/4$. Then $dx = du/4$, $16x^2 - 1 = u^2 - 1$ and

$$\int_{1/2\sqrt{2}}^{1/2} \frac{dx}{x\sqrt{16x^2-1}} = \int_{\sqrt{2}}^{2} \frac{du}{u\sqrt{u^2-1}} = \sec^{-1} u\Big|_{\sqrt{2}}^{2} = \sec^{-1} 2 - \sec^{-1}\sqrt{2} = \frac{\pi}{12}.$$

19. $\displaystyle\int \frac{dx}{x\sqrt{12x^2-3}}$

SOLUTION Let $u = 2x$. Then $du = 2\,dx$ and

$$\int \frac{dx}{x\sqrt{12x^2-3}} = \frac{1}{\sqrt{3}}\int \frac{du}{u\sqrt{u^2-1}} = \frac{1}{\sqrt{3}}\sec^{-1} u + C = \frac{1}{\sqrt{3}}\sec^{-1}(2x) + C.$$

20. $\displaystyle\int \frac{x\,dx}{x^4+1}$

SOLUTION Let $u = x^2$. Then $du = 2x\,dx$ and

$$\int \frac{x\,dx}{x^4+1} = \frac{1}{2}\int \frac{du}{u^2+1} = \frac{1}{2}\tan^{-1} u + C = \frac{1}{2}\tan^{-1} x^2 + C.$$

21. $\displaystyle\int \frac{dx}{x\sqrt{x^4-1}}$

SOLUTION Let $u = x^2$. Then $du = 2x\,dx$, and

$$\int \frac{dx}{x\sqrt{x^4-1}} = \int \frac{du}{2u\sqrt{u^2-1}} = \frac{1}{2}\sec^{-1} u + C = \frac{1}{2}\sec^{-1} x^2 + C.$$

22. $\displaystyle\int_{-1/2}^{0} \frac{(x+1)\,dx}{\sqrt{1-x^2}}$

SOLUTION Observe that

$$\int \frac{(x+1)\,dx}{\sqrt{1-x^2}} = \int \frac{x\,dx}{\sqrt{1-x^2}} + \int \frac{dx}{\sqrt{1-x^2}}.$$

In the first integral on the right, we let $u = 1 - x^2$, $du = -2x\,dx$. Thus

$$\int \frac{(x+1)\,dx}{\sqrt{1-x^2}} = -\frac{1}{2}\int \frac{du}{u^{1/2}} + \int \frac{1\,dx}{\sqrt{1-x^2}} = -\sqrt{1-x^2} + \sin^{-1} x + C.$$

Finally,

$$\int_{-1/2}^{0} \frac{(x+1)\,dx}{\sqrt{1-x^2}} = \left(-\sqrt{1-x^2} + \sin^{-1} x\right)\Big|_{-1/2}^{0} = -1 + \frac{\sqrt{3}}{2} + \frac{\pi}{6}.$$

23. $\displaystyle\int_{-\ln 2}^{0} \frac{e^x\,dx}{1+e^{2x}}$

SOLUTION Let $u = e^x$. Then $du = e^x\,dx$, and

$$\int_{-\ln 2}^{0} \frac{e^x\,dx}{1+e^{2x}} = \int_{1/2}^{1} \frac{du}{1+u^2} = \tan^{-1} u\Big|_{1/2}^{1} = \frac{\pi}{4} - \tan^{-1}(1/2).$$

24. $\displaystyle\int \frac{\ln(\cos^{-1} x)\,dx}{(\cos^{-1} x)\sqrt{1-x^2}}$

SOLUTION Let $u = \ln\cos^{-1} x$. Then $du = \dfrac{1}{\cos^{-1} x}\cdot\dfrac{-1}{\sqrt{1-x^2}}$, and

$$\int \frac{\ln(\cos^{-1} x)\,dx}{(\cos^{-1} x)\sqrt{1-x^2}} = -\int u\,du = -\frac{1}{2}u^2 + C = -\frac{1}{2}(\ln\cos^{-1} x)^2 + C.$$

25. $\displaystyle\int \frac{\tan^{-1} x\,dx}{1+x^2}$

SOLUTION Let $u = \tan^{-1} x$. Then $du = \dfrac{dx}{1+x^2}$, and

$$\int \frac{\tan^{-1} x\,dx}{1+x^2} = \int u\,du = \frac{1}{2}u^2 + C = \frac{(\tan^{-1} x)^2}{2} + C.$$

26. $\displaystyle\int_{1}^{\sqrt{3}} \frac{dx}{(\tan^{-1} x)(1+x^2)}$

SOLUTION Let $u = \tan^{-1} x$. Then $du = \dfrac{dx}{1+x^2}$, and

$$\int_{1}^{\sqrt{3}} \frac{dx}{(\tan^{-1} x)(1+x^2)} = \int_{\pi/4}^{\pi/3} \frac{1}{u}\,du = \ln|u|\Big|_{\pi/4}^{\pi/3} = \ln\frac{\pi}{3} - \ln\frac{\pi}{4} = \ln\frac{4}{3}.$$

27. $\int_0^1 3^x\,dx$

SOLUTION $\int_0^1 3^x\,dx = \left.\frac{3^x}{\ln 3}\right|_0^1 = \frac{1}{\ln 3}(3-1) = \frac{2}{\ln 3}.$

28. $\int_0^1 3^{-x}\,dx$

SOLUTION Let $u=-x$. Then $du=-dx$ and

$$\int_0^1 3^{-x}\,dx = -\int_0^{-1} 3^u\,du = -\left.\frac{3^u}{\ln 3}\right|_0^{-1} = \frac{1}{\ln 3}\left(-\frac{1}{3}+1\right) = \frac{2}{3\ln 3}.$$

29. $\int_0^{\log_4(3)} 4^x\,dx$

SOLUTION $\int_0^{\log_4(3)} 4^x\,dx = \left.\frac{4^x}{\ln 4}\right|_0^{\log_4 3} = \frac{1}{\ln 4}(3-1) = \frac{2}{\ln 4} = \frac{1}{\ln 2}.$

30. $\int_0^1 t5^{t^2}\,dt$

SOLUTION Let $u=t^2$. Then $du=2t\,dt$ and

$$\int_0^1 t5^{t^2}\,dt = \frac{1}{2}\int_0^1 5^u\,du = \left.\frac{5^u}{2\ln 5}\right|_0^1 = \frac{5}{2\ln 5} - \frac{1}{2\ln 5} = \frac{2}{\ln 5}.$$

31. $\int 9^x \sin(9^x)\,dx$

SOLUTION Let $u=9^x$. Then $du = 9^x \ln 9\,dx$ and

$$\int 9^x\sin(9^x)\,dx = \frac{1}{\ln 9}\int \sin u\,du = -\frac{1}{\ln 9}\cos u + C = -\frac{1}{\ln 9}\cos(9^x) + C.$$

32. $\int \frac{dx}{\sqrt{5^{2x}-1}}$

SOLUTION First, rewrite

$$\int \frac{dx}{\sqrt{5^{2x}-1}} = \int \frac{dx}{5^x\sqrt{1-5^{-2x}}} = \int \frac{5^{-x}\,dx}{\sqrt{1-5^{-2x}}}.$$

Now, let $u=5^{-x}$. Then $du = -5^{-x}\ln 5\,dx$ and

$$\int \frac{dx}{\sqrt{5^{2x}-1}} = -\frac{1}{\ln 5}\int \frac{du}{\sqrt{1-u^2}} = -\frac{1}{\ln 5}\sin^{-1} u + C = -\frac{1}{\ln 5}\sin^{-1}(5^{-x}) + C.$$

In Exercises 33–70, evaluate the integral using the methods covered in the text so far.

33. $\int ye^{y^2}\,dy$

SOLUTION Use the substitution $u=y^2$, $du=2y\,dy$. Then

$$\int ye^{y^2}\,dy = \frac{1}{2}\int e^u\,du = \frac{1}{2}e^u + C = \frac{1}{2}e^{y^2} + C.$$

34. $\int \frac{dx}{3x+5}$

SOLUTION Let $u=3x+5$. Then $du=3\,dx$ and

$$\int \frac{dx}{3x+5} = \frac{1}{3}\int\frac{du}{u} = \frac{1}{3}\ln|u| + C = \frac{1}{3}\ln|3x+5| + C.$$

35. $\int \frac{x\,dx}{\sqrt{4x^2+9}}$

SOLUTION Let $u=4x^2+9$. Then $du=8x\,dx$ and

$$\int \frac{x}{\sqrt{4x^2+9}}\,dx = \frac{1}{8}\int u^{-1/2}\,du = \frac{1}{4}u^{1/2} + C = \frac{1}{4}\sqrt{4x^2+9} + C.$$

36. $\int (x - x^{-2})^2\, dx$

SOLUTION $\int (x - x^{-2})^2\, dx = \int (x^2 - 2x^{-1} + x^{-4})\, dx = \frac{1}{3}x^3 - 2\ln|x| - \frac{1}{3}x^{-3} + C.$

37. $\int 7^{-x}\, dx$

SOLUTION Let $u = -x$. Then $du = -dx$ and

$$\int 7^{-x}\, dx = -\int 7^u\, du = -\frac{7^u}{\ln 7} + C = -\frac{7^{-x}}{\ln 7} + C.$$

38. $\int e^{9-12t}\, dt$

SOLUTION Let $u = 9 - 12t$. Then $du = -12\, dt$ and

$$\int e^{9-12t}\, dt = -\frac{1}{12}\int e^u\, du = -\frac{1}{12}e^u + C = -\frac{1}{12}e^{9-12t} + C.$$

39. $\int \sec^2\theta \tan^7\theta\, d\theta$

SOLUTION Let $u = \tan\theta$. Then $du = \sec^2\theta\, d\theta$ and

$$\int \sec^2\theta \tan^7\theta\, d\theta = \int u^7\, du = \frac{1}{8}u^8 + C = \frac{1}{8}\tan^8\theta + C.$$

40. $\int \frac{\cos(\ln t)\, dt}{t}$

SOLUTION Let $u = \ln t$. Then $du = dt/t$ and

$$\int \frac{\cos(\ln t)\, dt}{t} = \int \cos u\, du = \sin u + C = \sin(\ln t) + C.$$

41. $\int \frac{t\, dt}{\sqrt{7 - t^2}}$

SOLUTION Let $u = 7 - t^2$. Then $du = -2t\, dt$ and

$$\int \frac{t\, dt}{\sqrt{7 - t^2}} = -\frac{1}{2}\int u^{-1/2}\, du = -u^{1/2} + C = -\sqrt{7 - t^2} + C.$$

42. $\int 2^x e^{4x}\, dx$

SOLUTION First, note that

$$2^x = e^{x\ln 2} \quad \text{so} \quad 2^x e^{4x} = e^{(4+\ln 2)x}.$$

Thus,

$$\int 2^x e^{4x}\, dx = \int e^{(4+\ln 2)x}\, dx = \frac{1}{4 + \ln 2}e^{(4+\ln 2)x} + C.$$

43. $\int \frac{(3x + 2)\, dx}{x^2 + 4}$

SOLUTION Write

$$\int \frac{(3x + 2)\, dx}{x^2 + 4} = \int \frac{3x\, dx}{x^2 + 4} + \int \frac{2\, dx}{x^2 + 4}.$$

In the first integral, let $u = x^2 + 4$. Then $du = 2x\, dx$ and

$$\int \frac{3x\, dx}{x^2 + 4} = \frac{3}{2}\int \frac{du}{u} - \frac{3}{2}\ln|u| + C_1 = \frac{3}{2}\ln(x^2 + 4) + C_1.$$

For the second integral, let $x = 2u$. Then $dx = 2\, du$ and

$$\int \frac{2\, dx}{x^2 + 4} = \int \frac{du}{u^2 + 1} = \tan^{-1} u + C_2 = \tan^{-1}(x/2) + C_2.$$

Combining these two results yields

$$\int \frac{(3x+2)\,dx}{x^2+4} = \frac{3}{2}\ln(x^2+4) + \tan^{-1}(x/2) + C.$$

44. $\int \tan(4x+1)\,dx$

SOLUTION First we rewrite $\int \tan(4x+1)\,dx$ as $\int \frac{\sin(4x+1)}{\cos(4x+1)}\,dx$. Let $u = \cos(4x+1)$. Then $du = -4\sin(4x+1)\,dx$, and

$$\int \frac{\sin(4x+1)}{\cos(4x+1)}dx = -\frac{1}{4}\int \frac{du}{u} = -\frac{1}{4}\ln|\cos(4x+1)| + C.$$

45. $\int \frac{dx}{\sqrt{1-16x^2}}$

SOLUTION Let $u = 4x$. Then $du = 4\,dx$ and

$$\int \frac{dx}{\sqrt{1-16x^2}} = \frac{1}{4}\int \frac{du}{\sqrt{1-u^2}} = \frac{1}{4}\sin^{-1}u + C = \frac{1}{4}\sin^{-1}(4x) + C.$$

46. $\int e^t\sqrt{e^t+1}\,dt$

SOLUTION Use the substitution $u = e^t + 1$, $du = e^t\,dt$. Then

$$\int e^t\sqrt{e^t+1}\,dt = \int \sqrt{u}\,du = \frac{2}{3}u^{3/2} + C = \frac{2}{3}(e^t+1)^{3/2} + C.$$

47. $\int (e^{-x} - 4x)\,dx$

SOLUTION First, observe that

$$\int (e^{-x} - 4x)\,dx = \int e^{-x}\,dx - \int 4x\,dx = \int e^{-x}\,dx - 2x^2.$$

In the remaining integral, use the substitution $u = -x$, $du = -dx$. Then

$$\int e^{-x}\,dx = -\int e^u\,du = -e^u + C = -e^{-x} + C.$$

Finally,

$$\int (e^{-x} - 4x)\,dx = -e^{-x} - 2x^2 + C.$$

48. $\int (7 - e^{10x})\,dx$

SOLUTION First, observe that

$$\int (7 - e^{10x})\,dx = \int 7\,dx - \int e^{10x}\,dx = 7x - \int e^{10x}\,dx.$$

In the remaining integral, use the substitution $u = 10x$, $du = 10\,dx$. Then

$$\int e^{10x}\,dx = \frac{1}{10}\int e^u\,du = \frac{1}{10}e^u + C = \frac{1}{10}e^{10x} + C.$$

Finally,

$$\int (7 - e^{10x})\,dx = 7x - \frac{1}{10}e^{10x} + C.$$

49. $\int \frac{e^{2x} - e^{4x}}{e^x}\,dx$

SOLUTION

$$\int \left(\frac{e^{2x} - e^{4x}}{e^x}\right)dx = \int (e^x - e^{3x})\,dx = e^x - \frac{e^{3x}}{3} + C.$$

50. $\displaystyle\int \frac{dx}{x\sqrt{25x^2-1}}$

SOLUTION Let $u = 5x$. Then $du = 5\,dx$ and

$$\int \frac{dx}{x\sqrt{25x^2-1}} = \int \frac{du}{u\sqrt{u^2-1}} = \sec^{-1} u + C = \sec^{-1}(5x) + C.$$

51. $\displaystyle\int \frac{(x+5)\,dx}{\sqrt{4-x^2}}$

SOLUTION Write

$$\int \frac{(x+5)\,dx}{\sqrt{4-x^2}} = \int \frac{x\,dx}{\sqrt{4-x^2}} + \int \frac{5\,dx}{\sqrt{4-x^2}}.$$

In the first integral, let $u = 4 - x^2$. Then $du = -2x\,dx$ and

$$\int \frac{x\,dx}{\sqrt{4-x^2}} = -\frac{1}{2}\int u^{-1/2}\,du = -u^{1/2} + C_1 = -\sqrt{4-x^2} + C_1.$$

In the second integral, let $x = 2u$. Then $dx = 2\,du$ and

$$\int \frac{5\,dx}{\sqrt{4-x^2}} = 5\int \frac{du}{\sqrt{1-u^2}} = 5\sin^{-1} u + C_2 = 5\sin^{-1}(x/2) + C_2.$$

Combining these two results yields

$$\int \frac{(x+5)\,dx}{\sqrt{4-x^2}} = -\sqrt{4-x^2} + 5\sin^{-1}(x/2) + C.$$

52. $\displaystyle\int (t+1)\sqrt{t+1}\,dt$

SOLUTION Let $u = t + 1$. Then $du = dt$ and

$$\int (t+1)\sqrt{t+1}\,dt = \int u^{3/2}\,du = \frac{2}{5}u^{5/2} + C = \frac{2}{5}(t+1)^{5/2} + C.$$

53. $\displaystyle\int e^x \cos(e^x)\,dx$

SOLUTION Use the substitution $u = e^x$, $du = e^x\,dx$. Then

$$\int e^x \cos(e^x)\,dx = \int \cos u\,du = \sin u + C = \sin(e^x) + C.$$

54. $\displaystyle\int \frac{e^x}{\sqrt{e^x+1}}\,dx$

SOLUTION Use the substitution $u = e^x + 1$, $du = e^x\,dx$. Then

$$\int \frac{e^x}{\sqrt{e^x+1}}\,dx = \int \frac{du}{\sqrt{u}} = 2\sqrt{u} + C = 2\sqrt{e^x+1} + C.$$

55. $\displaystyle\int \frac{dx}{\sqrt{9-16x^2}}$

SOLUTION First rewrite

$$\int \frac{dx}{\sqrt{9-16x^2}} = \frac{1}{3}\int \frac{dx}{\sqrt{1-\left(\frac{4}{3}x\right)^2}}.$$

Now, let $u = \frac{4}{3}x$. Then $du = \frac{4}{3}\,dx$ and

$$\int \frac{dx}{\sqrt{9-16x^2}} = \frac{1}{4}\int \frac{du}{\sqrt{1-u^2}} = \frac{1}{4}\sin^{-1} u + C = \frac{1}{4}\sin^{-1}\left(\frac{4x}{3}\right) + C.$$

56. $\displaystyle\int \frac{dx}{(4x-1)\ln(8x-2)}$

SOLUTION Let $u = \ln(8x-2)$. Then $du = \dfrac{8}{8x-2}dx = \dfrac{4}{4x-1}dx$, and

$$\int \frac{dx}{(4x-1)\ln(8x-2)} = \frac{1}{4}\int \frac{du}{u} = \frac{1}{4}\ln|u| + C = \frac{1}{4}\ln|\ln(8x-2)| + C.$$

57. $\displaystyle\int e^x(e^{2x}+1)^3\,dx$

SOLUTION Use the substitution $u = e^x$, $du = e^x\,dx$. Then

$$\begin{aligned}\int e^x(e^{2x}+1)^3\,dx &= \int \left(u^2+1\right)^3\,du = \int \left(u^6+3u^4+3u^2+1\right)du\\ &= \frac{1}{7}u^7 + \frac{3}{5}u^5 + u^3 + u + C = \frac{1}{7}(e^x)^7 + \frac{3}{5}(e^x)^5 + (e^x)^3 + e^x + C\\ &= \frac{e^{7x}}{7} + \frac{3e^{5x}}{5} + e^{3x} + e^x + C.\end{aligned}$$

58. $\displaystyle\int \frac{dx}{x(\ln x)^5}$

SOLUTION Let $u = \ln x$. Then $du = dx/x$ and

$$\int \frac{dx}{x(\ln x)^5} = \int u^{-5}\,du = -\frac{1}{4}u^{-4} + C = -\frac{1}{4(\ln x)^4} + C.$$

59. $\displaystyle\int \frac{x^2\,dx}{x^3+2}$

SOLUTION Let $u = x^3+2$. Then $du = 3x^2\,dx$, and

$$\int \frac{x^2\,dx}{x^3+2} = \frac{1}{3}\int \frac{du}{u} = \frac{1}{3}\ln|x^3+2| + C.$$

60. $\displaystyle\int \frac{(3x-1)\,dx}{9-2x+3x^2}$

SOLUTION Let $u = 9-2x+3x^2$. Then $du = (-2+6x)\,dx = 2(3x-1)\,dx$, and

$$\int \frac{(3x-1)dx}{9-2x+3x^2} = \frac{1}{2}\int \frac{du}{u} = \frac{1}{2}\ln(9-2x+3x^2) + C.$$

61. $\displaystyle\int \cot x\,dx$

SOLUTION We rewrite $\int \cot x\,dx$ as $\int \frac{\cos x}{\sin x}\,dx$. Let $u = \sin x$. Then $du = \cos x\,dx$, and

$$\int \frac{\cos x}{\sin x}\,dx = \int \frac{du}{u} = \ln|\sin x| + C.$$

62. $\displaystyle\int \frac{\cos x}{2\sin x+3}\,dx$

SOLUTION Let $u = 2\sin x + 3$. Then $du = 2\cos x\,dx$, and

$$\int \frac{\cos x}{2\sin x+3}\,dx = \frac{1}{2}\int \frac{du}{u} = \frac{1}{2}\ln(2\sin x+3) + C,$$

where we have used the fact that $2\sin x + 3 \ge 1$ to drop the absolute value.

63. $\displaystyle\int \frac{4\ln x+5}{x}\,dx$

SOLUTION Let $u = 4\ln x + 5$. Then $du = (4/x)dx$, and

$$\int \frac{4\ln x+5}{x}dx = \frac{1}{4}\int u\,du = \frac{1}{8}u^2 + C = \frac{1}{8}(4\ln x+5)^2 + C.$$

64. $\int (\sec\theta \tan\theta) 5^{\sec\theta}\, d\theta$

SOLUTION Let $u = \sec\theta$. Then $du = \sec\theta \tan\theta\, d\theta$ and

$$\int (\sec\theta \tan\theta) 5^{\sec\theta}\, d\theta = \int 5^u\, du = \frac{5^u}{\ln 5} + C = \frac{5^{\sec\theta}}{\ln 5} + C.$$

65. $\int x 3^{x^2}\, dx$

SOLUTION Let $u = x^2$. Then $du = 2x\, dx$, and

$$\int x 3^{x^2}\, dx = \frac{1}{2}\int 3^u du = \frac{1}{2}\frac{3^u}{\ln 3} + C = \frac{3^{x^2}}{2\ln 3} + C.$$

66. $\int \frac{\ln(\ln x)}{x \ln x}\, dx$

SOLUTION Let $u = \ln(\ln x)$. Then $du = \frac{1}{\ln x} \cdot \frac{1}{x}\, dx$ and

$$\int \frac{\ln(\ln x)}{x \ln x}\, dx = \int u\, du = \frac{u^2}{2} + C = \frac{(\ln(\ln x))^2}{2} + C.$$

67. $\int \cot x \ln(\sin x)\, dx$

SOLUTION Let $u = \ln(\sin x)$. Then

$$du = \frac{1}{\sin x} \cdot \cos x\, dx = \cot x\, dx,$$

and

$$\int \cot x \ln(\sin x)\, dx = \int u\, du = \frac{u^2}{2} + C = \frac{(\ln(\sin x))^2}{2} + C.$$

68. $\int \frac{t\, dt}{\sqrt{1 - t^4}}$

SOLUTION Let $u = t^2$. Then $du = 2t\, dt$ and

$$\int \frac{t\, dt}{\sqrt{1 - t^4}} = \frac{1}{2}\int \frac{du}{\sqrt{1 - u^2}} = \frac{1}{2}\sin^{-1} u + C = \frac{1}{2}\sin^{-1} t^2 + C.$$

69. $\int t^2 \sqrt{t - 3}\, dt$

SOLUTION Let $u = t - 3$. Then $t = u + 3$, $du = dt$ and

$$\begin{aligned}
\int t^2 \sqrt{t - 3}\, dt &= \int (u + 3)^2 \sqrt{u}\, du \\
&= \int (u^2 + 6u + 9)\sqrt{u}\, du = \int (u^{5/2} + 6u^{3/2} + 9u^{1/2})\, du \\
&= \frac{2}{7}u^{7/2} + \frac{12}{5}u^{5/2} + 6u^{3/2} + C \\
&= \frac{2}{7}(t - 3)^{7/2} + \frac{12}{5}(t - 3)^{5/2} + 6(t - 3)^{3/2} + C.
\end{aligned}$$

70. $\int \cos x 5^{-2\sin x}\, dx$

SOLUTION Let $u = -2\sin x$. Then $du = -2\cos x\, dx$ and

$$\int \cos x 5^{-2\sin x}\, dx = -\frac{1}{2}\int 5^u\, du = -\frac{5^u}{2ln5} + C = -\frac{5^{-2\sin x}}{2\ln 5} + C.$$

71. Use Figure 4 to prove

$$\int_0^x \sqrt{1-t^2}\,dt = \frac{1}{2}x\sqrt{1-x^2} + \frac{1}{2}\sin^{-1} x$$

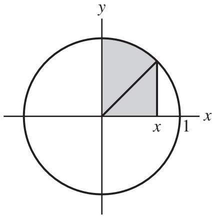

FIGURE 4

SOLUTION The definite integral $\int_0^x \sqrt{1-t^2}\,dt$ represents the area of the region under the upper half of the unit circle from 0 to x. The region consists of a sector of the circle and a right triangle. The sector has a central angle of $\frac{\pi}{2} - \theta$, where $\cos\theta = x$. Hence, the sector has an area of

$$\frac{1}{2}(1)^2\left(\frac{\pi}{2} - \cos^{-1} x\right) = \frac{1}{2}\sin^{-1} x.$$

The right triangle has a base of length x, a height of $\sqrt{1-x^2}$, and hence an area of $\frac{1}{2}x\sqrt{1-x^2}$. Thus,

$$\int_0^x \sqrt{1-t^2}\,dt = \frac{1}{2}x\sqrt{1-x^2} + \frac{1}{2}\sin^{-1} x.$$

72. Use the substitution $u = \tan x$ to evaluate

$$\int \frac{dx}{1+\sin^2 x}.$$

Hint: Show that

$$\frac{dx}{1+\sin^2 x} = \frac{du}{1+2u^2}$$

SOLUTION If $u = \tan x$, then $du = \sec^2 x\,dx$ and

$$\frac{du}{1+2u^2} = \frac{\sec^2 x\,dx}{1+2\tan^2 x} = \frac{dx}{\cos^2 x + 2\sin^2 x} = \frac{dx}{\cos^2 x + \sin^2 x + \sin^2 x} = \frac{dx}{1+\sin^2 x}.$$

Thus

$$\int \frac{dx}{1+\sin^2 x} = \int \frac{du}{1+2u^2} = \int \frac{du}{1+(\sqrt{2}u)^2} = \frac{1}{\sqrt{2}}\tan^{-1}(\sqrt{2}u) + C = \frac{1}{\sqrt{2}}\tan^{-1}((\tan x)\sqrt{2}) + C.$$

73. Prove:

$$\int \sin^{-1} t\,dt = \sqrt{1-t^2} + t\sin^{-1} t.$$

SOLUTION Let $G(t) = \sqrt{1-t^2} + t\sin^{-1} t$. Then

$$G'(t) = \frac{d}{dt}\sqrt{1-t^2} + \frac{d}{dt}\left(t\,\sin^{-1} t\right) = \frac{-t}{\sqrt{1-t^2}} + \left(t\cdot\frac{d}{dt}\sin^{-1} t + \sin^{-1} t\right)$$

$$= \frac{-t}{\sqrt{1-t^2}} + \left(\frac{t}{\sqrt{1-t^2}} + \sin^{-1} t\right) = \sin^{-1} t.$$

This proves the formula $\int \sin^{-1} t\,dt = \sqrt{1-t^2} + t\sin^{-1} t$.

74. **(a)** Verify for $r \neq 0$:

$$\int_0^T te^{rt}\,dt = \frac{e^{rT}(rT-1)+1}{r^2} \qquad \boxed{6}$$

Hint: For fixed r, let $F(T)$ be the value of the integral on the left. By FTC II, $F'(t) = te^{rt}$ and $F(0) = 0$. Show that the same is true of the function on the right.

(b) Use L'Hôpital's Rule to show that for fixed T, the limit as $r \to 0$ of the right-hand side of Eq. (6) is equal to the value of the integral for $r = 0$.

SOLUTION
(a) Let

$$f(t) = \frac{e^{rt}}{r^2}(rt - 1) + \frac{1}{r^2}.$$

Then

$$f'(t) = \frac{1}{r^2}\left(e^{rt}r + (rt - 1)(re^{rt})\right) = te^{rt}$$

and

$$f(0) = -\frac{1}{r^2} + \frac{1}{r^2} = 0,$$

as required.
(b) Using L'Hôpital's Rule,

$$\lim_{r\to 0} \frac{e^{rT}(rT - 1) + 1}{r^2} = \lim_{r\to 0} \frac{Te^{rT} + (rT - 1)(Te^{rT})}{2r} = \lim_{r\to 0} \frac{rT^2e^{rT}}{2r} = \lim_{r\to 0} \frac{T^2e^{rT}}{2} = \frac{T^2}{2}.$$

If $r = 0$ then, $\displaystyle\int_0^T te^{rt}\,dt = \int_0^T t\,dt = \left.\frac{t^2}{2}\right|_0^T = \frac{T^2}{2}$.

Further Insights and Challenges

75. Recall that if $f(t) \geq g(t)$ for $t \geq 0$, then for all $x \geq 0$,

$$\int_0^x f(t)\,dt \geq \int_0^x g(t)\,dt \qquad \boxed{7}$$

The inequality $e^t \geq 1$ holds for $t \geq 0$ because $e > 1$. Use Eq. (7) to prove that $e^x \geq 1 + x$ for $x \geq 0$. Then prove, by successive integration, the following inequalities (for $x \geq 0$):

$$e^x \geq 1 + x + \frac{1}{2}x^2, \qquad e^x \geq 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3$$

SOLUTION Integrating both sides of the inequality $e^t \geq 1$ yields

$$\int_0^x e^t\,dt = e^x - 1 \geq x \quad \text{or} \quad e^x \geq 1 + x.$$

Integrating both sides of this new inequality then gives

$$\int_0^x e^t\,dt = e^x - 1 \geq x + x^2/2 \quad \text{or} \quad e^x \geq 1 + x + x^2/2.$$

Finally, integrating both sides again gives

$$\int_0^x e^t\,dt = e^x - 1 \geq x + x^2/2 + x^3/6 \quad \text{or} \quad e^x \geq 1 + x + x^2/2 + x^3/6$$

as requested.

76. Generalize Exercise 75; that is, use induction (if you are familiar with this method of proof) to prove that for all $n \geq 0$,

$$e^x \geq 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 + \cdots + \frac{1}{n!}x^n \quad (x \geq 0)$$

SOLUTION For $n = 1$, $e^x \geq 1 + x$ by Exercise 75. Assume the statement is true for $n = k$. We need to prove the statement is true for $n = k + 1$. By the Induction Hypothesis,

$$e^x \geq 1 + x + x^2/2 + \cdots + x^k/k!.$$

Integrating both sides of this inequality yields

$$\int_0^x e^t\,dt = e^x - 1 \geq x + x^2/2 + \cdots + x^{k+1}/(k+1)!$$

or

$$e^x \geq 1 + x + x^2/2 + \cdots + x^{k+1}/(k+1)!$$

as required.

77. Use Exercise 75 to show that $e^x/x^2 \geq x/6$ and conclude that $\lim_{x\to\infty} e^x/x^2 = \infty$. Then use Exercise 76 to prove more generally that $\lim_{x\to\infty} e^x/x^n = \infty$ for all n.

SOLUTION By Exercise 75, $e^x \geq 1 + x + \frac{x^2}{2} + \frac{x^3}{6}$. Thus

$$\frac{e^x}{x^2} \geq \frac{1}{x^2} + \frac{1}{x} + \frac{1}{2} + \frac{x}{6} \geq \frac{x}{6}.$$

Since $\lim_{x\to\infty} x/6 = \infty$, $\lim_{x\to\infty} e^x/x^2 = \infty$. More generally, by Exercise 76,

$$e^x \geq 1 + \frac{x^2}{2} + \cdots + \frac{x^{n+1}}{(n+1)!}.$$

Thus

$$\frac{e^x}{x^n} \geq \frac{1}{x^n} + \cdots + \frac{x}{(n+1)!} \geq \frac{x}{(n+1)!}.$$

Since $\lim_{x\to\infty} \frac{x}{(n+1)!} = \infty$, $\lim_{x\to\infty} \frac{e^x}{x^n} = \infty$.

Exercises 78–80 develop an elegant approach to the exponential and logarithm functions. Define a function $G(x)$ for $x > 0$:

$$G(x) = \int_1^x \frac{1}{t}\, dt$$

78. Defining $\ln x$ as an Integral This exercise proceeds as if we didn't know that $G(x) = \ln x$ and shows directly that $G(x)$ has all the basic properties of the logarithm. Prove the following statements.

(a) $\int_a^{ab} \frac{1}{t}\, dt = \int_1^b \frac{1}{t}\, dt$ for all $a, b > 0$. *Hint:* Use the substitution $u = t/a$.

(b) $G(ab) = G(a) + G(b)$. *Hint:* Break up the integral from 1 to ab into two integrals and use (a).

(c) $G(1) = 0$ and $G(a^{-1}) = -G(a)$ for $a > 0$.

(d) $G(a^n) = nG(a)$ for all $a > 0$ and integers n.

(e) $G(a^{1/n}) = \frac{1}{n}G(a)$ for all $a > 0$ and integers $n \neq 0$.

(f) $G(a^r) = rG(a)$ for all $a > 0$ and rational numbers r.

(g) $G(x)$ is increasing. *Hint:* Use FTC II.

(h) There exists a number a such that $G(a) > 1$. *Hint:* Show that $G(2) > 0$ and take $a = 2^m$ for $m > 1/G(2)$.

(i) $\lim_{x\to\infty} G(x) = \infty$ and $\lim_{x\to 0+} G(x) = -\infty$

(j) There exists a unique number E such that $G(E) = 1$.

(k) $G(E^r) = r$ for every rational number r.

SOLUTION

(a) Let $u = t/a$. Then $du = dt/a$, $u(a) = 1$, $u(ab) = b$ and

$$\int_a^{ab} \frac{1}{t}\, dt = \int_a^{ab} \frac{a}{at}\, dt = \int_1^b \frac{1}{u}\, du = \int_1^b \frac{1}{t}\, dt.$$

(b) Using part (a),

$$G(ab) = \int_1^{ab} \frac{1}{t}\, dt = \int_1^a \frac{1}{t}\, dt + \int_a^{ab} \frac{1}{t}\, dt = \int_1^a \frac{1}{t}\, dt + \int_1^b \frac{1}{t}\, dt = G(a) + G(b).$$

(c) First,

$$G(1) = \int_1^1 \frac{1}{t}\, dt = 0.$$

Next,

$$G(a^{-1}) = G\left(\frac{1}{a}\right) = \int_1^{1/a} \frac{1}{t}\, dt = \int_a^1 \frac{1}{t}\, dt \quad \text{by part (a) with } b = \frac{1}{a}$$
$$= -\int_1^a \frac{1}{t}\, dt = -G(a).$$

(d) Using part (a),

$$G(a^n) = \int_1^{a^n} \frac{1}{t}\,dt = \int_1^{a} \frac{1}{t}\,dt + \int_a^{a^2} \frac{1}{t}\,dt + \cdots + \int_{a^{n-1}}^{a^n} \frac{1}{t}\,dt$$
$$= \int_1^{a} \frac{1}{t}\,dt + \int_1^{a} \frac{1}{t}\,dt + \cdots + \int_1^{a} \frac{1}{t}\,dt = nG(a).$$

(e) $G(a) = G((a^{1/n})^n = nG(a^{1/n})$. Thus, $G(a^{1/n}) = \frac{1}{n}G(a)$.

(f) Let $r = m/n$ where m and n are integers. Then

$$\begin{aligned} G(a^r) &= G(a^{m/n}) = G((a^m)^{1/n}) \\ &= \frac{1}{n}G(a^m) \quad \text{by part (e)} \\ &= \frac{m}{n}G(a) \quad \text{by part d} \\ &= rG(a). \end{aligned}$$

(g) By the Fundamental Theorem of Calculus, $G(x)$ is continuous on $(0, \infty)$ and $G'(x) = \frac{1}{x} > 0$ for $x > 0$. Thus, $G(x)$ is increasing and one-to-one for $x > 0$.

(h) First note that

$$G(2) = \int_1^2 \frac{1}{t}\,dt > \frac{1}{2} > 0$$

because $\frac{1}{t} > \frac{1}{2}$ for $t \in (1, 2)$. Now, let $a = 2^m$ for m an integer greater than $1/G(2)$. Then

$$G(a) = G(2^m) = mG(2) > \frac{1}{G(2)} \cdot G(2) = 1.$$

(i) First, let a be the value from part (h) for which $G(a) > 1$ (note that a itself is greater than 1). Now,

$$\lim_{x\to\infty} G(x) = \lim_{m\to\infty} G(a^m) = G(a) \lim_{m\to\infty} m = \infty.$$

For the other limit, let $t = 1/x$ and note

$$\lim_{x\to 0+} G(x) = \lim_{t\to\infty} G\left(\frac{1}{t}\right) = -\lim_{t\to\infty} G(t) = -\infty.$$

(j) By part (c), $G(1) = 0$ and by part (h) there exists an a such that $G(a) > 1$. the Intermediate Value Theorem then guarantees there exists a number E such that $1 < E < a$ and $G(E) = 1$. We know that E is unique because G is one-to-one.

(k) Using part (f) and then part (j),

$$G(E^r) = rG(E) = r \cdot 1 = r.$$

79. Defining e^x Use Exercise 78 to prove the following statements.

(a) $G(x)$ has an inverse with domain $\mathbf{R}$ and range $\{x : x > 0\}$. Denote the inverse by $F(x)$.

(b) $F(x + y) = F(x)F(y)$ for all x, y. *Hint:* It suffices to show that $G(F(x)F(y)) = G(F(x + y))$.

(c) $F(r) = E^r$ for all numbers. In particular, $F(0) = 1$.

(d) $F'(x) = F(x)$. *Hint:* Use the formula for the derivative of an inverse function.

This shows that $E = e$ and $F(x)$ is the function e^x as defined in the text.

SOLUTION

(a) The domain of $G(x)$ is $x > 0$ and, by part (i) of the previous exercise, the range of $G(x)$ is $\mathbf{R}$. Now,

$$G'(x) = \frac{1}{x} > 0$$

for all $x > 0$. Thus, $G(x)$ is increasing on its domain, which implies that $G(x)$ has an inverse. The domain of the inverse is $\mathbf{R}$ and the range is $\{x : x > 0\}$. Let $F(x)$ denote the inverse of $G(x)$.

(b) Let x and y be real numbers and suppose that $x = G(w)$ and $y = G(z)$ for some positive real numbers w and z. Then, using part (b) of the previous exercise

$$F(x + y) = F(G(w) + G(z)) = F(G(wz)) = wz = F(x) + F(y).$$

(c) Let r be any real number. By part (k) of the previous exercise, $G(E^r) = r$. By definition of an inverse function, it then follows that $F(r) = E^r$.

(d) By the formula for the derivative of an inverse function

$$F'(x) = \frac{1}{G'(F(x))} = \frac{1}{1/F(x)} = F(x).$$

80. Defining b^x Let $b > 0$ and let $f(x) = F(xG(b))$ with F as in Exercise 79. Use Exercise 78 (f) to prove that $f(r) = b^r$ for every rational number r. This gives us a way of defining b^x for irrational x, namely $b^x = f(x)$. With this definition, b^x is a differentiable function of x (because F is differentiable).

SOLUTION By Exercise 78 (f),

$$f(r) = F(rG(b)) = F(G(b^r)) = b^r,$$

for every rational number r.

81. The formula $\int x^n\,dx = \dfrac{x^{n+1}}{n+1} + C$ is valid for $n \neq -1$. Show that the exceptional case $n = -1$ is a limit of the general case by applying L'Hôpital's Rule to the limit on the left.

$$\lim_{n\to -1} \int_1^x t^n\,dt = \int_1^x t^{-1}\,dt \qquad \text{(for fixed } x > 0)$$

Note that the integral on the left is equal to $\dfrac{x^{n+1}-1}{n+1}$.

SOLUTION

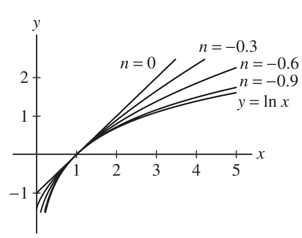
$$\lim_{n\to -1} \int_1^x t^n\,dt = \lim_{n\to -1} \left.\frac{t^{n+1}}{n+1}\right|_1^x = \lim_{n\to -1}\left(\frac{x^{n+1}}{n+1} - \frac{1^{n+1}}{n+1}\right)$$

$$= \lim_{n\to -1} \frac{x^{n+1}-1}{n+1} = \lim_{n\to -1}(x^{n+1})\ln x = \ln x = \int_1^x t^{-1}\,dt$$

Note that when using L'Hôpital's Rule in the second line, we need to differentiate with respect to n.

82. CAS The integral on the left in Exercise 81 is equal to $f_n(x) = \dfrac{x^{n+1}-1}{n+1}$. Investigate the limit graphically by plotting $f_n(x)$ for $n = 0, -0.3, -0.6$, and -0.9 together with $\ln x$ on a single plot.

SOLUTION



83. **(a)** Explain why the shaded region in Figure 5 has area $\int_0^{\ln a} e^y\,dy$.

(b) Prove the formula $\int_1^a \ln x\,dx = a\ln a - \int_0^{\ln a} e^y\,dy$.

(c) Conclude that $\int_1^a \ln x\,dx = a\ln a - a + 1$.

(d) Use the result of (a) to find an antiderivative of $\ln x$.

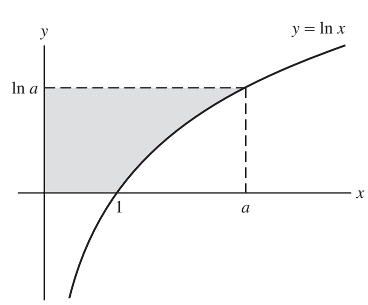


FIGURE 5

SOLUTION

(a) Interpreting the graph with y as the independent variable, we see that the function is $x = e^y$. Integrating in y then gives the area of the shaded region as $\int_0^{\ln a} e^y\,dy$

(b) We can obtain the area under the graph of $y = \ln x$ from $x = 1$ to $x = a$ by computing the area of the rectangle extending from $x = 0$ to $x = a$ horizontally and from $y = 0$ to $y = \ln a$ vertically and then subtracting the area of the shaded region. This yields

$$\int_1^a \ln x\,dx = a\ln a - \int_0^{\ln a} e^y\,dy.$$

(c) By direct calculation

$$\int_0^{\ln a} e^y\,dy = e^y\Big|_0^{\ln a} = a - 1.$$

Thus,

$$\int_1^a \ln x\,dx = a\ln a - (a-1) = a\ln a - a + 1.$$

(d) Based on these results it appears that

$$\int \ln x\,dx = x\ln x - x + C.$$

5.8 Exponential Growth and Decay

Preliminary Questions

1. Two quantities increase exponentially with growth constants $k = 1.2$ and $k = 3.4$, respectively. Which quantity doubles more rapidly?

SOLUTION Doubling time is inversely proportional to the growth constant. Consequently, the quantity with $k = 3.4$ doubles more rapidly.

2. A cell population grows exponentially beginning with one cell. Which takes longer: increasing from one to two cells or increasing from 15 million to 20 million cells?

SOLUTION It takes longer for the population to increase from one cell to two cells, because this requires doubling the population. Increasing from 15 million to 20 million is less than doubling the population.

3. Referring to his popular book *A Brief History of Time*, the renowned physicist Stephen Hawking said, "Someone told me that each equation I included in the book would halve its sales." Find a differential equation satisfied by the function $S(n)$, the number of copies sold if the book has n equations.

SOLUTION Let $S(0)$ denote the sales with no equations in the book. Translating Hawking's observation into an equation yields

$$S(n) = \frac{S(0)}{2^n}.$$

Differentiating with respect to n then yields

$$\frac{dS}{dn} = S(0)\frac{d}{dn}2^{-n} = -\ln 2S(0)2^{-n} = -\ln 2S(n).$$

4. The PV of N dollars received at time T is (choose the correct answer):

(a) The value at time T of N dollars invested today

(b) The amount you would have to invest today in order to receive N dollars at time T

SOLUTION The correct response is **(b)**: the PV of N dollars received at time T is the amount you would have to invest today in order to receive N dollars at time T.

5. In one year, you will be paid \$1. Will the PV increase or decrease if the interest rate goes up?

SOLUTION If the interest rate goes up, the present value of \$1 a year from now will decrease.

Exercises

1. A certain population P of bacteria obeys the exponential growth law $P(t) = 2000e^{1.3t}$ (t in hours).

(a) How many bacteria are present initially?

(b) At what time will there be 10,000 bacteria?

SOLUTION

(a) $P(0) = 2000e^0 = 2000$ bacteria initially.

(b) We solve $2000e^{1.3t} = 10,000$ for t. Thus, $e^{1.3t} = 5$ or

$$t = \frac{1}{1.3}\ln 5 \approx 1.24 \text{ hours.}$$

2. A quantity P obeys the exponential growth law $P(t) = e^{5t}$ (t in years).

(a) At what time t is $P = 10$?

(b) What is the doubling time for P?

SOLUTION

(a) $e^{5t} = 10$ when $t = \frac{1}{5}\ln 10 \approx 0.46$ years.

(b) The doubling time is $\frac{1}{5}\ln 2 \approx 0.14$ years.

3. Write $f(t) = 5(7)^t$ in the form $f(t) = P_0e^{kt}$ for some P_0 and k.

SOLUTION Because $7 = e^{\ln 7}$, it follows that

$$f(t) = 5(7)^t = 5(e^{\ln 7})^t = 5e^{t\ln 7}.$$

Thus, $P_0 = 5$ and $k = \ln 7$.

4. Write $f(t) = 9e^{1.4t}$ in the form $f(t) = P_0b^t$ for some P_0 and b.

SOLUTION Observe that

$$f(t) = 9e^{1.4t} = 9\left(e^{1.4}\right)^t,$$

so $P_0 = 9$ and $b = e^{1.4} \approx 4.0552$.

5. A certain RNA molecule replicates every 3 minutes. Find the differential equation for the number $N(t)$ of molecules present at time t (in minutes). How many molecules will be present after one hour if there is one molecule at $t = 0$?

SOLUTION The doubling time is $\dfrac{\ln 2}{k}$ so $k = \dfrac{\ln 2}{\text{doubling time}}$. Thus, the differential equation is $N'(t) = kN(t) = \dfrac{\ln 2}{3}N(t)$. With one molecule initially,

$$N(t) = e^{(\ln 2/3)t} = 2^{t/3}.$$

Thus, after one hour, there are

$$N(60) = 2^{60/3} = 1{,}048{,}576$$

molecules present.

6. A quantity P obeys the exponential growth law $P(t) = Ce^{kt}$ (t in years). Find the formula for $P(t)$, assuming that the doubling time is 7 years and $P(0) = 100$.

SOLUTION The doubling time is 7 years, so $7 = \ln 2/k$, or $k = \ln 2/7 = 0.099$ years^{-1}. With $P(0) = 100$, it follows that $P(t) = 100e^{0.099t}$.

7. Find all solutions to the differential equation $y' = -5y$. Which solution satisfies the initial condition $y(0) = 3.4$?

SOLUTION $y' = -5y$, so $y(t) = Ce^{-5t}$ for some constant C. The initial condition $y(0) = 3.4$ determines $C = 3.4$. Therefore, $y(t) = 3.4e^{-5t}$.

8. Find the solution to $y' = \sqrt{2}y$ satisfying $y(0) = 20$.

SOLUTION $y' = \sqrt{2}y$, so $y(t) = Ce^{\sqrt{2}t}$ for some constant C. The initial condition $y(0) = 20$ determines $C = 20$. Therefore, $y(t) = 20e^{\sqrt{2}t}$.

9. Find the solution to $y' = 3y$ satisfying $y(2) = 1000$.

SOLUTION $y' = 3y$, so $y(t) = Ce^{3t}$ for some constant C. The initial condition $y(2) = 1000$ determines $C = \dfrac{1000}{e^6}$. Therefore, $y(t) = \dfrac{1000}{e^6}e^{3t} = 1000e^{3(t-2)}$.

10. Find the function $y = f(t)$ that satisfies the differential equation $y' = -0.7y$ and the initial condition $y(0) = 10$.

SOLUTION Given that $y' = -0.7y$ and $y(0) = 10$, then $f(t) = 10e^{-0.7t}$.

11. The decay constant of cobalt-60 is 0.13 year^{-1}. Find its half-life.

SOLUTION Half-life $= \dfrac{\ln 2}{0.13} \approx 5.33$ years.

12. The half-life radium-226 is 1622 years. Find its decay constant.

SOLUTION Half-life $= \dfrac{\ln 2}{k}$ so $k = \dfrac{\ln 2}{\text{half-life}} = \dfrac{\ln 2}{1622} = 4.27 \times 10^{-4}$ years^{-1}.

13. One of the world's smallest flowering plants, *Wolffia globosa* (Figure 13), has a doubling time of approximately 30 hours. Find the growth constant k and determine the initial population if the population grew to 1000 after 48 hours.

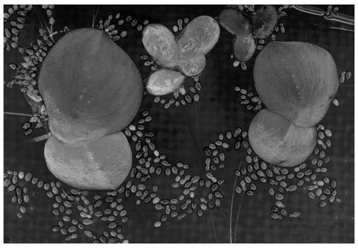

FIGURE 13 The tiny plants are *Wolffia*, with plant bodies smaller than the head of a pin.

SOLUTION By the formula for the doubling time, $30 = \dfrac{\ln 2}{k}$. Therefore,

$$k = \frac{\ln 2}{30} \approx 0.023 \text{ hours}^{-1}.$$

The plant population after t hours is $P(t) = P_0 e^{0.023t}$. If $P(48) = 1000$, then

$$P_0 e^{(0.023)48} = 1000 \quad \Rightarrow \quad P_0 = 1000e^{-(0.023)48} \approx 332$$

14. A 10-kg quantity of a radioactive isotope decays to 3 kg after 17 years. Find the decay constant of the isotope.

SOLUTION $P(t) = 10e^{-kt}$. Thus $P(17) = 3 = 10e^{-17k}$, so $k = \dfrac{\ln(3/10)}{-17} \approx 0.071$ years^{-1}.

15. The population of a city is $P(t) = 2 \cdot e^{0.06t}$ (in millions), where t is measured in years. Calculate the time it takes for the population to double, to triple, and to increase seven-fold.

SOLUTION Since $k = 0.06$, the doubling time is

$$\frac{\ln 2}{k} \approx 11.55 \text{ years.}$$

The tripling time is calculated in the same way as the doubling time. Solve for Δ in the equation

$$\begin{aligned} P(t + \Delta) &= 3P(t) \\ 2 \cdot e^{0.06(t+\Delta)} &= 3(2e^{0.06t}) \\ 2 \cdot e^{0.06t} e^{0.06\Delta} &= 3(2e^{0.06t}) \\ e^{0.06\Delta} &= 3 \\ 0.06\Delta &= \ln 3, \end{aligned}$$

or $\Delta = \ln 3/0.06 \approx 18.31$ years. Working in a similar fashion, we find that the time required for the population to increase seven-fold is

$$\frac{\ln 7}{k} = \frac{\ln 7}{0.06} \approx 32.43 \text{ years.}$$

16. What is the differential equation satisfied by $P(t)$, the number of infected computer hosts in Example 4? Over which time interval would $P(t)$ increase one hundred-fold?

SOLUTION Because the rate constant is $k = 0.0815$ s^{-1}, the differential equation for $P(t)$ is

$$\frac{dP}{dt} = 0.0815P.$$

The time for the number of infected computers to increase one hundred-fold is

$$\frac{\ln 100}{k} = \frac{\ln 100}{0.0815} \approx 56.51 \text{ s.}$$

17. The decay constant for a certain drug is $k = 0.35$ day^{-1}. Calculate the time it takes for the quantity present in the bloodstream to decrease by half, by one-third, and by one-tenth.

SOLUTION The time required for the quantity present in the bloodstream to decrease by half is

$$\frac{\ln 2}{k} = \frac{\ln 2}{0.35} \approx 1.98 \text{ days.}$$

To decay by one-third, the time is

$$\frac{\ln 3}{k} = \frac{\ln 3}{0.35} \approx 3.14 \text{ days.}$$

Finally, to decay by one-tenth, the time is

$$\frac{\ln 10}{k} = \frac{\ln 10}{0.35} \approx 6.58 \text{ days.}$$

18. Light Intensity The intensity of light passing through an absorbing medium decreases exponentially with the distance traveled. Suppose the decay constant for a certain plastic block is $k = 4$ m^{-1}. How thick must the block be to reduce the intensity by a factor of one-third?

SOLUTION Since intensity decreases exponentially, it can be modeled by an exponential decay equation $I(d) = I_0 e^{-kd}$. Assuming $I(0) = 1$, $I(d) = e^{-kd}$. Since the decay constant is $k = 4$, we have $I(d) = e^{-4d}$. Intensity will be reduced by a factor of one-third when $e^{-4d} = \frac{1}{3}$ or when $d = \dfrac{\ln(1/3)}{-4} \approx 0.275$ m.

19. Assuming that population growth is approximately exponential, which of the following two sets of data is most likely to represent the population (in millions) of a city over a 5-year period?

Year	2000	2001	2002	2003	2004
Set I	3.14	3.36	3.60	3.85	4.11
Set II	3.14	3.24	3.54	4.04	4.74

SOLUTION If the population growth is approximately exponential, then the ratio between successive years' data needs to be approximately the same.

Year	2000		2001		2002		2003		2004
Data I	3.14		3.36		3.60		3.85		4.11
Ratios		1.07006		1.07143		1.06944		1.06753	
Data II	3.14		3.24		3.54		4.04		4.74
Ratios		1.03185		1.09259		1.14124		1.17327	

As you can see, the ratio of successive years in the data from "Data I" is very close to 1.07. Therefore, we would expect exponential growth of about $P(t) \approx (3.14)(1.07^t)$.

20. The **atmospheric pressure** $P(h)$ (in kilopascals) at a height h meters above sea level satisfies a differential equation $P' = -kP$ for some positive constant k.

(a) Barometric measurements show that $P(0) = 101.3$ and $P(30,900) = 1.013$. What is the decay constant k?

(b) Determine the atmospheric pressure at $h = 500$.

SOLUTION

(a) Because $P' = -kP$ for some positive constant k, $P(h) = Ce^{-kh}$ where $C = P(0) = 101.3$. Therefore, $P(h) = 101.3e^{-kh}$. We know that $P(30{,}900) = 101.3e^{-30{,}900k} = 1.013$. Solving for k yields

$$k = -\frac{1}{30{,}900} \ln\left(\frac{1.013}{101.3}\right) \approx 0.000149 \text{ meters}^{-1}.$$

(b) $P(500) = 101.3e^{-0.000149(500)} \approx 94.03$ kilopascals.

21. Degrees in Physics One study suggests that from 1955 to 1970, the number of bachelor's degrees in physics awarded per year by U.S. universities grew exponentially, with growth constant $k = 0.1$.
(a) If exponential growth continues, how long will it take for the number of degrees awarded per year to increase 14-fold?
(b) If 2500 degrees were awarded in 1955, in which year were 10,000 degrees awarded?

SOLUTION
(a) The time required for the number of degrees to increase 14-fold is

$$\frac{\ln 14}{k} = \frac{\ln 14}{0.1} \approx 26.39 \text{ years.}$$

(b) The doubling time is $(\ln 2)/0.1 \approx 0.693/0.1 = 6.93$ years. Since degrees are usually awarded once a year, we round off the doubling time to 7 years. The number quadruples after 14 years, so 10, 000 degrees would be awarded in 1969.

22. The **Beer–Lambert Law** is used in spectroscopy to determine the molar absorptivity α or the concentration c of a compound dissolved in a solution at low concentrations (Figure 14). The law states that the intensity I of light as it passes through the solution satisfies $\ln(I/I_0) = \alpha c x$, where I_0 is the initial intensity and x is the distance traveled by the light. Show that I satisfies a differential equation $dI/dx = -kI$ for some constant k.

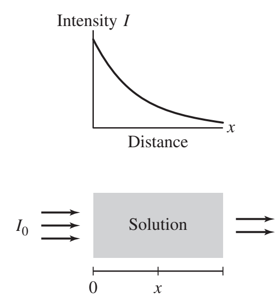

FIGURE 14 Light of intensity passing through a solution.

SOLUTION $\ln\left(\dfrac{I}{I_0}\right) = \alpha c I$ so $\dfrac{I}{I_0} = e^{\alpha c I}$ or $I = I_0 e^{\alpha c I}$. Therefore,

$$\frac{dI}{dx} = I_0 e^{\alpha c I}(\alpha c) = I(\alpha c) = -kI,$$

where $k = -\alpha c$ is a constant.

23. A sample of sheepskin parchment discovered by archaeologists had a C^{14}-to-C^{12} ratio equal to 40% of that found in the atmosphere. Approximately how old is the parchment?

SOLUTION The ratio of C^{14} to C^{12} is $Re^{-0.000121t} = 0.4R$ so $-0.000121t = \ln(0.4)$ or $t = 7572.65 \approx 7600$ years.

24. Chauvet Caves In 1994, three French speleologists (geologists specializing in caves) discovered a cave in southern France containing prehistoric cave paintings. A C^{14} analysis carried out by archeologist Helene Valladas showed the paintings to be between 29,700 and 32,400 years old, much older than any previously known human art. Given that the C^{14}-to-C^{12} ratio of the atmosphere is $R = 10^{-12}$, what range of C^{14}-to-C^{12} ratios did Valladas find in the charcoal specimens?

SOLUTION The C^{14}-C^{12} ratio found in the specimens ranged from

$$10^{-12}e^{-0.000121(32,400)} \approx 1.98 \times 10^{-14}$$

to

$$10^{-12}e^{-0.000121(29,700)} \approx 2.75 \times 10^{-14}.$$

25. A paleontologist discovers remains of animals that appear to have died at the onset of the Holocene ice age, between 10,000 and 12,000 years ago. What range of C^{14}-to-C^{12} ratio would the scientist expect to find in the animal remains?

SOLUTION The scientist would expect to find C^{14}-C^{12} ratios ranging from

$$10^{-12}e^{-0.000121(12,000)} \approx 2.34 \times 10^{-13}$$

to

$$10^{-12}e^{-0.000121(10,000)} \approx 2.98 \times 10^{-13}.$$

26. Inversion of Sugar When cane sugar is dissolved in water, it converts to invert sugar over a period of several hours. The percentage $f(t)$ of unconverted cane sugar at time t (in hours) satisfies $f' = -0.2f$. What percentage of cane sugar remains after 5 hours? After 10 hours?

SOLUTION $f' = -0.2f$, so $f(t) = Ce^{-0.2t}$. Since f is a percentage, at $t = 0$, $C = 100$ percent. Therefore. $f(t) = 100e^{-0.2t}$. Thus $f(5) = 100e^{-0.2(5)} \approx 36.79$ percent and $f(10) = 100e^{-0.2(10)} \approx 13.53$ percent.

27. Continuing with Exercise 26, suppose that 50 grams of sugar are dissolved in a container of water. After how many hours will 20 grams of invert sugar be present?

SOLUTION If there are 20 grams of invert sugar present, then there are 30 grams of unconverted sugar. This means that $f = 60$. Solving

$$100e^{-0.2t} = 60$$

for t yields

$$t = -\frac{1}{0.2}\ln 0.6 \approx 2.55 \text{ hours.}$$

28. Two bacteria colonies are cultivated in a laboratory. The first colony has a doubling time of 2 hours and the second a doubling time of 3 hours. Initially, the first colony contains 1000 bacteria and the second colony 3000 bacteria. At what time t will the sizes of the colonies be equal?

SOLUTION $P_1(t) = 1000e^{k_1 t}$ and $P_2(t) = 3000e^{k_2 t}$. Knowing that $k_1 = \frac{\ln 2}{2}$ hours^{-1} and $k_2 = \frac{\ln 2}{3}$ hours^{-1}, we need to solve $e^{k_1 t} = 3e^{k_2 t}$ for t. Thus

$$k_1 t = \ln(3e^{k_2 t}) = \ln 3 + \ln(e^{k_2 t}) = \ln 3 + k_2 t,$$

so

$$t = \frac{\ln 3}{k_1 - k_2} = \frac{6 \ln 3}{\ln 2} \approx 9.51 \text{ hours.}$$

29. Moore's Law In 1965, Gordon Moore predicted that the number N of transistors on a microchip would increase exponentially.

(a) Does the table of data below confirm Moore's prediction for the period from 1971 to 2000? If so, estimate the growth constant k.

(b) CAS Plot the data in the table.

(c) Let $N(t)$ be the number of transistors t years after 1971. Find an approximate formula $N(t) \approx Ce^{kt}$, where t is the number of years after 1971.

(d) Estimate the doubling time in Moore's Law for the period from 1971 to 2000.

(e) How many transistors will a chip contain in 2015 if Moore's Law continues to hold?

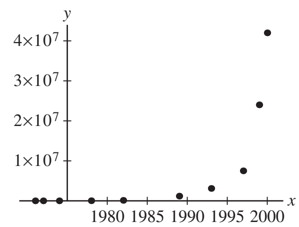
(f) Can Moore have expected his prediction to hold indefinitely?

Processor	Year	No. Transistors
4004	1971	2250
8008	1972	2500
8080	1974	5000
8086	1978	29,000
286	1982	120,000
386 processor	1985	275,000
486 DX processor	1989	1,180,000
Pentium processor	1993	3,100,000
Pentium II processor	1997	7,500,000
Pentium III processor	1999	24,000,000
Pentium 4 processor	2000	42,000,000
Xeon processor	2008	1,900,000,000

SOLUTION

(a) Yes, the graph looks like an exponential graph especially towards the latter years. We estimate the growth constant by setting 1971 as our starting point, so $P_0 = 2250$. Therefore, $P(t) = 2250e^{kt}$. In 2008, $t = 37$. Therefore, $P(37) = 2250e^{37k} = 1{,}900{,}000{,}000$, so $k = \frac{\ln 844{,}444.444}{37} \approx 0.369$. Note: A better estimate can be found by calculating k for each time period and then averaging the k values.

(b)



(c) $N(t) = 2250e^{0.369t}$
(d) The doubling time is $\ln 2/0.369 \approx 1.88$ years.
(e) In 2015, $t = 44$ years. Therefore, $N(44) = 2250e^{0.369(44)} \approx 2.53 \times 10^{10}$.
(f) No, you can't make a microchip smaller than an atom.

30. Assume that in a certain country, the rate at which jobs are created is proportional to the number of people who already have jobs. If there are 15 million jobs at $t = 0$ and 15.1 million jobs 3 months later, how many jobs will there be after 2 years?

SOLUTION Let $J(t)$ denote the number of people, in millions, who have jobs at time t, in months. Because the rate at which jobs are created is proportional to the number of people who already have jobs, $J'(t) = kJ(t)$, for some constant k. Given that $J(0) = 15$, it then follows that $J(t) = 15e^{kt}$. To determine k, we use $J(3) = 15.1$; therefore,

$$k = \frac{1}{3}\ln\left(\frac{15.1}{15}\right) \approx 2.215 \times 10^{-3} \text{ months}^{-1}.$$

Finally, after two years, there are

$$J(24) = 15e^{0.002215(24)} \approx 15.8 \text{ million}$$

jobs.

31. The only functions with a *constant* doubling time are the exponential functions P_0e^{kt} with $k > 0$. Show that the doubling time of linear function $f(t) = at + b$ at time t_0 is $t_0 + b/a$ (which increases with t_0). Compute the doubling times of $f(t) = 3t + 12$ at $t_0 = 10$ and $t_0 = 20$.

SOLUTION Let $f(t) = at + b$ and suppose $f(t_0) = P_0$. The time it takes for the value of f to double is the solution of the equation

$$2P_0 = 2(at_0 + b) = at + b \quad \text{or} \quad t = 2t_0 + b/a.$$

For the function $f(t) = 3t + 12$, $a = 3$, $b = 12$ and $b/a = 4$. With $t_0 = 10$, the doubling time is then 24; with $t_0 = 20$, the doubling time is 44.

32. Verify that the half-life of a quantity that decays exponentially with decay constant k is equal to $(\ln 2)/k$.

SOLUTION Let $y = Ce^{-kt}$ be an exponential decay function. Let t be the half-life of the quantity y, that is, the time t when $y = \frac{C}{2}$. Solving $\frac{C}{2} = Ce^{-kt}$ for t we get $-\ln 2 = -kt$, so $t = \ln 2/k$.

33. Compute the balance after 10 years if \$2000 is deposited in an account paying 9% interest and interest is compounded (a) quarterly, (b) monthly, and (c) continuously.

SOLUTION

(a) $P(10) = 2000(1 + 0.09/4)^{4(10)} = \$4870.38$
(b) $P(10) = 2000(1 + 0.09/12)^{12(10)} = \$4902.71$
(c) $P(10) = 2000e^{0.09(10)} = \$4919.21$

34. Suppose \$500 is deposited into an account paying interest at a rate of 7%, continuously compounded. Find a formula for the value of the account at time t. What is the value of the account after 3 years?

SOLUTION Let $P(t)$ denote the value of the account at time t. Because the initial deposit is \$500 and the account pays interest at a rate of 7%, compounded continuously, it follows that $P(t) = 500e^{0.07t}$. After three years, the value of the account is $P(3) = 500e^{0.07(3)} = \$616.84$.

35. A bank pays interest at a rate of 5%. What is the yearly multiplier if interest is compounded

(a) three times a year? **(b)** continuously?

SOLUTION

(a) $P(t) = P_0\left(1 + \frac{0.05}{3}\right)^{3t}$, so the yearly multiplier is $\left(1 + \frac{0.05}{3}\right)^{3} \approx 1.0508$.
(b) $P(t) = P_0e^{0.05t}$, so the yearly multiplier is $e^{0.05} \approx 1.0513$.

36. How long will it take for \$4000 to double in value if it is deposited in an account bearing 7% interest, continuously compounded?

SOLUTION The doubling time is $\frac{\ln 2}{0.7} \approx 9.9$ years.

37. How much must one invest today in order to receive \$20,000 after 5 years if interest is compounded continuously at the rate $r = 9\%$?

SOLUTION Solving $20{,}000 = P_0e^{0.09(5)}$ for P_0 yields

$$P_0 = \frac{20{,}000}{e^{0.45}} \approx \$12{,}752.56.$$

38. An investment increases in value at a continuously compounded rate of 9%. How large must the initial investment be in order to build up a value of $50,000 over a 7-year period?

SOLUTION Solving $50{,}000 = P_0 e^{0.09(7)}$ for P_0 yields

$$P_0 = \frac{50{,}000}{e^{0.63}} \approx \$26{,}629.59.$$

39. Compute the PV of $5000 received in 3 years if the interest rate is (a) 6% and (b) 11%. What is the PV in these two cases if the sum is instead received in 5 years?

SOLUTION In 3 years:

(a) $PV = 5000e^{-0.06(3)} = \$4176.35$

(b) $PV = 5000e^{-0.11(3)} = \$3594.62$

In 5 years:

(a) $PV = 5000e^{-0.06(5)} = \$3704.09$

(b) $PV = 5000e^{-0.11(5)} = \$2884.75$

40. Is it better to receive $1000 today or $1300 in 4 years? Consider $r = 0.08$ and $r = 0.03$.

SOLUTION Assuming continuous compounding, if $r = 0.08$, then the present value of $1300 four years from now is $1300e^{-0.08(4)} = \$943.99$. It is better to get $1000 now. On the other hand, if $r = 0.03$, the present value of $1300 four years from now is $1300e^{-0.03(4)} = \$1153.00$, so it is better to get the $1,300 in four years.

41. Find the interest rate r if the PV of $8000 to be received in 1 year is $7300.

SOLUTION Solving $7300 = 8000e^{-r(1)}$ for r yields

$$r = -\ln\left(\frac{7300}{8000}\right) = 0.0916,$$

or 9.16%.

42. A company can earn additional profits of $500,000/year for 5 years by investing $2 million to upgrade its factory. Is the investment worthwhile if the interest rate is 6%? (Assume the savings are received as a lump sum at the end of each year.)

SOLUTION The present value of the stream of additional profits is

$$500{,}000(e^{-0.06} + e^{-0.12} + e^{-0.18} + e^{-0.24} + e^{-0.3}) = \$2{,}095{,}700.63.$$

This is more than the $2 million cost of the upgrade, so the upgrade should be made.

43. A new computer system costing $25,000 will reduce labor costs by $7000/year for 5 years.

(a) Is it a good investment if $r = 8\%$?

(b) How much money will the company actually save?

SOLUTION

(a) The present value of the reduced labor costs is

$$7000(e^{-0.08} + e^{-0.16} + e^{-0.24} + e^{-0.32} + e^{-0.4}) = \$27{,}708.50.$$

This is more than the $25,000 cost of the computer system, so the computer system should be purchased.

(b) The present value of the savings is

$$\$27{,}708.50 - \$25{,}000 = \$2708.50.$$

44. After winning $25 million in the state lottery, Jessica learns that she will receive five yearly payments of $5 million beginning immediately.

(a) What is the PV of Jessica's prize if $r = 6\%$?

(b) How much more would the prize be worth if the entire amount were paid today?

SOLUTION

(a) The present value of the prize is

$$5{,}000{,}000(e^{-0.24} + e^{-0.18} + e^{-0.12} + e^{-0.06} + e^{-0.06(0)}) = \$22{,}252{,}915.21.$$

(b) If the entire amount were paid today, the present value would be $25 million, or $2,747,084.79 more than the stream of payments made over five years.

45. Use Eq. (3) to compute the PV of an income stream paying out $R(t) = \$5000$/year continuously for 10 years, assuming $r = 0.05$.

SOLUTION $PV = \int_0^{10} 5000e^{-0.05t}\,dt = -100{,}000e^{-0.05t}\Big|_0^{10} = \$39{,}346.93.$

46. Find the PV of an investment that pays out continuously at a rate of \$800/year for 5 years, assuming $r = 0.08$.

SOLUTION $PV = \int_0^{5} 800e^{-0.08t}\,dt = -10{,}000e^{-0.08t}\Big|_0^{5} = \$3296.80.$

47. Find the PV of an income stream that pays out continuously at a rate $R(t) = \$5000e^{0.1t}$/year for 7 years, assuming $r = 0.05$.

SOLUTION $PV = \int_0^{7} 5000e^{0.1t}e^{-0.05t}\,dt = \int_0^{7} 5000e^{0.05t}\,dt = 100{,}000e^{0.05t}\Big|_0^{7} = \$41{,}906.75.$

48. A commercial property generates income at the rate $R(t)$. Suppose that $R(0) = \$70{,}000$/year and that $R(t)$ increases at a continuously compounded rate of 5%. Find the PV of the income generated in the first 4 years if $r = 6\%$.

SOLUTION $PV = \int_0^{4} 70{,}000e^{0.05t}e^{-0.06t}\,dt = -\frac{70{,}000}{0.01}e^{-0.01t}\Big|_0^{4} = \$274{,}473.93.$

49. Show that an investment that pays out R dollars per year continuously for T years has a PV of $R(1 - e^{-rT})/r$.

SOLUTION The present value of an investment that pays out R dollars/year continuously for T years is

$$PV = \int_0^{T} Re^{-rt}\,dt.$$

Let $u = -rt,\ du = -r\,dt$. Then

$$PV = -\frac{1}{r}\int_0^{-rT} Re^{u}\,du = -\frac{R}{r}e^{u}\Big|_0^{-rT} = -\frac{R}{r}(e^{-rT} - 1) = \frac{R}{r}(1 - e^{-rT}).$$

50. Explain this statement: If T is very large, then the PV of the income stream described in Exercise 49 is approximately R/r.

SOLUTION Because

$$\lim_{T\to\infty} e^{-rT} = \lim_{T\to\infty}\frac{1}{e^{rt}} = 0,$$

it follows that

$$\lim_{T\to\infty}\frac{R}{r}(1 - e^{-rT}) = \frac{R}{r}.$$

51. Suppose that $r = 0.06$. Use the result of Exercise 50 to estimate the payout rate R needed to produce an income stream whose PV is \$20,000, assuming that the stream continues for a large number of years.

SOLUTION From Exercise 50, $PV = \frac{R}{r}$ so $20{,}000 = \frac{R}{0.06}$ or $R = \$1200$.

52. Verify by differentiation:

$$\int te^{-rt}\,dt = -\frac{e^{-rt}(1 + rt)}{r^2} + C \qquad \boxed{5}$$

Use Eq. (5) to compute the PV of an investment that pays out income continuously at a rate $R(t) = (5000 + 1000t)$ dollars per year for 5 years, assuming $r = 0.05$.

SOLUTION

$$\frac{d}{dt}\left(-\frac{e^{-rt}(1 + rt)}{r^2}\right) = \frac{-1}{r^2}\left(e^{-rt}(r) + (1 + rt)(-re^{-rt})\right) = \frac{-1}{r}\left(e^{-rt} - e^{-rt} - rte^{-rt}\right) = te^{-rt}$$

Therefore

$$\begin{aligned} PV &= \int_0^{5}(5000 + 1000t)e^{-0.05t}\,dt = \int_0^{5} 5000e^{-0.05t}\,dt + \int_0^{5} 1000te^{-0.05t}\,dt \\ &= \frac{5000}{-0.05}(e^{-0.05(5)} - 1) - 1000\left(\frac{e^{-0.05(5)}(1 + 0.05(5))}{(0.05)^2}\right) + 1000\frac{1}{(0.05)^2} \\ &= 22{,}119.92 - 389{,}400.39 + 400{,}000 \approx \$32{,}719.53. \end{aligned}$$

53. Use Eq. (5) to compute the PV of an investment that pays out income continuously at a rate $R(t) = (5000 + 1000t)e^{0.02t}$ dollars per year for 10 years, assuming $r = 0.08$.

SOLUTION

$$\begin{aligned} PV &= \int_0^{10} (5000 + 1000t)(e^{0.02t})e^{-0.08t}\,dt = \int_0^{10} 5000e^{-0.06t}\,dt + \int_0^{10} 1000te^{-0.06t}\,dt \\ &= \frac{5000}{-0.06}(e^{-0.06(10)} - 1) - 1000\left(\frac{e^{-0.06(10)}(1 + 0.06(10))}{(0.06)^2}\right) + 1000\frac{1}{(0.06)^2} \\ &= 37{,}599.03 - 243{,}916.28 + 277{,}777.78 \approx \$71{,}460.53. \end{aligned}$$

54. **Banker's Rule of 70** If you earn an interest rate of R percent, continuously compounded, your money doubles after approximately $70/R$ years. For example, at $R = 5\%$, your money doubles after $70/5$ or 14 years. Use the concept of doubling time to justify the Banker's Rule. (*Note:* Sometimes, the rule $72/R$ is used. It is less accurate but easier to apply because 72 is divisible by more numbers than 70.)

SOLUTION The doubling time is

$$t = \frac{\ln 2}{r} = \frac{\ln 2 \cdot 100}{r\%} = \frac{69.93}{r\%} \approx \frac{70}{r\%}.$$

55. **Drug Dosing Interval** Let $y(t)$ be the drug concentration (in mg/kg) in a patient's body at time t. The initial concentration is $y(0) = L$. Additional doses that increase the concentration by an amount d are administered at regular time intervals of length T. In between doses, $y(t)$ decays exponentially—that is, $y' = -ky$. Find the value of T (in terms of k and d) for which the the concentration varies between L and $L - d$ as in Figure 15.

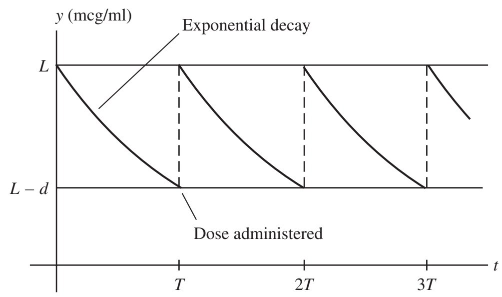


FIGURE 15 Drug concentration with periodic doses.

SOLUTION Because $y' = -ky$ and $y(0) = L$, it follows that $y(t) = Le^{-kt}$. We want $y(T) = L - d$, thus

$$Le^{-kT} = L - d \quad \text{or} \quad T = -\frac{1}{k}\ln\left(1 - \frac{d}{L}\right).$$

Exercises 56 and 57: The ***Gompertz differential equation***

$$\frac{dy}{dt} = ky\ln\left(\frac{y}{M}\right) \qquad \boxed{6}$$

(where M and k are constants) was introduced in 1825 by the English mathematician Benjamin Gompertz and is still used today to model aging and mortality.

56. Show that $y = Me^{ae^{kt}}$ satisfies Eq. (6) for any constant a.

SOLUTION Let $y = Me^{ae^{kt}}$. Then

$$\frac{dy}{dt} = M(kae^{kt})e^{ae^{kt}}$$

and, since

$$\ln(y/M) = ae^{kt},$$

we have

$$ky\ln(y/M) = Mkae^{kt}e^{ae^{kt}} = \frac{dy}{dt}.$$

57. To model mortality in a population of 200 laboratory rats, a scientist assumes that the number $P(t)$ of rats alive at time t (in months) satisfies Eq. (6) with $M = 204$ and $k = 0.15$ month^{-1} (Figure 16). Find $P(t)$ [note that $P(0) = 200$] and determine the population after 20 months.

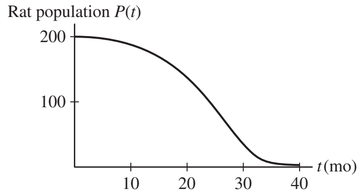

FIGURE 16

SOLUTION The solution to the Gompertz equation with $M = 204$ and $k = 0.15$ is of the form:

$$P(t) = 204e^{ae^{0.15t}}$$

Applying the initial condition allows us to solve for a:

$$200 = 204e^{a}$$
$$\frac{200}{204} = e^{a}$$
$$\ln\left(\frac{200}{204}\right) = a$$

so that $a \approx -0.02$. After $t = 20$ months,

$$P(20) = 204e^{-0.02e^{0.15(20)}} = 136.51,$$

so there are 136 rats.

58. **Isotopes for Dating** Which of the following would be most suitable for dating extremely old rocks: carbon-14 (half-life 5570 years), lead-210 (half-life 22.26 years), or potassium-49 (half-life 1.3 billion years)? Explain why.

SOLUTION For extremely old rocks, you need to have an isotope that decays very slowly. In other words, you want a very large half-life such as Potassium-49; otherwise, the amount of undecayed isotope in the rock sample would be too small to accurately measure.

59. Let $P = P(t)$ be a quantity that obeys an exponential growth law with growth constant k. Show that P increases m-fold after an interval of $(\ln m)/k$ years.

SOLUTION For m-fold growth, $P(t) = mP_0$ for some t. Solving $mP_0 = P_0e^{kt}$ for t, we find $t = \dfrac{\ln m}{k}$

Further Insights and Challenges

60. **Average Time of Decay** Physicists use the radioactive decay law $R = R_0e^{-kt}$ to compute the average or *mean time* M until an atom decays. Let $F(t) = R/R_0 = e^{-kt}$ be the fraction of atoms that have survived to time t without decaying.

(a) Find the inverse function $t(F)$.

(b) By definition of $t(F)$, a fraction $1/N$ of atoms decays in the time interval

$$\left[t\left(\frac{j}{N}\right), t\left(\frac{j-1}{N}\right)\right]$$

Use this to justify the approximation $M \approx \dfrac{1}{N}\displaystyle\sum_{j=1}^{N} t\left(\frac{j}{N}\right)$. Then argue, by passing to the limit as $N \to \infty$, that $M = \int_0^1 t(F)\,dF$. Strictly speaking, this is an *improper integral* because $t(0)$ is infinite (it takes an infinite amount of time for all atoms to decay). Therefore, we define M as a limit

$$M = \lim_{c\to 0}\int_c^1 t(F)\,dF$$

(c) Verify the formula $\int \ln x\,dx = x\ln x - x$ by differentiation and use it to show that for $c > 0$,

$$M = \lim_{c\to 0}\left(\frac{1}{k} + \frac{1}{k}(c\ln c - c)\right)$$

(d) Show that $M = 1/k$ by evaluating the limit (use L'Hôpital's Rule to compute $\lim_{c\to 0} c \ln c$).

(e) What is the mean time to decay for radon (with a half-life of 3.825 days)?

SOLUTION

(a) $F = e^{-kt}$ so $\ln F = -kt$ and $t(F) = \dfrac{\ln F}{-k}$

(b) $M \approx \dfrac{1}{N} \sum_{j=1}^{N} t(j/N)$. For the interval [0, 1], from the approximation given, the subinterval length is $1/N$ and thus the right-hand endpoints have x-coordinate (j/N). Thus we have a Riemann sum and by definition,

$$\lim_{N\to\infty} \frac{1}{N} \sum_{j=1}^{N} t(j/N) = \int_0^1 t(F)dF.$$

(c) $\dfrac{d}{dx}(x \ln x - x) = x\left(\dfrac{1}{x}\right) + \ln x - 1 = \ln x$. Thus

$$\begin{aligned}\int_c^1 t(F)\,dF &= -\frac{1}{k}(F \ln F - F)\Big|_c^1 = \frac{1}{k}(F - F\ln F)\Big|_c^1 \\ &= \frac{1}{k}(1 - 1\ln 1 - (c - c\ln c)) \\ &= \frac{1}{k} + \frac{1}{k}(c \ln c - c).\end{aligned}$$

(d) By, L'Hôpital's Rule,

$$\lim_{c\to 0+} c \ln c = \lim_{c\to 0+} \frac{\ln c}{c^{-1}} = \lim_{c\to 0+} \frac{c^{-1}}{-c^{-2}} = -\lim_{c\to 0+} c = 0.$$

Thus, $M = \lim_{c\to 0} \displaystyle\int_c^1 t(F)dF = \lim_{c\to 0}\left(\frac{1}{k} + \frac{1}{k}(c\ln c - c)\right) = \frac{1}{k}$.

(e) Since the half-life is 3.825 days, $k = \dfrac{\ln 2}{3.825}$ and $\dfrac{1}{k} = 5.52$. Thus, $M = 5.52$ days.

61. Modify the proof of the relation $e = \lim_{n\to\infty}\left(1 + \frac{1}{n}\right)^n$ given in the text to prove $e^x = \lim_{n\to\infty}\left(1 + \frac{x}{n}\right)^n$. *Hint:* Express $\ln(1 + xn^{-1})$ as an integral and estimate above and below by rectangles.

SOLUTION Start by expressing

$$\ln\left(1 + \frac{x}{n}\right) = \int_1^{1+x/n} \frac{dt}{t}.$$

Following the proof in the text, we note that

$$\frac{x}{n+x} \le \ln\left(1 + \frac{x}{n}\right) \le \frac{x}{n}$$

provided $x > 0$, while

$$\frac{x}{n} \le \ln\left(1 + \frac{x}{n}\right) \le \frac{x}{n+x}$$

when $x < 0$. Multiplying both sets of inequalities by n and passing to the limit as $n \to \infty$, the squeeze theorem guarantees that

$$\lim_{n\to\infty}\left(\ln\left(1 + \frac{x}{n}\right)\right)^n = x.$$

Finally,

$$\lim_{n\to\infty}\left(1 + \frac{x}{n}\right)^n = e^x.$$

62. Prove that, for $n > 0$,

$$\left(1 + \frac{1}{n}\right)^n \le e \le \left(1 + \frac{1}{n}\right)^{n+1}$$

Hint: Take logarithms and use Eq. (4).

SOLUTION Taking logarithms throughout the desired inequality, we find the equivalent inequality

$$n \ln\left(1 + \frac{1}{n}\right) \le 1 \le (n+1)\ln\left(1 + \frac{1}{n}\right).$$

Multiplying Eq. (4) by n yields

$$\frac{n}{n+1} \le n \ln\left(1 + \frac{1}{n}\right) \le 1,$$

which establishes the left-hand side of the desired inequality. On the other hand, multiplying Eq. (4) by $n+1$ yields

$$1 \le (n+1)\ln\left(1 + \frac{1}{n}\right) \le 1 + \frac{1}{n},$$

which establishes the right-hand side of the desired inequality.

63. A bank pays interest at the rate r, compounded M times yearly. The **effective interest rate** r_e is the rate at which interest, if compounded annually, would have to be paid to produce the same yearly return.

(a) Find r_e if $r = 9\%$ compounded monthly.

(b) Show that $r_e = (1 + r/M)^M - 1$ and that $r_e = e^r - 1$ if interest is compounded continuously.

(c) Find r_e if $r = 11\%$ compounded continuously.

(d) Find the rate r that, compounded weekly, would yield an effective rate of 20%.

SOLUTION

(a) Compounded monthly, $P(t) = P_0(1 + r/12)^{12t}$. By the definition of r_e,

$$P_0(1 + 0.09/12)^{12t} = P_0(1 + r_e)^t$$

so

$$(1 + 0.09/12)^{12t} = (1 + r_e)^t \quad \text{or} \quad r_e = (1 + 0.09/12)^{12} - 1 = 0.0938,$$

or 9.38%

(b) In general,

$$P_0(1 + r/M)^{Mt} = P_0(1 + r_e)^t,$$

so $(1 + r/M)^{Mt} = (1 + r_e)^t$ or $r_e = (1 + r/M)^M - 1$. If interest is compounded continuously, then $P_0 e^{rt} = P_0(1 + r_e)^t$ so $e^{rt} = (1 + r_e)^t$ or $r_e = e^r - 1$.

(c) Using part (b), $r_e = e^{0.11} - 1 \approx 0.1163$ or 11.63%.

(d) Solving

$$0.20 = \left(1 + \frac{r}{52}\right)^{52} - 1$$

for r yields $r = 52(1.2^{1/52} - 1) = 0.1826$ or 18.26%.

CHAPTER REVIEW EXERCISES

In Exercises 1–4, refer to the function $f(x)$ whose graph is shown in Figure 1.

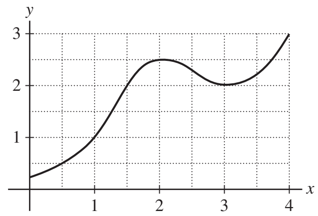

FIGURE 1

1. Estimate L_4 and M_4 on [0, 4].

SOLUTION With $n = 4$ and an interval of [0, 4], $\Delta x = \frac{4-0}{4} = 1$. Then,

$$L_4 = \Delta x(f(0) + f(1) + f(2) + f(3)) = 1\left(\frac{1}{4} + 1 + \frac{5}{2} + 2\right) = \frac{23}{4}$$

and

$$M_4 = \Delta x\left(f\left(\frac{1}{2}\right) + f\left(\frac{3}{2}\right) + f\left(\frac{5}{2}\right) + f\left(\frac{7}{2}\right)\right) = 1\left(\frac{1}{2} + 2 + \frac{9}{4} + \frac{9}{4}\right) = 7.$$

2. Estimate R_4, L_4, and M_4 on [1, 3].

SOLUTION With $n = 4$ and an interval of [1, 3], $\Delta x = \frac{3-1}{4} = \frac{1}{2}$. Then,

$$R_4 = \Delta x\left(f\left(\frac{3}{2}\right) + f(2) + f\left(\frac{5}{2}\right) + f(3)\right) = \frac{1}{2}\left(2 + \frac{5}{2} + \frac{9}{4} + 2\right) = \frac{35}{8};$$

$$L_4 = \Delta x\left(f(1) + f\left(\frac{3}{2}\right) + f(2) + f\left(\frac{5}{2}\right)\right) = \frac{1}{2}\left(1 + 2 + \frac{5}{2} + \frac{9}{4}\right) = \frac{31}{8}; \text{ and}$$

$$M_4 = \Delta x\left(f\left(\frac{5}{4}\right) + f\left(\frac{7}{4}\right) + f\left(\frac{9}{4}\right) + f\left(\frac{11}{4}\right)\right) = \frac{1}{2}\left(\frac{3}{2} + \frac{9}{4} + \frac{5}{2} + \frac{17}{8}\right) = \frac{67}{16}.$$

3. Find an interval $[a, b]$ on which R_4 is larger than $\int_a^b f(x)\,dx$. Do the same for L_4.

SOLUTION In general, R_N is larger than $\int_a^b f(x)\,dx$ on any interval $[a, b]$ over which $f(x)$ is increasing. Given the graph of $f(x)$, we may take $[a, b] = [0, 2]$. In order for L_4 to be larger than $\int_a^b f(x)\,dx$, $f(x)$ must be decreasing over the interval $[a, b]$. We may therefore take $[a, b] = [2, 3]$.

4. Justify $\frac{3}{2} \le \int_1^2 f(x)\,dx \le \frac{9}{4}$.

SOLUTION Because $f(x)$ is increasing on [1, 2], we know that

$$L_N \le \int_1^2 f(x)\,dx \le R_N$$

for any N. Now,

$$L_2 = \frac{1}{2}(1+2) = \frac{3}{2} \qquad \text{and} \qquad R_2 = \frac{1}{2}\left(2 + \frac{5}{2}\right) = \frac{9}{4},$$

so

$$\frac{3}{2} \le \int_1^2 f(x)\,dx \le \frac{9}{4}.$$

In Exercises 5–8, let $f(x) = x^2 + 3x$.

5. Calculate R_6, M_6, and L_6 for $f(x)$ on the interval [2, 5]. Sketch the graph of $f(x)$ and the corresponding rectangles for each approximation.

SOLUTION Let $f(x) = x^2 + 3x$. A uniform partition of [2, 5] with $N = 6$ subintervals has

$$\Delta x = \frac{5-2}{6} = \frac{1}{2}, \qquad x_j = a + j\Delta x = 2 + \frac{j}{2},$$

and

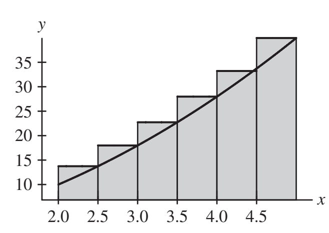
$$x_j^* = a + \left(j - \frac{1}{2}\right)\Delta x = \frac{7}{4} + \frac{j}{2}.$$

Now,

$$R_6 = \Delta x \sum_{j=1}^{6} f(x_j) = \frac{1}{2}\left(f\left(\frac{5}{2}\right) + f(3) + f\left(\frac{7}{2}\right) + f(4) + f\left(\frac{9}{2}\right) + f(5)\right)$$

$$= \frac{1}{2}\left(\frac{55}{4} + 18 + \frac{91}{4} + 28 + \frac{135}{4} + 40\right) = \frac{625}{8}.$$

The rectangles corresponding to this approximation are shown below.

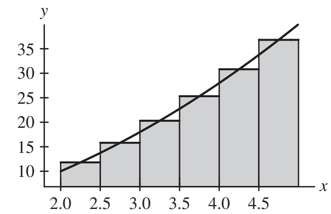


Next,

$$M_6 = \Delta x \sum_{j=1}^{6} f(x_j^*) = \frac{1}{2}\left(f\left(\frac{9}{4}\right) + f\left(\frac{11}{4}\right) + f\left(\frac{13}{4}\right) + f\left(\frac{15}{4}\right) + f\left(\frac{17}{4}\right) + f\left(\frac{19}{4}\right)\right)$$

$$= \frac{1}{2}\left(\frac{189}{16} + \frac{253}{16} + \frac{325}{16} + \frac{405}{16} + \frac{493}{16} + \frac{589}{16}\right) = \frac{2254}{32} = \frac{1127}{16}.$$

The rectangles corresponding to this approximation are shown below.

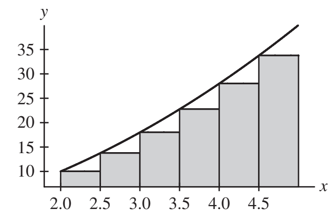


Finally,

$$L_6 = \Delta x \sum_{j=0}^{5} f(x_j) = \frac{1}{2}\left(f(2) + f\left(\frac{5}{2}\right) + f(3) + f\left(\frac{7}{2}\right) + f(4) + f\left(\frac{9}{2}\right)\right)$$

$$= \frac{1}{2}\left(10 + \frac{55}{4} + 18 + \frac{91}{4} + 28 + \frac{135}{4}\right) = \frac{505}{8}.$$

The rectangles corresponding to this approximation are shown below.



6. Use FTC I to evaluate $A(x) = \int_{-2}^{x} f(t)\,dt$.

SOLUTION Let $f(x) = x^2 + 3x$. Then

$$A(x) = \int_{-2}^{x} (t^2 + 3t)\,dt = \left(\frac{1}{3}t^3 + \frac{3}{2}t^2\right)\Big|_{-2}^{x} = \frac{1}{3}x^3 + \frac{3}{2}x^2 - \left(-\frac{8}{3} + 6\right) = \frac{1}{3}x^3 + \frac{3}{2}x^2 - \frac{10}{3}.$$

7. Find a formula for R_N for $f(x)$ on [2, 5] and compute $\int_2^5 f(x)\,dx$ by taking the limit.

SOLUTION Let $f(x) = x^2 + 3x$ on the interval [2, 5]. Then $\Delta x = \frac{5-2}{N} = \frac{3}{N}$ and $a = 2$. Hence,

$$R_N = \Delta x \sum_{j=1}^{N} f(2 + j\Delta x) = \frac{3}{N}\sum_{j=1}^{N}\left(\left(2 + \frac{3j}{N}\right)^2 + 3\left(2 + \frac{3j}{N}\right)\right) = \frac{3}{N}\sum_{j=1}^{N}\left(10 + \frac{21j}{N} + \frac{9j^2}{N^2}\right)$$

$$= 30 + \frac{63}{N^2}\sum_{j=1}^{N} j + \frac{27}{N^3}\sum_{j=1}^{N} j^2$$

$$= 30 + \frac{63}{N^2}\left(\frac{N^2}{2} + \frac{N}{2}\right) + \frac{27}{N^3}\left(\frac{N^3}{3} + \frac{N^2}{2} + \frac{N}{6}\right)$$

$$= \frac{141}{2} + \frac{45}{N} + \frac{9}{2N^2}$$

and

$$\lim_{N\to\infty} R_N = \lim_{N\to\infty}\left(\frac{141}{2} + \frac{45}{N} + \frac{9}{2N^2}\right) = \frac{141}{2}.$$

8. Find a formula for L_N for $f(x)$ on [0, 2] and compute $\int_0^2 f(x)\,dx$ by taking the limit.

SOLUTION Let $f(x) = x^2 + 3x$ and N be a positive integer. Then

$$\Delta x = \frac{2-0}{N} = \frac{2}{N}$$

and

$$x_j = a + j\Delta x = 0 + \frac{2j}{N} = \frac{2j}{N}$$

for $0 \le j \le N$. Thus,

$$L_N = \Delta x \sum_{j=0}^{N-1} f(x_j) = \frac{2}{N}\sum_{j=0}^{N-1}\left(\frac{4j^2}{N^2} + \frac{6j}{N}\right) = \frac{8}{N^3}\sum_{j=0}^{N-1} j^2 + \frac{12}{N^2}\sum_{j=0}^{N-1} j$$
$$= \frac{4(N-1)(2N-1)}{3N^2} + \frac{6(N-1)}{N} = \frac{26}{3} - \frac{10}{N} + \frac{4}{3N^2}.$$

Finally,

$$\int_0^2 f(x)\,dx = \lim_{N\to\infty}\left(\frac{26}{3} - \frac{10}{N} + \frac{4}{3N^2}\right) = \frac{26}{3}.$$

9. Calculate R_5, M_5, and L_5 for $f(x) = (x^2+1)^{-1}$ on the interval [0, 1].

SOLUTION Let $f(x) = (x^2+1)^{-1}$. A uniform partition of [0, 1] with $N = 5$ subintervals has

$$\Delta x = \frac{1-0}{5} = \frac{1}{5}, \qquad x_j = a + j\Delta x = \frac{j}{5},$$

and

$$x_j^* = a + \left(j - \frac{1}{2}\right)\Delta x = \frac{2j-1}{10}.$$

Now,

$$R_5 = \Delta x \sum_{j=1}^{5} f(x_j) = \frac{1}{5}\left(f\left(\frac{1}{5}\right) + f\left(\frac{2}{5}\right) + f\left(\frac{3}{5}\right) + f\left(\frac{4}{5}\right) + f(1)\right)$$
$$= \frac{1}{5}\left(\frac{25}{26} + \frac{25}{29} + \frac{25}{34} + \frac{25}{41} + \frac{1}{2}\right) \approx 0.733732.$$

Next,

$$M_5 = \Delta x \sum_{j=1}^{5} f(x_j^*) = \frac{1}{5}\left(f\left(\frac{1}{10}\right) + f\left(\frac{3}{10}\right) + f\left(\frac{1}{2}\right) + f\left(\frac{7}{10}\right) + f\left(\frac{9}{10}\right)\right)$$
$$= \frac{1}{5}\left(\frac{100}{101} + \frac{100}{109} + \frac{4}{5} + \frac{100}{149} + \frac{100}{181}\right) \approx 0.786231.$$

Finally,

$$L_5 = \Delta x \sum_{j=0}^{4} f(x_j) = \frac{1}{5}\left(f(0) + f\left(\frac{1}{5}\right) + f\left(\frac{2}{5}\right) + f\left(\frac{3}{5}\right) + f\left(\frac{4}{5}\right)\right)$$
$$= \frac{1}{5}\left(1 + \frac{25}{26} + \frac{25}{29} + \frac{25}{34} + \frac{25}{41}\right) \approx 0.833732.$$

10. Let R_N be the Nth right-endpoint approximation for $f(x) = x^3$ on [0, 4] (Figure 2).

(a) Prove that $R_N = \dfrac{64(N+1)^2}{N^2}$.

(b) Prove that the area of the region within the right-endpoint rectangles above the graph is equal to

$$\frac{64(2N+1)}{N^2}$$

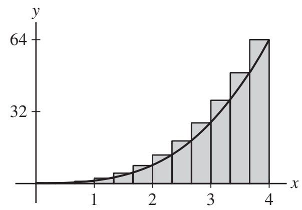


FIGURE 2 Approximation R_N for $f(x) = x^3$ on [0, 4].

SOLUTION

(a) Let $f(x) = x^3$ and N be a positive integer. Then

$$\Delta x = \frac{4-0}{N} = \frac{4}{N} \qquad \text{and} \qquad x_j = a + j\Delta x = 0 + \frac{4j}{N} = \frac{4j}{N}$$

for $0 \le j \le N$. Thus,

$$R_N = \Delta x \sum_{j=1}^{N} f(x_j) = \frac{4}{N}\sum_{j=1}^{N}\frac{64j^3}{N^3} = \frac{256}{N^4}\sum_{j=1}^{N} j^3 = \frac{256}{N^4}\frac{N^2(N+1)^2}{4} = \frac{64(N+1)^2}{N^2}.$$

(b) The area between the graph of $y = x^3$ and the x-axis over [0, 4] is

$$\int_0^4 x^3\,dx = \frac{1}{4}x^4\Big|_0^4 = 64.$$

The area of the region below the right-endpoint rectangles and above the graph is therefore

$$\frac{64(N+1)^2}{N^2} - 64 = \frac{64(2N+1)}{N^2}.$$

11. Which approximation to the area is represented by the shaded rectangles in Figure 3? Compute R_5 and L_5.

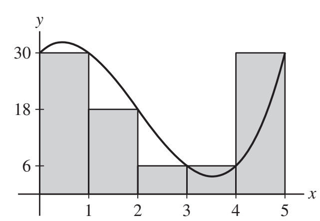

FIGURE 3

SOLUTION There are five rectangles and the height of each is given by the function value at the right endpoint of the subinterval. Thus, the area represented by the shaded rectangles is R_5.

From the figure, we see that $\Delta x = 1$. Then

$$R_5 = 1(30 + 18 + 6 + 6 + 30) = 90 \qquad \text{and} \qquad L_5 = 1(30 + 30 + 18 + 6 + 6) = 90.$$

12. Calculate any two Riemann sums for $f(x) = x^2$ on the interval [2, 5], but choose partitions with at least five subintervals of unequal widths and intermediate points that are neither endpoints nor midpoints.

SOLUTION Let $f(x) = x^2$. Riemann sums will, of course, vary. Here are two possibilities. Take $N = 5$,

$$P = \{x_0 = 2, x_1 = 2.7, x_2 = 3.1, x_3 = 3.6, x_4 = 4.2, x_5 = 5\}$$

and

$$C = \{c_1 = 2.5, c_2 = 3, c_3 = 3.5, c_4 = 4, c_5 = 4.5\}.$$

Then,

$$R(f, P, C) = \sum_{j=1}^{5} \Delta x_j f(c_j) = 0.7(6.25) + 0.4(9) + 0.5(12.25) + 0.6(16) + 0.8(20.25) = 39.9.$$

Alternately, take $N = 6$,

$$P = \{x_0 = 2, x_1 = 2.5, x_2 = 3.5, x_3 = 4, x_4 = 4.25, x_5 = 4.75, x_6 = 5\}$$

and

$$C = \{c_1 = 2.1, c_2 = 3, c_3 = 3.7, c_4 = 4.2, c_5 = 4.5, c_6 = 4.8\}.$$

Then,

$$\begin{aligned} R(f, P, C) &= \sum_{j=1}^{6} \Delta x_j f(c_j) \\ &= 0.5(4.41) + 1(9) + 0.5(13.69) + 0.25(17.64) + 0.5(20.25) + 0.25(23.04) = 38.345. \end{aligned}$$

In Exercises 13–16, express the limit as an integral (or multiple of an integral) and evaluate.

13. $\displaystyle\lim_{N\to\infty} \frac{\pi}{6N} \sum_{j=1}^{N} \sin\left(\frac{\pi}{3} + \frac{\pi j}{6N}\right)$

SOLUTION Let $f(x) = \sin x$ and N be a positive integer. A uniform partition of the interval $[\pi/3, \pi/2]$ with N subintervals has

$$\Delta x = \frac{\pi}{6N} \qquad \text{and} \qquad x_j = \frac{\pi}{3} + \frac{\pi j}{6N}$$

for $0 \le j \le N$. Then

$$\frac{\pi}{6N} \sum_{j=1}^{N} \sin\left(\frac{\pi}{3} + \frac{\pi j}{6N}\right) = \Delta x \sum_{j=1}^{N} f(x_j) = R_N;$$

consequently,

$$\lim_{N\to\infty} \frac{\pi}{6N} \sum_{j=1}^{N} \sin\left(\frac{\pi}{3} + \frac{\pi j}{6N}\right) = \int_{\pi/3}^{\pi/2} \sin x\, dx = -\cos x\Big|_{\pi/3}^{\pi/2} = 0 + \frac{1}{2} = \frac{1}{2}.$$

14. $\displaystyle\lim_{N\to\infty} \frac{3}{N} \sum_{k=0}^{N-1} \left(10 + \frac{3k}{N}\right)$

SOLUTION Let $f(x) = x$ and N be a positive integer. A uniform partition of the interval $[10, 13]$ with N subintervals has

$$\Delta x = \frac{3}{N} \qquad \text{and} \qquad x_j = 10 + \frac{3j}{N}$$

for $0 \le j \le N$. Then

$$\frac{3}{N} \sum_{k=0}^{N-1} \left(10 + \frac{3k}{N}\right) = \Delta x \sum_{j=0}^{N-1} f(x_j) = L_N;$$

consequently,

$$\begin{aligned} \lim_{N\to\infty} \frac{3}{N} \sum_{k=0}^{N-1} \left(10 + \frac{3k}{N}\right) &= \int_{10}^{13} x\, dx = \frac{1}{2}x^2\Big|_{10}^{13} \\ &= \frac{169}{2} - \frac{100}{2} = \frac{69}{2}. \end{aligned}$$

15. $\displaystyle\lim_{N\to\infty} \frac{5}{N}\sum_{j=1}^{N}\sqrt{4+5j/N}$

SOLUTION Let $f(x) = \sqrt{x}$ and N be a positive integer. A uniform partition of the interval [4, 9] with N subintervals has

$$\Delta x = \frac{5}{N} \qquad \text{and} \qquad x_j = 4 + \frac{5j}{N}$$

for $0 \le j \le N$. Then

$$\frac{5}{N}\sum_{j=1}^{N}\sqrt{4+5j/N} = \Delta x \sum_{j=1}^{N} f(x_j) = R_N;$$

consequently,

$$\lim_{N\to\infty}\frac{5}{N}\sum_{j=1}^{N}\sqrt{4+5j/N} = \int_4^9 \sqrt{x}\,dx = \frac{2}{3}x^{3/2}\bigg|_4^9 = \frac{54}{3} - \frac{16}{3} = \frac{38}{3}.$$

16. $\displaystyle\lim_{N\to\infty}\frac{1^k + 2^k + \cdots + N^k}{N^{k+1}} \quad (k > 0)$

SOLUTION Observe that

$$\frac{1^k + 2^k + 3^k + \cdots + N^k}{N^{k+1}} = \frac{1}{N}\left[\left(\frac{1}{N}\right)^k + \left(\frac{2}{N}\right)^k + \left(\frac{3}{N}\right)^k + \cdots \left(\frac{N}{N}\right)^k\right] = \frac{1}{N}\sum_{j=1}^{N}\left(\frac{j}{N}\right)^k.$$

Now, let $f(x) = x^k$ and N be a positive integer. A uniform partition of the interval [0, 1] with N subintervals has

$$\Delta x = \frac{1}{N} \qquad \text{and} \qquad x_j = \frac{j}{N}$$

for $0 \le j \le N$. Then

$$\frac{1}{N}\sum_{j=1}^{N}\left(\frac{j}{N}\right)^k = \Delta x \sum_{j=1}^{N} f(x_j) = R_N;$$

consequently,

$$\lim_{N\to\infty}\frac{1}{N}\sum_{j=1}^{N}\left(\frac{j}{N}\right)^k = \int_0^1 x^k\,dx = \frac{1}{k+1}x^{k+1}\bigg|_0^1 = \frac{1}{k+1}.$$

In Exercises 17–20, use the given substitution to evaluate the integral.

17. $\displaystyle\int_0^2 \frac{dt}{4t+12}, \quad u = 4t + 12$

SOLUTION Let $u = 4t + 12$. Then $du = 4dt$, and the new limits of integration are $u = 12$ and $u = 20$. Thus,

$$\int_0^2 \frac{dt}{4t+12} = \frac{1}{4}\int_{12}^{20}\frac{du}{u} = \frac{1}{4}\ln u\bigg|_{12}^{20} = \frac{1}{4}(\ln 20 - \ln 12) = \frac{1}{4}\ln\frac{20}{12} = \frac{1}{4}\ln\frac{5}{3}.$$

18. $\displaystyle\int \frac{(x^2+1)\,dx}{(x^3+3x)^4}, \qquad u = x^3 + 3x$

SOLUTION Let $u = x^3 + 3x$. Then $du = (3x^2 + 3)\,dx = 3(x^2 + 1)\,dx$ and

$$\int \frac{(x^2+1)\,dx}{(x^3+3x)^4} = \frac{1}{3}\int u^{-4}\,du = -\frac{1}{9}u^{-3} + C = -\frac{1}{9}(x^3+3x)^{-3} + C.$$

19. $\int_0^{\pi/6} \sin x \cos^4 x\, dx, \qquad u = \cos x$

SOLUTION Let $u = \cos x$. Then $du = -\sin x\, dx$ and the new limits of integration are $u = 1$ and $u = \sqrt{3}/2$. Thus,

$$\begin{aligned}\int_0^{\pi/6} \sin x \cos^4 x\, dx &= -\int_1^{\sqrt{3}/2} u^4\, du \\ &= -\frac{1}{5}u^5\Big|_1^{\sqrt{3}/2} \\ &= \frac{1}{5}\left(1 - \frac{9\sqrt{3}}{32}\right).\end{aligned}$$

20. $\int \sec^2(2\theta)\tan(2\theta)\, d\theta, \quad u = \tan(2\theta)$

SOLUTION Let $u = \tan(2\theta)$. Then $du = 2\sec^2(2\theta)\, d\theta$ and

$$\int \sec^2(2\theta)\tan(2\theta)\, d\theta = \frac{1}{2}\int u\, du = \frac{1}{4}u^2 + C = \frac{1}{4}\tan^2(2\theta) + C.$$

In Exercises 21–70, evaluate the integral.

21. $\int (20x^4 - 9x^3 - 2x)\, dx$

SOLUTION $\int (20x^4 - 9x^3 - 2x)\, dx = 4x^5 - \frac{9}{4}x^4 - x^2 + C.$

22. $\int_0^2 (12x^3 - 3x^2)\, dx$

SOLUTION $\int_0^2 (12x^3 - 3x^2)\, dx = (3x^4 - x^3)\Big|_0^2 = (48 - 8) - 0 = 40.$

23. $\int (2x^2 - 3x)^2\, dx$

SOLUTION $\int (2x^2 - 3x)^2\, dx = \int (4x^4 - 12x^3 + 9x^2)\, dx = \frac{4}{5}x^5 - 3x^4 + 3x^3 + C.$

24. $\int_0^1 (x^{7/3} - 2x^{1/4})\, dx$

SOLUTION $\int_0^1 (x^{7/3} - 2x^{1/4})\, dx = \left(\frac{3}{10}x^{10/3} - \frac{8}{5}x^{5/4}\right)\Big|_0^1 = \frac{3}{10} - \frac{8}{5} = -\frac{13}{10}.$

25. $\int \frac{x^5 + 3x^4}{x^2}\, dx$

SOLUTION $\int \frac{x^5 + 3x^4}{x^2}\, dx = \int (x^3 + 3x^2)\, dx = \frac{1}{4}x^4 + x^3 + C.$

26. $\int_1^3 r^{-4}\, dr$

SOLUTION $\int_1^3 r^{-4}\, dr = -\frac{1}{3}r^{-3}\Big|_1^3 = -\frac{1}{3}\left(\frac{1}{27} - 1\right) = \frac{26}{81}.$

27. $\int_{-3}^{3} |x^2 - 4|\, dx$

SOLUTION

$$\begin{aligned}\int_{-3}^{3} |x^2 - 4|\, dx &= \int_{-3}^{2} (x^2 - 4)\, dx + \int_{-2}^{2} (4 - x^2)\, dx + \int_{2}^{3} (x^2 - 4)\, dx \\ &= \left(\frac{1}{3}x^3 - 4x\right)\Big|_{-3}^{-2} + \left(4x - \frac{1}{3}x^3\right)\Big|_{-2}^{2} + \left(\frac{1}{3}x^3 - 4x\right)\Big|_{2}^{3} \\ &= \left(\frac{16}{3} - 3\right) + \left(\frac{16}{3} + \frac{16}{3}\right) + \left(-3 + \frac{16}{3}\right) \\ &= \frac{46}{3}.\end{aligned}$$

28. $\int_{-2}^{4} |(x - 1)(x - 3)|\, dx$

SOLUTION

$$\begin{aligned}\int_{-2}^{4} |(x - 1)(x - 3)|\, dx &= \int_{-2}^{1} (x^2 - 4x + 3)\, dx + \int_{1}^{3} (-x^2 + 4x - 3)\, dx + \int_{3}^{4} (x^2 - 4x + 3)\, dx \\ &= \left(\frac{1}{3}x^3 - 2x^2 + 3x\right)\Big|_{-2}^{1} + \left(-\frac{1}{3}x^3 + 2x^2 - 3x\right)\Big|_{1}^{3} + \left(\frac{1}{3}x^3 - 2x^2 + 3x\right)\Big|_{3}^{4} \\ &= \frac{4}{3} - \left(-\frac{50}{3}\right) + 0 - \left(-\frac{4}{3}\right) + \frac{4}{3} - 0 \\ &= \frac{62}{3}.\end{aligned}$$

29. $\int_{1}^{3} [t]\, dt$

SOLUTION

$$\int_{1}^{3} [t]\, dt = \int_{1}^{2} [t]\, dt + \int_{2}^{3} [t]\, dt = \int_{1}^{2} dt + \int_{2}^{3} 2\, dt = t\Big|_{1}^{2} + 2t\Big|_{2}^{3} = (2 - 1) + (6 - 4) = 3.$$

30. $\int_{0}^{2} (t - [t])^2\, dt$

SOLUTION

$$\begin{aligned}\int_{0}^{2} (t - [t])^2\, dt &= \int_{0}^{1} t^2\, dt + \int_{1}^{2} (t - 1)^2\, dt \\ &= \frac{1}{3}t^3\Big|_{0}^{1} + \frac{1}{3}(t - 1)^3\Big|_{1}^{2} \\ &= \frac{1}{3} + \frac{1}{3} = \frac{2}{3}.\end{aligned}$$

31. $\int (10t - 7)^{14}\, dt$

SOLUTION Let $u = 10t - 7$. Then $du = 10dt$ and

$$\int (10t - 7)^{14}\, dt = \frac{1}{10} \int u^{14}\, du = \frac{1}{150}u^{15} + C = \frac{1}{150}(10t - 7)^{15} + C.$$

32. $\int_{2}^{3} \sqrt{7y - 5}\, dy$

SOLUTION Let $u = 7y - 5$. Then $du = 7dy$ and when $y = 2$, $u = 9$ and when $y = 3$, $u = 16$. Finally,

$$\int_{2}^{3} \sqrt{7y - 5}\, dy = \frac{1}{7} \int_{9}^{16} u^{1/2}\, du = \frac{1}{7} \cdot \frac{2}{3}u^{3/2}\Big|_{9}^{16} = \frac{2}{21}(64 - 27) = \frac{74}{21}.$$

33. $\displaystyle\int \frac{(2x^3+3x)\,dx}{(3x^4+9x^2)^5}$

SOLUTION Let $u = 3x^4 + 9x^2$. Then $du = (12x^3 + 18x)\,dx = 6(2x^3 + 3x)\,dx$ and

$$\int \frac{(2x^3+3x)\,dx}{(3x^4+9x^2)^5} = \frac{1}{6}\int u^{-5}\,du = -\frac{1}{24}u^{-4} + C = -\frac{1}{24}(3x^4+9x^2)^{-4} + C.$$

34. $\displaystyle\int_{-3}^{-1} \frac{x\,dx}{(x^2+5)^2}$

SOLUTION Let $u = x^2 + 5$. Then $du = 2x\,dx$ and

$$\begin{aligned}\int_{-3}^{-1} \frac{x\,dx}{(x^2+5)^2} &= \frac{1}{2}\int_{14}^{6} u^{-2}\,du = -\frac{1}{2}u^{-1}\Big|_{14}^{6}\\ &= -\frac{1}{2}\left(\frac{1}{6}-\frac{1}{14}\right) = -\frac{1}{21}.\end{aligned}$$

35. $\displaystyle\int_0^5 15x\sqrt{x+4}\,dx$

SOLUTION Let $u = x + 4$. Then $x = u - 4$, $du = dx$ and the new limits of integration are $u = 4$ and $u = 9$. Thus,

$$\begin{aligned}\int_0^5 15x\sqrt{x+4}\,dx &= \int_4^9 15(u-4)\sqrt{u}\,du\\ &= 15\int_4^9 (u^{3/2} - 4u^{1/2})\,du\\ &= 15\left(\frac{2}{5}u^{5/2} - \frac{8}{3}u^{3/2}\right)\Big|_4^9\\ &= 15\left(\left(\frac{486}{5} - 72\right) - \left(\frac{64}{5} - \frac{64}{3}\right)\right)\\ &= 506.\end{aligned}$$

36. $\displaystyle\int t^2\sqrt{t+8}\,dt$

SOLUTION Let $u = t + 8$. Then $du = dt$, $t = u - 8$, and

$$\begin{aligned}\int t^2\sqrt{t+8}\,dt = \int (u-8)^2\sqrt{u}\,du &= \int (u^{5/2} - 16u^{3/2} + 64u^{1/2})\,du\\ &= \frac{2}{7}u^{7/2} - \frac{32}{5}u^{5/2} + \frac{128}{3}u^{3/2} + C\\ &= \frac{2}{7}(t+8)^{7/2} - \frac{32}{5}(t+8)^{5/2} + \frac{128}{3}(t+8)^{3/2} + C.\end{aligned}$$

37. $\displaystyle\int_0^1 \cos\left(\frac{\pi}{3}(t+2)\right)\,dt$

SOLUTION $\displaystyle\int_0^1 \cos\left(\frac{\pi}{3}(t+2)\right)\,dt = \frac{3}{\pi}\sin\left(\frac{\pi}{3}(t+2)\right)\Big|_0^1 = -\frac{3\sqrt{3}}{2\pi}.$

38. $\displaystyle\int_{\pi/2}^{\pi} \sin\left(\frac{5\theta-\pi}{6}\right)\,d\theta$

SOLUTION Let

$$u = \frac{5\theta - \pi}{6} \quad \text{so that} \quad du = \frac{5}{6}d\theta.$$

Then

$$\begin{aligned}\int_{\pi/2}^{\pi} \sin\left(\frac{5\theta-\pi}{6}\right)\,d\theta &= \frac{6}{5}\int_{\pi/4}^{2\pi/3} \sin u\,du\\ &= -\frac{6}{5}\cos u\Big|_{\pi/4}^{2\pi} 3\\ &= -\frac{6}{5}\left(-\frac{1}{2} - \frac{\sqrt{2}}{2}\right) = \frac{3}{5}(1+\sqrt{2}).\end{aligned}$$

39. $\int t^2 \sec^2(9t^3+1)\,dt$

SOLUTION Let $u = 9t^3 + 1$. Then $du = 27t^2\,dt$ and

$$\int t^2 \sec^2(9t^3+1)\,dt = \frac{1}{27}\int \sec^2 u\,du = \frac{1}{27}\tan u + C = \frac{1}{27}\tan(9t^3+1) + C.$$

40. $\int \sin^2(3\theta)\cos(3\theta)\,d\theta$

SOLUTION Let $u = \sin(3\theta)$. Then $du = 3\cos(3\theta)d\theta$ and

$$\int \sin^2(3\theta)\cos(3\theta)\,d\theta = \frac{1}{3}\int u^2\,du = \frac{1}{9}u^3 + C = \frac{1}{9}\sin^3(3\theta) + C.$$

41. $\int \csc^2(9-2\theta)\,d\theta$

SOLUTION Let $u = 9 - 2\theta$. Then $du = -2\,d\theta$ and

$$\int \csc^2(9-2\theta)\,d\theta = -\frac{1}{2}\int \csc^2 u\,du = \frac{1}{2}\cot u + C = \frac{1}{2}\cot(9-2\theta) + C.$$

42. $\int \sin\theta\sqrt{4-\cos\theta}\,d\theta$

SOLUTION Let $u = 4 - \cos\theta$. Then $du = \sin\theta\,d\theta$ and

$$\int \sin\theta\sqrt{4-\cos\theta}\,d\theta = \int u^{1/2}\,du = \frac{2}{3}u^{3/2} + C = \frac{2}{3}(4-\cos\theta)^{3/2} + C.$$

43. $\int_0^{\pi/3} \frac{\sin\theta}{\cos^{2/3}\theta}\,d\theta$

SOLUTION Let $u = \cos\theta$. Then $du = -\sin\theta\,d\theta$ and when $\theta = 0$, $u = 1$ and when $\theta = \frac{\pi}{3}$, $u = \frac{1}{2}$. Finally,

$$\int_0^{\pi/3} \frac{\sin\theta}{\cos^{2/3}\theta}\,d\theta = -\int_1^{1/2} u^{-2/3}\,du = -3u^{1/3}\Big|_1^{1/2} = -3(2^{-1/3}-1) = 3 - \frac{3\sqrt[3]{4}}{2}.$$

44. $\int \frac{\sec^2 t\,dt}{(\tan t - 1)^2}$

SOLUTION Let $u = \tan t - 1$. Then $du = \sec^2 t\,dt$ and

$$\int \frac{\sec^2 t\,dt}{(\tan t - 1)^2} = \int u^{-2}\,du = -u^{-1} + C = -\frac{1}{\tan t - 1} + C.$$

45. $\int e^{9-2x}\,dx$

SOLUTION Let $u = 9 - 2x$. Then $du = -2\,dx$, and

$$\int e^{9-2x}\,dx = -\frac{1}{2}\int e^u\,du = -\frac{1}{2}e^u + C = -\frac{1}{2}e^{9-2x} + C.$$

46. $\int_1^3 e^{4x-3}\,dx$

SOLUTION $\int_1^3 e^{4x-3}\,dx = \frac{1}{4}e^{4x-3}\Big|_1^3 = \frac{1}{4}(e^9 - e).$

47. $\int x^2 e^{x^3}\,dx$

SOLUTION Let $u = x^3$. Then $du = 3x^2\,dx$, and

$$\int x^2 e^{x^3}\,dx = \frac{1}{3}\int e^u du = \frac{1}{3}e^u + C = \frac{1}{3}e^{x^3} + C.$$

48. $\int_0^{\ln 3} e^{x-e^x}\,dx$

SOLUTION Note $e^{x-e^x} = e^x e^{-e^x}$. Now, let $u = e^x$. Then $du = e^x\,dx$, and the new limits of integration are $u = e^0 = 1$ and $u = e^{\ln 3} = 3$. Thus,

$$\int_0^{\ln 3} e^{x-e^x}\,dx = \int_0^{\ln 3} e^x e^{-e^x}\,dx = \int_1^3 e^{-u}\,du = -e^{-t}\Big|_1^3 = -(e^{-3} - e^{-1}) = e^{-1} - e^{-3}.$$

49. $\int e^x 10^x\,dx$

SOLUTION $\int e^x 10^x\,dx = \int (10e)^x\,dx = \dfrac{(10e)^x}{\ln(10e)} + C = \dfrac{(10e)^x}{\ln 10 + \ln e} + C = \dfrac{10^x e^x}{\ln 10 + 1} + C.$

50. $\int e^{-2x}\sin(e^{-2x})\,dx$

SOLUTION Let $u = e^{-2x}$. Then $du = -2e^{-2x}dx$, and

$$\int e^{-2x}\sin\left(e^{-2x}\right)\,dx = -\frac{1}{2}\int \sin u\,du = \frac{\cos u}{2} + C = \frac{1}{2}\cos\left(e^{-2x}\right) + C.$$

51. $\int \dfrac{e^{-x}\,dx}{(e^{-x}+2)^3}$

SOLUTION Let $u = e^{-x} + 2$. Then $du = -e^{-x}\,dx$ and

$$\int \frac{e^{-x}\,dx}{(e^{-x}+2)^3} = -\int u^{-3}\,du = \frac{1}{2u^2} + C = \frac{1}{2(e^{-x}+2)^2} + C.$$

52. $\int \sin\theta\cos\theta e^{\cos^2\theta+1}\,d\theta$

SOLUTION Let $u = \cos^2\theta + 1$. Then $du = -2\sin\theta\cos\theta\,d\theta$ and

$$\int \sin\theta\cos\theta e^{\cos^2\theta+1}\,d\theta = -\frac{1}{2}\int e^u\,du = -\frac{1}{2}e^u + C = -\frac{1}{2}e^{\cos^2\theta+1} + C.$$

53. $\int_0^{\pi/6}\tan 2\theta\,d\theta$

SOLUTION $\int_0^{\pi/6}\tan 2\theta\,d\theta = \dfrac{1}{2}\ln|\sec 2\theta|\Big|_0^{\pi/6} = \dfrac{1}{2}\ln 2.$

54. $\int_{\pi/3}^{2\pi/3}\cot\left(\frac{1}{2}\theta\right)\,d\theta$

SOLUTION

$$\begin{aligned}\int_{\pi/3}^{2\pi/3}\cot\left(\frac{1}{2}\theta\right)\,d\theta &= 2\ln\left|\sin\frac{\theta}{2}\right|\Big|_{\pi/3}^{2\pi}3\\ &= 2\left(\ln\sin\frac{\pi}{3} - \ln\sin\frac{\pi}{6}\right)\\ &= 2\left(\ln\frac{\sqrt{3}}{2} - \ln\frac{1}{2}\right) = \ln 3.\end{aligned}$$

55. $\int \dfrac{dt}{t(1+(\ln t)^2)}$

SOLUTION Let $u = \ln t$. Then, $du = \frac{1}{t}\,dt$ and

$$\int \frac{dt}{t(1+(\ln t)^2)} = \int \frac{du}{1+u^2} = \tan^{-1}u + C = \tan^{-1}(\ln t) + C.$$

56. $\displaystyle\int \frac{\cos(\ln x)\,dx}{x}$

SOLUTION Let $u = \ln x$. Then $du = \frac{dx}{x}$, and

$$\int \frac{\cos(\ln x)}{x}dx = \int \cos u\,du = \sin u + C = \sin(\ln x) + C.$$

57. $\displaystyle\int_1^e \frac{\ln x\,dx}{x}$

SOLUTION Let $u = \ln x$. Then $du = \frac{dx}{x}$ and the new limits of integration are $u = \ln 1 = 0$ and $u = \ln e = 1$. Thus,

$$\int_1^e \frac{\ln x\,dx}{x} = \int_0^1 u\,du = \frac{1}{2}u^2\Big|_0^1 = \frac{1}{2}.$$

58. $\displaystyle\int \frac{dx}{x\sqrt{\ln x}}$

SOLUTION Let $u = \ln x$. Then $du = \frac{1}{x}\,dx$, and

$$\int \frac{dx}{x\sqrt{\ln x}} = \int u^{-1/2}\,du = 2\sqrt{u} + C = 2\sqrt{\ln x} + C.$$

59. $\displaystyle\int \frac{dx}{4x^2+9}$

SOLUTION Let $u = \frac{2x}{3}$. Then $x = \frac{3}{2}u$, $dx = \frac{3}{2}\,du$, and

$$\int \frac{dx}{4x^2+9} = \int \frac{\frac{3}{2}\,du}{4\cdot\frac{9}{4}u^2+9} = \frac{1}{6}\int \frac{du}{u^2+1} = \frac{1}{6}\tan^{-1}u + C = \frac{1}{6}\tan^{-1}\left(\frac{2x}{3}\right) + C.$$

60. $\displaystyle\int_0^{0.8} \frac{dx}{\sqrt{1-x^2}}$

SOLUTION $\displaystyle\int_0^{0.8} \frac{dx}{\sqrt{1-x^2}} = \sin^{-1}x\Big|_0^{0.8} = \sin^{-1}0.8 - \sin^{-1}0 = \sin^{-1}0.8.$

61. $\displaystyle\int_4^{12} \frac{dx}{x\sqrt{x^2-1}}$

SOLUTION $\displaystyle\int_4^{12} \frac{dx}{x\sqrt{x^2-1}} = \sec^{-1}x\Big|_4^{12} = \sec^{-1}12 - \sec^{-1}4.$

62. $\displaystyle\int_0^3 \frac{x\,dx}{x^2+9}$

SOLUTION Let $u = x^2 + 9$. Then $du = 2x\,dx$, and the new limits of integration are $u = 9$ and $u = 18$. Thus,

$$\int_0^3 \frac{x\,dx}{x^2+9} = \frac{1}{2}\int_9^{18} \frac{du}{u} = \frac{1}{2}\ln u\Big|_9^{18} = \frac{1}{2}(\ln 18 - \ln 9) = \frac{1}{2}\ln\frac{18}{9} = \frac{1}{2}\ln 2.$$

63. $\displaystyle\int_0^3 \frac{dx}{x^2+9}$

SOLUTION Let $u = \frac{x}{3}$. Then $du = \frac{dx}{3}$, and the new limits of integration are $u = 0$ and $u = 1$. Thus,

$$\int_0^3 \frac{dx}{x^2+9} = \frac{1}{3}\int_0^1 \frac{dt}{t^2+1} = \frac{1}{3}\tan^{-1}t\Big|_0^1 = \frac{1}{3}(\tan^{-1}1 - \tan^{-1}0) = \frac{1}{3}\left(\frac{\pi}{4} - 0\right) = \frac{\pi}{12}.$$

64. $\displaystyle\int \frac{dx}{\sqrt{e^{2x}-1}}$

SOLUTION Let $u = e^x$. Then

$$du = e^x\,dx \quad\Rightarrow\quad du = u\,dx \quad\Rightarrow\quad u^{-1}du = dx$$

By substitution, we obtain

$$\int \frac{dx}{\sqrt{e^{2x}-1}} = \int \frac{du}{u\sqrt{u^2-1}}$$
$$= \sec^{-1} u + C = \sec^{-1}(e^x) + C$$

65. $\displaystyle\int \frac{x\,dx}{\sqrt{1-x^4}}$

SOLUTION Let $u = x^2$. Then $du = 2x\,dx$, and $\sqrt{1-x^4} = \sqrt{1-u^2}$. Thus,

$$\int \frac{x\,dx}{\sqrt{1-x^4}} = \frac{1}{2}\int \frac{du}{\sqrt{1-u^2}} = \frac{1}{2}\sin^{-1}u + C = \frac{1}{2}\sin^{-1}(x^2) + C.$$

66. $\displaystyle\int_0^1 \frac{dx}{25-x^2}$

SOLUTION Let $x = 5u$. Then $dx = 5\,du$, and the new limits of integration are $u = 0$ and $u = \frac{1}{5}$. Thus,

$$\int_0^1 \frac{dx}{25-x^2} = \frac{1}{25}\int_0^{1/5} \frac{5\,du}{1-u^2} = \frac{5}{25}\int_0^{1/5} \frac{du}{1-u^2}$$
$$= \frac{1}{5}\tanh^{-1}u\Big|_0^{1/5} = \frac{1}{5}\left(\tanh^{-1}\frac{1}{5} - \tanh^{-1}0\right) = \frac{1}{5}\tanh^{-1}\frac{1}{5}.$$

67. $\displaystyle\int_0^4 \frac{dx}{2x^2+1}$

SOLUTION Let $u = \sqrt{2}x$. Then $du = \sqrt{2}\,dx$, and the new limits of integration are $u = 0$ and $u = 4\sqrt{2}$. Thus,

$$\int_0^4 \frac{dx}{2x^2+1} = \int_0^{4\sqrt{2}} \frac{\frac{1}{\sqrt{2}}\,du}{u^2+1} = \frac{1}{\sqrt{2}}\int_0^{4\sqrt{2}} \frac{du}{u^2+1}$$
$$= \frac{1}{\sqrt{2}}\tan^{-1}u\Big|_0^{4\sqrt{2}} = \frac{1}{\sqrt{2}}\left(\tan^{-1}(4\sqrt{2}) - \tan^{-1}0\right) = \frac{1}{\sqrt{2}}\tan^{-1}(4\sqrt{2}).$$

68. $\displaystyle\int_5^8 \frac{dx}{x\sqrt{x^2-16}}$

SOLUTION Let $x = 4u$. Then $dx = 4\,du$, and the new limits of integration are $u = \frac{5}{4}$ and $u = 2$. Thus,

$$\int_5^8 \frac{dx}{x\sqrt{x^2-16}} = \frac{1}{4}\int_{5/4}^2 \frac{du}{u\sqrt{u^2-1}} = \frac{1}{4}\left(\sec^{-1}u\right)\Big|_{5/4}^2 = \frac{1}{4}\left(\sec^{-1}2 - \sec^{-1}\frac{5}{4}\right) = \frac{1}{4}\left(\frac{\pi}{3} - \sec^{-1}\frac{5}{4}\right).$$

69. $\displaystyle\int_0^1 \frac{(\tan^{-1}x)^3\,dx}{1+x^2}$

SOLUTION Let $u = \tan^{-1}x$. Then

$$du = \frac{1}{1+x^2}\,dx$$

and

$$\int_0^1 \frac{(\tan^{-1}x)^3\,dx}{1+x^2} = \int_0^{\pi/4} u^3\,du = \frac{1}{4}u^4\Big|_0^{\pi/4} = \frac{1}{4}\left(\frac{\pi}{4}\right)^4 = \frac{\pi^4}{1024}.$$

70. $\displaystyle\int \frac{\cos^{-1}t\,dt}{\sqrt{1-t^2}}$

SOLUTION Let $u = \cos^{-1}t$. Then $du = -\frac{1}{\sqrt{1-t^2}}\,dt$, and

$$\int \frac{\cos^{-1}t}{\sqrt{1-t^2}}\,dt = -\int u\,du = -\frac{1}{2}u^2 + C = -\frac{1}{2}\left(\cos^{-1}t\right)^2 + C.$$

71. Combine to write as a single integral:

$$\int_0^8 f(x)\,dx + \int_{-2}^0 f(x)\,dx + \int_8^6 f(x)\,dx$$

SOLUTION First, rewrite

$$\int_0^8 f(x)\,dx = \int_0^6 f(x)\,dx + \int_6^8 f(x)\,dx$$

and observe that

$$\int_8^6 f(x)\,dx = -\int_6^8 f(x)\,dx.$$

Thus,

$$\int_0^8 f(x)\,dx + \int_8^6 f(x)\,dx = \int_0^6 f(x)\,dx.$$

Finally,

$$\int_0^8 f(x)\,dx + \int_{-2}^0 f(x)\,dx + \int_8^6 f(x)\,dx = \int_0^6 f(x)\,dx + \int_{-2}^0 f(x)\,dx = \int_{-2}^6 f(x)\,dx.$$

72. Let $A(x) = \int_0^x f(x)\,dx$, where $f(x)$ is the function shown in Figure 4. Identify the location of the local minima, the local maxima, and points of inflection of $A(x)$ on the interval $[0, E]$, as well as the intervals where $A(x)$ is increasing, decreasing, concave up, or concave down. Where does the absolute max of $A(x)$ occur?

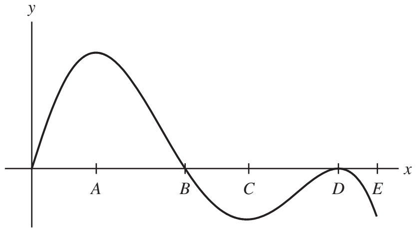

FIGURE 4

SOLUTION Let $f(x)$ be the function shown in Figure 4 and define

$$A(x) = \int_0^x f(x)\,dx.$$

Then $A'(x) = f(x)$ and $A''(x) = f'(x)$. Hence, $A(x)$ is increasing when $f(x)$ is positive, is decreasing when $f(x)$ is negative, is concave up when $f(x)$ is increasing and is concave down when $f(x)$ is decreasing. Thus, $A(x)$ is increasing for $0 < x < B$, is decreasing for $B < x < D$ and for $D < x < E$, has a local maximum at $x = B$ and no local minima. Moreover, $A(x)$ is concave up for $0 < x < A$ and for $C < x < D$, is concave down for $A < x < C$ and for $D < x < E$, and has a point of inflection at $x = A$, $x = C$ and $x = D$. The absolute maximum value for $A(x)$ occurs at $x = B$.

73. Find the local minima, the local maxima, and the inflection points of $A(x) = \displaystyle\int_3^x \frac{t\,dt}{t^2+1}$.

SOLUTION Let

$$A(x) = \int_3^x \frac{t\,dt}{t^2+1}.$$

Then

$$A'(x) = \frac{x}{x^2+1}$$

and

$$A''(x) = \frac{(x^2+1)(1) - x(2x)}{(x^2+1)^2} = \frac{1-x^2}{(x^2+1)^2}.$$

Now, $x = 0$ is the only critical point of A; because $A''(0) > 0$, it follows that A has a local minimum at $x = 0$. There are no local maxima. Moreover, $A(x)$ is concave down for $|x| > 1$ and concave up for $|x| < 1$. $A(x)$ therefore has inflection points at $x = \pm 1$.

74. A particle starts at the origin at time $t = 0$ and moves with velocity $v(t)$ as shown in Figure 5.

(a) How many times does the particle return to the origin in the first 12 seconds?

(b) What is the particle's maximum distance from the origin?

(c) What is particle's maximum distance to the left of the origin?

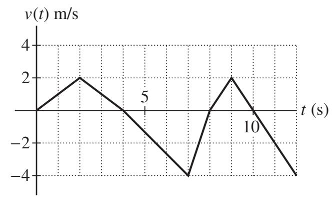

FIGURE 5

SOLUTION Because the particle starts at the origin, the position of the particle is given by

$$s(t) = \int_0^t v(\tau)\,d\tau;$$

that is by the signed area between the graph of the velocity and the t-axis over the interval $[0, t]$. Using the geometry in Figure 5, we see that $s(t)$ is increasing for $0 < t < 4$ and for $8 < t < 10$ and is decreasing for $4 < t < 8$ and for $10 < t < 12$. Furthermore,

$$s(0) = 0 \text{ m}, \quad s(4) = 4 \text{ m}, \quad s(8) = -4 \text{ m}, \quad s(10) = -2 \text{ m}, \quad \text{and} \quad s(12) = -6 \text{ m}.$$

(a) In the first 12 seconds, the particle returns to the origin once, sometime between $t = 4$ and $t = 8$ seconds.

(b) The particle's maximum distance from the origin is 6 meters (to the left at $t = 12$ seconds).

(c) The particle's distance to the left of the origin is 6 meters.

75. On a typical day, a city consumes water at the rate of $r(t) = 100 + 72t - 3t^2$ (in thousands of gallons per hour), where t is the number of hours past midnight. What is the daily water consumption? How much water is consumed between 6 PM and midnight?

SOLUTION With a consumption rate of $r(t) = 100 + 72t - 3t^2$ thousand gallons per hour, the daily consumption of water is

$$\int_0^{24} (100 + 72t - 3t^2)\,dt = \left(100t + 36t^2 - t^3\right)\Big|_0^{24} = 100(24) + 36(24)^2 - (24)^3 = 9312,$$

or 9.312 million gallons. From 6 PM to midnight, the water consumption is

$$\begin{aligned}\int_{18}^{24} (100 + 72t - 3t^2)\,dt &= \left(100t + 36t^2 - t^3\right)\Big|_{18}^{24} \\ &= 100(24) + 36(24)^2 - (24)^3 - \left(100(18) + 36(18)^2 - (18)^3\right) \\ &= 9312 - 7632 = 1680,\end{aligned}$$

or 1.68 million gallons.

76. The learning curve in a certain bicycle factory is $L(x) = 12x^{-1/5}$ (in hours per bicycle), which means that it takes a bike mechanic $L(n)$ hours to assemble the nth bicycle. If a mechanic has produced 24 bicycles, how long does it take her or him to produce the second batch of 12?

SOLUTION The second batch of 12 bicycles consists of bicycles 13 through 24. The time it takes to produce these bicycles is

$$\int_{13}^{24} 12x^{-1/5}\,dx = 15x^{4/5}\Big|_{13}^{24} = 15\left(24^{4/5} - 13^{4/5}\right) \approx 73.91 \text{ hours}.$$

77. Cost engineers at NASA have the task of projecting the cost P of major space projects. It has been found that the cost C of developing a projection increases with P at the rate $dC/dP \approx 21P^{-0.65}$, where C is in thousands of dollars and P in millions of dollars. What is the cost of developing a projection for a project whose cost turns out to be $P = \$35$ million?

SOLUTION Assuming it costs nothing to develop a projection for a project with a cost of \$0, the cost of developing a projection for a project whose cost turns out to be \$35 million is

$$\int_0^{35} 21P^{-0.65}\,dP = 60P^{0.35}\Big|_0^{35} = 60(35)^{0.35} \approx 208.245,$$

or \$208,245.

78. An astronomer estimates that in a certain constellation, the number of stars per magnitude m, per degree-squared of sky, is equal to $A(m) = 2.4 \times 10^{-6} m^{7.4}$ (fainter stars have higher magnitudes). Determine the total number of stars of magnitude between 6 and 15 in a one-degree-squared region of sky.

SOLUTION The total number of stars of magnitude between 6 and 15 in a one-degree-squared region of sky is

$$\int_6^{15} A(m)\,dm = \int_6^{15} 2.4 \times 10^{-6} m^{7.4}\,dm$$
$$= \frac{2}{7} \times 10^{-6} m^{8.4} \Big|_6^{15}$$
$$\approx 2162$$

79. Evaluate $\displaystyle\int_{-8}^{8} \frac{x^{15}\,dx}{3+\cos^2 x}$, using the properties of odd functions.

SOLUTION Let $f(x) = \frac{x^{15}}{3+\cos^2 x}$ and note that

$$f(-x) = \frac{(-x)^{15}}{3+\cos^2(-x)} = -\frac{x^{15}}{\cos^2 x} = -f(x).$$

Because $f(x)$ is an odd function and the interval $-8 \le x \le 8$ is symmetric about $x = 0$, it follows that

$$\int_{-8}^{8} \frac{x^{15}\,dx}{3+\cos^2 x} = 0.$$

80. Evaluate $\int_0^1 f(x)\,dx$, assuming that $f(x)$ is an even continuous function such that

$$\int_1^2 f(x)\,dx = 5, \qquad \int_{-2}^{1} f(x)\,dx = 8$$

SOLUTION Using the given information

$$\int_{-2}^{2} f(x)\,dx = \int_{-2}^{1} f(x)\,dx + \int_1^2 f(x)\,dx = 13.$$

Because $f(x)$ is an even function, it follows that

$$\int_{-2}^{0} f(x)\,dx = \int_0^2 f(x)\,dx,$$

so

$$\int_0^2 f(x)\,dx = \frac{13}{2}.$$

Finally,

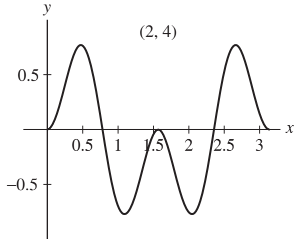
$$\int_0^1 f(x)\,dx = \int_0^2 f(x)\,dx - \int_1^2 f(x)\,dx = \frac{13}{2} - 5 = \frac{3}{2}.$$

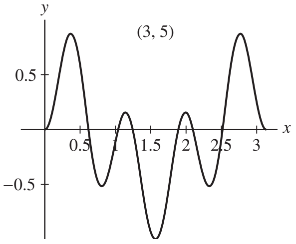
81. GU Plot the graph of $f(x) = \sin mx \sin nx$ on $[0, \pi]$ for the pairs $(m, n) = (2, 4), (3, 5)$ and in each case guess the value of $I = \int_0^\pi f(x)\,dx$. Experiment with a few more values (including two cases with $m = n$) and formulate a conjecture for when I is zero.

SOLUTION The graphs of $f(x) = \sin mx \sin nx$ with $(m, n) = (2, 4)$ and $(m, n) = (3, 5)$ are shown below. It appears as if the positive areas balance the negative areas, so we expect that

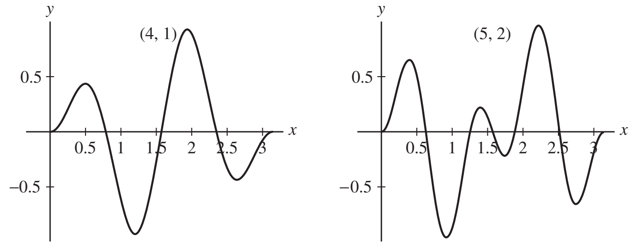
$$I = \int_0^\pi f(x)\,dx = 0$$

in these cases.





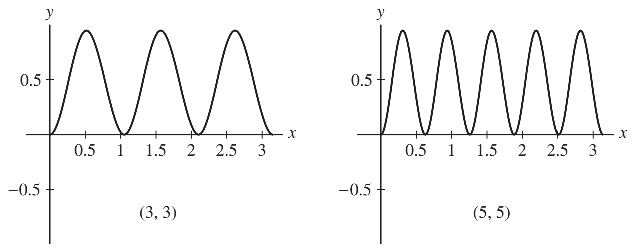
We arrive at the same conclusion for the cases $(m, n) = (4, 1)$ and $(m, n) = (5, 2)$.



However, when $(m, n) = (3, 3)$ and when $(m, n) = (5, 5)$, the value of

$$I = \int_0^{\pi} f(x)\, dx$$

is clearly not zero as there is no negative area.



We therefore conjecture that I is zero whenever $m \neq n$.

82. Show that

$$\int x\, f(x)\, dx = xF(x) - G(x)$$

where $F'(x) = f(x)$ and $G'(x) = F(x)$. Use this to evaluate $\int x \cos x\, dx$.

SOLUTION Suppose $F'(x) = f(x)$ and $G'(x) = F(x)$. Then

$$\frac{d}{dx}(xF(x) - G(x)) = xF'(x) + F(x) - G'(x) = xf(x) + F(x) - F(x) = xf(x).$$

Therefore, $xF(x) - G(x)$ is an antiderivative of $xf(x)$ and

$$\int xf(x)\, dx = xF(x) - G(x) + C.$$

To evaluate $\int x \cos x\, dx$, note that $f(x) = \cos x$. Thus, we may take $F(x) = \sin x$ and $G(x) = -\cos x$. Finally,

$$\int x \cos x\, dx = x \sin x + \cos x + C.$$

83. Prove

$$2 \le \int_1^2 2^x\, dx \le 4 \qquad \text{and} \qquad \frac{1}{9} \le \int_1^2 3^{-x}\, dx \le \frac{1}{3}$$

SOLUTION The function $f(x) = 2^x$ is increasing, so $1 \le x \le 2$ implies that $2 = 2^1 \le 2^x \le 2^2 = 4$. Consequently,

$$2 = \int_1^2 2\, dx \le \int_1^2 2^x\, dx \le \int_1^2 4\, dx = 4.$$

On the other hand, the function $f(x) = 3^{-x}$ is decreasing, so $1 \le x \le 2$ implies that

$$\frac{1}{9} = 3^{-2} \le 3^{-x} \le 3^{-1} = \frac{1}{3}.$$

It then follows that

$$\frac{1}{9} = \int_1^2 \frac{1}{9}\, dx \le \int_1^2 3^{-x}\, dx \le \int_1^2 \frac{1}{3}\, dx = \frac{1}{3}.$$

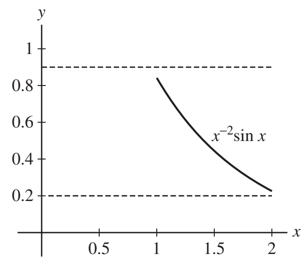
84. GU Plot the graph of $f(x) = x^{-2}\sin x$, and show that $0.2 \le \int_1^2 f(x)\,dx \le 0.9$.

SOLUTION Let $f(x) = x^{-2}\sin x$. From the figure below, we see that

$$0.2 \le f(x) \le 0.9$$

for $1 \le x \le 2$. Therefore,

$$0.2 = \int_0^1 0.2\,dx \le \int_0^1 f(x)\,dx \le \int_0^1 0.9\,dx = 0.9.$$



85. Find upper and lower bounds for $\int_0^1 f(x)\,dx$, for $f(x)$ in Figure 6.

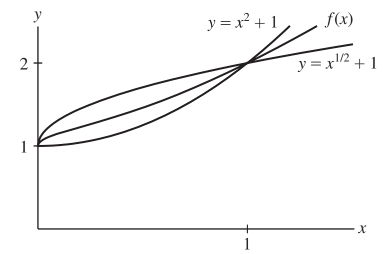


FIGURE 6

SOLUTION From the figure, we see that the inequalities $x^2 + 1 \le f(x) \le \sqrt{x} + 1$ hold for $0 \le x \le 1$. Because

$$\int_0^1 (x^2 + 1)\,dx = \left(\frac{1}{3}x^3 + x\right)\Big|_0^1 = \frac{4}{3}$$

and

$$\int_0^1 (\sqrt{x} + 1)\,dx = \left(\frac{2}{3}x^{3/2} + x\right)\Big|_0^1 = \frac{5}{3},$$

it follows that

$$\frac{4}{3} \le \int_0^1 f(x)\,dx \le \frac{5}{3}.$$

In Exercises 86–91, find the derivative.

86. $A'(x)$, where $A(x) = \int_3^x \sin(t^3)\,dt$

SOLUTION Let $A(x) = \int_3^x \sin(t^3)\,dt$. Then $A'(x) = \sin(x^3)$.

87. $A'(\pi)$, where $A(x) = \int_2^x \frac{\cos t}{1+t}\,dt$

SOLUTION Let $A(x) = \int_2^x \frac{\cos t}{1+t}\,dt$. Then $A'(x) = \frac{\cos x}{1+x}$ and

$$A'(\pi) = \frac{\cos \pi}{1+\pi} = -\frac{1}{1+\pi}.$$

88. $\frac{d}{dy}\int_{-2}^{y} 3^x\,dx$

SOLUTION $\frac{d}{dy}\int_{-2}^{y} 3^x\,dx = 3^y.$

89. $G'(x)$, where $G(x) = \int_{-2}^{\sin x} t^3\,dt$

SOLUTION Let $G(x) = \int_{-2}^{\sin x} t^3\,dt$. Then

$$G'(x) = \sin^3 x \frac{d}{dx}\sin x = \sin^3 x \cos x.$$

90. $G'(2)$, where $G(x) = \int_0^{x^3} \sqrt{t+1}\,dt$

SOLUTION Let $G(x) = \int_0^{x^3} \sqrt{t+1}\,dt$. Then

$$G'(x) = \sqrt{x^3+1}\frac{d}{dx}x^3 = 3x^2\sqrt{x^3+1}$$

and $G'(2) = 3(2)^2\sqrt{8+1} = 36$.

91. $H'(1)$, where $H(x) = \int_{4x^2}^{9} \frac{1}{t}\,dt$

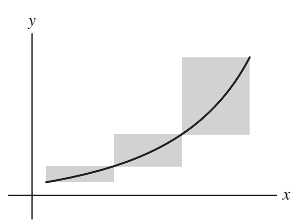
SOLUTION Let $H(x) = \int_{4x^2}^{9} \frac{1}{t}\,dt = -\int_9^{4x^2} \frac{1}{t}\,dt$. Then

$$H'(x) = -\frac{1}{4x^2}\frac{d}{dx}4x^2 = -\frac{8x}{4x^2} = -\frac{2}{x}$$

and $H'(1) = -2$.

92. Explain with a graph: If $f(x)$ is increasing and concave up on $[a, b]$, then L_N is more accurate than R_N. Which is more accurate if $f(x)$ is increasing and concave down?

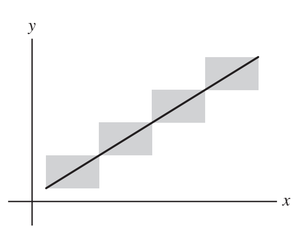
SOLUTION Consider the figure below, which displays a portion of the graph of an increasing, concave up function.



The shaded rectangles represent the differences between the right-endpoint approximation R_N and the left-endpoint approximation L_N. In particular, the portion of each rectangle that lies below the graph of $y = f(x)$ is the amount by which L_N underestimates the area under the graph, whereas the portion of each rectangle that lies above the graph of $y = f(x)$ is the amount by which R_N overestimates the area. Because the graph of $y = f(x)$ is increasing and concave up, the lower portion of each shaded rectangle is smaller than the upper portion. Therefore, L_N is more accurate (introduces less error) than R_N. By similar reasoning, if $f(x)$ is increasing and concave down, then R_N is more accurate than L_N.

93. Explain with a graph: If $f(x)$ is linear on $[a, b]$, then the $\int_a^b f(x)\,dx = \frac{1}{2}(R_N + L_N)$ for all N.

SOLUTION Consider the figure below, which displays a portion of the graph of a linear function.



The shaded rectangles represent the differences between the right-endpoint approximation R_N and the left-endpoint approximation L_N. In particular, the portion of each rectangle that lies below the graph of $y = f(x)$ is the amount by which L_N underestimates the area under the graph, whereas the portion of each rectangle that lies above the graph of $y = f(x)$ is the amount by which R_N overestimates the area. Because the graph of $y = f(x)$ is a line, the lower portion of each shaded rectangle is exactly the same size as the upper portion. Therefore, if we average L_N and R_N, the error in the two approximations will exactly cancel, leaving

$$\frac{1}{2}(R_N + L_N) = \int_a^b f(x)\,dx.$$

94. In this exercise, we prove

$$x - \frac{x^2}{2} \le \ln(1+x) \le x \qquad (\text{for } x > 0) \qquad \boxed{1}$$

(a) Show that $\ln(1+x) = \int_0^x \frac{dt}{1+t}$ for $x > 0$.
(b) Verify that $1 - t \le \frac{1}{1+t} \le 1$ for all $t > 0$.
(c) Use (b) to prove Eq. (1).
(d) Verify Eq. (1) for $x = 0.5$, 0.1, and 0.01.

SOLUTION
(a) Let $x > 0$. Then

$$\int_0^x \frac{dt}{1+t} = \ln(1+t)\Big|_0^x = \ln(1+x) - \ln 1 = \ln(1+x).$$

(b) For $t > 0$, $1 + t > 1$, so $\frac{1}{1+t} < 1$. Moreover, $(1-t)(1+t) = 1 - t^2 < 1$. Because $1 + t > 0$, it follows that $1 - t < \frac{1}{1+t}$. Hence,

$$1 - t \le \frac{1}{1+t} \le 1.$$

(c) Integrating each expression in the result from part (b) from $t = 0$ to $t = x$ yields

$$x - \frac{x^2}{2} \le \ln(1+x) \le x.$$

(d) For $x = 0.5$, $x = 0.1$ and $x = 0.01$, we obtain the string of inequalities

$$\begin{aligned} 0.375 \le\ & 0.405465 \le 0.5 \\ 0.095 \le\ & 0.095310 \le 0.1 \\ 0.00995 \le\ & 0.00995033 \le 0.01, \end{aligned}$$

respectively.

95. Let

$$F(x) = x\sqrt{x^2-1} - 2\int_1^x \sqrt{t^2-1}\,dt$$

Prove that $F(x)$ and $\cosh^{-1} x$ differ by a constant by showing that they have the same derivative. Then prove they are equal by evaluating both at $x = 1$.

SOLUTION Let

$$F(x) = x\sqrt{x^2-1} - 2\int_1^x \sqrt{t^2-1}\,dt.$$

Then

$$\frac{dF}{dx} = \sqrt{x^2-1} + \frac{x^2}{\sqrt{x^2-1}} - 2\sqrt{x^2-1} = \frac{x^2}{\sqrt{x^2-1}} - \sqrt{x^2-1} = \frac{1}{\sqrt{x^2-1}}.$$

Also, $\frac{d}{dx}(\cosh^{-1}x) = \frac{1}{\sqrt{x^2-1}}$; therefore, $F(x)$ and $\cosh^{-1}x$ have the same derivative. We conclude that $F(x)$ and $\cosh^{-1}x$ differ by a constant:

$$F(x) = \cosh^{-1}x + C.$$

Now, let $x = 1$. Because $F(1) = 0$ and $\cosh^{-1} 1 = 0$, it follows that $C = 0$. Therefore,

$$F(x) = \cosh^{-1}x.$$

96. Let $f(x)$ be a positive increasing continuous function on $[a, b]$, where $0 \le a < b$ as in Figure 7. Show that the shaded region has area

$$I = bf(b) - af(a) - \int_a^b f(x)\,dx \qquad \boxed{2}$$

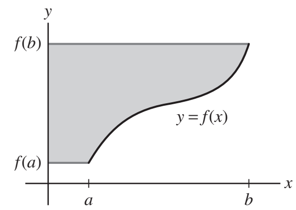


FIGURE 7

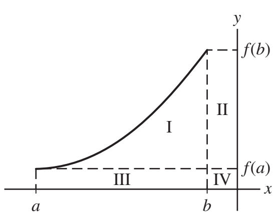
SOLUTION We can construct the shaded region in Figure 7 by taking a rectangle of length b and height $f(b)$ and removing a rectangle of length a and height $f(a)$ as well as the region between the graph of $y = f(x)$ and the x-axis over the interval $[a, b]$. The area of the resulting region is then the area of the large rectangle minus the area of the small rectangle and minus the area under the curve $y = f(x)$; that is,

$$I = bf(b) - af(a) - \int_a^b f(x)\,dx.$$

97. How can we interpret the quantity I in Eq. (2) if $a < b \le 0$? Explain with a graph.

SOLUTION We will consider each term on the right-hand side of (2) separately. For convenience, let **I**, **II**, **III** and **IV** denote the area of the similarly labeled region in the diagram below.



Because $b < 0$, the expression $bf(b)$ is the opposite of the area of the rectangle along the right; that is,

$$bf(b) = -\mathbf{II} - \mathbf{IV}.$$

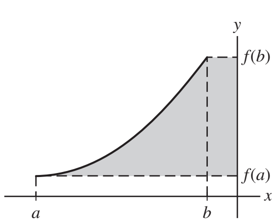
Similarly,

$$-af(a) = \mathbf{III} + \mathbf{IV} \qquad \text{and} \qquad -\int_a^b f(x)\,dx = -\mathbf{I} - \mathbf{III}.$$

Therefore,

$$bf(b) - af(a) - \int_a^b f(x)\,dx = -\mathbf{I} - \mathbf{II};$$

that is, the opposite of the area of the shaded region shown below.



98. The isotope thorium-234 has a half-life of 24.5 days.

(a) What is the differential equation satisfied by $y(t)$, the amount of thorium-234 in a sample at time t?

(b) At $t = 0$, a sample contains 2 kg of thorium-234. How much remains after 40 days?

SOLUTION

(a) By the equation for half-life,

$$24.5 = \frac{\ln 2}{k}, \quad \text{so} \quad k = \frac{\ln 2}{24.5} \approx 0.028 \text{ days}^{-1}.$$

Therefore, the differential equation for $y(t)$ is

$$y' = -0.028y.$$

(b) If there are 2 kg of thorium-234 at $t = 0$, then $y(t) = 2e^{-0.028t}$. After 40 days, the amount of thorium-234 is

$$y(40) = 2e^{-0.028(40)} = 0.653 \text{ kg}.$$

99. The Oldest Snack Food? In Bat Cave, New Mexico, archaeologists found ancient human remains, including cobs of popping corn whose C^{14}-to-C^{12} ratio was approximately 48% of that found in living matter. Estimate the age of the corn cobs.

SOLUTION Let t be the age of the corn cobs. The C^{14} to C^{12} ratio decreased by a factor of $e^{-0.000121t}$ which is equal to 0.48. That is:

$$e^{-0.000121t} = 0.48,$$

so

$$-0.000121t = \ln 0.48,$$

and

$$t = -\frac{1}{0.000121} \ln 0.48 \approx 6065.9.$$

We conclude that the age of the corn cobs is approximately 6065.9 years.

100. The C^{14}-to-C^{12} ratio of a sample is proportional to the disintegration rate (number of beta particles emitted per minute) that is measured directly with a Geiger counter. The disintegration rate of carbon in a living organism is 15.3 beta particles per minute per gram. Find the age of a sample that emits 9.5 beta particles per minute per gram.

SOLUTION Let t be the age of the sample in years. Because the disintegration rate for the sample has dropped from 15.3 beta particles/min per gram to 9.5 beta particles/min per gram and the C^{14} to C^{12} ratio is proportional to the disintegration rate, it follows that

$$e^{-0.000121t} = \frac{9.5}{15.3},$$

so

$$t = -\frac{1}{0.000121} \ln \frac{9.5}{15.3} \approx 3938.5.$$

We conclude that the sample is approximately 3938.5 years old.

101. What is the interest rate if the PV of \$50,000 to be delivered in 3 years is \$43,000?

SOLUTION Let r denote the interest rate. The present value of \$50,000 received in 3 years with an interest rate of r is $50{,}000e^{-3r}$. Thus, we need to solve

$$43{,}000 = 50{,}000e^{-3r}$$

for r. This yields

$$r = -\frac{1}{3} \ln \frac{43}{50} = 0.0503.$$

Thus, the interest rate is 5.03%.

102. An equipment upgrade costing \$1 million will save a company \$320,000 per year for 4 years. Is this a good investment if the interest rate is $r = 5\%$? What is the largest interest rate that would make the investment worthwhile? Assume that the savings are received as a lump sum at the end of each year.

SOLUTION With an interest rate of $r = 5\%$, the present value of the four payments is

$$\$320{,}000\left(e^{-0.05} + e^{-0.1} + e^{-0.15} + e^{-0.2}\right) = \$1{,}131{,}361.78.$$

As this is greater than the \$1 million cost of the upgrade, this is a good investment. To determine the largest interest rate that would make the investment worthwhile, we must solve the equation

$$320{,}000\left(e^{-r} + e^{-2r} + e^{-3r} + e^{-4r}\right) = 1{,}000{,}000$$

for r. Using a computer algebra system, we find $r = 10.13\%$.

103. Find the PV of an income stream paying out continuously at a rate of $5000e^{-0.1t}$ dollars per year for 5 years, assuming an interest rate of $r = 4\%$.

SOLUTION $PV = \int_0^5 5000e^{-0.1t}e^{-0.04t}\,dt = \int_0^5 5000e^{-0.14t}\,dt = \frac{5000}{-0.14}e^{-0.14t}\Big|_0^5 = \$17,979.10.$

104. Calculate the limit:

(a) $\lim_{n\to\infty}\left(1+\frac{4}{n}\right)^n$ **(b)** $\lim_{n\to\infty}\left(1+\frac{1}{n}\right)^{4n}$ **(c)** $\lim_{n\to\infty}\left(1+\frac{4}{n}\right)^{3n}$

SOLUTION

(a) $\lim_{n\to\infty}\left(1+\frac{4}{n}\right)^n = \lim_{n\to\infty}\left[\left(1+\frac{1}{n/4}\right)^{n/4}\right]^4 = e^4.$

(b) $\lim_{n\to\infty}\left(1+\frac{1}{n}\right)^{4n} = \lim_{n\to\infty}\left[\left(1+\frac{1}{n}\right)^{n}\right]^4 = e^4.$

(c) $\lim_{n\to\infty}\left(1+\frac{4}{n}\right)^{3n} = \lim_{n\to\infty}\left[\left(1+\frac{1}{n/4}\right)^{n/4}\right]^{12} = e^{12}.$

6 APPLICATIONS OF THE INTEGRAL

6.1 Area Between Two Curves

Preliminary Questions

1. What is the area interpretation of $\displaystyle\int_a^b \big(f(x) - g(x)\big)\,dx$ if $f(x) \ge g(x)$?

SOLUTION Because $f(x) \ge g(x)$, $\int_a^b (f(x) - g(x))\,dx$ represents the area of the region bounded between the graphs of $y = f(x)$ and $y = g(x)$, bounded on the left by the vertical line $x = a$ and on the right by the vertical line $x = b$.

2. Is $\displaystyle\int_a^b \big(f(x) - g(x)\big)\,dx$ still equal to the area between the graphs of f and g if $f(x) \ge 0$ but $g(x) \le 0$?

SOLUTION Yes. Since $f(x) \ge 0$ and $g(x) \le 0$, it follows that $f(x) - g(x) \ge 0$.

3. Suppose that $f(x) \ge g(x)$ on [0, 3] and $g(x) \ge f(x)$ on [3, 5]. Express the area between the graphs over [0, 5] as a sum of integrals.

SOLUTION Remember that to calculate an area between two curves, one must subtract the equation for the lower curve from the equation for the upper curve. Over the interval [0, 3], $y = f(x)$ is the upper curve. On the other hand, over the interval [3, 5], $y = g(x)$ is the upper curve. The area between the graphs over the interval [0, 5] is therefore given by

$$\int_0^3 (f(x) - g(x))\,dx + \int_3^5 (g(x) - f(x))\,dx.$$

4. Suppose that the graph of $x = f(y)$ lies to the left of the y-axis. Is $\int_a^b f(y)\,dy$ positive or negative?

SOLUTION If the graph of $x = f(y)$ lies to the left of the y-axis, then for each value of y, the corresponding value of x is less than zero. Hence, the value of $\int_a^b f(y)\,dy$ is negative.

Exercises

1. Find the area of the region between $y = 3x^2 + 12$ and $y = 4x + 4$ over $[-3, 3]$ (Figure 9).

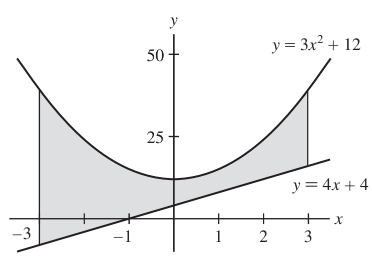


FIGURE 9

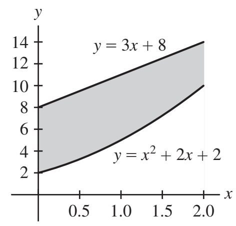
SOLUTION As the graph of $y = 3x^2 + 12$ lies above the graph of $y = 4x + 4$ over the interval $[-3, 3]$, the area between the graphs is

$$\int_{-3}^{3} \Big((3x^2 + 12) - (4x + 4)\Big)\,dx = \int_{-3}^{3} (3x^2 - 4x + 8)\,dx = \Big(x^3 - 2x^2 + 8x\Big)\Big|_{-3}^{3} = 102.$$

2. Find the area of the region between the graphs of $f(x) = 3x + 8$ and $g(x) = x^2 + 2x + 2$ over [0, 2].

SOLUTION From the diagram below, we see that the graph of $f(x) = 3x + 8$ lies above the graph of $g(x) = x^2 + 2x + 2$ over the interval [0, 2]. Thus, the area between the graphs is

$$\int_0^2 \Big[(3x + 8) - \Big(x^2 + 2x + 2\Big)\Big]\,dx = \int_0^2 \Big(-x^2 + x + 6\Big)\,dx = \Big(-\frac{1}{3}x^3 + \frac{1}{2}x^2 + 6x\Big)\Big|_0^2 = \frac{34}{3}.$$



3. Find the area of the region enclosed by the graphs of $f(x) = x^2 + 2$ and $g(x) = 2x + 5$ (Figure 10).

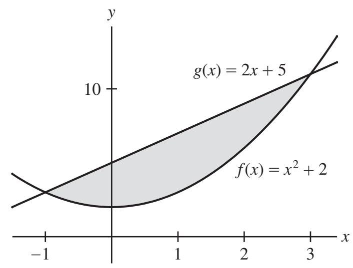


FIGURE 10

SOLUTION From the figure, we see that the graph of $g(x) = 2x + 5$ lies above the graph of $f(x) = x^2 + 2$ over the interval $[-1, 3]$. Thus, the area between the graphs is

$$\int_{-1}^{3} \left[(2x+5) - \left(x^2+2\right)\right] dx = \int_{-1}^{3} \left(-x^2 + 2x + 3\right) dx$$

$$= \left(-\frac{1}{3}x^3 + x^2 + 3x\right)\Big|_{-1}^{3}$$

$$= 9 - \left(-\frac{5}{3}\right) = \frac{32}{3}.$$

4. Find the area of the region enclosed by the graphs of $f(x) = x^3 - 10x$ and $g(x) = 6x$ (Figure 11).

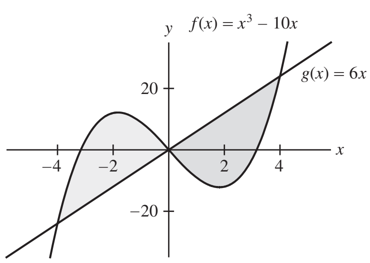

FIGURE 11

SOLUTION From the figure, we see that the graph of $f(x) = x^3 - 10x$ lies above the graph of $g(x) = 6x$ over the interval $[-4, 0]$, while the graph of $g(x) = 6x$ lies above the graph of $f(x) = x^3 - 10x$ over the interval $[0, 4]$. Thus, the area enclosed by the two graphs is

$$A = \int_{-4}^{0} \left(x^3 - 10x - 6x\right) dx + \int_{0}^{4} \left(6x - (x^3 - 10x)\right) dx$$

$$= \int_{-4}^{0} (x^3 - 16x)\, dx + \int_{0}^{4} (16x - x^3)\, dx$$

$$= \left(\frac{1}{4}x^4 - 8x^2\right)\Big|_{-4}^{0} + \left(8x^2 - \frac{1}{4}x^4\right)\Big|_{0}^{4}$$

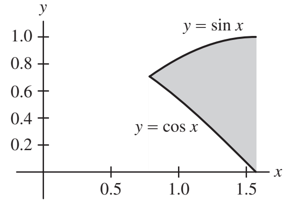
$$= 64 + 64 = 128.$$

In Exercises 5 and 6, sketch the region between $y = \sin x$ and $y = \cos x$ over the interval and find its area.

5. $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$

SOLUTION Over the interval $[\frac{\pi}{4}, \frac{\pi}{2}]$, the graph of $y = \cos x$ lies below that of $y = \sin x$ (see the sketch below). Hence, the area between the two curves is

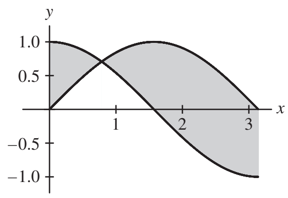
$$\int_{\pi/4}^{\pi/2} (\sin x - \cos x)\, dx = (-\cos x - \sin x)\Big|_{\pi/4}^{\pi/2} = (0 - 1) - \left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}\right) = \sqrt{2} - 1.$$



6. $[0, \pi]$

SOLUTION Over the interval $[0, \frac{\pi}{4}]$, the graph of $y = \sin x$ lies below that of $y = \cos x$, while over the interval $[\frac{\pi}{4}, \pi]$, the orientation of the graphs is reversed (see the sketch below). The area between the graphs over $[0, \pi]$ is then

$$\begin{aligned} &\int_0^{\pi/4} (\cos x - \sin x)\, dx + \int_{\pi/4}^{\pi} (\sin x - \cos x)\, dx \\ &= (\sin x + \cos x)\Big|_0^{\pi/4} + (-\cos x - \sin x)\Big|_{\pi/4}^{\pi} \\ &= \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2} - (0 + 1) + (1 - 0) - \left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}\right) = 2\sqrt{2}. \end{aligned}$$



In Exercises 7 and 8, let $f(x) = 20 + x - x^2$ and $g(x) = x^2 - 5x$.

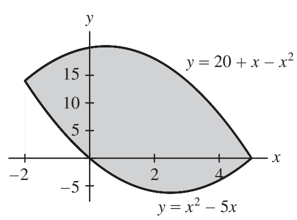
7. Sketch the region enclosed by the graphs of $f(x)$ and $g(x)$ and compute its area.

SOLUTION Setting $f(x) = g(x)$ gives $20 + x - x^2 = x^2 - 5x$, which simplifies to

$$0 = 2x^2 - 6x - 20 = 2(x - 5)(x + 2).$$

Thus, the curves intersect at $x = -2$ and $x = 5$. With $y = 20 + x - x^2$ being the upper curve (see the sketch below), the area between the two curves is

$$\int_{-2}^{5} \left((20 + x - x^2) - (x^2 - 5x)\right) dx = \int_{-2}^{5} \left(20 + 6x - 2x^2\right) dx = \left(20x + 3x^2 - \frac{2}{3}x^3\right)\Big|_{-2}^{5} = \frac{343}{3}.$$



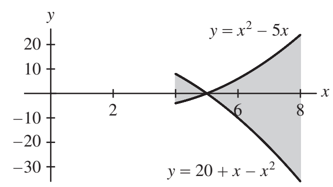
8. Sketch the region between the graphs of $f(x)$ and $g(x)$ over [4, 8] and compute its area as a sum of two integrals.

SOLUTION Setting $f(x) = g(x)$ gives $20 + x - x^2 = x^2 - 5x$, which simplifies to

$$0 = 2x^2 - 6x - 20 = 2(x-5)(x+2).$$

Thus, the curves intersect at $x = -2$ and $x = 5$. Over the interval [4, 5], $y = 20 + x - x^2$ is the upper curve but over the interval [5, 8], $y = x^2 - 5x$ is the upper curve (see the sketch below). The area between the two curves over the interval [4, 8] is then

$$\int_4^5 \Big((20 + x - x^2) - (x^2 - 5x)\Big)\,dx + \int_5^8 \Big((x^2 - 5x) - (20 + x - x^2)\Big)\,dx$$
$$= \int_4^5 \Big(-2x^2 + 6x + 20\Big)\,dx + \int_5^8 \Big(2x^2 - 6x - 20\Big)\,dx$$
$$= \left(-\frac{2}{3}x^2 + 3x^2 + 20x\right)\Big|_4^5 + \left(\frac{2}{3}x^3 - 3x^2 - 20x\right)\Big|_5^8 = \frac{19}{3} + 81 = \frac{262}{3}.$$



9. Find the area between $y = e^x$ and $y = e^{2x}$ over [0, 1].

SOLUTION As the graph of $y = e^{2x}$ lies above the graph of $y = e^x$ over the interval [0, 1], the area between the graphs is

$$\int_0^1 (e^{2x} - e^x)\,dx = \left(\frac{1}{2}e^{2x} - e^x\right)\Big|_0^1 = \frac{1}{2}e^2 - e - \left(\frac{1}{2} - 1\right) = \frac{1}{2}e^2 - e + \frac{1}{2}.$$

10. Find the area of the region bounded by $y = e^x$ and $y = 12 - e^x$ and the y-axis.

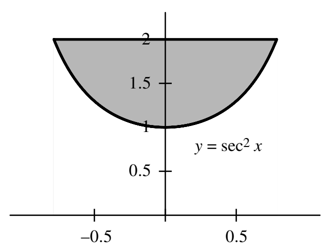
SOLUTION The two graphs intersect when $e^x = 12 - e^x$, or when $x = \ln 6$. As the graph of $y = 12 - e^x$ lies above the graph of $y = e^x$ over the interval $[0, \ln 6]$, the area between the graphs is

$$\int_0^{ln 6} \left(12 - e^x - e^x\right)\,dx = (12x - 2e^x)\Big|_0^{\ln 6} = 12\ln 6 - 12 - (0 - 2) = 12\ln 6 - 10.$$

11. Sketch the region bounded by the line $y = 2$ and the graph of $y = \sec^2 x$ for $-\frac{\pi}{2} < x < \frac{\pi}{2}$ and find its area.

SOLUTION A sketch of the region bounded by $y = \sec^2 x$ and $y = 2$ is shown below. Note the region extends from $x = -\frac{\pi}{4}$ on the left to $x = \frac{\pi}{4}$ on the right. As the graph of $y = 2$ lies above the graph of $y = \sec^2 x$, the area between the graphs is

$$\int_{-\pi/4}^{\pi/4} (2 - \sec^2 x)\,dx = (2x - \tan x)\Big|_{-\pi/4}^{\pi/4} = \left(\frac{\pi}{2} - 1\right) - \left(-\frac{\pi}{2} + 1\right) = \pi - 2.$$



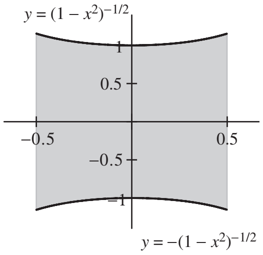
12. Sketch the region bounded by

$$y = \frac{1}{\sqrt{1 - x^2}} \quad \text{and} \quad y = -\frac{1}{\sqrt{1 - x^2}}$$

for $-\frac{1}{2} \le x \le \frac{1}{2}$ and find its area.

SOLUTION A sketch of the region bounded by $y = \frac{1}{\sqrt{1-x^2}}$ and $y = -\frac{1}{\sqrt{1-x^2}}$ for $-\frac{1}{2} \le x \le \frac{1}{2}$ is shown below. As the graph of $y = \frac{1}{\sqrt{1-x^2}}$ lies above the graph of $y = -\frac{1}{\sqrt{1-x^2}}$, the area between the graphs is

$$\int_{-1/2}^{1/2} \left[\frac{1}{\sqrt{1-x^2}} - \left(-\frac{1}{\sqrt{1-x^2}}\right)\right] dx = 2\sin^{-1} x \Big|_{-1/2}^{1/2} = 2\left[\frac{\pi}{6} - \left(-\frac{\pi}{6}\right)\right] = \frac{2\pi}{3}.$$



In Exercises 13–16, find the area of the shaded region in Figures 12–15.

13.

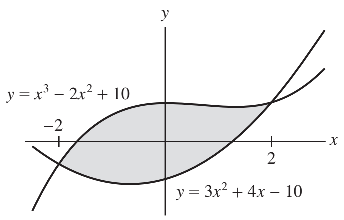


FIGURE 12

SOLUTION As the graph of $y = x^3 - 2x^2 + 10$ lies above the graph of $y = 3x^2 + 4x - 10$, the area of the shaded region is

$$\int_{-2}^{2} \left((x^3 - 2x^2 + 10) - (3x^2 + 4x - 10)\right) dx = \int_{-2}^{2} \left(x^3 - 5x^2 - 4x + 20\right) dx$$
$$= \left(\frac{1}{4}x^4 - \frac{5}{3}x^3 - 2x^2 + 20x\right)\Big|_{-2}^{2} = \frac{160}{3}.$$

14.

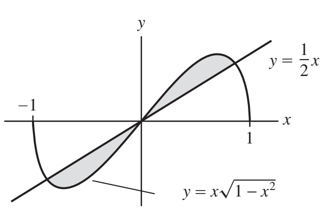

FIGURE 13

SOLUTION Setting $\frac{1}{2}x = x\sqrt{1-x^2}$ yields $x = 0$ or $\frac{1}{2} = \sqrt{1-x^2}$, so that $x = \pm\frac{\sqrt{3}}{2}$. Over the interval $[-\frac{\sqrt{3}}{2}, 0]$, $y = \frac{1}{2}x$ is the upper curve but over the interval $[0, \frac{\sqrt{3}}{2}]$, $y = x\sqrt{1-x^2}$ is the upper curve. The area of the shaded region is then

$$\int_{-\sqrt{3}/2}^{0} \left(\frac{1}{2}x - x\sqrt{1-x^2}\right) dx + \int_{0}^{\sqrt{3}/2} \left(x\sqrt{1-x^2} - \frac{1}{2}x\right) dx$$
$$= \left(\frac{1}{4}x^2 + \frac{1}{3}(1-x^2)^{3/2}\right)\Big|_{-\sqrt{3}/2}^{0} + \left(-\frac{1}{3}(1-x^2)^{3/2} - \frac{1}{4}x^2\right)\Big|_{0}^{\sqrt{3}/2} = \frac{5}{48} + \frac{5}{48} = \frac{5}{24}.$$

15.

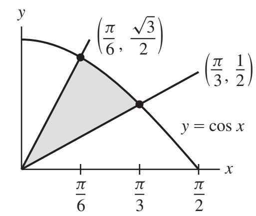

FIGURE 14

SOLUTION The line on the top-left has equation $y = \frac{3\sqrt{3}}{\pi}x$, and the line on the bottom-right has equation $y = \frac{3}{2\pi}x$. Thus, the area to the left of $x = \frac{\pi}{6}$ is

$$\int_0^{\pi/6} \left(\frac{3\sqrt{3}}{\pi}x - \frac{3}{2\pi}x\right) dx = \left(\frac{3\sqrt{3}}{2\pi}x^2 - \frac{3}{4\pi}x^2\right)\Bigg|_0^{\pi/6} = \frac{3\sqrt{3}}{2\pi}\frac{\pi^2}{36} - \frac{3}{4\pi}\frac{\pi^2}{36} = \frac{(2\sqrt{3}-1)\pi}{48}.$$

The area to the right of $x = \frac{\pi}{6}$ is

$$\int_{\pi/6}^{\pi/3} \left(\cos x - \frac{3}{2\pi}x\right) dx = \left(\sin x - \frac{3}{4\pi}x^2\right)\Bigg|_{\pi/6}^{\pi/3} = \frac{8\sqrt{3} - 8 - \pi}{16}.$$

The entire area is then

$$\frac{(2\sqrt{3}-1)\pi}{48} + \frac{8\sqrt{3}-8-\pi}{16} = \frac{12\sqrt{3} - 12 + (\sqrt{3}-2)\pi}{24}.$$

16.

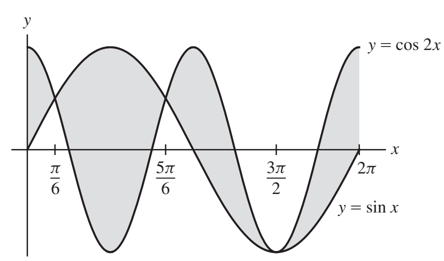

FIGURE 15

SOLUTION Over the interval $[0, \pi/6]$, the graph of $y = \cos 2x$ lies above the graph of $y = \sin x$. The orientation of the two graphs reverses over $[\pi/6, 5\pi/6]$ and reverses again over $[5\pi/6, 2\pi]$. Thus, the area between the two graphs is given by

$$A = \int_0^{\pi/6} (\cos 2x - \sin x)\, dx + \int_{\pi/6}^{5\pi/6} (\sin x - \cos 2x)\, dx + \int_{5\pi/6}^{2\pi} (\cos 2x - \sin x)\, dx.$$

Carrying out the integration and evaluation, we find

$$\begin{aligned} A &= \left(\frac{1}{2}\sin 2x + \cos x\right)\Bigg|_0^{\pi/6} + \left(-\cos x - \frac{1}{2}\sin 2x\right)\Bigg|_{\pi/6}^{5\pi/6} + \left(\frac{1}{2}\sin 2x + \cos x\right)\Bigg|_{5\pi/6}^{2\pi} \\ &= \frac{\sqrt{3}}{4} + \frac{\sqrt{3}}{2} - 1 + \frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{4} - \left(-\frac{\sqrt{3}}{2} - \frac{\sqrt{3}}{4}\right) + 1 - \left(-\frac{\sqrt{3}}{4} - \frac{\sqrt{3}}{2}\right) \\ &= 3\sqrt{3}. \end{aligned}$$

In Exercises 17 and 18, find the area between the graphs of $x = \sin y$ and $x = 1 - \cos y$ over the given interval (Figure 16).

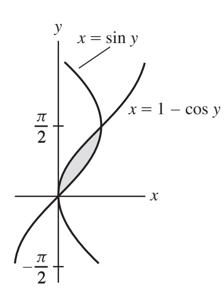

FIGURE 16

17. $0 \le y \le \frac{\pi}{2}$

SOLUTION As shown in the figure, the graph on the right is $x = \sin y$ and the graph on the left is $x = 1 - \cos y$. Therefore, the area between the two curves is given by

$$\int_0^{\pi/2} (\sin y - (1 - \cos y))\, dy = \left(-\cos y - y + \sin y\right)\Big|_0^{\pi/2} = \left(-\frac{\pi}{2} + 1\right) - (-1) = 2 - \frac{\pi}{2}.$$

18. $-\frac{\pi}{2} \le y \le \frac{\pi}{2}$

SOLUTION The shaded region in the figure shows the area between the graphs from $y = 0$ to $y = \frac{\pi}{2}$. It is bounded on the right by $x = \sin y$ and on the left by $x = 1 - \cos y$. Therefore, the area between the graphs from $y = 0$ to $y = \frac{\pi}{2}$ is

$$\int_0^{\pi/2} (\sin y - (1 - \cos y))\, dy = \left(-\cos y - y + \sin y\right)\Big|_0^{\pi/2} = \left(-\frac{\pi}{2} + 1\right) - (-1) = 2 - \frac{\pi}{2}.$$

The graphs cross at $y = 0$. Since $x = 1 - \cos y$ lies to the right of $x = \sin y$ on the interval $[-\frac{\pi}{2}, 0]$ along the y-axis, the area between the graphs from $y = -\frac{\pi}{2}$ to $y = 0$ is

$$\int_{-\pi/2}^{0} ((1 - \cos y) - \sin y)\, dy = \left(y - \sin y + \cos y\right)\Big|_{-\pi/2}^{0} = 1 - \left(-\frac{\pi}{2} + 1\right) = \frac{\pi}{2}.$$

The total area between the graphs from $y = -\frac{\pi}{2}$ to $y = \frac{\pi}{2}$ is the sum

$$\int_0^{\pi/2} (\sin y - (1 - \cos y))\, dy + \int_{-\pi/2}^{0} ((1 - \cos y) - \sin y)\, dy = 2 - \frac{\pi}{2} + \frac{\pi}{2} = 2.$$

19. Find the area of the region lying to the right of $x = y^2 + 4y - 22$ and to the left of $x = 3y + 8$.

SOLUTION Setting $y^2 + 4y - 22 = 3y + 8$ yields

$$0 = y^2 + y - 30 = (y + 6)(y - 5),$$

so the two curves intersect at $y = -6$ and $y = 5$. The area in question is then given by

$$\int_{-6}^{5} \left((3y + 8) - (y^2 + 4y - 22)\right) dy = \int_{-6}^{5} \left(-y^2 - y + 30\right) dy = \left(-\frac{y^3}{3} - \frac{y^2}{2} + 30y\right)\Bigg|_{-6}^{5} = \frac{1331}{6}.$$

20. Find the area of the region lying to the right of $x = y^2 - 5$ and to the left of $x = 3 - y^2$.

SOLUTION Setting $y^2 + 5 = 3 - y^2$ yields $2y^2 = 8$ or $y = \pm 2$. The area of the region enclosed by the two graphs is then

$$\int_{-2}^{2} \left((3 - y^2) - (y^2 + 5)\right) dy = \int_{-2}^{2} \left(8 - 2y^2\right) dy = \left(8y - \frac{2}{3}y^3\right)\Big|_{-2}^{2} = \frac{64}{3}.$$

21. Figure 17 shows the region enclosed by $x = y^3 - 26y + 10$ and $x = 40 - 6y^2 - y^3$. Match the equations with the curves and compute the area of the region.

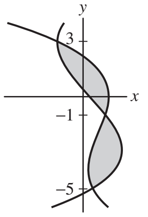

FIGURE 17

SOLUTION Substituting $y = 0$ into the equations for both curves indicates that the graph of $x = y^3 - 26y + 10$ passes through the point $(10, 0)$ while the graph of $x = 40 - 6y^2 - y^3$ passes through the point $(40, 0)$. Therefore, over the

y-interval $[-1, 3]$, the graph of $x = 40 - 6y^2 - y^3$ lies to the right of the graph of $x = y^3 - 26y + 10$. The orientation of the two graphs is reversed over the y-interval $[-5, -1]$. Hence, the area of the shaded region is

$$\int_{-5}^{-1} \left((y^3 - 26y + 10) - (40 - 6y^2 - y^3)\right) dy + \int_{-1}^{3} \left((40 - 6y^2 - y^3) - (y^3 - 26y + 10)\right) dy$$
$$= \int_{-5}^{-1} \left(2y^3 + 6y^2 - 26y - 30\right) dy + \int_{-1}^{3} \left(-2y^3 - 6y^2 + 26y + 30\right) dy$$
$$= \left(\frac{1}{2}y^4 + 2y^3 - 13y^2 - 30y\right)\Big|_{-5}^{-1} + \left(-\frac{1}{2}y^4 - 2y^3 + 13y^2 + 30y\right)\Big|_{-1}^{3} = 256.$$

22. Figure 18 shows the region enclosed by $y = x^3 - 6x$ and $y = 8 - 3x^2$. Match the equations with the curves and compute the area of the region.

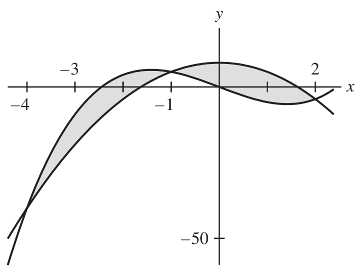

FIGURE 18 Region between $y = x^3 - 6x$ and $y = 8 - 3x^2$.

SOLUTION Setting $x^3 - 6x = 8 - 3x^2$ yields $(x + 1)(x + 4)(x - 2) = 0$, so the two curves intersect at $x = -4$, $x = -1$ and $x = 2$. Over the interval $[-4, -1]$, $y = x^3 - 6x$ is the upper curve, while $y = 8 - 3x^2$ is the upper curve over the interval $[-1, 2]$. The area of the region enclosed by the two curves is then

$$\int_{-4}^{-1} \left((x^3 - 6x) - (8 - 3x^2)\right) dx + \int_{-1}^{2} \left((8 - 3x^2) - (x^3 - 6x)\right) dx$$
$$= \left(\frac{1}{4}x^4 - 3x^2 - 8x + x^3\right)\Big|_{-4}^{-1} + \left(8x - x^3 - \frac{1}{4}x^4 + 3x^2\right)\Big|_{-1}^{2} = \frac{81}{4} + \frac{81}{4} = \frac{81}{2}.$$

In Exercises 23 and 24, find the area enclosed by the graphs in two ways: by integrating along the x-axis and by integrating along the y-axis.

23. $x = 9 - y^2, \quad x = 5$

SOLUTION Along the y-axis, we have points of intersection at $y = \pm 2$. Therefore, the area enclosed by the two curves is

$$\int_{-2}^{2} \left(9 - y^2 - 5\right) dy = \int_{-2}^{2} \left(4 - y^2\right) dy = \left(4y - \frac{1}{3}y^3\right)\Big|_{-2}^{2} = \frac{32}{3}.$$

Along the x-axis, we have integration limits of $x = 5$ and $x = 9$. Therefore, the area enclosed by the two curves is

$$\int_{5}^{9} 2\sqrt{9 - x}\, dx = -\frac{4}{3}(9 - x)^{3/2}\Big|_{5}^{9} = 0 - \left(-\frac{32}{3}\right) = \frac{32}{3}.$$

24. The *semicubical parabola* $y^2 = x^3$ and the line $x = 1$.

SOLUTION Since $y^2 = x^3$, it follows that $x \geq 0$ since $y^2 \geq 0$. Therefore, $y = \pm x^{3/2}$, and the area of the region enclosed by the semicubical parabola and $x = 1$ is

$$\int_{0}^{1} \left(x^{3/2} - (-x^{3/2})\right) dx = \int_{0}^{1} 2x^{3/2}\, dx = \frac{4}{5}x^{5/2}\Big|_{0}^{1} = \frac{4}{5}.$$

Along the y-axis, we have integration limits of $y = \pm 1$. Therefore, the area enclosed by the two curves is

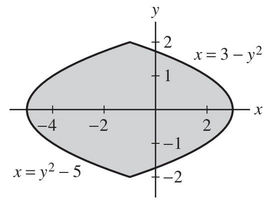
$$\int_{-1}^{1} \left(1 - y^{2/3}\right) dy = \left(y - \frac{3}{5}y^{5/3}\right)\Big|_{-1}^{1} = \left(1 - \frac{3}{5}\right) - \left(-1 + \frac{3}{5}\right) = \frac{4}{5}.$$

In Exercises 25 and 26, find the area of the region using the method (integration along either the x- or the y-axis) that requires you to evaluate just one integral.

25. Region between $y^2 = x + 5$ and $y^2 = 3 - x$

SOLUTION From the figure below, we see that integration along the x-axis would require two integrals, but integration along the y-axis requires only one integral. Setting $y^2 - 5 = 3 - y^2$ yields points of intersection at $y = \pm 2$. Thus, the area is given by

$$\int_{-2}^{2} \left((3 - y^2) - (y^2 + 5) \right) dy = \int_{-2}^{2} \left(8 - 2y^2 \right) dy = \left(8y - \frac{2}{3}y^3 \right) \Big|_{-2}^{2} = \frac{64}{3}.$$



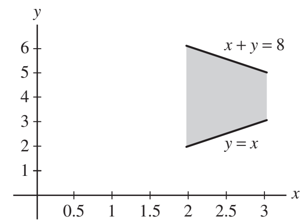
26. Region between $y = x$ and $x + y = 8$ over $[2, 3]$

SOLUTION From the figure below, we see that integration along the y-axis would require three integrals, but integration along the x-axis requires only one integral. The area of the region is then

$$\int_{2}^{3} \left((8 - x) - x \right) dx = (8x - x^2) \Big|_{2}^{3} = (24 - 9) - (16 - 4) = 3.$$

As a check, the area of a trapezoid is given by

$$\frac{h}{2}(b_1 + b_2) = \frac{1}{2}(4 + 2) = 3.$$

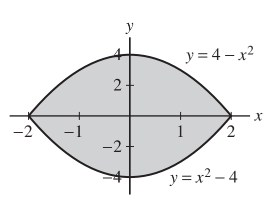


In Exercises 27–44, sketch the region enclosed by the curves and compute its area as an integral along the x- or y-axis.

27. $y = 4 - x^2, \quad y = x^2 - 4$

SOLUTION Setting $4 - x^2 = x^2 - 4$ yields $2x^2 = 8$ or $x^2 = 4$. Thus, the curves $y = 4 - x^2$ and $y = x^2 - 4$ intersect at $x = \pm 2$. From the figure below, we see that $y = 4 - x^2$ lies above $y = x^2 - 4$ over the interval $[-2, 2]$; hence, the area of the region enclosed by the curves is

$$\int_{-2}^{2} \left((4 - x^2) - (x^2 - 4) \right) dx = \int_{-2}^{2} (8 - 2x^2)\, dx = \left(8x - \frac{2}{3}x^3 \right) \Big|_{-2}^{2} = \frac{64}{3}.$$



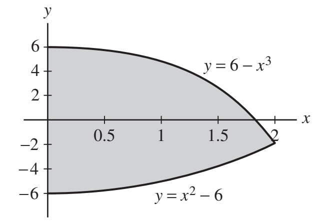
28. $y = x^2 - 6, \quad y = 6 - x^3, \quad y$-axis

SOLUTION Setting $x^2 - 6 = 6 - x^3$ yields

$$0 = x^3 + x^2 - 12 = (x - 2)(x^2 + 3x + 6),$$

so the curves $y = x^2 - 6$ and $y = 6 - x^3$ intersect at $x = 2$. Using the graph shown below, we see that $y = 6 - x^3$ lies above $y = x^2 - 6$ over the interval [0, 2]; hence, the area of the region enclosed by these curves and the y-axis is

$$\int_0^2 \left((6 - x^3) - (x^2 - 6)\right) dx = \int_0^2 (-x^3 - x^2 + 12)\, dx = \left(-\frac{1}{4}x^4 - \frac{1}{3}x^3 + 12x\right)\Big|_0^2 = \frac{52}{3}.$$

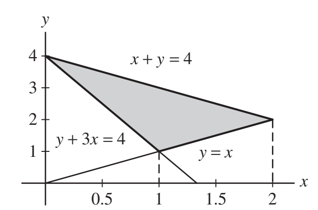


29. $x + y = 4, \quad x - y = 0, \quad y + 3x = 4$

SOLUTION From the graph below, we see that the top of the region enclosed by the three lines is always bounded by $x + y = 4$. On the other hand, the bottom of the region is bounded by $y + 3x = 4$ for $0 \le x \le 1$ and by $x - y = 0$ for $1 \le x \le 2$. The total area of the region is then

$$\int_0^1 ((4 - x) - (4 - 3x))\ dx + \int_1^2 ((4 - x) - x)\ dx = \int_0^1 2x\, dx + \int_1^2 (4 - 2x)\, dx$$

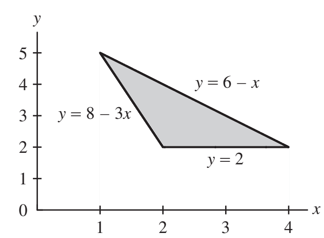
$$= x^2\Big|_0^1 + (4x - x^2)\Big|_1^2 = 1 + (8 - 4) - (4 - 1) = 2.$$



30. $y = 8 - 3x, \quad y = 6 - x, \quad y = 2$

SOLUTION From the figure below, we see that the graph of $y = 6 - x$ lies to the right of the graph of $y = 8 - 3x$, so integration in y is most appropriate for this problem. Setting $8 - 3x = 6 - x$ yields $x = 1$, so the y-coordinate of the point of intersection between $y = 8 - 3x$ and $y = 6 - x$ is 5. The area bounded by the three given curves is thus

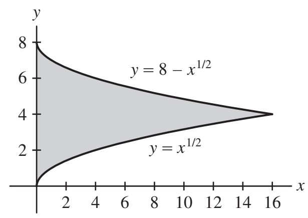
$$\begin{aligned} A &= \int_2^5 \left((6 - y) - \frac{1}{3}(8 - y)\right) dy \\ &= \int_2^5 \left(\frac{10}{3} - \frac{2}{3}y\right) dy \\ &= \left(\frac{10}{3}y - \frac{1}{3}y^2\right)\Big|_2^5 \\ &= \left(\frac{50}{3} - \frac{25}{3}\right) - \left(\frac{20}{3} - \frac{4}{3}\right) \\ &= 3. \end{aligned}$$



31. $y = 8 - \sqrt{x}, \quad y = \sqrt{x}, \quad x = 0$

SOLUTION Setting $8 - \sqrt{x} = \sqrt{x}$ yields $\sqrt{x} = 4$ or $x = 16$. Using the graph shown below, we see that $y = 8 - \sqrt{x}$ lies above $y = \sqrt{x}$ over the interval $[0, 16]$. The area of the region enclosed by these two curves and the y-axis is then

$$\int_0^{16} \left(8 - \sqrt{x} - \sqrt{x}\right) dx = \int_0^{16} \left(8 - 2\sqrt{x}\right) dx = \left(8x - \frac{4}{3}x^{3/2}\right)\bigg|_0^{16} = \frac{128}{3}.$$



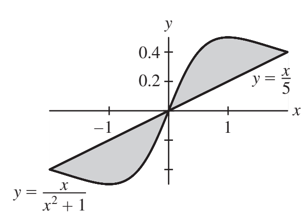
32. $y = \dfrac{x}{x^2+1}, \quad y = \dfrac{x}{5}$

SOLUTION Setting

$$\frac{x}{x^2+1} = \frac{x}{5} \quad \text{yields} \quad x = -2, 0, 2.$$

From the figure below, we see that the graph of $y = x/5$ lies above the graph of $y = x/(x^2+1)$ over $[-2, 0]$ and that the orientation is reversed over $[0, 2]$. Thus,

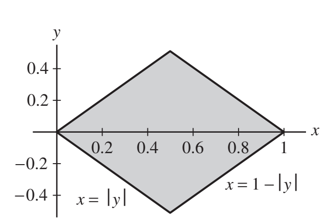
$$\begin{aligned} A &= \int_{-2}^{0} \left(\frac{x}{5} - \frac{x}{x^2+1}\right) dx + \int_0^2 \left(\frac{x}{x^2+1} - \frac{x}{5}\right) dx \\ &= \left(\frac{x^2}{10} - \frac{1}{2}\ln(x^2+1)\right)\bigg|_{-2}^{0} + \left(\frac{1}{2}\ln(x^2+1) - \frac{x^2}{10}\right)\bigg|_0^2 \\ &= \left(0 - \frac{2}{5} + \frac{1}{2}\ln 5\right) + \left(\frac{1}{2}\ln 5 - \frac{2}{5} - 0\right) \\ &= \ln 5 - \frac{4}{5}. \end{aligned}$$



33. $x = |y|, \quad x = 1 - |y|$

SOLUTION From the graph below, we see that the region enclosed by the curves $x = |y|$ and $x = 1 - |y|$ is symmetric with respect to the x-axis. We can therefore determine the total area by doubling the area in the first quadrant. For $y > 0$, setting $y = 1 - y$ yields $y = \frac{1}{2}$ as the point of intersection. Moreover, $x = 1 - |y| = 1 - y$ lies to the right of $x = |y| = y$, so the total area of the region is

$$2\int_0^{1/2} \left((1-y) - y\right) dy = 2\left(y - y^2\right)\bigg|_0^{1/2} = 2\left(\frac{1}{2} - \frac{1}{4}\right) = \frac{1}{2}.$$



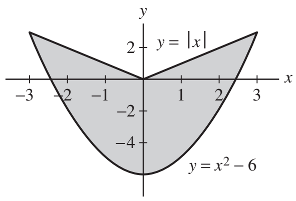
34. $y = |x|, \quad y = x^2 - 6$

SOLUTION From the graph below, we see that the region enclosed by the curves $y = |x|$ and $y = x^2 - 6$ is symmetric with respect to the y-axis. We can therefore determine the total area of the region by doubling the area of the portion of the region to the right of the y-axis. For $x > 0$, setting $x = x^2 - 6$ yields

$$0 = x^2 - x - 6 = (x-3)(x+2),$$

so the curves intersect at $x = 3$. Moreover, on the interval $[0, 3]$, $y = |x| = x$ lies above $y = x^2 - 6$. Therefore, the area of the region enclosed by the two curves is

$$2\int_0^3 \left(x - (x^2 - 6)\right) dx = 2\left(\frac{1}{2}x^2 - \frac{1}{3}x^3 + 6x\right)\Bigg|_0^3 = 2\left(\frac{9}{2} - 9 + 18\right) = 27.$$



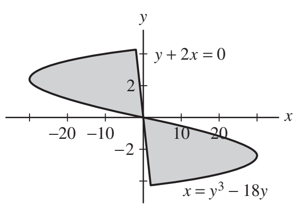
35. $x = y^3 - 18y, \quad y + 2x = 0$

SOLUTION Setting $y^3 - 18y = -\frac{y}{2}$ yields

$$0 = y^3 - \frac{35}{2}y = y\left(y^2 - \frac{35}{2}\right),$$

so the points of intersection occur at $y = 0$ and $y = \pm\frac{\sqrt{70}}{2}$. From the graph below, we see that both curves are symmetric with respect to the origin. It follows that the portion of the region enclosed by the curves in the second quadrant is identical to the region enclosed in the fourth quadrant. We can therefore determine the total area enclosed by the two curves by doubling the area enclosed in the second quadrant. In the second quadrant, $y + 2x = 0$ lies to the right of $x = y^3 - 18y$, so the total area enclosed by the two curves is

$$2\int_0^{\sqrt{70}/2} \left(-\frac{y}{2} - (y^3 - 18y)\right) dy = 2\left(\frac{35}{4}y^2 - \frac{1}{4}y^4\right)\Bigg|_0^{\sqrt{70}/2} = 2\left(\frac{1225}{8} - \frac{1225}{16}\right) = \frac{1225}{8}.$$



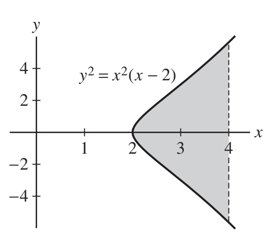
36. $y = x\sqrt{x-2}, \quad y = -x\sqrt{x-2}, \quad x = 4$

SOLUTION Note that $y = x\sqrt{x-2}$ and $y = -x\sqrt{x-2}$ are the upper and lower branches, respectively, of the curve $y^2 = x^2(x-2)$. The area enclosed by this curve and the vertical line $x = 4$ is

$$\int_2^4 \left(x\sqrt{x-2} - (-x\sqrt{x-2})\right) dx = \int_2^4 2x\sqrt{x-2}\,dx.$$

Substitute $u = x - 2$. Then $du = dx$, $x = u + 2$ and

$$\int_2^4 2x\sqrt{x-2}\,dx = \int_0^2 2(u+2)\sqrt{u}\,du = \int_0^2 \left(2u^{3/2} + 4u^{1/2}\right) du = \left(\frac{4}{5}u^{5/2} + \frac{8}{3}u^{3/2}\right)\Bigg|_0^2 = \frac{128\sqrt{2}}{15}.$$



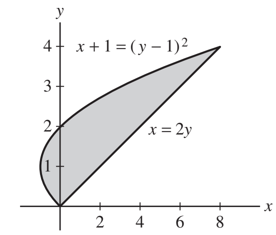
37. $x = 2y, \quad x + 1 = (y - 1)^2$

SOLUTION Setting $2y = (y-1)^2 - 1$ yields

$$0 = y^2 - 4y = y(y - 4),$$

so the two curves intersect at $y = 0$ and at $y = 4$. From the graph below, we see that $x = 2y$ lies to the right of $x + 1 = (y-1)^2$ over the interval $[0, 4]$ along the y-axis. Thus, the area of the region enclosed by the two curves is

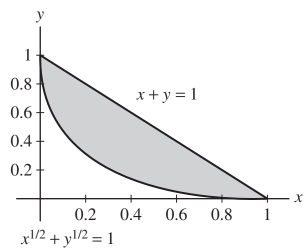
$$\int_0^4 \left(2y - ((y-1)^2 - 1)\right)\, dy = \int_0^4 \left(4y - y^2\right)\, dy = \left(2y^2 - \frac{1}{3}y^3\right)\Big|_0^4 = \frac{32}{3}.$$



38. $x + y = 1, \quad x^{1/2} + y^{1/2} = 1$

SOLUTION From the graph below, we see that the two curves intersect at $x = 0$ and at $x = 1$ and that $x + y = 1$ lies above $x^{1/2} + y^{1/2} = 1$. The area of the region enclosed by the two curves is then

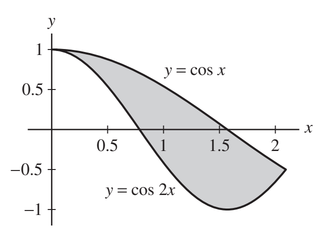
$$\int_0^1 \left((1 - x) - (1 - \sqrt{x})^2\right)\, dx = \int_0^1 \left(-2x + 2\sqrt{x}\right)\, dx = \left(-x^2 + \frac{4}{3}x^{3/2}\right)\Big|_0^1 = \frac{1}{3}.$$



39. $y = \cos x, \quad y = \cos 2x, \quad x = 0, \quad x = \dfrac{2\pi}{3}$

SOLUTION From the graph below, we see that $y = \cos x$ lies above $y = \cos 2x$ over the interval $[0, \frac{2\pi}{3}]$. The area of the region enclosed by the two curves is therefore

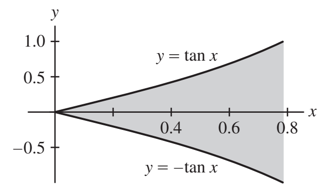
$$\int_0^{2\pi/3} (\cos x - \cos 2x)\, dx = \left(\sin x - \frac{1}{2}\sin 2x\right)\Big|_0^{2\pi/3} = \frac{3\sqrt{3}}{4}.$$



40. $y = \tan x, \quad y = -\tan x, \quad x = \dfrac{\pi}{4}$

SOLUTION Because the graph of $y = \tan x$ lies above the graph of $y = -\tan x$ over the interval $[0, \pi/4]$, the area bounded by the two curves is

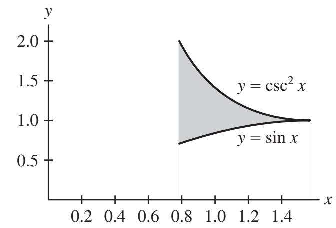
$$\begin{aligned} A &= \int_0^{\pi/4} (\tan x - (-\tan x))\, dx = 2\int_0^{\pi/4} \tan x\, dx \\ &= 2\ln|\sec x|\Big|_0^{\pi/4} \\ &= 2\ln 2 - 2\ln 1 = 2\ln 2. \end{aligned}$$



41. $y = \sin x, \quad y = \csc^2 x, \quad x = \dfrac{\pi}{4}$

SOLUTION Over the interval $[\frac{\pi}{4}, \frac{\pi}{2}]$, $y = \csc^2 x$ lies above $y = \sin x$. The area of the region enclosed by the two curves is then

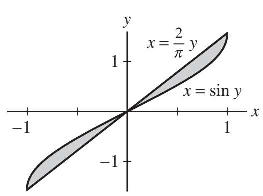
$$\int_{\pi/4}^{\pi/2} \left(\csc^2 x - \sin x\right) dx = \left(-\cot x + \cos x\right)\Big|_{\pi/4}^{\pi/2} = (0 - 0) - \left(-1 + \frac{\sqrt{2}}{2}\right) = 1 - \frac{\sqrt{2}}{2}.$$



42. $x = \sin y, \quad x = \dfrac{2}{\pi} y$

SOLUTION Here, integration along the y-axis will require less work than integration along the x-axis. The curves intersect when $\frac{2y}{\pi} = \sin y$ or when $y = 0, \pm\frac{\pi}{2}$. From the graph below, we see that both curves are symmetric with respect to the origin. It follows that the portion of the region enclosed by the curves in the first quadrant is identical to the region enclosed in the third quadrant. We can therefore determine the total area enclosed by the two curves by doubling the area enclosed in the first quadrant. In the first quadrant, $x = \sin y$ lies to the right of $x = \frac{2y}{\pi}$, so the total area enclosed by the two curves is

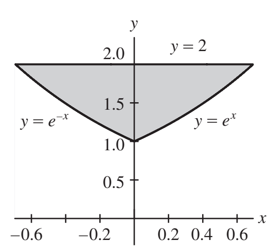
$$2\int_0^{\pi/2} \left(\sin y - \frac{2}{\pi} y\right) dy = 2\left(-\cos y - \frac{1}{\pi} y^2\right)\Big|_0^{\pi/2} = 2\left[\left(0 - \frac{\pi}{4}\right) - (-1 - 0)\right] = 2 - \frac{\pi}{2}.$$



43. $y = e^x, \quad y = e^{-x}, \quad y = 2$

SOLUTION From the figure below, we see that integration in y would be most appropriate - unfortunately, we have not yet learned how to integrate $\ln y$. Consequently, we will calculate the area using two integrals in x:

$$\begin{aligned} A &= \int_{-\ln 2}^{0} (2 - e^{-x})\, dx + \int_0^{\ln 2} (2 - e^x)\, dx \\ &= \left(2x + e^{-x}\right)\Big|_{-\ln 2}^{0} + \left(2x - e^x\right)\Big|_0^{\ln 2} \\ &= 1 - (-2\ln 2 + 2) + (2\ln 2 - 2) - (-1) = 4\ln 2 - 2. \end{aligned}$$



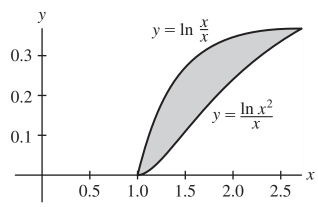
44. $y = \dfrac{\ln x}{x}, \quad y = \dfrac{(\ln x)^2}{x}$

SOLUTION Setting

$$\frac{\ln x}{x} = \frac{(\ln x)^2}{2} \quad \text{yields} \quad x = 1, e.$$

From the figure below, we see that the graph of $y = \ln x/x$ lies above the graph of $y = (\ln x)^2/x$ over the interval $[1, e]$. Thus, the area between the two curves is

$$\begin{aligned} A &= \int_1^e \left(\frac{\ln x}{x} - \frac{(\ln x)^2}{x} \right) dx \\ &= \left(\frac{1}{2}(\ln x)^2 - \frac{1}{3}(\ln x)^3 \right)\Bigg|_1^e \\ &= \frac{1}{2} - \frac{1}{3} = \frac{1}{6}. \end{aligned}$$



45. CAS Plot

$$y = \frac{x}{\sqrt{x^2+1}} \quad \text{and} \quad y = (x-1)^2$$

on the same set of axes. Use a computer algebra system to find the points of intersection numerically and compute the area between the curves.

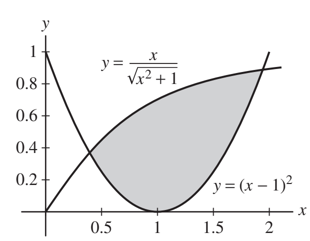
SOLUTION Using a computer algebra system, we find that the curves

$$y = \frac{x}{\sqrt{x^2+1}} \qquad \text{and} \qquad y = (x-1)^2$$

intersect at $x = 0.3943285581$ and at $x = 1.942944418$. From the graph below, we see that $y = \frac{x}{\sqrt{x^2+1}}$ lies above $y = (x-1)^2$, so the area of the region enclosed by the two curves is

$$\int_{0.3943285581}^{1.942944418} \left(\frac{x}{\sqrt{x^2+1}} - (x-1)^2 \right) dx = 0.7567130951$$

The value of the definite integral was also obtained using a computer algebra system.



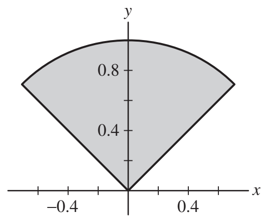
46. Sketch a region whose area is represented by

$$\int_{-\sqrt{2}/2}^{\sqrt{2}/2} \left(\sqrt{1-x^2} - |x| \right) dx$$

and evaluate using geometry.

SOLUTION Matching the integrand $\sqrt{1-x^2} - |x|$ with the $y_{\text{TOP}} - y_{\text{BOT}}$ template for calculating area, we see that the region in question is bounded along the top by the curve $y = \sqrt{1-x^2}$ (the upper half of the unit circle) and is bounded along the bottom by the curve $y = |x|$. Hence, the region is $\frac{1}{4}$ of the unit circle (see the figure below). The area of the region must then be

$$\frac{1}{4}\pi(1)^2 = \frac{\pi}{4}.$$



47. Athletes 1 and 2 run along a straight track with velocities $v_1(t)$ and $v_2(t)$ (in m/s) as shown in Figure 19.

(a) Which of the following is represented by the area of the shaded region over [0, 10]?

i. The distance between athletes 1 and 2 at time $t = 10$ s.

ii. The difference in the distance traveled by the athletes over the time interval [0, 10].

(b) Does Figure 19 give us enough information to determine who is ahead at time $t = 10$ s?

(c) If the athletes begin at the same time and place, who is ahead at $t = 10$ s? At $t = 25$ s?

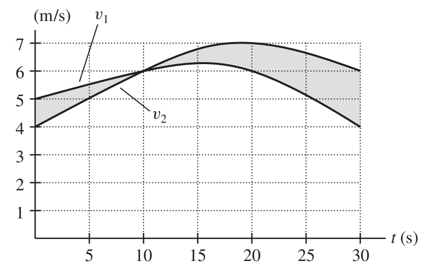


FIGURE 19

SOLUTION

(a) The area of the shaded region over [0, 10] represents **(ii)**: the difference in the distance traveled by the athletes over the time interval [0, 10].

(b) No, Figure 19 does not give us enough information to determine who is ahead at time $t = 10$ s. We would additionally need to know the relative position of the runners at $t = 0$ s.

(c) If the athletes begin at the same time and place, then athlete 1 is ahead at $t = 10$ s because the velocity graph for athlete 1 lies above the velocity graph for athlete 2 over the interval [0, 10]. Over the interval [10, 25], the velocity graph for athlete 2 lies above the velocity graph for athlete 1 and appears to have a larger area than the area between the graphs over [0, 10]. Thus, it appears that athlete 2 is ahead at $t = 25$ s.

48. Express the area (not signed) of the shaded region in Figure 20 as a sum of three integrals involving $f(x)$ and $g(x)$.

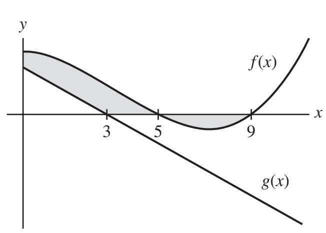

FIGURE 20

SOLUTION Because either the curve bounding the top of the region or the curve bounding the bottom of the region or both change at $x = 3$ and at $x = 5$, the area is calculated using three integrals. Specifically, the area is

$$\int_0^3 (f(x) - g(x))\,dx + \int_3^5 (f(x) - 0)\,dx + \int_5^9 (0 - f(x))\,dx$$

$$= \int_0^3 (f(x) - g(x))\,dx + \int_3^5 f(x)\,dx - \int_5^9 f(x)\,dx.$$

49. Find the area enclosed by the curves $y = c - x^2$ and $y = x^2 - c$ as a function of c. Find the value of c for which this area is equal to 1.

SOLUTION The curves intersect at $x = \pm\sqrt{c}$, with $y = c - x^2$ above $y = x^2 - c$ over the interval $[-\sqrt{c}, \sqrt{c}]$. The area of the region enclosed by the two curves is then

$$\int_{-\sqrt{c}}^{\sqrt{c}} \left((c - x^2) - (x^2 - c)\right) dx = \int_{-\sqrt{c}}^{\sqrt{c}} \left(2c - 2x^2\right) dx = \left(2cx - \frac{2}{3}x^3\right)\Big|_{-\sqrt{c}}^{\sqrt{c}} = \frac{8}{3}c^{3/2}.$$

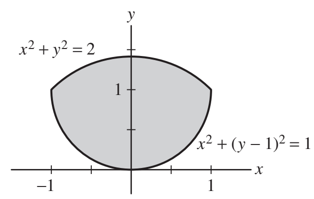
In order for the area to equal 1, we must have $\frac{8}{3}c^{3/2} = 1$, which gives

$$c = \frac{9^{1/3}}{4} \approx 0.520021.$$

50. Set up (but do not evaluate) an integral that expresses the area between the circles $x^2 + y^2 = 2$ and $x^2 + (y - 1)^2 = 1$.

SOLUTION Setting $2 - y^2 = 1 - (y - 1)^2$ yields $y = 1$. The two circles therefore intersect at the points $(1, 1)$ and $(-1, 1)$. From the graph below, we see that over the interval $[-1, 1]$, the upper half of the circle $x^2 + y^2 = 2$ lies above the lower half of the circle $x^2 + (y - 1)^2 = 1$. The area enclosed by the two circles is therefore given by the integral

$$\int_{-1}^{1} \left(\sqrt{2 - x^2} - (1 - \sqrt{1 - x^2})\right) dx.$$



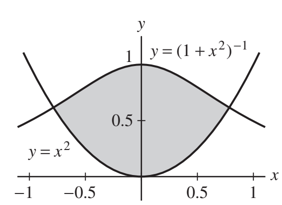
51. Set up (but do not evaluate) an integral that expresses the area between the graphs of $y = (1 + x^2)^{-1}$ and $y = x^2$.

SOLUTION Setting $(1 + x^2)^{-1} = x^2$ yields $x^4 + x^2 - 1 = 0$. This is a quadratic equation in the variable x^2. By the quadratic formula,

$$x^2 = \frac{-1 \pm \sqrt{1 - 4(-1)}}{2} = \frac{-1 \pm \sqrt{5}}{2}.$$

As x^2 must be nonnegative, we discard $\frac{-1-\sqrt{5}}{2}$. Finally, we find the two curves intersect at $x = \pm\sqrt{\frac{-1+\sqrt{5}}{2}}$. From the graph below, we see that $y = (1 + x^2)^{-1}$ lies above $y = x^2$. The area enclosed by the two curves is then

$$\int_{-\sqrt{\frac{-1+\sqrt{5}}{2}}}^{\sqrt{\frac{-1+\sqrt{5}}{2}}} \left((1 + x^2)^{-1} - x^2\right) dx.$$

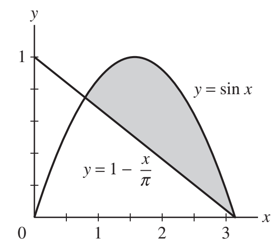


52. CAS Find a numerical approximation to the area above $y = 1 - (x/\pi)$ and below $y = \sin x$ (find the points of intersection numerically).

SOLUTION The region in question is shown in the figure below. Using a computer algebra system, we find that $y = 1 - x/\pi$ and $y = \sin x$ intersect on the left at $x = 0.8278585215$. Analytically, we determine the two curves intersect on the right at $x = \pi$. The area above $y = 1 - x/\pi$ and below $y = \sin x$ is then

$$\int_{0.8278585215}^{\pi} \left(\sin x - \left(1 - \frac{x}{\pi}\right)\right) dx = 0.8244398727,$$

where the definite integral was evaluated using a computer algebra system.

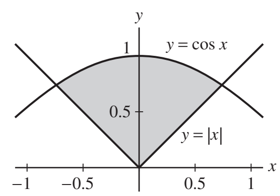


53. CAS Find a numerical approximation to the area above $y = |x|$ and below $y = \cos x$.

SOLUTION The region in question is shown in the figure below. We see that the region is symmetric with respect to the y-axis, so we can determine the total area of the region by doubling the area of the portion in the first quadrant. Using a computer algebra system, we find that $y = \cos x$ and $y = |x|$ intersect at $x = 0.7390851332$. The area of the region between the two curves is then

$$2\int_0^{0.7390851332} (\cos x - x)\, dx = 0.8009772242,$$

where the definite integral was evaluated using a computer algebra system.

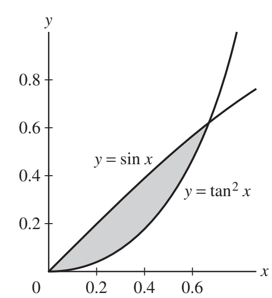


54. CAS Use a computer algebra system to find a numerical approximation to the number c (besides zero) in $\left[0, \frac{\pi}{2}\right]$, where the curves $y = \sin x$ and $y = \tan^2 x$ intersect. Then find the area enclosed by the graphs over $[0, c]$.

SOLUTION The region in question is shown in the figure below. Using a computer algebra system, we find that $y = \sin x$ and $y = \tan^2 x$ intersect at $x = 0.6662394325$. The area of the region enclosed by the two curves is then

$$\int_0^{0.6662394325} \left(\sin x - \tan^2 x\right) dx = 0.09393667698,$$

where the definite integral was evaluated using a computer algebra system.



55. The back of Jon's guitar (Figure 21) is 19 inches long. Jon measured the width at 1-in. intervals, beginning and ending $\frac{1}{2}$ in. from the ends, obtaining the results

$$6,\ 9,\ 10.25,\ 10.75,\ 10.75,\ 10.25,\ 9.75,\ 9.5,\ 10,\ 11.25,$$
$$12.75,\ 13.75,\ 14.25,\ 14.5,\ 14.5,\ 14,\ 13.25,\ 11.25,\ 9$$

Use the midpoint rule to estimate the area of the back.

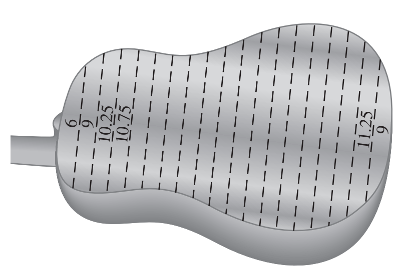


FIGURE 21 Back of guitar.

SOLUTION Note that the measurements were taken at the midpoint of each one-inch section of the guitar. For example, in the 0 to 1 inch section, the midpoint would be at $\frac{1}{2}$ inch, and thus the approximate area of the first rectangle would be $1 \cdot 6$ inches^2. An approximation for the entire area is then

$$\begin{aligned} A &= 1(6 + 9 + 10.25 + 10.75 + 10.75 + 10.25 + 9.75 + 9.5 + 10 + 11.25 \\ &\quad + 12.75 + 13.75 + 14.25 + 14.5 + 14.5 + 14 + 13.25 + 11.25 + 9) \\ &= 214.75 \text{ in}^2. \end{aligned}$$

56. Referring to Figure 1 at the beginning of this section, estimate the projected number of additional joules produced in the years 2009–2030 as a result of government stimulus spending in 2009–2010. *Note:* One watt is equal to one joule per second, and one gigawatt is 10^9 watts.

SOLUTION We make some rough estimates of the areas depicted in Figure 1. From 2009 through 2012, the area between the curves is roughly a right triangle with a base of 3 and a height of 40; from 2012 through 2020, the area is roughly an 8 by 40 rectangle. Finally, from 2020 through 2030, the area is roughly a trapezoid with height 10 and bases 40 and 27. Thus, additional energy produced is approximately

$$\frac{1}{2}(3)(40) + 8(40) + \frac{1}{2}(10)(40 + 27) = 715 \text{ gigawatt-years.}$$

Because 1 gigawatt is equal to 10^9 joules per second and 1 year (assuming 365 days) is equal to 31536000 seconds, the additional joules produced in the years 2009–2030 as a result of government stimulus spending in 2009–2010 is approximately 2.25×10^{19}.

Exercises 57 and 58 use the notation and results of Exercises 49–51 of Section 3.4. For a given country, $F(r)$ is the fraction of total income that goes to the bottom rth fraction of households. The graph of $y = F(r)$ is called the Lorenz curve.

57. Let A be the area between $y = r$ and $y = F(r)$ over the interval [0, 1] (Figure 22). The **Gini index** is the ratio $G = A/B$, where B is the area under $y = r$ over [0, 1].

(a) Show that $G = 2\int_0^1 (r - F(r))\, dr$.

(b) Calculate G if

$$F(r) = \begin{cases} \frac{1}{3}r & \text{for } 0 \le r \le \frac{1}{2} \\ \frac{5}{3}r - \frac{2}{3} & \text{for } \frac{1}{2} \le r \le 1 \end{cases}$$

(c) The Gini index is a measure of income distribution, with a lower value indicating a more equal distribution. Calculate G if $F(r) = r$ (in this case, all households have the same income by Exercise 51(b) of Section 3.4).

(d) What is G if all of the income goes to one household? *Hint:* In this extreme case, $F(r) = 0$ for $0 \le r < 1$.

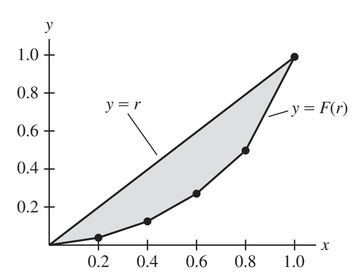

FIGURE 22 Lorenz Curve for U.S. in 2001.

SOLUTION

(a) Because the graph of $y = r$ lies above the graph of $y = F^{\cdot\cdot}$ in Figure 22,

$$A = \int_0^1 (r - F(r))\, dr.$$

Moreover,

$$B = \int_0^1 r\, dr = \frac{1}{2}r^2\bigg|_0^1 = \frac{1}{2}.$$

Thus,

$$G = \frac{A}{B} = 2\int_0^1 (r - F(r))\, dr.$$

(b) With the given $F(r)$,

$$\begin{aligned} G &= 2\int_0^{1/2}\left(r-\frac{1}{3}r\right)\,dr + 2\int_{1/2}^{1}\left(r-\left(\frac{5}{3}r-\frac{2}{3}\right)\right)\,dr \\ &= \frac{4}{3}\int_0^{1/2} r\,dr - \frac{4}{3}\int_{1/2}^{1}(r-1)\,dr \\ &= \frac{2}{3}r^2\Big|_0^{1/2} - \frac{4}{3}\left(\frac{1}{2}r^2 - r\right)\Big|_{1/2}^{1} \\ &= \frac{1}{6} - \frac{4}{3}\left(-\frac{1}{2}\right) + \frac{4}{3}\left(-\frac{3}{8}\right) = \frac{1}{3}. \end{aligned}$$

(c) If $F(r) = r$, then

$$G = 2\int_0^1 (r-r)\,dr = 0.$$

(d) If $F(r) = 0$ for $0 \le r < 1$, then

$$G = 2\int_0^1 (r-0)\,dr = 2\left(\frac{1}{2}r^2\right)\Big|_0^1 = 2\left(\frac{1}{2}\right) = 1.$$

58. Calculate the Gini index of the United States in the year 2001 from the Lorenz curve in Figure 22, which consists of segments joining the data points in the following table.

r	0	0.2	0.4	0.6	0.8	1
$F(r)$	0	0.035	0.123	0.269	0.499	1

SOLUTION From part (a) of the previous exercise,

$$G = 2\int_0^1 (r - F(r))\,dr = 1 - 2\int_0^1 F(r)\,dr.$$

Because $F(r)$ consists of segments joining the data points in the given table, the area under the graph of $y = F(r)$ consists of a triangle and four trapezoids. The area is

$$\frac{1}{2}(0.2)(0.035) + \frac{1}{2}(0.2)(0.035+0.123) + \frac{1}{2}(0.2)(0.123+0.269) + \frac{1}{2}(0.2)(0.269+0.499) + \frac{1}{2}(0.2)(0.499+1)$$

or 0.2852. Finally,

$$G = 1 - 2(0.2852) = 0.4296.$$

Further Insights and Challenges

59. Find the line $y = mx$ that divides the area under the curve $y = x(1-x)$ over [0, 1] into two regions of equal area.

SOLUTION First note that

$$\int_0^1 x(1-x)\,dx = \int_0^1 \left(x - x^2\right)\,dx = \left(\frac{1}{2}x^2 - \frac{1}{3}x^3\right)\Big|_0^1 = \frac{1}{6}.$$

Now, the line $y = mx$ and the curve $y = x(1-x)$ intersect when $mx = x(1-x)$, or at $x = 0$ and at $x = 1 - m$. The area of the region enclosed by the two curves is then

$$\int_0^{1-m} (x(1-x) - mx)\,dx = \int_0^{1-m} \left((1-m)x - x^2\right)\,dx = \left((1-m)\frac{x^2}{2} - \frac{1}{3}x^3\right)\Big|_0^{1-m} = \frac{1}{6}(1-m)^3.$$

To have $\frac{1}{6}(1-m)^3 = \frac{1}{2}\cdot\frac{1}{6}$ requires

$$m = 1 - \left(\frac{1}{2}\right)^{1/3} \approx 0.206299.$$

60. CAS Let c be the number such that the area under $y = \sin x$ over $[0, \pi]$ is divided in half by the line $y = cx$ (Figure 23). Find an equation for c and solve this equation *numerically* using a computer algebra system.

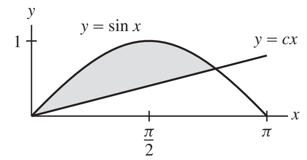

FIGURE 23

SOLUTION First note that

$$\int_0^{\pi} \sin x\,dx = -\cos x\Big|_0^{\pi} = 2.$$

Now, let $y = cx$ and $y = \sin x$ intersect at $x = a$. Then $ca = \sin a$, which gives $c = \frac{\sin a}{a}$ and $y = cx = \frac{\sin a}{a}x$. Then

$$\int_0^a \left(\sin x - \frac{\sin a}{a}x\right) dx = \left(-\cos x - \frac{\sin a}{2a}x^2\right)\Big|_0^a = 1 - \cos a - \frac{a\sin a}{2}.$$

We need

$$1 - \cos a - \frac{a\sin a}{2} = \frac{1}{2}(2) = 1,$$

which gives $a = 2.458714176$ and finally

$$c = \frac{\sin a}{a} = 0.2566498570.$$

61. Explain geometrically (without calculation):

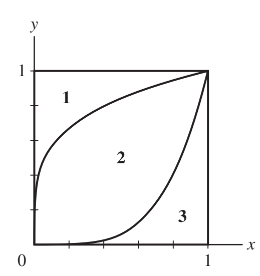
$$\int_0^1 x^n\,dx + \int_0^1 x^{1/n}\,dx = 1 \qquad (\text{for } n > 0)$$

SOLUTION Let A_1 denote the area of region 1 in the figure below. Define A_2 and A_3 similarly. It is clear from the figure that

$$A_1 + A_2 + A_3 = 1.$$

Now, note that x^n and $x^{1/n}$ are inverses of each other. Therefore, the graphs of $y = x^n$ and $y = x^{1/n}$ are symmetric about the line $y = x$, so regions 1 and 3 are also symmetric about $y = x$. This guarantees that $A_1 = A_3$. Finally,

$$\int_0^1 x^n\,dx + \int_0^1 x^{1/n}\,dx = A_3 + (A_2 + A_3) = A_1 + A_2 + A_3 = 1.$$



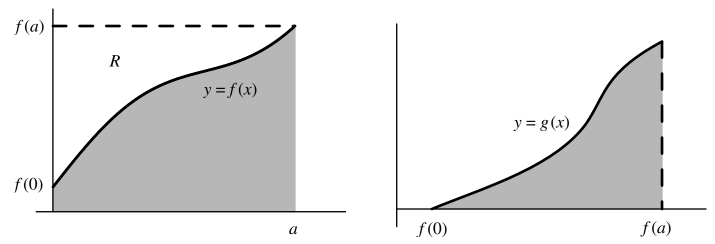
62. Let $f(x)$ be an increasing function with inverse $g(x)$. Explain geometrically:

$$\int_0^a f(x)\,dx + \int_{f(0)}^{f(a)} g(x)\,dx = af(a)$$

SOLUTION The region whose area is represented by $\int_0^a f(x)\,dx$ is shown as the shaded portion of the graph below on the left, and the region whose area is represented by $\int_{f(0)}^{f(a)} g(x)\,dx$ is shown as the shaded portion of the graph below on the right. Because f and g are inverse functions, the graph of $y = f(x)$ is obtained by reflecting the graph of $y = g(x)$

through the line $y = x$. It then follows that if we were to reflect the shaded region in the graph below on the right through the line $y = x$, the reflected region would coincide exactly with the region R in the graph below on the left. Thus

$$\int_0^a f(x)\,dx + \int_{f(0)}^{f(a)} g(x)\,dx = \text{ area of a rectangle with width } a \text{ and height } f(a) = af(a).$$



6.2 Setting Up Integrals: Volume, Density, Average Value

Preliminary Questions

1. What is the average value of $f(x)$ on $[0, 4]$ if the area between the graph of $f(x)$ and the x-axis is equal to 12?

SOLUTION Assuming that $f(x) \geq 0$ over the interval $[1, 4]$, the fact that the area between the graph of f and the x-axis is equal to 9 indicates that $\int_1^4 f(x)\,dx = 9$. The average value of f over the interval $[1, 4]$ is then

$$\frac{\int_1^4 f(x)\,dx}{4-1} = \frac{9}{3} = 3.$$

2. Find the volume of a solid extending from $y = 2$ to $y = 5$ if every cross section has area $A(y) = 5$.

SOLUTION Because the cross-sectional area of the solid is constant, the volume is simply the cross-sectional area times the length, or $5 \times 3 = 15$.

3. What is the definition of flow rate?

SOLUTION The flow rate of a fluid is the volume of fluid that passes through a cross-sectional area at a given point per unit time.

4. Which assumption about fluid velocity did we use to compute the flow rate as an integral?

SOLUTION To express flow rate as an integral, we assumed that the fluid velocity depended only on the radial distance from the center of the tube.

5. The average value of $f(x)$ on $[1, 4]$ is 5. Find $\displaystyle\int_1^4 f(x)\,dx$.

SOLUTION

$$\begin{aligned}\int_1^4 f(x)\,dx &= \text{average value on } [1,4] \times \text{ length of } [1,4] \\ &= 5 \times 3 = 15.\end{aligned}$$

Exercises

1. Let V be the volume of a pyramid of height 20 whose base is a square of side 8.

(a) Use similar triangles as in Example 1 to find the area of the horizontal cross section at a height y.

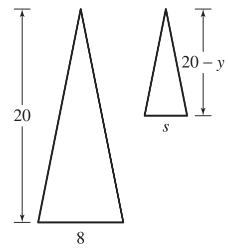
(b) Calculate V by integrating the cross-sectional area.

SOLUTION

(a) We can use similar triangles to determine the side length, s, of the square cross section at height y. Using the diagram below, we find

$$\frac{8}{20} = \frac{s}{20-y} \qquad \text{or} \qquad s = \frac{2}{5}(20-y).$$

The area of the cross section at height y is then given by $\frac{4}{25}(20-y)^2$.



(b) The volume of the pyramid is

$$\int_0^{20} \frac{4}{25}(20-y)^2\,dy = -\frac{4}{75}(20-y)^3\Big|_0^{20} = \frac{1280}{3}.$$

2. Let V be the volume of a right circular cone of height 10 whose base is a circle of radius 4 [Figure 17(A)].

(a) Use similar triangles to find the area of a horizontal cross section at a height y.

(b) Calculate V by integrating the cross-sectional area.

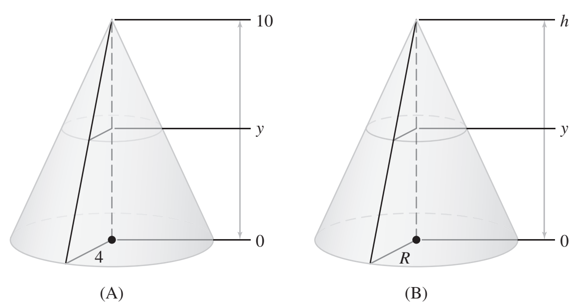


FIGURE 17 Right circular cones.

SOLUTION

(a) If r is the radius at height y (see Figure 17), then

$$\frac{10}{4} = \frac{10-y}{r}$$

from similar triangles, which implies that $r = 4 - \frac{2}{5}y$. The area of the cross-section at height y is then

$$A = \pi\left(4 - \frac{2}{5}y\right)^2.$$

(b) The volume of the cone is

$$V = \int_0^{10} \pi\left(4-\frac{2}{5}y\right)^2 dy = -\frac{5\pi}{6}\left(4-\frac{2}{5}y\right)^3\Big|_0^{10} = \frac{160\pi}{3}.$$

3. Use the method of Exercise 2 to find the formula for the volume of a right circular cone of height h whose base is a circle of radius R [Figure 17(B)].

SOLUTION

(a) From similar triangles (see Figure 17),

$$\frac{h}{h-y} = \frac{R}{r_0},$$

where r_0 is the radius of the cone at a height of y. Thus, $r_0 = R - \frac{Ry}{h}$.

(b) The volume of the cone is

$$\pi\int_0^h \left(R - \frac{Ry}{h}\right)^2 dy = \frac{-h\pi}{R}\,\frac{\left(R-\frac{Ry}{h}\right)^3}{3}\Bigg|_0^h = \frac{h\pi}{R}\,\frac{R^3}{3} = \frac{\pi R^2 h}{3}.$$

4. Calculate the volume of the ramp in Figure 18 in three ways by integrating the area of the cross sections:

(a) Perpendicular to the x-axis (rectangles).

(b) Perpendicular to the y-axis (triangles).

(c) Perpendicular to the z-axis (rectangles).

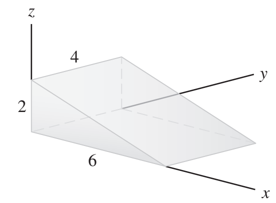

FIGURE 18 Ramp of length 6, width 4, and height 2.

SOLUTION

(a) Cross sections perpendicular to the x-axis are rectangles of width 4 and height $2 - \frac{1}{3}x$. The volume of the ramp is then

$$\int_0^6 4\left(-\frac{1}{3}x + 2\right)\,dx = \left(-\frac{2}{3}x^2 + 8x\right)\bigg|_0^6 = 24.$$

(b) Cross sections perpendicular to the y-axis are right triangles with legs of length 2 and 6. The volume of the ramp is then

$$\int_0^4 \left(\frac{1}{2}\cdot 2\cdot 6\right)\,dy = (6y)\bigg|_0^4 = 24.$$

(c) Cross sections perpendicular to the z-axis are rectangles of length $6 - 3z$ and width 4. The volume of the ramp is then

$$\int_0^2 4\,(-3(z-2))\,dz = (-6z^2 + 24z)\bigg|_0^2 = 24.$$

5. Find the volume of liquid needed to fill a sphere of radius R to height h (Figure 19).

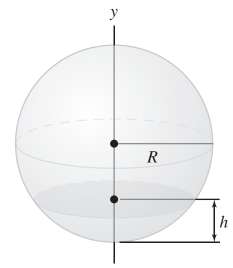

FIGURE 19 Sphere filled with liquid to height h.

SOLUTION The radius r at any height y is given by $r = \sqrt{R^2 - (R-y)^2}$. Thus, the volume of the filled portion of the sphere is

$$\pi\int_0^h r^2\,dy = \pi\int_0^h \left(R^2 - (R-y)^2\right)\,dy = \pi\int_0^h (2Ry - y^2)\,dy = \pi\left(Ry^2 - \frac{y^3}{3}\right)\bigg|_0^h = \pi\left(Rh^2 - \frac{h^3}{3}\right).$$

6. Find the volume of the wedge in Figure 20(A) by integrating the area of vertical cross sections.

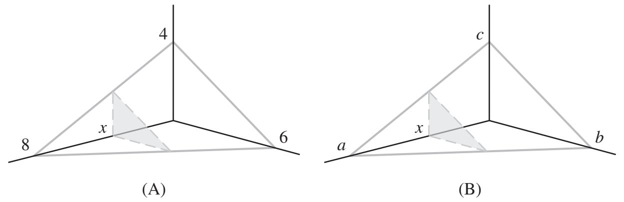

FIGURE 20

SOLUTION Cross sections of the wedge taken perpendicular to the x-axis are right triangles. Using similar triangles, we find the base and the height of the cross sections to be $\frac{3}{4}(8-x)$ and $\frac{1}{2}(8-x)$, respectively. The volume of the wedge is then

$$\frac{3}{16}\int_0^8 (8-x)^2\,dx = \frac{3}{16}\int_0^8 \left(64 - 16x + x^2\right)\,dx = \frac{3}{16}\left(64x - 8x^2 + \frac{1}{3}x^3\right)\bigg|_0^8 = 32.$$

7. Derive a formula for the volume of the wedge in Figure 20(B) in terms of the constants a, b, and c.

SOLUTION The line from c to a is given by the equation $(z/c) + (x/a) = 1$ and the line from b to a is given by $(y/b) + (x/a) = 1$. The cross sections perpendicular to the x-axis are right triangles with height $c(1 - x/a)$ and base $b(1 - x/a)$. Thus we have

$$\int_0^a \frac{1}{2}bc\,(1 - x/a)^2\,dx = -\frac{1}{6}abc\left(1 - \frac{x}{a}\right)^3\Big|_0^a = \frac{1}{6}abc.$$

8. Let B be the solid whose base is the unit circle $x^2 + y^2 = 1$ and whose vertical cross sections perpendicular to the x-axis are equilateral triangles. Show that the vertical cross sections have area $A(x) = \sqrt{3}(1 - x^2)$ and compute the volume of B.

SOLUTION At the arbitrary location x, the side of the equilateral triangle cross section that lies in the base of the solid extends from the top half of the unit circle (with $y = \sqrt{1 - x^2}$) to the bottom half (with $y = -\sqrt{1 - x^2}$). The equilateral triangle therefore has sides of length $s = 2\sqrt{1 - x^2}$ and an area of

$$A(x) = \frac{s^2\sqrt{3}}{4} = \sqrt{3}(1 - x^2).$$

Finally, the volume of the solid is

$$\sqrt{3}\int_{-1}^1 \left(1 - x^2\right)\,dx = \sqrt{3}\left(x - \frac{1}{3}x^3\right)\Big|_{-1}^1 = \frac{4\sqrt{3}}{3}.$$

In Exercises 9–14, find the volume of the solid with the given base and cross sections.

9. The base is the unit circle $x^2 + y^2 = 1$, and the cross sections perpendicular to the x-axis are triangles whose height and base are equal.

SOLUTION At each location x, the side of the triangular cross section that lies in the base of the solid extends from the top half of the unit circle (with $y = \sqrt{1 - x^2}$) to the bottom half (with $y = -\sqrt{1 - x^2}$). The triangle therefore has base and height equal to $2\sqrt{1 - x^2}$ and area $2(1 - x^2)$. The volume of the solid is then

$$\int_{-1}^1 2(1 - x^2)\,dx = 2\left(x - \frac{1}{3}x^3\right)\Big|_{-1}^1 = \frac{8}{3}.$$

10. The base is the triangle enclosed by $x + y = 1$, the x-axis, and the y-axis. The cross sections perpendicular to the y-axis are semicircles.

SOLUTION The diameter of the semicircle lies in the base of the solid and thus has length $1 - y$ for each y. The area of the semicircle is then

$$\frac{1}{2}\pi\left(\frac{1 - y}{2}\right)^2 = \frac{1}{8}\pi(1 - y)^2.$$

Finally, the volume of the solid is

$$\frac{\pi}{8}\int_0^1 (1 - y)^2\,dy = \frac{\pi}{8}\int_0^1 (1 - 2y + y^2)\,dy = \frac{\pi}{8}\left(y - y^2 + \frac{1}{3}y^3\right)\Big|_0^1 = \frac{\pi}{24}.$$

11. The base is the semicircle $y = \sqrt{9 - x^2}$, where $-3 \le x \le 3$. The cross sections perpendicular to the x-axis are squares.

SOLUTION For each x, the base of the square cross section extends from the semicircle $y = \sqrt{9 - x^2}$ to the x-axis. The square therefore has a base with length $\sqrt{9 - x^2}$ and an area of $\left(\sqrt{9 - x^2}\right)^2 = 9 - x^2$. The volume of the solid is then

$$\int_{-3}^3 \left(9 - x^2\right)\,dx = \left(9x - \frac{1}{3}x^3\right)\Big|_{-3}^3 = 36.$$

12. The base is a square, one of whose sides is the interval $[0, \ell]$ along the x-axis. The cross sections perpendicular to the x-axis are rectangles of height $f(x) = x^2$.

SOLUTION For each x, the rectangular cross section has base ℓ and height x^2. The cross-sectional area is then ℓx^2, and the volume of the solid is

$$\int_0^\ell \left(\ell x^2\right)\,dx = \left(\frac{1}{3}\ell x^3\right)\Big|_0^\ell = \frac{1}{3}\ell^4.$$

13. The base is the region enclosed by $y = x^2$ and $y = 3$. The cross sections perpendicular to the y-axis are squares.

SOLUTION At any location y, the distance to the parabola from the y-axis is $\sqrt{y}$. Thus the base of the square will have length $2\sqrt{y}$. Therefore the volume is

$$\int_0^3 \left(2\sqrt{y}\right)\left(2\sqrt{y}\right)\,dy = \int_0^3 4y\,dy = 2y^2\Big|_0^3 = 18.$$

14. The base is the region enclosed by $y = x^2$ and $y = 3$. The cross sections perpendicular to the y-axis are rectangles of height y^3.

SOLUTION As in previous exercise, for each y, the width of the rectangle will be $2\sqrt{y}$. Because the height is y^3, the volume of the solid is given by

$$2\int_0^3 y^{7/2}\,dy = \frac{4}{9}y^{9/2}\Big|_0^3 = 36\sqrt{3}.$$

15. Find the volume of the solid whose base is the region $|x| + |y| \le 1$ and whose vertical cross sections perpendicular to the y-axis are semicircles (with diameter along the base).

SOLUTION The region R in question is a diamond shape connecting the points $(1, 0)$, $(0, -1)$, $(-1, 0)$, and $(0, 1)$. Thus, in the lower half of the xy-plane, the radius of the circles is $y + 1$ and in the upper half, the radius is $1 - y$. Therefore, the volume is

$$\frac{\pi}{2}\int_{-1}^0 (y+1)^2\,dy + \frac{\pi}{2}\int_0^1 (1-y)^2\,dy = \frac{\pi}{2}\left(\frac{1}{3}+\frac{1}{3}\right) = \frac{\pi}{3}.$$

16. Show that a pyramid of height h whose base is an equilateral triangle of side s has volume $\frac{\sqrt{3}}{12}hs^2$.

SOLUTION Using similar triangles, the side length of the equilateral triangle at height x above the base is

$$\frac{s(h-x)}{h};$$

the area of the cross section is therefore given by

$$\frac{\sqrt{3}}{4}\left(\frac{s(h-x)}{h}\right)^2.$$

Thus, the volume of the pyramid is

$$\frac{s^2\sqrt{3}}{4h^2}\int_0^h (h-x)^2\,dx = \left(-\frac{s^2\sqrt{3}}{12h^2}(h-x)^3\right)\Big|_0^h = \frac{\sqrt{3}}{12}s^2h.$$

17. The area of an ellipse is πab, where a and b are the lengths of the semimajor and semiminor axes (Figure 21). Compute the volume of a cone of height 12 whose base is an ellipse with semimajor axis $a = 6$ and semiminor axis $b = 4$.

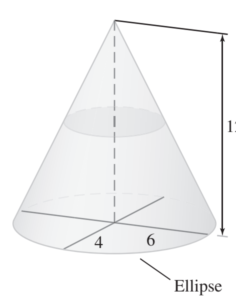

FIGURE 21

SOLUTION At each height y, the elliptical cross section has major axis $\frac{1}{2}(12 - y)$ and minor axis $\frac{1}{3}(12 - y)$. The cross-sectional area is then $\frac{\pi}{6}(12 - y)^2$, and the volume is

$$\int_0^{12} \frac{\pi}{6}(12-y)^2\,dy = -\frac{\pi}{18}(12-y)^3\Big|_0^{12} = 96\pi.$$

18. Find the volume V of a *regular* tetrahedron (Figure 22) whose face is an equilateral triangle of side s. The tetrahedron has height $h = \sqrt{2/3}s$.

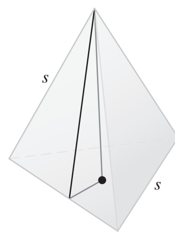

FIGURE 22

SOLUTION Our first task is to determine the relationship between the height of the tetrahedron, h, and the side length of the equilateral triangles, s. Let B be the orthocenter of the tetrahedron (the point directly below the apex), and let b denote the distance from B to each corner of the base triangle. By the Law of Cosines, we have

$$s^2 = b^2 + b^2 - 2b^2 \cos 120° = 3b^2,$$

so $b^2 = \frac{1}{3}s^2$. Thus

$$h^2 = s^2 - b^2 = \frac{2}{3}s^2 \quad \text{or} \quad h = s\sqrt{\frac{2}{3}}.$$

Therefore, using similar triangles, the side length of the equilateral triangle at height z above the base is

$$s\left(\frac{h-z}{h}\right) = s - \frac{z}{\sqrt{2/3}}.$$

The volume of the tetrahedron is then given by

$$\int_0^{s\sqrt{2/3}} \frac{\sqrt{3}}{4}\left(s - \frac{z}{\sqrt{2/3}}\right)^2 dz = -\frac{\sqrt{2}}{12}\left(s - \frac{z}{\sqrt{2/3}}\right)^3\Bigg|_0^{s\sqrt{2/3}} = \frac{s^3\sqrt{2}}{12}.$$

19. A frustum of a pyramid is a pyramid with its top cut off [Figure 23(A)]. Let V be the volume of a frustum of height h whose base is a square of side a and whose top is a square of side b with $a > b \geq 0$.

(a) Show that if the frustum were continued to a full pyramid, it would have height $ha/(a-b)$ [Figure 23(B)].

(b) Show that the cross section at height x is a square of side $(1/h)(a(h-x)+bx)$.

(c) Show that $V = \frac{1}{3}h(a^2 + ab + b^2)$. A papyrus dating to the year 1850 BCE indicates that Egyptian mathematicians had discovered this formula almost 4000 years ago.

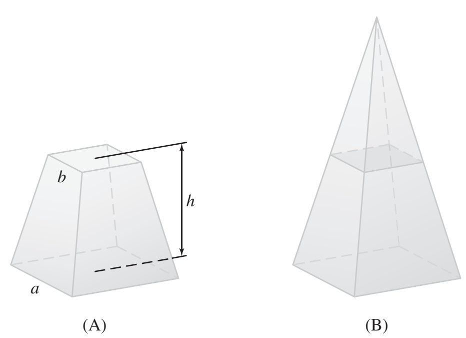

FIGURE 23

SOLUTION

(a) Let H be the height of the full pyramid. Using similar triangles, we have the proportion

$$\frac{H}{a} = \frac{H-h}{b}$$

which gives

$$H = \frac{ha}{a-b}.$$

(b) Let w denote the side length of the square cross section at height x. By similar triangles, we have

$$\frac{a}{H} = \frac{w}{H-x}.$$

Substituting the value for H from part (a) gives

$$w = \frac{a(h-x)+bx}{h}.$$

(c) The volume of the frustrum is

$$\int_0^h \left(\frac{1}{h}(a(h-x)+bx)\right)^2 dx = \frac{1}{h^2}\int_0^h \left(a^2(h-x)^2 + 2ab(h-x)x + b^2x^2\right) dx$$
$$= \frac{1}{h^2}\left(-\frac{a^2}{3}(h-x)^3 + abhx^2 - \frac{2}{3}abx^3 + \frac{1}{3}b^2x^3\right)\bigg|_0^h = \frac{h}{3}\left(a^2+ab+b^2\right).$$

20. A plane inclined at an angle of 45° passes through a diameter of the base of a cylinder of radius r. Find the volume of the region within the cylinder and below the plane (Figure 24).

FIGURE 24

SOLUTION Place the center of the base at the origin. Then, for each x, the vertical cross section taken perpendicular to the x-axis is a rectangle of base $2\sqrt{r^2-x^2}$ and height x. The volume of the solid enclosed by the plane and the cylinder is therefore

$$\int_0^r 2x\sqrt{r^2-x^2}\,dx = \int_0^{r^2} \sqrt{u}\,du = \left(\frac{2}{3}u^{3/2}\right)\bigg|_0^{r^2} = \frac{2}{3}r^3.$$

21. The solid S in Figure 25 is the intersection of two cylinders of radius r whose axes are perpendicular.

(a) The horizontal cross section of each cylinder at distance y from the central axis is a rectangular strip. Find the strip's width.

(b) Find the area of the horizontal cross section of S at distance y.

(c) Find the volume of S as a function of r.

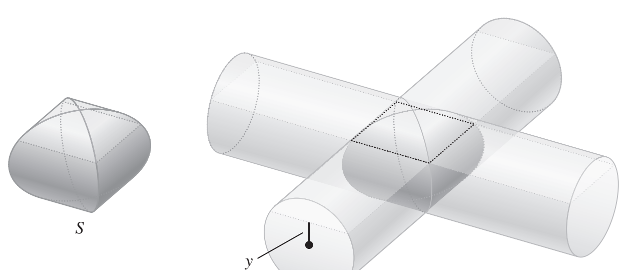

FIGURE 25 Two cylinders intersecting at right angles.

SOLUTION

(a) The horizontal cross section at distance y from the central axis (for $-r \le y \le r$) is a square of width $w = 2\sqrt{r^2-y^2}$.

(b) The area of the horizontal cross section of S at distance y from the central axis is $w^2 = 4(r^2-y^2)$.

(c) The volume of the solid S is then

$$4\int_{-r}^r \left(r^2-y^2\right) dy = 4\left(r^2y - \frac{1}{3}y^3\right)\bigg|_{-r}^r = \frac{16}{3}r^3.$$

22. Let S be the intersection of two cylinders of radius r whose axes intersect at an angle θ. Find the volume of S as a function of r and θ.

SOLUTION Each cross section at distance y from the central axis (for $-r \le y \le r$) is a rhombus with side length $\dfrac{2\sqrt{r^2-y^2}}{\sin\theta}$. The area of each rhombus is $\dfrac{4(r^2-y^2)}{\sin\theta}$, and thus the volume of the solid will be

$$\frac{4}{\sin\theta}\int_{-r}^{r}\left(r^2-y^2\right)dy = \frac{16r^3}{3\sin\theta}.$$

23. Calculate the volume of a cylinder inclined at an angle $\theta = 30^\circ$ with height 10 and base of radius 4 (Figure 26).

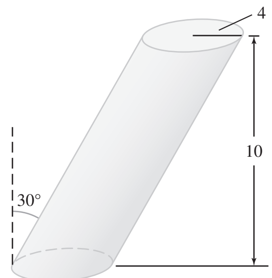

FIGURE 26 Cylinder inclined at an angle $\theta = 30^\circ$.

SOLUTION The area of each circular cross section is $\pi(4)^2 = 16\pi$, hence the volume of the cylinder is

$$\int_0^{10} 16\pi\,dx = (16\pi x)\Big|_0^{10} = 160\pi$$

24. The areas of cross sections of Lake Nogebow at 5-meter intervals are given in the table below. Figure 27 shows a contour map of the lake. Estimate the volume V of the lake by taking the average of the right- and left-endpoint approximations to the integral of cross-sectional area.

Depth (m)	0	5	10	15	20
Area (million m^2)	2.1	1.5	1.1	0.835	0.217

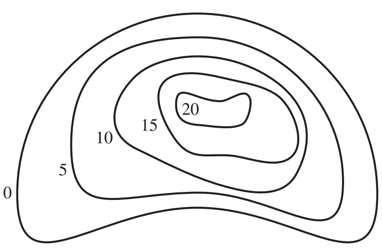

FIGURE 27 Depth contour map of Lake Nogebow.

SOLUTION The volume of the lake is

$$\int_0^{20} A(z)\,dz,$$

where $A(z)$ denotes the cross-sectional area of the lake at depth z. The right- and left-endpoint approximations to this integral, with $\Delta z = 5$, are

$$R = 5\,(1.5 + 1.1 + 0.835 + 0.217) = 18.26$$

$$L = 5\,(2.1 + 1.5 + 1.1 + 0.835) = 27.675$$

Thus

$$V \approx \frac{1}{2}(18.26 + 27.675) = 22.97 \text{ million m}^3.$$

25. Find the total mass of a 1-m rod whose linear density function is $\rho(x) = 10(x+1)^{-2}$ kg/m for $0 \le x \le 1$.

SOLUTION The total mass of the rod is

$$\int_0^1 \rho(x)\,dx = \int_0^1 \left(10(x+1)^{-2}\right)dx = \left(-10(x+1)^{-1}\right)\Big|_0^1 = 5\text{ kg}.$$

26. Find the total mass of a 2-m rod whose linear density function is $\rho(x) = 1 + 0.5\sin(\pi x)$ kg/m for $0 \le x \le 2$.

SOLUTION The total mass of the rod is

$$\int_0^2 \rho(x)\,dx = \int_0^2 (1 + 0.5\sin\pi x)\,dx = \left(x - 0.5\frac{\cos\pi x}{\pi}\right)\Big|_0^2 = 2 \text{ kg},$$

27. A mineral deposit along a strip of length 6 cm has density $s(x) = 0.01x(6-x)$ g/cm for $0 \le x \le 6$. Calculate the total mass of the deposit.

SOLUTION The total mass of the deposit is

$$\int_0^6 s(x)\,dx = \int_0^6 0.01x(6-x)\,dx = \left(0.03x^2 - \frac{0.01}{3}x^3\right)\Big|_0^6 = 0.36 \text{ g}.$$

28. Charge is distributed along a glass tube of length 10 cm with linear charge density $\rho(x) = x(x^2+1)^{-2} \times 10^{-4}$ coulombs per centimeter for $0 \le x \le 10$. Calculate the total charge.

SOLUTION The total charge along the tube is

$$\int_0^{10} \rho(x)\,dx = 10^{-4}\int_0^{10} \frac{x}{(x^2+1)^2}\,dx = 10^{-4}\left(-\frac{1}{2}(x^2+1)^{-1}\right)\Big|_0^{10} = 5 \times 10^{-5}\left(1 - \frac{1}{101}\right) = 4.95 \times 10^{-5}$$

coulombs.

29. Calculate the population within a 10-mile radius of the city center if the radial population density is $\rho(r) = 4(1 + r^2)^{1/3}$ (in thousands per square mile).

SOLUTION The total population is

$$\begin{aligned} 2\pi\int_0^{10} r\cdot\rho(r)\,dr &= 2\pi\int_0^{10} 4r(1+r^2)^{1/3}\,dr = 3\pi(1+r^2)^{4/3}\Big|_0^{10} \\ &\approx 4423.59 \text{ thousand} \approx 4.4 \text{ million}. \end{aligned}$$

30. Odzala National Park in the Republic of the Congo has a high density of gorillas. Suppose that the radial population density is $\rho(r) = 52(1+r^2)^{-2}$ gorillas per square kilometer, where r is the distance from a grassy clearing with a source of water. Calculate the number of gorillas within a 5-km radius of the clearing.

SOLUTION The number of gorillas within a 5-km radius of the clearing is

$$2\pi\int_0^5 r\cdot\rho(r)\,dr = \int_0^5 \frac{104\pi r}{(1+r^2)^2} = -\frac{52\pi}{1+r^2}\Big|_0^5 = 50\pi \approx 157.$$

31. Table 1 lists the population density (in people per square kilometer) as a function of distance r (in kilometers) from the center of a rural town. Estimate the total population within a 1.2-km radius of the center by taking the average of the left- and right-endpoint approximations.

TABLE 1 **Population Density**

r	$\rho(r)$	r	$\rho(r)$
0.0	125.0	0.8	56.2
0.2	102.3	1.0	46.0
0.4	83.8	1.2	37.6
0.6	68.6		

SOLUTION The total population is given by

$$2\pi\int_0^{1.2} r\cdot\rho(r)\,dr.$$

With $\Delta r = 0.2$, the left- and right-endpoint approximations to the required definite integral are

$$\begin{aligned} L_6 &= 0.2(2\pi)[0(125) + (0.2)(102.3) + (0.4)(83.8) + (0.6)(68.6) + (0.8)(56.2) + (1)(46)] \\ &= 233.86; \\ R_{10} &= 0.2(2\pi)[(0.2)(102.3) + (0.4)(83.8) + (0.6)(68.6) + (0.8)(56.2) + (1)(46) + (1.2)(37.6)] \\ &= 290.56. \end{aligned}$$

This gives an average of 262.21. Thus, there are roughly 262 people within a 1.2-km radius of the town center.

32. Find the total mass of a circular plate of radius 20 cm whose mass density is the radial function $\rho(r) = 0.03 + 0.01\cos(\pi r^2)$ g/cm^2.

SOLUTION The total mass of the plate is

$$2\pi \int_0^{20} r \cdot \rho(r)\, dr = 2\pi \int_0^{20} \left(0.03r + 0.01r\cos(\pi r^2)\right) dr = 2\pi \left(0.015r^2 + \frac{0.01}{2\pi}\sin(\pi r^2)\right)\Big|_0^{20} = 12\pi \text{ grams.}$$

33. The density of deer in a forest is the radial function $\rho(r) = 150(r^2+2)^{-2}$ deer per square kilometer, where r is the distance (in kilometers) to a small meadow. Calculate the number of deer in the region $2 \le r \le 5$ km.

SOLUTION The number of deer in the region $2 \le r \le 5$ km is

$$2\pi \int_2^5 r\,(150)\left(r^2+2\right)^{-2} dr = -150\pi\left(\frac{1}{r^2+2}\right)\Big|_2^5 = -150\pi\left(\frac{1}{27} - \frac{1}{6}\right) \approx 61 \text{ deer.}$$

34. Show that a circular plate of radius 2 cm with radial mass density $\rho(r) = \frac{4}{r}$ g/cm^2 has finite total mass, even though the density becomes infinite at the origin.

SOLUTION The total mass of the plate is

$$2\pi \int_0^2 r\left(\frac{4}{r}\right) dr = 2\pi \int_0^2 4\, dr = 16\pi \text{ g.}$$

35. Find the flow rate through a tube of radius 4 cm, assuming that the velocity of fluid particles at a distance r cm from the center is $v(r) = (16 - r^2)$ cm/s.

SOLUTION The flow rate is

$$2\pi \int_0^R r v(r)\, dr = 2\pi \int_0^4 r\left(16 - r^2\right) dr = 2\pi\left(8r^2 - \frac{1}{4}r^4\right)\Big|_0^4 = 128\pi \,\frac{\text{cm}^3}{\text{s}}.$$

36. The velocity of fluid particles flowing through a tube of radius 5 cm is $v(r) = (10 - 0.3r - 0.34r^2)$ cm/s, where r cm is the distance from the center. What quantity per second of fluid flows through the portion of the tube where $0 \le r \le 2$?

SOLUTION The flow rate through the portion of the tube where $0 \le r \le 2$ is

$$\begin{aligned} 2\pi \int_0^2 r v(r)\, dr &= 2\pi \int_0^2 r\left(10 - 0.3r - 0.34r^2\right) dr = 2\pi \int_0^2 \left(10r - 0.3r^2 - 0.34r^3\right) dr \\ &= 2\pi\left(5r^2 - 0.1r^3 - 0.085r^4\right)\Big|_0^2 \\ &= 112.09\,\frac{\text{cm}^3}{\text{s}} \end{aligned}$$

37. A solid rod of radius 1 cm is placed in a pipe of radius 3 cm so that their axes are aligned. Water flows through the pipe and around the rod. Find the flow rate if the velocity of the water is given by the radial function $v(r) = 0.5(r-1)(3-r)$ cm/s.

SOLUTION The flow rate is

$$2\pi \int_1^3 r(0.5)(r-1)(3-r)\, dr = \pi \int_1^3 \left(-r^3 + 4r^2 - 3r\right) dr = \pi\left(-\frac{1}{4}r^4 + \frac{4}{3}r^3 - \frac{3}{2}r^2\right)\Big|_1^3 = \frac{8\pi}{3}\,\frac{\text{cm}^3}{\text{s}}.$$

38. Let $v(r)$ be the velocity of blood in an arterial capillary of radius $R = 4 \times 10^{-5}$ m. Use Poiseuille's Law (Example 6) with $k = 10^6$ (m-s)$^{-1}$ to determine the velocity at the center of the capillary and the flow rate (use correct units).

SOLUTION According to Poiseuille's Law, $v(r) = k(R^2 - r^2)$. With $R = 4 \times 10^{-5}$ m and $k = 10^6$ (m-s)$^{-1}$,

$$v(0) = 0.0016 \text{ m/s}.$$

The flow rate through the capillary is

$$2\pi \int_0^R kr(R^2 - r^2)\, dr = 2\pi k\left(\frac{R^2r^2}{2} - \frac{r^4}{4}\right)\Big|_0^R = 2\pi k\frac{R^4}{4} \approx 4.02 \times 10^{-12}\,\frac{\text{m}^3}{\text{s}}.$$

In Exercises 39–48, calculate the average over the given interval.

39. $f(x) = x^3$, $[0, 4]$

SOLUTION The average is

$$\frac{1}{4-0}\int_0^4 x^3\,dx = \frac{1}{4}\int_0^4 x^3\,dx = \left.\frac{1}{16}x^4\right|_0^4 = 16.$$

40. $f(x) = x^3$, $[-1, 1]$

SOLUTION The average is

$$\frac{1}{1-(-1)}\int_{-1}^1 x^3\,dx = \frac{1}{2}\int_{-1}^1 x^3\,dx = \left.\frac{1}{8}x^4\right|_{-1}^1 = 0.$$

41. $f(x) = \cos x$, $\left[0, \frac{\pi}{6}\right]$

SOLUTION The average is

$$\frac{1}{\pi/6-0}\int_0^{\pi/6}\cos x\,dx = \frac{6}{\pi}\int_0^{\pi/6}\cos x\,dx = \left.\frac{6}{\pi}\sin x\right|_0^{\pi/6} = \frac{3}{\pi}.$$

42. $f(x) = \sec^2 x$, $\left[\frac{\pi}{6}, \frac{\pi}{3}\right]$

SOLUTION The average is

$$\frac{1}{\pi/3-\pi/6}\int_{\pi/6}^{\pi/3}\sec^2 x\,dx = \frac{6}{\pi}\int_{\pi/6}^{\pi/3}\sec^2 x\,dx = \left.\frac{6}{\pi}\tan x\right|_{\pi/6}^{\pi/3} = \frac{6}{\pi}\left(\sqrt{3}-\frac{\sqrt{3}}{3}\right) = \frac{4\sqrt{3}}{\pi}.$$

43. $f(s) = s^{-2}$, $[2, 5]$

SOLUTION The average is

$$\frac{1}{5-2}\int_2^5 s^{-2}\,ds = \left.-\frac{1}{3}s^{-1}\right|_2^5 = \frac{1}{10}.$$

44. $f(x) = \dfrac{\sin(\pi/x)}{x^2}$, $[1, 2]$

SOLUTION The average is

$$\frac{1}{2-1}\int_1^2 \frac{\sin(\pi/x)}{x^2}\,dx = \frac{1}{\pi}\int_{\pi/2}^{\pi}\sin u\,du = \left.-\frac{1}{\pi}\cos u\right|_{\pi/2}^{\pi} = \frac{1}{\pi}.$$

45. $f(x) = 2x^3 - 6x^2$, $[-1, 3]$

SOLUTION The average is

$$\frac{1}{3-(-1)}\int_{-1}^3 (2x^3-6x^2)\,dx = \frac{1}{4}\int_{-1}^3 (2x^3-6x^2)\,dx = \left.\frac{1}{4}\left(\frac{1}{2}x^4 - 2x^3\right)\right|_{-1}^3 = \frac{1}{4}\left(-\frac{27}{2}-\frac{5}{2}\right) = -4.$$

46. $f(x) = \dfrac{1}{x^2+1}$, $[-1, 1]$

SOLUTION The average is

$$\frac{1}{1-(-1)}\int_{-1}^1 \frac{1}{x^2+1}\,dx = \left.\frac{1}{2}\tan^{-1} x\right|_{-1}^1 = \frac{1}{2}\left[\frac{\pi}{4} - \left(-\frac{\pi}{4}\right)\right] = \frac{\pi}{4}.$$

47. $f(x) = x^n$ for $n \ge 0$, $[0, 1]$

SOLUTION For $n > -1$, the average is

$$\frac{1}{1-0}\int_0^1 x^n\,dx = \int_0^1 x^n\,dx = \left.\frac{1}{n+1}x^{n+1}\right|_0^1 = \frac{1}{n+1}.$$

48. $f(x) = e^{-nx}, \quad [-1, 1]$

SOLUTION The average is

$$\frac{1}{1-(-1)} \int_{-1}^{1} e^{-nx}\, dx = \frac{1}{2}\left(-\frac{1}{n}e^{-nx}\right)\Big|_{-1}^{1} = \frac{1}{2}\left(-\frac{1}{n}e^{-n} + \frac{1}{n}e^{n}\right) = \frac{1}{n}\sinh n.$$

49. The temperature (in °C) at time t (in hours) in an art museum varies according to $T(t) = 20 + 5\cos\left(\frac{\pi}{12}t\right)$. Find the average over the time periods [0, 24] and [2, 6].

SOLUTION

- The average temperature over the 24-hour period is

$$\frac{1}{24-0}\int_0^{24}\left(20 + 5\cos\left(\frac{\pi}{12}t\right)\right) dt = \frac{1}{24}\left(20t + \frac{60}{\pi}\sin\left(\frac{\pi}{12}t\right)\right)\Big|_0^{24} = 20°\text{C}.$$

- The average temperature over the 4-hour period is

$$\frac{1}{6-2}\int_2^{6}\left(20 + 5\cos\left(\frac{\pi}{12}t\right)\right) dt = \frac{1}{4}\left(20t + \frac{60}{\pi}\sin\left(\frac{\pi}{12}t\right)\right)\Big|_2^{6} = 22.4°\text{C}.$$

50. A ball thrown in the air vertically from ground level with initial velocity 18 m/s has height $h(t) = 18t - 9.8t^2$ at time t (in seconds). Find the average height and the average speed over the time interval extending from the ball's release to its return to ground level.

SOLUTION Let $h(t) = 18t - 9.8t^2$. The ball is at ground level when $t = 0$ s and when

$$t = \frac{18}{9.8} = \frac{9}{4.9}\text{ s.}$$

The average height of the ball is then

$$\begin{aligned}\frac{1}{\frac{9}{4.9}-0}\int_0^{9/4.9}(18t - 9.8t^2)\, dt &= \frac{4.9}{9}\left(9t^2 - \frac{9.8}{3}t^3\right)\Big|_0^{9/4.9}\\ &= \frac{4.9}{9}\left[9\left(\frac{9}{4.9}\right)^2 - \frac{9.8}{3}\left(\frac{9}{4.9}\right)^3\right]\\ &= 5.51\text{ m.}\end{aligned}$$

The average speed is given by

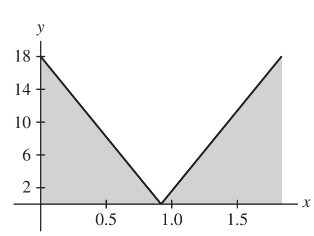
$$\frac{1}{\frac{9}{4.9}-0}\int_0^{9/4.9}|v(t)|\, dt.$$

Now, $v(t) = h'(t) = 18 - 19.6t$. From the figure below, which shows the graph of $|v(t)|$ over the interval $[0, 9/4.9]$, we see that

$$\int_0^{9/4.9}|v(t)|\, dt = \left(\frac{9}{9.8}\right)18.$$

Thus, the average speed is

$$\frac{4.9}{9}\left(\frac{9}{9.8}\right)18 = 9\text{ m/s.}$$



51. Find the average speed over the time interval $[1, 5]$ of a particle whose position at time t is $s(t) = t^3 - 6t^2$ m/s.

SOLUTION The average speed over the time interval $[1, 5]$ is

$$\frac{1}{5-1}\int_1^5 |s'(t)|\,dt.$$

Because $s'(t) = 3t^2 - 12t = 3t(t-4)$, it follows that

$$\begin{aligned}\int_1^5 |s'(t)|\,dt &= \int_1^4 (12t - 3t^2)\,dt + \int_4^5 (3t^2 - 12t)\,dt\\ &= (6t^2 - t^3)\Big|_1^4 + (t^3 - 6t^2)\Big|_4^5\\ &= (96-64) - (6-1) + (125-150) - (64-96)\\ &= 34.\end{aligned}$$

Thus, the average speed is

$$\frac{34}{4} = \frac{17}{2}\ \text{m/s}.$$

52. An object with zero initial velocity accelerates at a constant rate of 10 m/s^2. Find its average velocity during the first 15 seconds.

SOLUTION An acceleration $a(t) = 10$ gives $v(t) = 10t + c$ for some constant c and zero initial velocity implies $c = 0$. Thus the average velocity is given by

$$\frac{1}{15-0}\int_0^{15} 10t\,dt = \frac{1}{3}t^2\Big|_0^{15} = 75\ \text{m/s}.$$

53. The acceleration of a particle is $a(t) = 60t - 4t^3$ m/s^2. Compute the average acceleration and the average speed over the time interval $[2, 6]$, assuming that the particle's initial velocity is zero.

SOLUTION The average acceleration over the time interval $[2, 6]$ is

$$\begin{aligned}\frac{1}{6-2}\int_2^6 (60t - 4t^3)\,dt &= \frac{1}{4}(30t^2 - t^4)\Big|_2^6\\ &= \frac{1}{4}\left[(1080-1296) - (120-16)\right]\\ &= -\frac{320}{4} = -80\ \text{m/s}^2.\end{aligned}$$

Given $a(t) = 60t - 4t^3$ and $v(0) = 0$, it follows that $v(t) = 30t^2 - t^4$. Now, average speed is given by

$$\frac{1}{6-2}\int_2^6 |v(t)|\,dt.$$

Based on the formula for $v(t)$,

$$\begin{aligned}\int_2^6 |v(t)|\,dt &= \int_2^{\sqrt{30}} (30t^2 - t^4)\,dt + \int_{\sqrt{30}}^6 (t^4 - 30t^2)\,dt\\ &= \left(10t^3 - \frac{1}{5}t^5\right)\Big|_2^{\sqrt{30}} + \left(\frac{1}{5}t^5 - 10t^3\right)\Big|_{\sqrt{30}}^6\\ &= 120\sqrt{30} - \frac{368}{5} - \frac{3024}{5} + 120\sqrt{30}\\ &= 240\sqrt{30} - \frac{3392}{5}.\end{aligned}$$

Finally, the average speed is

$$\frac{1}{4}\left(240\sqrt{30} - \frac{3392}{5}\right) = 60\sqrt{30} - \frac{848}{5} \approx 159.03\ \text{m/s}.$$

54. What is the average area of the circles whose radii vary from 0 to R?

SOLUTION The average area is

$$\frac{1}{R-0}\int_0^R \pi r^2\,dr = \frac{\pi}{3R}r^3\Big|_0^R = \frac{1}{3}\pi R^2.$$

55. Let M be the average value of $f(x) = x^4$ on [0, 3]. Find a value of c in [0, 3] such that $f(c) = M$.

SOLUTION We have

$$M = \frac{1}{3-0}\int_0^3 x^4\,dx = \frac{1}{3}\int_0^3 x^4\,dx = \frac{1}{15}x^5\Big|_0^3 = \frac{81}{5}.$$

Then $M = f(c) = c^4 = \frac{81}{5}$ implies $c = \frac{3}{5^{1/4}} = 2.006221$.

56. Let $f(x) = \sqrt{x}$. Find a value of c in [4, 9] such that $f(c)$ is equal to the average of f on [4, 9].

SOLUTION The average value is

$$\frac{1}{9-4}\int_4^9 \sqrt{x}\,dx = \frac{1}{5}\int_4^9 \sqrt{x}\,dx = \frac{2}{15}x^{3/2}\Big|_4^9 = \frac{38}{15}.$$

Then $f(c) = \sqrt{c} = \frac{38}{15}$ implies

$$c = \left(\frac{38}{15}\right)^2 = \frac{1444}{225} \approx 6.417778.$$

57. Let M be the average value of $f(x) = x^3$ on $[0, A]$, where $A > 0$. Which theorem guarantees that $f(c) = M$ has a solution c in $[0, A]$? Find c.

SOLUTION The Mean Value Theorem for Integrals guarantees that $f(c) = M$ has a solution c in $[0, A]$. With $f(x) = x^3$ on $[0, A]$,

$$M = \frac{1}{A-0}\int_0^A x^3\,dx = \frac{1}{A}\,\frac{1}{4}x^4\Big|_0^A = \frac{A^3}{4}.$$

Solving $f(c) = c^3 = \frac{A^3}{4}$ for c yields

$$c = \frac{A}{\sqrt[3]{4}}.$$

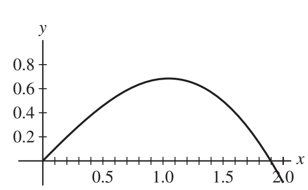
58. CAS Let $f(x) = 2\sin x - x$. Use a computer algebra system to plot $f(x)$ and estimate:

(a) The positive root α of $f(x)$.

(b) The average value M of $f(x)$ on $[0, \alpha]$.

(c) A value $c \in [0, \alpha]$ such that $f(c) = M$.

SOLUTION Let $f(x) = 2\sin x - x$. A graph of $y = f(x)$ is shown below. From this graph, the positive root of $f(x)$ appears to be roughly $x = 1.9$.



(a) Using a computer algebra system, solving the equation

$$2\sin\alpha - \alpha = 0$$

yields $\alpha = 1.895494267$.

(b) The average value of $f(x)$ on $[0, \alpha]$ is

$$M = \frac{1}{\alpha - 0}\int_0^\alpha f(x)\,dx = 0.4439980667.$$

(c) Solving

$$f(c) = 2\sin c - c = 0.4439980667$$

yields either $c = 0.4805683082$ or $c = 1.555776337$.

59. Which of $f(x) = x\sin^2 x$ and $g(x) = x^2\sin^2 x$ has a larger average value over $[0, 1]$? Over $[1, 2]$?

SOLUTION The functions f and g differ only in the power of x multiplying $\sin^2 x$. It is also important to note that $\sin^2 x \geq 0$ for all x. Now, for each $x \in (0, 1)$, $x > x^2$ so

$$f(x) = x\sin^2 x > x^2\sin^2 x = g(x).$$

Thus, over $[0, 1]$, $f(x)$ will have a larger average value than $g(x)$. On the other hand, for each $x \in (1, 2)$, $x^2 > x$, so

$$g(x) = x^2\sin^2 x > x\sin^2 x = f(x).$$

Thus, over $[1, 2]$, $g(x)$ will have the larger average value.

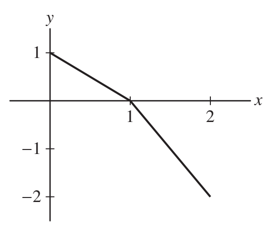
60. Find the average of $f(x) = ax + b$ over the interval $[-M, M]$, where a, b, and M are arbitrary constants.

SOLUTION The average is

$$\frac{1}{M-(-M)}\int_{-M}^{M}(ax+b)\,dx = \frac{1}{2M}\int_{-M}^{M}(ax+b)\,dx = \frac{1}{2M}\left(\frac{a}{2}x^2 + bx\right)\Bigg|_{-M}^{M} = b.$$

61. Sketch the graph of a function $f(x)$ such that $f(x) \geq 0$ on $[0, 1]$ and $f(x) \leq 0$ on $[1, 2]$, whose average on $[0, 2]$ is negative.

SOLUTION Many solutions will exist. One could be



62. Give an example of a function (necessarily discontinuous) that does not satisfy the conclusion of the MVT for Integrals.

SOLUTION There are an infinite number of discontinuous functions that do not satisfy the conclusion of the Mean Value Theorem for Integrals. Consider the function on $[-1, 1]$ such that for $x < 0$, $f(x) = -1$ and for $x \geq 0$, $f(x) = 1$. Clearly the average value is 0 but $f(c) \neq 0$ for all c in $[-1, 1]$.

Further Insights and Challenges

63. An object is tossed into the air vertically from ground level with initial velocity v_0 ft/s at time $t = 0$. Find the average speed of the object over the time interval $[0, T]$, where T is the time the object returns to earth.

SOLUTION The height is given by $h(t) = v_0 t - 16t^2$. The ball is at ground level at time $t = 0$ and $T = v_0/16$. The velocity is given by $v(t) = v_0 - 32t$ and thus the speed is given by $s(t) = |v_0 - 32t|$. The average speed is

$$\begin{aligned}\frac{1}{v_0/16 - 0}\int_0^{v_0/16}|v_0 - 32t|\,dt &= \frac{16}{v_0}\int_0^{v_0/32}(v_0 - 32t)\,dt + \frac{16}{v_0}\int_{v_0/32}^{v_0/16}(32t - v_0)\,dt\\ &= \frac{16}{v_0}\left(v_0 t - 16t^2\right)\Big|_0^{v_0/32} + \frac{16}{v_0}\left(16t^2 - v_0 t\right)\Big|_{v_0/32}^{v_0/16} = v_0/2.\end{aligned}$$

64. Review the MVT stated in Section 4.3 (Theorem 1, p. 266) and show how it can be used, together with the Fundamental Theorem of Calculus, to prove the MVT for Integrals.

SOLUTION The Mean Value Theorem essentially states that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

for some $c \in (a, b)$. Let F be any antiderivative of f. Then

$$f(c) = F'(c) = \frac{F(b) - F(a)}{b - a} = \frac{1}{b-a}(F(b) - F(a)) = \frac{1}{b-a}\int_a^b f(x)\,dx.$$

6.3 Volumes of Revolution

Preliminary Questions

1. Which of the following is a solid of revolution?

(a) Sphere **(b)** Pyramid **(c)** Cylinder **(d)** Cube

SOLUTION The sphere and the cylinder have circular cross sections; hence, these are solids of revolution. The pyramid and cube do not have circular cross sections, so these are not solids of revolution.

2. True or false? When the region under a single graph is rotated about the x-axis, the cross sections of the solid perpendicular to the x-axis are circular disks.

SOLUTION True. The cross sections will be disks with radius equal to the value of the function.

3. True or false? When the region between two graphs is rotated about the x-axis, the cross sections to the solid perpendicular to the x-axis are circular disks.

SOLUTION False. The cross sections may be washers.

4. Which of the following integrals expresses the volume obtained by rotating the area between $y = f(x)$ and $y = g(x)$ over $[a, b]$ around the x-axis? [Assume $f(x) \geq g(x) \geq 0$.]

(a) $\pi \int_a^b \big(f(x) - g(x)\big)^2\, dx$

(b) $\pi \int_a^b \big(f(x)^2 - g(x)^2\big)\, dx$

SOLUTION The correct answer is **(b)**. Cross sections of the solid will be washers with outer radius $f(x)$ and inner radius $g(x)$. The area of the washer is then $\pi f(x)^2 - \pi g(x)^2 = \pi(f(x)^2 - g(x)^2)$.

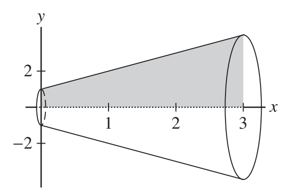
Exercises

In Exercises 1–4, (a) sketch the solid obtained by revolving the region under the graph of $f(x)$ about the x-axis over the given interval, (b) describe the cross section perpendicular to the x-axis located at x, and (c) calculate the volume of the solid.

1. $f(x) = x + 1, \quad [0, 3]$

SOLUTION

(a) A sketch of the solid of revolution is shown below:



(b) Each cross section is a disk with radius $x + 1$.

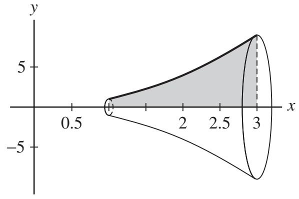
(c) The volume of the solid of revolution is

$$\pi \int_0^3 (x+1)^2\, dx = \pi \int_0^3 (x^2 + 2x + 1)\, dx = \pi \left(\frac{1}{3}x^3 + x^2 + x\right)\Big|_0^3 = 21\pi.$$

2. $f(x) = x^2, \quad [1, 3]$

SOLUTION

(a) A sketch of the solid of revolution is shown below:



(b) Each cross section is a disk of radius x^2.

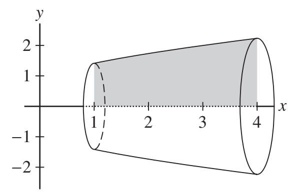
(c) The volume of the solid of revolution is

$$\pi \int_1^3 \left(x^2\right)^2 dx = \pi \left(\frac{x^5}{5}\right)\Bigg|_1^3 = \frac{242\pi}{5}.$$

3. $f(x) = \sqrt{x+1}, \quad [1, 4]$

SOLUTION

(a) A sketch of the solid of revolution is shown below:



(b) Each cross section is a disk with radius $\sqrt{x+1}$.

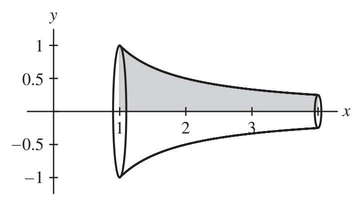
(c) The volume of the solid of revolution is

$$\pi \int_1^4 (\sqrt{x+1})^2\, dx = \pi \int_1^4 (x+1)\, dx = \pi \left(\frac{1}{2}x^2 + x\right)\Bigg|_1^4 = \frac{21\pi}{2}.$$

4. $f(x) = x^{-1}, \quad [1, 4]$

SOLUTION

(a) A sketch of the solid of revolution is shown below:



(b) Each cross section is a disk with radius x^{-1}.

(c) The volume of the solid of revolution is

$$\pi \int_1^4 (x^{-1})^2\, dx = \pi \int_1^4 x^{-2}\, dx = \pi\, (-x)^{-1}\Big|_1^4 = \frac{3\pi}{4}.$$

In Exercises 5–12, find the volume of revolution about the x-axis for the given function and interval.

5. $f(x) = x^2 - 3x, \quad [0, 3]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_0^3 (x^2 - 3x)^2\, dx = \pi \int_0^3 (x^4 - 6x^3 + 9x^2)\, dx = \pi \left(\frac{1}{5}x^5 - \frac{3}{2}x^4 + 3x^3\right)\Bigg|_0^3 = \frac{81\pi}{10}.$$

6. $f(x) = \dfrac{1}{x^2}, \quad [1, 4]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_1^4 (x^{-2})^2\, dx = \pi \int_1^4 x^{-4}\, dx = \pi \left(-\frac{1}{3}x^{-3}\right)\Bigg|_1^4 = \frac{21\pi}{64}.$$

7. $f(x) = x^{5/3}, \quad [1, 8]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_1^8 (x^{5/3})^2\, dx = \pi \int_1^8 x^{10/3}\, dx = \frac{3\pi}{13} x^{13/3}\Bigg|_1^8 = \frac{3\pi}{13}(2^{13} - 1) = \frac{24573\pi}{13}.$$

8. $f(x) = 4 - x^2$, $[0, 2]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_0^2 (4 - x^2)^2\, dx = \pi \int_0^2 (16 - 8x^2 + x^4)\, dx = \pi \left(16x - \frac{8}{3}x^3 + \frac{1}{5}x^5 \right)\Big|_0^2 = \frac{256\pi}{15}.$$

9. $f(x) = \dfrac{2}{x+1}$, $[1, 3]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_1^3 \left(\frac{2}{x+1} \right)^2 dx = 4\pi \int_1^3 (x+1)^{-2}\, dx = -4\pi\, (x+1)^{-1} \Big|_1^3 = \pi.$$

10. $f(x) = \sqrt{x^4 + 1}$, $[1, 3]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_1^3 (\sqrt{x^4+1})^2\, dx = \pi \int_1^3 (x^4 + 1)\, dx = \pi \left(\frac{1}{5}x^5 + x \right)\Big|_1^3 = \frac{252\pi}{5}.$$

11. $f(x) = e^x$, $[0, 1]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_0^1 (e^x)^2\, dx = \frac{1}{2}\pi e^{2x} \Big|_0^1 = \frac{1}{2}\pi(e^2 - 1).$$

12. $f(x) = \sqrt{\cos x \sin x}$, $\left[0, \frac{\pi}{2}\right]$

SOLUTION The volume of the solid of revolution is

$$\pi \int_0^{\pi/2} (\sqrt{\cos x \sin x})^2\, dx = \pi \int_0^{\pi/2} (\cos x \sin x)\, dx = \frac{\pi}{2} \int_0^{\pi/2} \sin 2x\, dx = \frac{\pi}{4}\,(-\cos 2x)\Big|_0^{\pi/2} = \frac{\pi}{2}.$$

In Exercises 13 and 14, R is the shaded region in Figure 11.

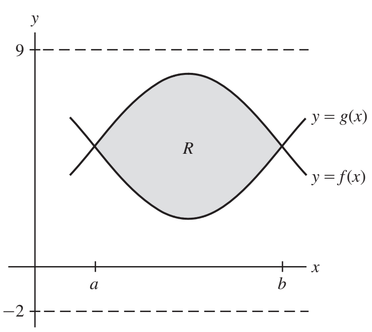


FIGURE 11

13. Which of the integrands (i)–(iv) is used to compute the volume obtained by rotating region R about $y = -2$?
- (i) $(f(x)^2 + 2^2) - (g(x)^2 + 2^2)$
- (ii) $(f(x) + 2)^2 - (g(x) + 2)^2$
- (iii) $(f(x)^2 - 2^2) - (g(x)^2 - 2^2)$
- (iv) $(f(x) - 2)^2 - (g(x) - 2)^2$

SOLUTION when the region R is rotated about $y = -2$, the outer radius is $f(x) - (-2) = f(x) + 2$ and the inner radius is $g(x) - (-2) = g(x) + 2$. Thus, the appropriate integrand is **(ii)**: $(f(x) + 2)^2 - (g(x) + 2)^2$.

14. Which of the integrands (i)–(iv) is used to compute the volume obtained by rotating R about $y = 9$?
- (i) $(9 + f(x))^2 - (9 + g(x))^2$
- (ii) $(9 + g(x))^2 - (9 + f(x))^2$
- (iii) $(9 - f(x))^2 - (9 - g(x))^2$
- (iv) $(9 - g(x))^2 - (9 - f(x))^2$

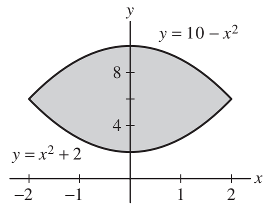
SOLUTION when the region R is rotated about $y = 9$, the outer radius is $9 - g(x)$ and the inner radius is $9 - f(x)$. Thus, the appropriate integrand is **(iv)**: $(9 - g(x))^2 - (9 - f(x))^2$.

In Exercises 15–20, (a) sketch the region enclosed by the curves, (b) describe the cross section perpendicular to the x-axis located at x, and (c) find the volume of the solid obtained by rotating the region about the x-axis.

15. $y = x^2 + 2, \quad y = 10 - x^2$

SOLUTION

(a) Setting $x^2 + 2 = 10 - x^2$ yields $2x^2 = 8$, or $x^2 = 4$. The two curves therefore intersect at $x = \pm 2$. The region enclosed by the two curves is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a washer with outer radius $R = 10 - x^2$ and inner radius $r = x^2 + 2$.

(c) The volume of the solid of revolution is

$$\pi \int_{-2}^{2} \left((10 - x^2)^2 - (x^2 + 2)^2\right) dx = \pi \int_{-2}^{2} (96 - 24x^2)\, dx = \pi \left(96x - 8x^3\right)\Big|_{-2}^{2} = 256\pi.$$

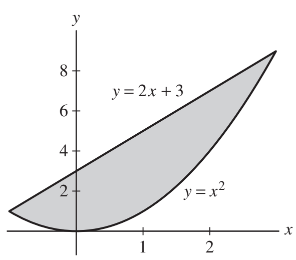
16. $y = x^2, \quad y = 2x + 3$

SOLUTION

(a) Setting $x^2 = 2x + 3$ yields

$$0 = x^2 - 2x - 3 = (x - 3)(x + 1).$$

The two curves therefore intersect at $x = -1$ and $x = 3$. The region enclosed by the two curves is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a washer with outer radius $R = 2x + 3$ and inner radius $r = x^2$.

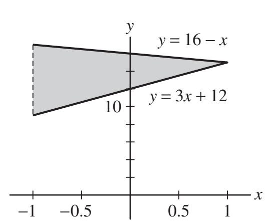
(c) The volume of the solid of revolution is

$$\pi \int_{-1}^{3} \left((2x + 3)^2 - (x^2)^2\right) dx = \pi \int_{-1}^{3} (4x^2 + 12x + 9 - x^4)\, dx = \pi \left(\frac{4}{3}x^3 + 6x^2 + 9x - \frac{1}{5}x^5\right)\Big|_{-1}^{3} = \frac{1088\pi}{15}.$$

17. $y = 16 - x, \quad y = 3x + 12, \quad x = -1$

SOLUTION

(a) Setting $16 - x = 3x + 12$, we find that the two lines intersect at $x = 1$. The region enclosed by the two curves is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a washer with outer radius $R = 16 - x$ and inner radius $r = 3x + 12$.

(c) The volume of the solid of revolution is

$$\pi \int_{-1}^{1} \left((16 - x)^2 - (3x + 12)^2\right) dx = \pi \int_{-1}^{1} (112 - 104x - 8x^2)\, dx = \pi \left(112x - 52x^2 - \frac{8}{3}x^3\right)\Big|_{-1}^{1} = \frac{656\pi}{3}.$$

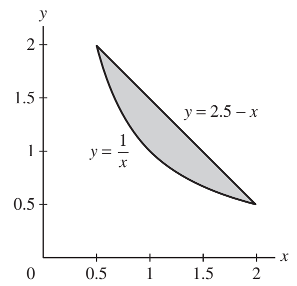
18. $y = \dfrac{1}{x}, \quad y = \dfrac{5}{2} - x$

SOLUTION

(a) Setting $\frac{1}{x} = \frac{5}{2} - x$ yields

$$0 = x^2 - \frac{5}{2}x + 1 = (x - 2)\left(x - \frac{1}{2}\right).$$

The two curves therefore intersect at $x = 2$ and $x = \frac{1}{2}$. The region enclosed by the two curves is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a washer with outer radius $R = \frac{5}{2} - x$ and inner radius $r = x^{-1}$.

(c) The volume of the solid of revolution is

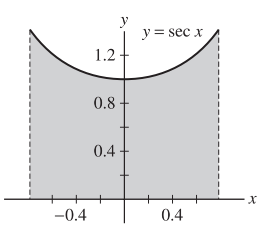
$$\pi \int_{1/2}^{2} \left(\left(\frac{5}{2} - x\right)^2 - \left(\frac{1}{x}\right)^2\right) dx = \pi \int_{1/2}^{2} \left(\frac{25}{4} - 5x + x^2 - x^{-2}\right) dx$$

$$= \pi \left(\frac{25}{4}x - \frac{5}{2}x^2 + \frac{1}{3}x^3 + x^{-1}\right)\Big|_{1/2}^{2} = \frac{9\pi}{8}.$$

19. $y = \sec x, \quad y = 0, \quad x = -\dfrac{\pi}{4}, \quad x = \dfrac{\pi}{4}$

SOLUTION

(a) The region in question is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a circular disk with radius $R = \sec x$.

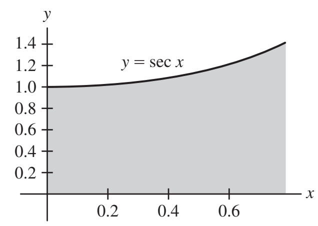
(c) The volume of the solid of revolution is

$$\pi \int_{-\pi/4}^{\pi/4} (\sec x)^2\, dx = \pi\,(\tan x)\Big|_{-\pi/4}^{\pi/4} = 2\pi.$$

20. $y = \sec x, \quad y = 0, \quad x = 0, \quad x = \frac{\pi}{4}$

SOLUTION

(a) The region in question is shown in the figure below.



(b) When the region is rotated about the x-axis, each cross section is a circular disk with radius $R = \sec x$.

(c) The volume of the solid of revolution is

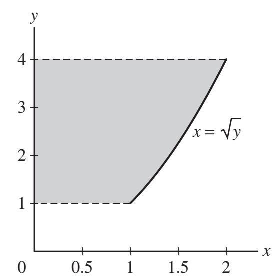
$$\pi \int_0^{\pi/4} (\sec x)^2 \, dx = \pi \left(\tan x\right) \Big|_0^{\pi/4} = \pi.$$

In Exercises 21–24, find the volume of the solid obtained by rotating the region enclosed by the graphs about the y-axis over the given interval.

21. $x = \sqrt{y}, \quad x = 0; \quad 1 \le y \le 4$

SOLUTION When the region in question (shown in the figure below) is rotated about the y-axis, each cross section is a disk with radius $\sqrt{y}$. The volume of the solid of revolution is

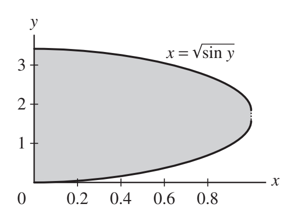
$$\pi \int_1^4 \left(\sqrt{y}\right)^2 \, dy = \frac{\pi y^2}{2}\Big|_1^4 = \frac{15\pi}{2}.$$



22. $x = \sqrt{\sin y}, \quad x = 0; \quad 0 \le y \le \pi$

SOLUTION When the region in question (shown in the figure below) is rotated about the y-axis, each cross section is a disk with radius $\sqrt{\sin y}$. The volume of the solid of revolution is

$$\pi \int_0^{\pi} \left(\sqrt{\sin y}\right)^2 \, dy = \pi \left(-\cos y\right) \Big|_0^{\pi} = 2\pi.$$



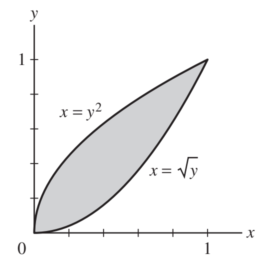
23. $x = y^2, \quad x = \sqrt{y}$

SOLUTION Setting $y^2 = \sqrt{y}$ and then squaring both sides yields

$$y^4 = y \quad \text{or} \quad y^4 - y = y(y^3 - 1) = 0,$$

so the two curves intersect at $y = 0$ and $y = 1$. When the region in question (shown in the figure below) is rotated about the y-axis, each cross section is a washer with outer radius $R = \sqrt{y}$ and inner radius $r = y^2$. The volume of the solid of revolution is

$$\pi \int_0^1 \left((\sqrt{y})^2 - (y^2)^2\right) \, dy = \pi \left(\frac{y^2}{2} - \frac{y^5}{5}\right)\Big|_0^1 = \frac{3\pi}{10}.$$



24. $x = 4 - y, \quad x = 16 - y^2$

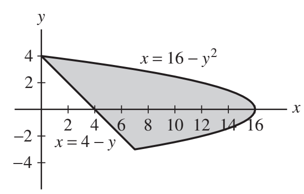
SOLUTION Setting $4 - y = 16 - y^2$ yields

$$0 = y^2 - y - 12 = (y - 4)(y + 3),$$

so the two curves intersect at $y = -3$ and $y = 4$. When the region enclosed by the two curves (shown in the figure below) is rotated about the y-axis, each cross section is a washer with outer radius $R = 16 - y^2$ and inner radius $r = 4 - y$. The volume of the solid of revolution is

$$\pi \int_{-3}^{4} \left((16 - y^2)^2 - (4 - y)^2\right) dy = \pi \int_{-3}^{4} \left(y^4 - 33y^2 + 8y + 240\right) dy$$

$$= \pi \left(\frac{1}{5}y^5 - 11y^3 + 4y^2 + 240y\right)\bigg|_{-3}^{4} = \frac{4802\pi}{5}.$$



25. Rotation of the region in Figure 12 about the y-axis produces a solid with two types of different cross sections. Compute the volume as a sum of two integrals, one for $-12 \le y \le 4$ and one for $4 \le y \le 12$.

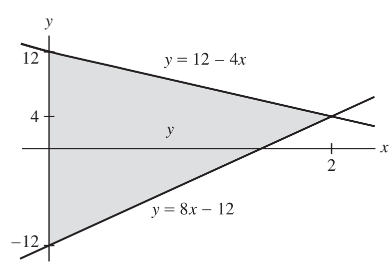


FIGURE 12

SOLUTION For $-12 \le y \le 4$, the cross section is a disk with radius $\frac{1}{8}(y + 12)$; for $4 \le y \le 12$, the cross section is a disk with radius $\frac{1}{4}(12 - y)$. Therefore, the volume of the solid of revolution is

$$V = \frac{\pi}{8} \int_{-12}^{4} (y + 12)^2 \, dy + \frac{\pi}{4} \int_{4}^{12} (12 - y)^2 \, dy$$

$$= \frac{\pi}{24}(y + 12)^3\bigg|_{-12}^{4} - \frac{\pi}{12}(12 - y)^3\bigg|_{4}^{12}$$

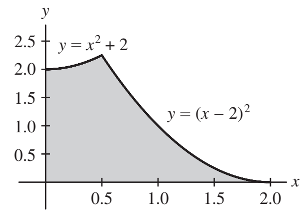
$$= \frac{512\pi}{3} + \frac{128\pi}{3} = \frac{640\pi}{3}.$$

26. Let R be the region enclosed by $y = x^2 + 2$, $y = (x - 2)^2$ and the axes $x = 0$ and $y = 0$. Compute the volume V obtained by rotating R about the x-axis. *Hint:* Express V as a sum of two integrals.

SOLUTION Setting $x^2 + 2 = (x - 2)^2$ yields $4x = 2$ or $x = 1/2$. When the region enclosed by the two curves and the coordinate axes (shown in the figure below) is rotated about the x-axis, there are two different cross sections. For

$0 \le x \le 1/2$, the cross section is a disk of radius x^2+2; for $1/2 \le x \le 2$, the cross section is a disk of radius $(x-2)^2$. The volume of the solid of revolution is therefore

$$V = \pi \int_0^{1/2} (x^2+2)\,dx + \pi \int_{1/2}^{2} (x-2)^2\,dx$$
$$= \pi\left(\frac{1}{3}x^3 + 2x\right)\Big|_0^{1/2} + \frac{\pi}{3}(x-2)^3\Big|_{1/2}^{2}$$
$$= \frac{25\pi}{24} + \frac{9\pi}{8} = \frac{13\pi}{6}.$$



In Exercises 27–32, find the volume of the solid obtained by rotating region A in Figure 13 about the given axis.

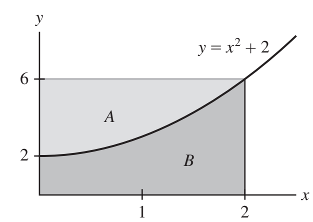


FIGURE 13

27. x-axis

SOLUTION Rotating region A about the x-axis produces a solid whose cross sections are washers with outer radius $R = 6$ and inner radius $r = x^2 + 2$. The volume of the solid of revolution is

$$\pi \int_0^2 \left((6)^2 - (x^2+2)^2\right) dx = \pi \int_0^2 (32 - 4x^2 - x^4)\,dx = \pi\left(32x - \frac{4}{3}x^3 - \frac{1}{5}x^5\right)\Big|_0^2 = \frac{704\pi}{15}.$$

28. $y = -2$

SOLUTION Rotating region A about $y = -2$ produces a solid whose cross sections are washers with outer radius $R = 6 - (-2) = 8$ and inner radius $r = x^2 + 2 - (-2) = x^2 + 4$. The volume of the solid of revolution is

$$\pi \int_0^2 \left((8)^2 - (x^2+4)^2\right) dx = \pi \int_0^2 (48 - 8x^2 - x^4)\,dx = \pi\left(48x - \frac{8}{3}x^3 - \frac{1}{5}x^5\right)\Big|_0^2 = \frac{1024\pi}{15}.$$

29. $y = 2$

SOLUTION Rotating the region A about $y = 2$ produces a solid whose cross sections are washers with outer radius $R = 6 - 2 = 4$ and inner radius $r = x^2 + 2 - 2 = x^2$. The volume of the solid of revolution is

$$\pi \int_0^2 \left(4^2 - (x^2)^2\right) dx = \pi\left(16x - \frac{1}{5}x^5\right)\Big|_0^2 = \frac{128\pi}{5}.$$

30. y-axis

SOLUTION Rotating region A about the y-axis produces a solid whose cross sections are disks with radius $R = \sqrt{y-2}$. Note that here we need to integrate along the y-axis. The volume of the solid of revolution is

$$\pi \int_2^6 (\sqrt{y-2})^2\,dy = \pi \int_2^6 (y-2)\,dy = \pi\left(\frac{1}{2}y^2 - 2y\right)\Big|_2^6 = 8\pi.$$

31. $x = -3$

SOLUTION Rotating region A about $x = -3$ produces a solid whose cross sections are washers with outer radius $R = \sqrt{y-2} - (-3) = \sqrt{y-2} + 3$ and inner radius $r = 0 - (-3) = 3$. The volume of the solid of revolution is

$$\pi \int_2^6 \left((3 + \sqrt{y-2})^2 - (3)^2\right) dy = \pi \int_2^6 (6\sqrt{y-2} + y - 2)\, dy = \pi \left(4(y-2)^{3/2} + \frac{1}{2}y^2 - 2y\right)\Big|_2^6 = 40\pi.$$

32. $x = 2$

SOLUTION Rotating region A about $x = 2$ produces a solid whose cross sections are washers with outer radius $R = 2 - 0 = 2$ and inner radius $r = 2 - \sqrt{y-2}$. The volume of the solid of revolution is

$$\pi \int_2^6 \left(2^2 - (2 - \sqrt{y-2})^2\right) dy = \pi \int_2^6 \left(4\sqrt{y-2} - y + 2\right) dy = \pi \left(\frac{8}{3}(y-2)^{3/2} - \frac{1}{2}y^2 + 2y\right)\Big|_2^6 = \frac{40\pi}{3}.$$

In Exercises 33–38, find the volume of the solid obtained by rotating region B in Figure 13 about the given axis.

33. x-axis

SOLUTION Rotating region B about the x-axis produces a solid whose cross sections are disks with radius $R = x^2 + 2$. The volume of the solid of revolution is

$$\pi \int_0^2 (x^2+2)^2\, dx = \pi \int_0^2 (x^4 + 4x^2 + 4)\, dx = \pi \left(\frac{1}{5}x^5 + \frac{4}{3}x^3 + 4x\right)\Big|_0^2 = \frac{376\pi}{15}.$$

34. $y = -2$

SOLUTION Rotating region B about $y = -2$ produces a solid whose cross sections are washers with outer radius $R = x^2 + 2 - (-2) = x^2 + 4$ and inner radius $r = 0 - (-2) = 2$. The volume of the solid of revolution is

$$\pi \int_0^2 \left((x^2+4)^2 - (2)^2\right) dx = \pi \int_0^2 (x^4 + 8x^2 + 12)\, dx = \pi \left(\frac{1}{5}x^5 + \frac{8}{3}x^3 + 12x\right)\Big|_0^2 = \frac{776\pi}{15}.$$

35. $y = 6$

SOLUTION Rotating region B about $y = 6$ produces a solid whose cross sections are washers with outer radius $R = 6 - 0 = 6$ and inner radius $r = 6 - (x^2 + 2) = 4 - x^2$. The volume of the solid of revolution is

$$\pi \int_0^2 \left(6^2 - (4 - x^2)^2\right) dy = \pi \int_0^2 \left(20 + 8x^2 - x^4\right) dy = \pi \left(20x + \frac{8}{3}x^3 - \frac{1}{5}x^5\right)\Big|_0^2 = \frac{824\pi}{15}.$$

36. y-axis

Hint for Exercise 36: Express the volume as a sum of two integrals along the y-axis or use Exercise 30.

SOLUTION Rotating region B about the y-axis produces a solid with two different cross sections. For each $y \in [0, 2]$, the cross section is a disk with radius $R = 2$; for each $y \in [2, 6]$, the cross section is a washer with outer radius $R = 2$ and inner radius $r = \sqrt{y-2}$. The volume of the solid of revolution is

$$\pi \int_0^2 (2)^2\, dy + \pi \int_2^6 \left((2)^2 - (\sqrt{y-2})^2\right) dy = \pi \int_0^2 4\, dy + \pi \int_2^6 (6 - y)\, dy$$
$$= \pi\,(4y)\Big|_0^2 + \pi \left(6y - \frac{1}{2}y^2\right)\Big|_2^6 = 16\pi.$$

Alternately, we recognize that rotating both region A and region B about the y-axis produces a cylinder of radius $R = 2$ and height $h = 6$. The volume of this cylinder is $\pi(2)^2 \cdot 6 = 24\pi$. In Exercise 30, we found that the volume of the solid generated by rotating region A about the y-axis to be 8π. Therefore, the volume of the solid generated by rotating region B about the y-axis is $24\pi - 8\pi = 16\pi$.

37. $x = 2$

SOLUTION Rotating region B about $x = 2$ produces a solid with two different cross sections. For each $y \in [0, 2]$, the cross section is a disk with radius $R = 2$; for each $y \in [2, 6]$, the cross section is a disk with radius $R = 2 - \sqrt{y-2}$. The volume of the solid of revolution is

$$\pi \int_0^2 (2)^2\, dy + \pi \int_2^6 (2 - \sqrt{y-2})^2\, dy = \pi \int_0^2 4\, dy + \pi \int_2^6 (2 + y - 4\sqrt{y-2})\, dy$$
$$= \pi\,(4y)\Big|_0^2 + \pi \left(2y + \frac{1}{2}y^2 - \frac{8}{3}(y-2)^{3/2}\right)\Big|_2^6 = \frac{32\pi}{3}.$$

38. $x = -3$

SOLUTION Rotating region B about $x = -3$ produces a solid with two different cross sections. For each $y \in [0, 2]$, the cross section is a washer with outer radius $R = 2 - (-3) = 5$ and inner radius $r = 0 - (-3) = 3$; for each $y \in [2, 6]$, the cross section is a washer with outer radius $R = 2 - (-3) = 5$ and inner radius $r = \sqrt{y-2} - (-3) = \sqrt{y-2} + 3$. The volume of the solid of revolution is

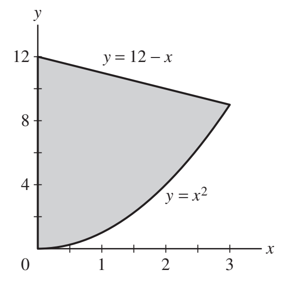
$$\begin{aligned}\pi \int_0^2 \left((5)^2 - (3)^2\right) dy + \pi \int_2^6 \left((5)^2 - (\sqrt{y-2} + 3)^2\right) dy \\ = \pi \int_0^2 16\, dy + \pi \int_2^6 (18 - y - 6\sqrt{y-2})\, dy \\ = \pi\,(16y)\Big|_0^2 + \pi \left(18y - \frac{1}{2}y^2 - 4(y-2)^{3/2}\right)\Big|_2^6 = 56\pi.\end{aligned}$$

In Exercises 39–52, find the volume of the solid obtained by rotating the region enclosed by the graphs about the given axis.

39. $y = x^2, \quad y = 12 - x, \quad x = 0, \quad$ about $y = -2$

SOLUTION Rotating the region enclosed by $y = x^2$, $y = 12 - x$ and the y-axis (shown in the figure below) about $y = -2$ produces a solid whose cross sections are washers with outer radius $R = 12 - x - (-2) = 14 - x$ and inner radius $r = x^2 - (-2) = x^2 + 2$. The volume of the solid of revolution is

$$\begin{aligned}\pi \int_0^3 \left((14 - x)^2 - (x^2 + 2)^2\right) dx &= \pi \int_0^3 (192 - 28x - 3x^2 - x^4)\, dx \\ &= \pi \left(192x - 14x^2 - x^3 - \frac{1}{5}x^5\right)\Big|_0^3 = \frac{1872\pi}{5}.\end{aligned}$$



40. $y = x^2, \quad y = 12 - x, \quad x = 0, \quad$ about $y = 15$

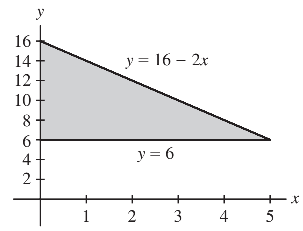
SOLUTION Rotating the region enclosed by $y = x^2$, $y = 12 - x$ and the y-axis (see the figure in the previous exercise) about $y = 15$ produces a solid whose cross sections are washers with outer radius $R = 15 - x^2$ and inner radius $r = 15 - (12 - x) = 3 + x$. The volume of the solid of revolution is

$$\begin{aligned}\pi \int_0^3 \left((15 - x^2)^2 - (3 + x)^2\right) dx &= \pi \int_0^3 (216 - 6x - 31x^2 + x^4)\, dx \\ &= \pi \left(216x - 3x^2 - \frac{31}{3}x^3 + \frac{1}{5}x^5\right)\Big|_0^3 = \frac{1953\pi}{5}.\end{aligned}$$

41. $y = 16 - 2x, \quad y = 6, \quad x = 0, \quad$ about x-axis

SOLUTION Rotating the region enclosed by $y = 16 - 2x$, $y = 6$ and the y-axis (shown in the figure below) about the x-axis produces a solid whose cross sections are washers with outer radius $R = 16 - 2x$ and inner radius $r = 6$. The volume of the solid of revolution is

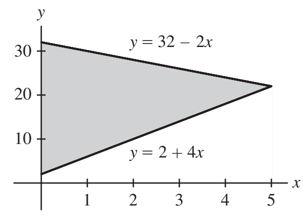
$$\begin{aligned}\pi \int_0^5 \left((16 - 2x)^2 - 6^2\right) dx &= \pi \int_0^5 (220 - 64x + 4x^2)\, dx \\ &= \pi \left(220x - 32x^2 + \frac{4}{3}x^3\right)\Big|_0^5 = \frac{1400\pi}{3}.\end{aligned}$$



42. $y = 32 - 2x, \quad y = 2 + 4x, \quad x = 0,$ about y-axis

SOLUTION Rotating the region enclosed by $y = 32 - 2x$, $y = 2 + 4x$ and the y-axis (shown in the figure below) about the y-axis produces a solid with two different cross sections. For $2 \le y \le 22$, the cross section is a disk of radius $\frac{1}{4}(y-2)$; for $22 \le y \le 32$, the cross section is a disk of radius $\frac{1}{2}(32-y)$. The volume of the solid of revolution is

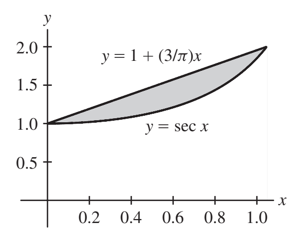
$$\begin{aligned} V &= \frac{\pi}{4}\int_2^{22} (y-2)^2\,dy + \frac{\pi}{2}\int_{22}^{32} (32-y)^2\,dy \\ &= \frac{\pi}{12}(y-2)^3\Big|_2^{22} - \frac{\pi}{6}(32-y)^3\Big|_{22}^{32} \\ &= \frac{2000\pi}{3} + \frac{500\pi}{3} = \frac{2500\pi}{3}. \end{aligned}$$



43. $y = \sec x, \quad y = 1 + \dfrac{3}{\pi}x,$ about x-axis

SOLUTION We first note that $y = \sec x$ and $y = 1 + (3/\pi)x$ intersect at $x = 0$ and $x = \pi/3$. Rotating the region enclosed by $y = \sec x$ and $y = 1 + (3/\pi)x$ (shown in the figure below) about the x-axis produces a cross section that is a washer with outer radius $R = 1 + (3/\pi)x$ and inner radius $r = \sec x$. The volume of the solid of revolution is

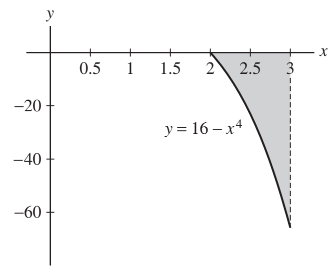
$$\begin{aligned} V &= \pi\int_0^{\pi/3} \left(\left(1 + \frac{3}{\pi}x\right)^2 - \sec^2 x\right) dx \\ &= \pi\int_0^{\pi/3} \left(1 + \frac{6}{\pi}x + \frac{9}{\pi^2}x^2 - \sec^2 x\right) dx \\ &= \pi\left(x + \frac{3}{\pi}x^2 + \frac{3}{\pi^2}x^3 - \tan x\right)\Big|_0^{\pi/3} \\ &= \pi\left(\frac{\pi}{3} + \frac{\pi}{3} + \frac{\pi}{9} - \sqrt{3}\right) = \frac{7\pi^2}{9} - \sqrt{3}\pi. \end{aligned}$$



44. $x = 2, \quad x = 3, \quad y = 16 - x^4, \quad y = 0,$ about y-axis

SOLUTION Rotating the region enclosed by $x = 2$, $x = 3$, $y = 16 - x^4$ and the x-axis (shown in the figure below) about the y-axis produces a solid whose cross sections are washers with outer radius $R = 3$ and inner radius $r = \sqrt[4]{16-y}$. The volume of the solid of revolution is

$$\pi\int_{-65}^{0}\left(9 - \sqrt{16-y}\right) dy = \left(9y + \frac{2}{3}(16-y)^{3/2}\right)\Big|_{-65}^{0} = \frac{425\pi}{3}.$$



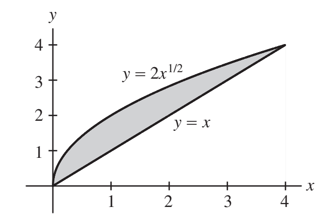
45. $y = 2\sqrt{x}, \quad y = x, \quad$ about $x = -2$

SOLUTION Setting $2\sqrt{x} = x$ and squaring both sides yields

$$4x = x^2 \quad \text{or} \quad x(x-4) = 0,$$

so the two curves intersect at $x = 0$ and $x = 4$. Rotating the region enclosed by $y = 2\sqrt{x}$ and $y = x$ (see the figure below) about $x = -2$ produces a solid whose cross sections are washers with outer radius $R = y - (-2) = y + 2$ and inner radius $r = \frac{1}{4}y^2 - (-2) = \frac{1}{4}y^2 + 2$. The volume of the solid of revolution is

$$\begin{aligned} V &= \pi \int_0^4 \left((y+2)^2 - \left(\frac{1}{4}y^2 + 2 \right)^2 \right) dy \\ &= \pi \int_0^4 \left(4y - \frac{1}{16}y^4 \right) dy \\ &= \pi \left(2y^2 - \frac{1}{80}y^5 \right) \Big|_0^4 \\ &= \pi \left(32 - \frac{64}{5} \right) = \frac{96\pi}{5}. \end{aligned}$$



46. $y = 2\sqrt{x}, \quad y = x, \quad$ about $y = 4$

SOLUTION Setting $2\sqrt{x} = x$ and squaring both sides yields

$$4x = x^2 \quad \text{or} \quad x(x-4) = 0,$$

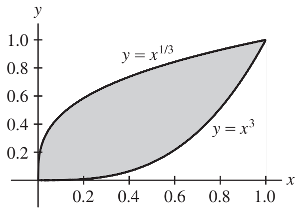
so the two curves intersect at $x = 0$ and $x = 4$. Rotating the region enclosed by $y = 2\sqrt{x}$ and $y = x$ (see the figure from the previous exercise) about $y = 4$ produces a solid whose cross sections are washers with outer radius $R = 4 - x$ and inner radius $r = 4 - 2\sqrt{x}$. The volume of the solid of revolution is

$$\begin{aligned} V &= \pi \int_0^4 \left((4-x)^2 - (4 - 2\sqrt{x})^2 \right) dy \\ &= \pi \int_0^4 \left(x^2 - 12x + 16\sqrt{x} \right) dy \\ &= \pi \left(\frac{1}{3}x^3 - 6x^2 + \frac{32}{3}x^{3/2} \right) \Big|_0^4 \\ &= \pi \left(\frac{64}{3} - 96 + \frac{256}{3} \right) = \frac{32\pi}{3}. \end{aligned}$$

47. $y = x^3, \quad y = x^{1/3}, \quad$ for $x \geq 0, \quad$ about y-axis

SOLUTION Rotating the region enclosed by $y = x^3$ and $y = x^{1/3}$ (shown in the figure below) about the y-axis produces a solid whose cross sections are washers with outer radius $R = y^{1/3}$ and inner radius $r = y^3$. The volume of the solid of revolution is

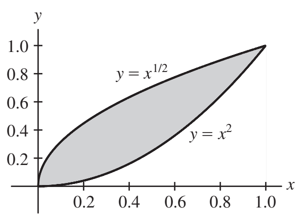
$$\pi \int_0^1 \left((y^{1/3})^2 - (y^3)^2 \right) dy = \pi \int_0^1 (y^{2/3} - y^6)\, dy = \pi \left(\frac{3}{5}y^{5/3} - \frac{1}{7}y^7 \right) \Big|_0^1 = \frac{16\pi}{35}.$$



48. $y = x^2$, $y = x^{1/2}$, about $x = -2$

SOLUTION Rotating the region enclosed by $y = x^2$ and $y = x^{1/2}$ (shown in the figure below) about $x = -2$ produces a solid whose cross sections are washers with outer radius $R = \sqrt{y} - (-2) = \sqrt{y} + 2$ and inner radius $r = y^2 - (-2) = y^2 + 2$. The volume of the solid of revolution is

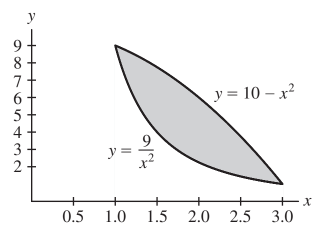
$$\pi \int_0^1 \left((\sqrt{y}+2)^2 - (y^2+2)^2\right) dy = \pi \int_0^1 \left(y + 4\sqrt{y} - y^4 - 4y^2\right) dy$$
$$= \pi \left(\frac{1}{2}y^2 + \frac{8}{3}y^{3/2} - \frac{1}{5}y^5 - \frac{4}{3}y^3\right)\Big|_0^1$$
$$= \pi \left(\frac{1}{2} + \frac{8}{3} - \frac{1}{5} - \frac{4}{3}\right) = \frac{49\pi}{30}.$$



49. $y = \dfrac{9}{x^2}$, $y = 10 - x^2$, $x \ge 0$, about $y = 12$

SOLUTION The region enclosed by the two curves is shown in the figure below. Rotating this region about $y = 12$ produces a solid whose cross sections are washers with outer radius $R = 12 - 9x^{-2}$ and inner radius $r = 12 - (10 - x^2) = 2 + x^2$. The volume of the solid of revolution is

$$\pi \int_1^3 \left((12 - 9x^{-2})^2 - (x^2+2)^2\right) dx = \pi \int_1^3 \left(140 - 4x^2 - x^4 - 216x^{-2} + 81x^{-4}\right) dx$$
$$= \pi \left(140x - \frac{4}{3}x^3 - \frac{1}{5}x^5 + 216x^{-1} - 27x^{-3}\right)\Big|_1^3 = \frac{1184\pi}{15}.$$



50. $y = \dfrac{9}{x^2}$, $y = 10 - x^2$, $x \ge 0$, about $x = -1$

SOLUTION The region enclosed by the two curves is shown in the figure from the previous exercise. Rotating this region about $x = -1$ produces a solid whose cross sections are washers with outer radius $R = \sqrt{10-y} - (-1) = \sqrt{10-y} + 1$ and inner radius $r = 3y^{-1/2} - (-1) = 3y^{-1/2} + 1$. The volume of the solid of revolution is

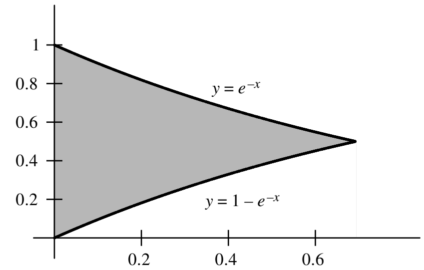
$$V = \pi \int_1^9 \left((\sqrt{10-y}+1)^2 - (3y^{-1/2}+1)^2\right) dy$$
$$= \pi \int_1^9 \left(10 - y + 2\sqrt{10-y} - 9y^{-1} - 6y^{-1/2}\right) dy$$
$$= \pi \left(10y - \frac{1}{2}y^2 - \frac{4}{3}(10-y)^{3/2} - 9\ln y - 12\sqrt{y}\right)\Big|_1^9$$

$$= \pi\left(\left(90 - \frac{81}{2} - \frac{4}{3} - 9\ln 9 - 36\right) - \left(10 - \frac{1}{2} - 36 - 12\right)\right)$$
$$= \pi\left(\frac{73}{6} - 9\ln 9 + \frac{77}{2}\right) = \left(\frac{152}{3} - 9\ln 9\right)\pi.$$

51. $y = e^{-x}, \quad y = 1 - e^{-x}, \quad x = 0, \quad \text{about } y = 4$

SOLUTION Rotating the region enclosed by $y = 1 - e^{-x}$, $y = e^{-x}$ and the y-axis (shown in the figure below) about the line $y = 4$ produces a solid whose cross sections are washers with outer radius $R = 4 - (1 - e^{-x}) = 3 + e^{-x}$ and inner radius $r = 4 - e^{-x}$. The volume of the solid of revolution is

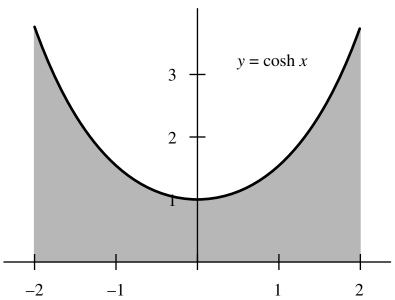
$$\pi\int_0^{\ln 2}\left((3 + e^{-x})^2 - (4 - e^{-x})^2\right)dx = \pi\int_0^{\ln 2}(14e^{-x} - 7)\,dx = \pi(-14e^{-x} - 7x)\Big|_0^{\ln 2}$$
$$= \pi(-7 - 7\ln 2 + 14) = 7\pi(1 - \ln 2).$$



52. $y = \cosh x, \quad x = \pm 2, \quad \text{about } x\text{-axis}$

SOLUTION Rotating the region enclosed by $y = \cosh x$, $x = \pm 2$ and the x-axis (shown in the figure below) about the x-axis produces a solid whose cross sections are disks with radius $R = \cosh x$. The volume of the solid of revolution is

$$\pi\int_{-2}^{2}\cosh^2 x\,dx = \frac{1}{2}\pi\int_{-2}^{2}(1 + \cosh 2x)\,dx = \frac{1}{2}\pi\left(x + \frac{1}{2}\sinh 2x\right)\Big|_{-2}^{2}$$
$$= \frac{1}{2}\pi\left[\left(2 + \frac{1}{2}\sinh 4\right) - \left(-2 + \frac{1}{2}\sinh(-4)\right)\right] = \frac{1}{2}\pi(4 + \sinh 4).$$



53. The bowl in Figure 14(A) is 21 cm high, obtained by rotating the curve in Figure 14(B) as indicated. Estimate the volume capacity of the bowl shown by taking the average of right- and left-endpoint approximations to the integral with $N = 7$.

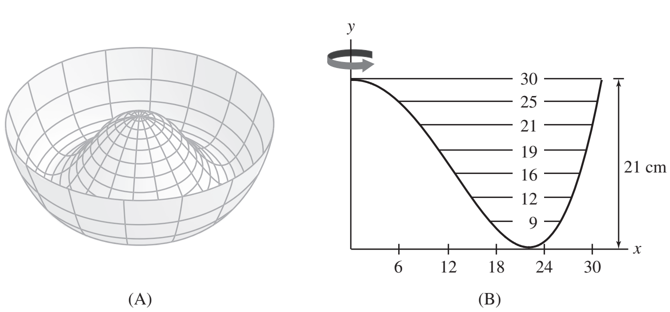


FIGURE 14

SOLUTION Using the given values for the inner radii and the values in Figure 14(B), which indicate the difference between the inner and outer radii, we find

$$R_7 = 3\pi\left((23^2 - 14^2) + (25^2 - 13^2) + (26^2 - 10^2) + (27^2 - 8^2) + (28^2 - 7^2) + (29^2 - 4^2) + (30^2 - 0^2)\right)$$
$$= 3\pi(4490) = 13470\pi$$

and

$$L_7 = 3\pi\left((20^2 - 20^2) + (23^2 - 14^2) + (25^2 - 13^2) + (26^2 - 10^2) + (27^2 - 8^2) + (28^2 - 7^2) + (29^2 - 4^2)\right)$$
$$= 3\pi(3590) = 10770\pi$$

Averaging these two values, we estimate that the volume capacity of the bowl is

$$V = 12120\pi \approx 38076.1 \text{ cm}^3.$$

54. The region between the graphs of $f(x)$ and $g(x)$ over [0, 1] is revolved about the line $y = -3$. Use the midpoint approximation with values from the following table to estimate the volume V of the resulting solid.

x	0.1	0.3	0.5	0.7	0.9
$f(x)$	8	7	6	7	8
$g(x)$	2	3.5	4	3.5	2

SOLUTION The volume of the resulting solid is

$$V = \pi\int_0^1 \left((f(x)+3)^2 - (g(x)+3)^2\right)\,dx$$
$$\approx 0.2\pi\left((11^2 - 5^2) + (10^2 - 6.5^2) + (9^2 - 7^2) + (10^2 - 6.5^2) + (11^2 - 5^2)\right)$$
$$= 0.2\pi(96 + 57.75 + 32 + 57.75 + 96) = 67.9\pi.$$

55. Find the volume of the cone obtained by rotating the region under the segment joining $(0, h)$ and $(r, 0)$ about the y-axis.

SOLUTION The segment joining $(0, h)$ and $(r, 0)$ has the equation

$$y = -\frac{h}{r}x + h \quad \text{or} \quad x = \frac{r}{h}(h - y).$$

Rotating the region under this segment about the y-axis produces a cone with volume

$$\frac{\pi r^2}{h^2}\int_0^h (h-y)^2\,dx = -\frac{\pi r^2}{3h^2}(h-y)^3\bigg|_0^h$$
$$= \frac{1}{3}\pi r^2 h.$$

56. The **torus** (doughnut-shaped solid) in Figure 15 is obtained by rotating the circle $(x-a)^2 + y^2 = b^2$ around the y-axis (assume that $a > b$). Show that it has volume $2\pi^2 ab^2$. *Hint:* Evaluate the integral by interpreting it as the area of a circle.

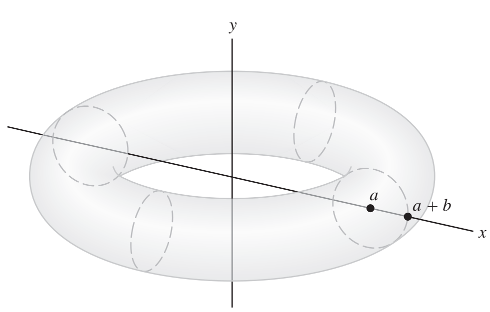

FIGURE 15 Torus obtained by rotating a circle about the y-axis.

SOLUTION Rotating the region enclosed by the circle $(x-a)^2+y^2=b^2$ about the y-axis produces a torus whose cross sections are washers with outer radius $R=a+\sqrt{b^2-y^2}$ and inner radius $r=a-\sqrt{b^2-y^2}$. The volume of the torus is then

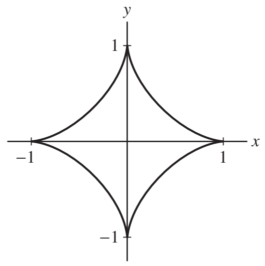
$$\pi\int_{-b}^{b}\left(\left(a+\sqrt{b^2-y^2}\right)^2-\left(a-\sqrt{b^2-y^2}\right)^2\right)dy=4a\pi\int_{-b}^{b}\sqrt{b^2-y^2}\,dy.$$

Now, the remaining definite integral is one-half the area of a circle of radius b; therefore, the volume of the torus is

$$4a\pi\cdot\frac{1}{2}\pi b^2=2\pi^2ab^2.$$

57. $\boxed{\text{GU}}$ Sketch the hypocycloid $x^{2/3}+y^{2/3}=1$ and find the volume of the solid obtained by revolving it about the x-axis.

SOLUTION A sketch of the hypocycloid is shown below.



For the hypocycloid, $y=\pm\left(1-x^{2/3}\right)^{3/2}$. Rotating this region about the x-axis will produce a solid whose cross sections are disks with radius $R=\left(1-x^{2/3}\right)^{3/2}$. Thus the volume of the solid of revolution will be

$$\pi\int_{-1}^{1}\left((1-x^{2/3})^{3/2}\right)^2dx=\pi\left(\frac{-x^3}{3}+\frac{9}{7}x^{7/3}-\frac{9}{5}x^{5/3}+x\right)\Bigg|_{-1}^{1}=\frac{32\pi}{105}.$$

58. The solid generated by rotating the region between the branches of the hyperbola $y^2-x^2=1$ about the x-axis is called a **hyperboloid** (Figure 16). Find the volume of the hyperboloid for $-a\le x\le a$.

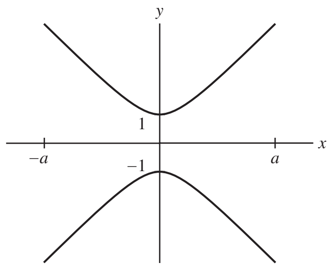


FIGURE 16 The hyperbola with equation $y^2-x^2=1$.

SOLUTION Each cross section is a disk of radius $R=\sqrt{1+x^2}$, so the volume of the hyperboloid is

$$\pi\int_{-a}^{a}\left(\sqrt{1+x^2}\right)^2dx=\pi\int_{-a}^{a}(1+x^2)\,dx=\pi\left(x+\frac{1}{3}x^3\right)\Bigg|_{-a}^{a}=\pi\left(\frac{2a^3+6a}{3}\right)$$

59. A "bead" is formed by removing a cylinder of radius r from the center of a sphere of radius R (Figure 17). Find the volume of the bead with $r=1$ and $R=2$.

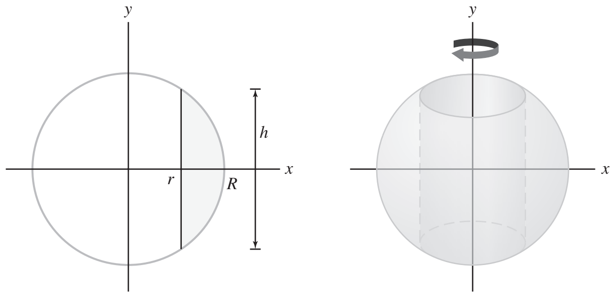

FIGURE 17 A bead is a sphere with a cylinder removed.

SOLUTION The equation of the outer circle is $x^2 + y^2 = 2^2$, and the inner cylinder intersects the sphere when $y = \pm\sqrt{3}$. Each cross section of the bead is a washer with outer radius $\sqrt{4 - y^2}$ and inner radius 1, so the volume is given by

$$\pi \int_{-\sqrt{3}}^{\sqrt{3}} \left(\left(\sqrt{4 - y^2} \right)^2 - 1^2 \right) dy = \pi \int_{-\sqrt{3}}^{\sqrt{3}} \left(3 - y^2 \right) dy = 4\pi\sqrt{3}.$$

Further Insights and Challenges

60. Find the volume V of the bead (Figure 17) in terms of r and R. Then show that $V = \frac{\pi}{6}h^3$, where h is the height of the bead. This formula has a surprising consequence: Since V can be expressed in terms of h alone, it follows that two beads of height 1 cm, one formed from a sphere the size of an orange and the other from a sphere the size of the earth, would have the same volume! Can you explain intuitively how this is possible?

SOLUTION The equation for the outer circle of the bead is $x^2 + y^2 = R^2$, and the inner cylinder intersects the sphere when $y = \pm\sqrt{R^2 - r^2}$. Each cross section of the bead is a washer with outer radius $\sqrt{R^2 - y^2}$ and inner radius r, so the volume is

$$\pi \int_{-\sqrt{R^2-r^2}}^{\sqrt{R^2-r^2}} \left(\left(\sqrt{R^2 - y^2} \right)^2 - r^2 \right) dy = \pi \int_{-\sqrt{R^2-r^2}}^{\sqrt{R^2-r^2}} (R^2 - r^2 - y^2)\, dy$$

$$= \pi \left((R^2 - r^2)y - \frac{1}{3}y^3 \right) \Big|_{-\sqrt{R^2-r^2}}^{\sqrt{R^2-r^2}} = \frac{4}{3}(R^2 - r^2)^{3/2}\pi.$$

Now, $h = 2\sqrt{R^2 - r^2} = 2(R^2 - r^2)^{1/2}$, which gives $h^3 = 8(R^2 - r^2)^{3/2}$ and finally $(R^2 - r^2)^{3/2} = \frac{1}{8}h^3$. Substituting into the expression for the volume gives $V = \frac{\pi}{6}h^3$. The beads may have the same volume but clearly the wall of the earth-sized bead must be extremely thin while the orange-sized bead would be thicker.

61. The solid generated by rotating the region inside the ellipse with equation $\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1$ around the x-axis is called an **ellipsoid**. Show that the ellipsoid has volume $\frac{4}{3}\pi ab^2$. What is the volume if the ellipse is rotated around the y-axis?

SOLUTION

- Rotating the ellipse about the x-axis produces an ellipsoid whose cross sections are disks with radius $R = b\sqrt{1 - (x/a)^2}$. The volume of the ellipsoid is then

$$\pi \int_{-a}^{a} \left(b\sqrt{1 - (x/a)^2} \right)^2 dx = b^2\pi \int_{-a}^{a} \left(1 - \frac{1}{a^2}x^2 \right) dx = b^2\pi \left(x - \frac{1}{3a^2}x^3 \right) \Big|_{-a}^{a} = \frac{4}{3}\pi ab^2.$$

- Rotating the ellipse about the y-axis produces an ellipsoid whose cross sections are disks with radius $R = a\sqrt{1 - (y/b)^2}$. The volume of the ellipsoid is then

$$\int_{-b}^{b} \left(a\sqrt{1 - (y/b)^2} \right)^2 dy = a^2\pi \int_{-b}^{b} \left(1 - \frac{1}{b^2}y^2 \right) dy = a^2\pi \left(y - \frac{1}{3b^2}y^3 \right) \Big|_{-b}^{b} = \frac{4}{3}\pi a^2 b.$$

62. The curve $y = f(x)$ in Figure 18, called a **tractrix**, has the following property: the tangent line at each point (x, y) on the curve has slope

$$\frac{dy}{dx} = \frac{-y}{\sqrt{1 - y^2}}$$

Let R be the shaded region under the graph of $0 \le x \le a$ in Figure 18. Compute the volume V of the solid obtained by revolving R around the x-axis in terms of the constant $c = f(a)$. *Hint:* Use the substitution $u = f(x)$ to show that

$$V = \pi \int_c^1 u\sqrt{1 - u^2}\, du$$

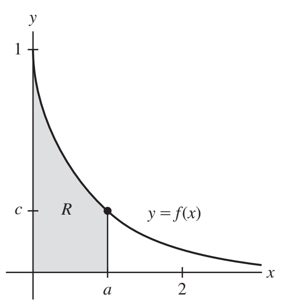

FIGURE 18 The tractrix.

SOLUTION Let $y = f(x)$ be the tractrix depicted in Figure 18. Rotating the region R about the x-axis produces a solid whose cross sections are disks with radius $f(x)$. The volume of the resulting solid is then

$$V = \pi \int_0^a [f(x)]^2\, dx.$$

Now, let $u = f(x)$. Then

$$du = f'(x)\,dx = \frac{-f(x)}{\sqrt{1-[f(x)]^2}}\,dx = \frac{-u}{\sqrt{1-u^2}}\,dx;$$

hence,

$$dx = -\frac{\sqrt{1-u^2}}{u}\,du,$$

and

$$V = \pi \int_1^c u^2 \left(-\frac{\sqrt{1-u^2}}{u}\,du\right) = \pi \int_c^1 u\sqrt{1-u^2}\,du.$$

Carrying out the integration, we find

$$V = -\frac{\pi}{3}(1-u^2)^{3/2}\Big|_c^1 = \frac{\pi}{3}(1-c^2)^{3/2}.$$

63. Verify the formula

$$\int_{x_1}^{x_2} (x-x_1)(x-x_2)\,dx = \frac{1}{6}(x_1-x_2)^3 \qquad \boxed{3}$$

Then prove that the solid obtained by rotating the shaded region in Figure 19 about the x-axis has volume $V = \frac{\pi}{6}BH^2$, with B and H as in the figure. *Hint:* Let x_1 and x_2 be the roots of $f(x) = ax + b - (mx+c)^2$, where $x_1 < x_2$. Show that

$$V = \pi \int_{x_1}^{x_2} f(x)\,dx$$

and use Eq. (3).

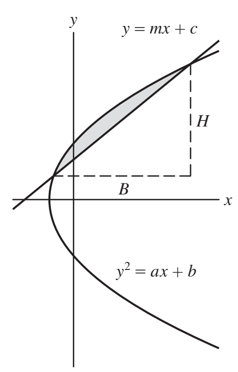

FIGURE 19 The line $y = mx + c$ intersects the parabola $y^2 = ax + b$ at two points above the x-axis.

SOLUTION First, we calculate

$$\int_{x_1}^{x_2} (x-x_1)(x-x_2)\,dx = \left(\frac{1}{3}x^3 - \frac{1}{2}(x_1+x_2)x^2 + x_1x_2x\right)\Big|_{x_1}^{x_2} = \frac{1}{6}x_1^3 - \frac{1}{2}x_1^2x_2 + \frac{1}{2}x_1x_2^2 - \frac{1}{6}x_2^3$$
$$= \frac{1}{6}\left(x_1^3 - 3x_1^2x_2 + 3x_1x_2^2 - x_2^3\right) = \frac{1}{6}(x_1-x_2)^3.$$

Now, consider the region enclosed by the parabola $y^2 = ax + b$ and the line $y = mx + c$, and let x_1 and x_2 denote the x-coordinates of the points of intersection between the two curves with $x_1 < x_2$. Rotating the region about the y-axis produces a solid whose cross sections are washers with outer radius $R = \sqrt{ax+b}$ and inner radius $r = mx + c$. The volume of the solid of revolution is then

$$V = \pi \int_{x_1}^{x_2} \left(ax + b - (mx+c)^2\right)\,dx$$

Because x_1 and x_2 are roots of the equation $ax + b - (mx + c)^2 = 0$ and $ax + b - (mx + c)^2$ is a quadratic polynomial in x with leading coefficient $-m^2$, it follows that $ax + b - (mx + c)^2 = -m^2(x - x_1)(x - x_2)$. Therefore,

$$V = -\pi m^2 \int_{x_1}^{x_2} (x - x_1)(x - x_2)\, dx = \frac{\pi}{6} m^2 (x_2 - x_1)^3,$$

where we have used Eq. (3). From the diagram, we see that

$$B = x_2 - x_1 \qquad \text{and} \qquad H = mB,$$

so

$$V = \frac{\pi}{6} m^2 B^3 = \frac{\pi}{6} B\,(mB)^2 = \frac{\pi}{6} BH^2.$$

64. Let R be the region in the unit circle lying above the cut with the line $y = mx + b$ (Figure 20). Assume the points where the line intersects the circle lie above the x-axis. Use the method of Exercise 63 to show that the solid obtained by rotating R about the x-axis has volume $V = \frac{\pi}{6} hd^2$, with h and d as in the figure.

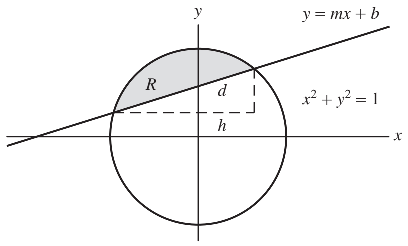

FIGURE 20

SOLUTION Let x_1 and x_2 denote the x-coordinates of the points of intersection between the circle $x^2 + y^2 = 1$ and the line $y = mx + b$ with $x_1 < x_2$. Rotating the region enclosed by the two curves about the x-axis produces a solid whose cross sections are washers with outer radius $R = \sqrt{1 - x^2}$ and inner radius $r = mx + b$. The volume of the resulting solid is then

$$V = \pi \int_{x_1}^{x_2} \left((1 - x^2) - (mx + b)^2 \right) dx$$

Because x_1 and x_2 are roots of the equation $(1 - x^2) - (mx + b)^2 = 0$ and $(1 - x^2) - (mx + b)^2$ is a quadratic polynomial in x with leading coefficient $-(1 + m^2)$, it follows that $(1 - x^2) - (mx + b)^2 = -(1 + m^2)(x - x_1)(x - x_2)$. Therefore,

$$V = -\pi(1 + m^2) \int_{x_1}^{x_2} (x - x_1)(x - x_2)\, dx = \frac{\pi}{6}(1 + m^2)(x_2 - x_1)^3.$$

From the diagram, we see that $h = x_2 - x_1$. Moreover, by the Pythagorean theorem, $d^2 = h^2 + (mh)^2 = (1 + m^2)h^2$. Thus,

$$V = \frac{\pi}{6}(1 + m^2)h^3 = \frac{\pi}{6} h \left[(1 + m^2)h^2 \right] = \frac{\pi}{6} hd^2.$$

6.4 The Method of Cylindrical Shells

Preliminary Questions

1. Consider the region $\mathcal{R}$ under the graph of the constant function $f(x) = h$ over the interval $[0, r]$. Give the height and the radius of the cylinder generated when $\mathcal{R}$ is rotated about:

(a) the x-axis **(b)** the y-axis

SOLUTION

(a) When the region is rotated about the x-axis, each shell will have radius h and height r.
(b) When the region is rotated about the y-axis, each shell will have radius r and height h.

2. Let V be the volume of a solid of revolution about the y-axis.

(a) Does the Shell Method for computing V lead to an integral with respect to x or y?
(b) Does the Disk or Washer Method for computing V lead to an integral with respect to x or y?

SOLUTION

(a) The Shell method requires slicing the solid parallel to the axis of rotation. In this case, that will mean slicing the solid in the vertical direction, so integration will be with respect to x.
(b) The Disk or Washer method requires slicing the solid perpendicular to the axis of rotation. In this case, that means slicing the solid in the horizontal direction, so integration will be with respect to y.

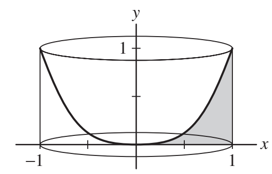
Exercises

In Exercises 1–6, sketch the solid obtained by rotating the region underneath the graph of the function over the given interval about the y-axis, and find its volume.

1. $f(x) = x^3$, $[0, 1]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height x^3, so the volume of the solid is

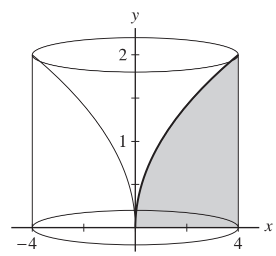
$$2\pi \int_0^1 x \cdot x^3\, dx = 2\pi \int_0^1 x^4\, dx = 2\pi \left(\frac{1}{5}x^5\right)\Big|_0^1 = \frac{2}{5}\pi.$$



2. $f(x) = \sqrt{x}$, $[0, 4]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height $\sqrt{x}$, so the volume of the solid is

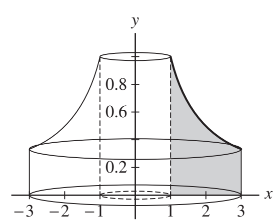
$$2\pi \int_0^4 x\sqrt{x}\, dx = 2\pi \int_0^4 x^{3/2}\, dx = 2\pi \left(\frac{2}{5}x^{5/2}\right)\Big|_0^4 = \frac{128}{5}\pi.$$



3. $f(x) = x^{-1}$, $[1, 3]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height x^{-1}, so the volume of the solid is

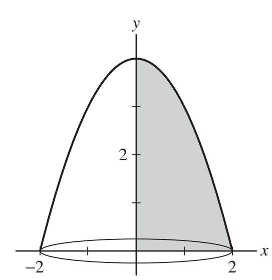
$$2\pi \int_1^3 x(x^{-1})\, dx = 2\pi \int_1^3 1\, dx = 2\pi\ (x)\Big|_1^3 = 4\pi.$$



4. $f(x) = 4 - x^2$, $[0, 2]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height $4 - x^2$, so the volume of the solid is

$$2\pi \int_0^2 x(4 - x^2)\, dx = 2\pi \int_0^2 (4x - x^3)\, dx = 2\pi \left(2x^2 - \frac{1}{4}x^4\right)\Big|_0^2 = 8\pi.$$



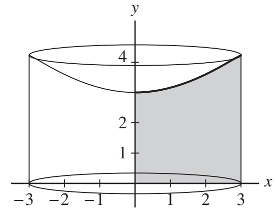
5. $f(x) = \sqrt{x^2 + 9}$, $[0, 3]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height $\sqrt{x^2 + 9}$, so the volume of the solid is

$$2\pi \int_0^3 x\sqrt{x^2 + 9}\,dx.$$

Let $u = x^2 + 9$. Then $du = 2x\,dx$ and

$$2\pi \int_0^3 x\sqrt{x^2 + 9}\,dx = \pi \int_9^{18} \sqrt{u}\,du = \pi \left(\frac{2}{3}u^{3/2}\right)\Big|_9^{18} = 18\pi(2\sqrt{2} - 1).$$



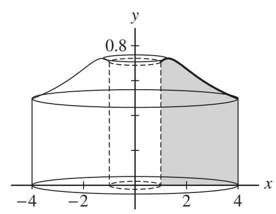
6. $f(x) = \dfrac{x}{\sqrt{1 + x^3}}$, $[1, 4]$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height $\dfrac{x}{\sqrt{1 + x^3}}$, so the volume of the solid is

$$2\pi \int_1^4 x\left(\frac{x}{\sqrt{1 + x^3}}\right) dx = 2\pi \int_1^4 \frac{x^2}{\sqrt{1 + x^3}}\,dx.$$

Let $u = 1 + x^3$. Then $du = 3x^2\,dx$ and

$$2\pi \int_1^4 \frac{x^2}{\sqrt{1 + x^3}}\,dx = \frac{2}{3}\pi \int_2^{65} u^{-1/2}\,du = \frac{2}{3}\pi \left(2u^{1/2}\right)\Big|_2^{65} = \frac{4\pi}{3}\left(\sqrt{65} - \sqrt{2}\right).$$

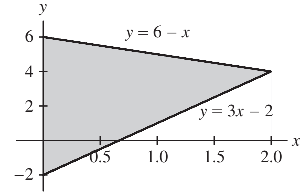


In Exercises 7–12, use the Shell Method to compute the volume obtained by rotating the region enclosed by the graphs as indicated, about the y-axis.

7. $y = 3x - 2$, $y = 6 - x$, $x = 0$

SOLUTION The region enclosed by $y = 3x - 2$, $y = 6 - x$ and $x = 0$ is shown below. When rotating this region about the y-axis, each shell has radius x and height $6 - x - (3x - 2) = 8 - 4x$. The volume of the resulting solid is

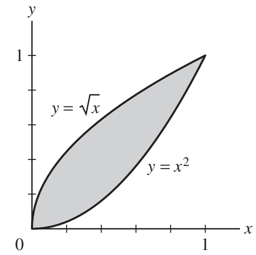
$$2\pi \int_0^2 x(8 - 4x)\,dx = 2\pi \int_0^2 (8x - 4x^2)\,dx = 2\pi \left(4x^2 - \frac{4}{3}x^3\right)\Big|_0^2 = \frac{32}{3}\pi.$$



8. $y = \sqrt{x}, \quad y = x^2$

SOLUTION The region enclosed by $y = \sqrt{x}$ and $y = x^2$ is shown below. When rotating this region about the y-axis, each shell has radius x and height $\sqrt{x} - x^2$. The volume of the resulting solid is

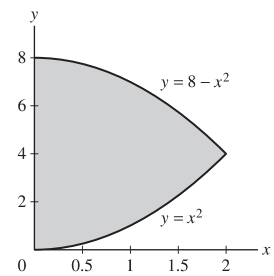
$$2\pi \int_0^1 x(\sqrt{x} - x^2)\, dx = 2\pi \int_0^1 (x^{3/2} - x^3)\, dx = 2\pi \left(\frac{2}{5}x^{5/2} - \frac{1}{4}x^4 \right)\Big|_0^1 = \frac{3}{10}\pi.$$



9. $y = x^2, \quad y = 8 - x^2, \quad x = 0, \quad$ for $x \geq 0$

SOLUTION The region enclosed by $y = x^2$, $y = 8 - x^2$ and the y-axis is shown below. When rotating this region about the y-axis, each shell has radius x and height $8 - x^2 - x^2 = 8 - 2x^2$. The volume of the resulting solid is

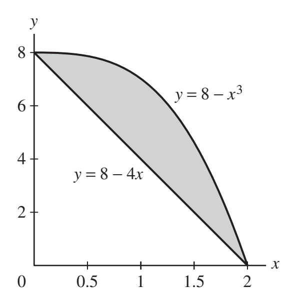
$$2\pi \int_0^2 x(8 - 2x^2)\, dx = 2\pi \int_0^2 (8x - 2x^3)\, dx = 2\pi \left(4x^2 - \frac{1}{2}x^4 \right)\Big|_0^2 = 16\pi.$$



10. $y = 8 - x^3, \quad y = 8 - 4x, \quad$ for $x \geq 0$

SOLUTION The region enclosed by $y = 8 - x^3$ and $y = 8 - 4x$ is shown below. When rotating this region about the y-axis, each shell has radius x and height $(8 - x^3) - (8 - 4x) = 4x - x^3$. The volume of the resulting solid is

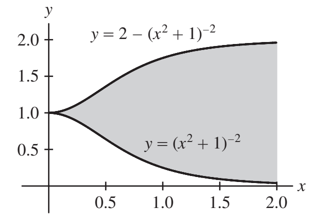
$$2\pi \int_0^2 x(4x - x^3)\, dx = 2\pi \int_0^2 (4x^2 - x^4)\, dx = 2\pi \left(\frac{4}{3}x^3 - \frac{1}{5}x^5 \right)\Big|_0^2 = \frac{128\pi}{15}.$$



11. $y = (x^2 + 1)^{-2}, \quad y = 2 - (x^2 + 1)^{-2}, \quad x = 2$

SOLUTION The region enclosed by $y = (x^2 + 1)^{-2}$, $y = 2 - (x^2 + 1)^{-2}$ and $x = 2$ is shown below. When rotating this region about the y-axis, each shell has radius x and height $2 - (x^2 + 1)^{-2} - (x^2 + 1)^{-2} = 2 - 2(x^2 + 1)^{-2}$. The volume of the resulting solid is

$$2\pi \int_0^2 x(2 - 2(x^2 + 1)^{-2})\, dx = 2\pi \int_0^2 \left(2x - \frac{2x}{(x^2 + 1)^{-2}} \right) dx = 2\pi \left(x^2 + \frac{1}{x^2 + 1} \right)\Big|_0^2 = \frac{32}{5}\pi.$$

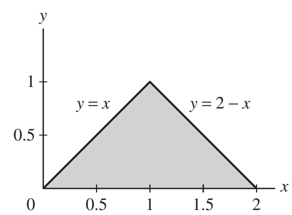


12. $y = 1 - |x - 1|, \quad y = 0$

SOLUTION The region enclosed by $y = 1 - |x - 1|$ and the x-axis is shown below. When rotating this region about the y-axis, two different shells are generated. For each $x \in [0, 1]$, the shell has radius x and height x; for each $x \in [1, 2]$, the shell has radius x and height $2 - x$. The volume of the resulting solid is

$$2\pi \int_0^1 x(x)\,dx + 2\pi \int_1^2 x(2-x)\,dx = 2\pi \int_0^1 (x^2)\,dx + 2\pi \int_1^2 (2x - x^2)\,dx$$

$$= 2\pi \left(\frac{1}{3}x^3\right)\Big|_0^1 + 2\pi \left(x^2 - \frac{1}{3}x^3\right)\Big|_1^2 = 2\pi.$$

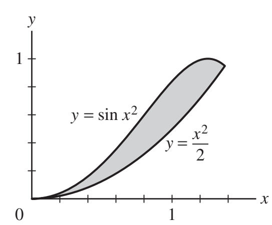


In Exercises 13 and 14, use a graphing utility to find the points of intersection of the curves numerically and then compute the volume of rotation of the enclosed region about the y-axis.

13. GU $y = \frac{1}{2}x^2, \quad y = \sin(x^2)$

SOLUTION The region enclosed by $y = \frac{1}{2}x^2$ and $y = \sin x^2$ is shown below. When rotating this region about the y-axis, each shell has radius x and height $\sin x^2 - \frac{1}{2}x^2$. Using a computer algebra system, we find that the x-coordinate of the point of intersection on the right is $x = 1.376769504$. Thus, the volume of the resulting solid of revolution is

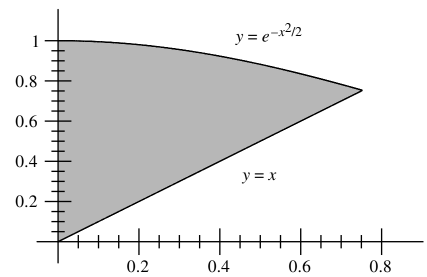
$$2\pi \int_0^{1.376769504} x\left(\sin x^2 - \frac{1}{2}x^2\right)\,dx = 1.321975576.$$



14. GU $y = e^{-x^2/2}, \quad y = x, \quad x = 0$

SOLUTION The region enclosed by $y = e^{-x^2/2}$, $y = x$ and the y-axis is shown below. When rotating this region about the y-axis, each shell has radius x and height $e^{-x^2/2} - x$. Using a computer algebra system, we find that the x-coordinate of the point of intersection on the right is $x = 0.7530891650$. Thus, volume of the resulting solid of revolution is

$$2\pi \int_0^{0.7530891650} x(e^{-x^2/2} - x)\,dx = 0.6568505551$$

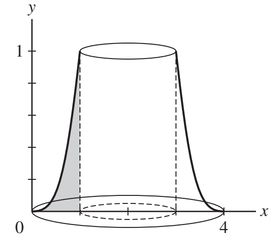


In Exercises 15–20, sketch the solid obtained by rotating the region underneath the graph of $f(x)$ over the interval about the given axis, and calculate its volume using the Shell Method.

15. $f(x) = x^3$, $[0, 1]$, about $x = 2$

SOLUTION A sketch of the solid is shown below. Each shell has radius $2 - x$ and height x^3, so the volume of the solid is

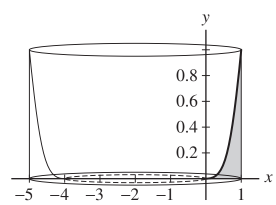
$$2\pi \int_0^1 (2-x)\left(x^3\right) dx = 2\pi \int_0^1 (2x^3 - x^4)\, dx = 2\pi \left(\frac{x^4}{2} - \frac{x^5}{5}\right)\Big|_0^1 = \frac{3\pi}{5}.$$



16. $f(x) = x^3$, $[0, 1]$, about $x = -2$

SOLUTION A sketch of the solid is shown below. Each shell has radius $x - (-2) = x + 2$ and height x^3, so the volume of the solid is

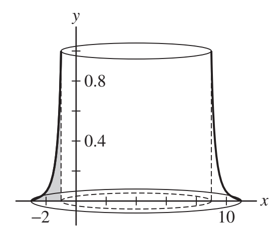
$$2\pi \int_0^1 (2+x)\left(x^3\right) dx = 2\pi \int_0^1 (2x^3 + x^4)\, dx = 2\pi \left(\frac{x^4}{2} + \frac{x^5}{5}\right)\Big|_0^1 = \frac{7\pi}{5}.$$



17. $f(x) = x^{-4}$, $[-3, -1]$, about $x = 4$

SOLUTION A sketch of the solid is shown below. Each shell has radius $4 - x$ and height x^{-4}, so the volume of the solid is

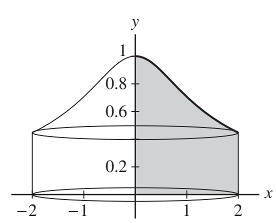
$$2\pi \int_{-3}^{-1} (4-x)\left(x^{-4}\right) dx = 2\pi \int_{-3}^{-1} (4x^{-4} - x^{-3})\, dx = 2\pi \left(\frac{1}{2}x^{-2} - \frac{4}{3}x^{-3}\right)\Big|_{-3}^{-1} = \frac{280\pi}{81}.$$



18. $f(x) = \dfrac{1}{\sqrt{x^2+1}}$, $[0, 2]$, about $x = 0$

SOLUTION A sketch of the solid is shown below. Each shell has radius x and height $\dfrac{1}{\sqrt{x^2+1}}$, so the volume of the solid is

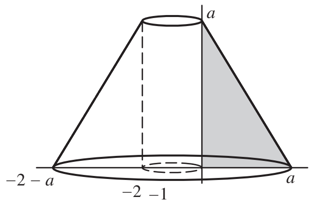
$$2\pi \int_0^2 x\left(\frac{1}{\sqrt{x^2+1}}\right) dx = 2\pi\left(\sqrt{x^2+1}\right)\Big|_0^2 = 2\pi(\sqrt{5} - 1).$$



19. $f(x) = a - x$ with $a > 0$, $[0, a]$, about $x = -1$

SOLUTION A sketch of the solid is shown below. Each shell has radius $x - (-1) = x + 1$ and height $a - x$, so the volume of the solid is

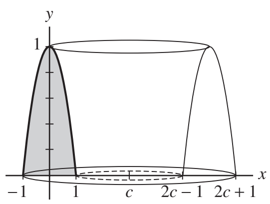
$$\begin{aligned} 2\pi \int_0^a (x+1)(a-x)\,dx &= 2\pi \int_0^a \left(a + (a-1)x - x^2\right) dx \\ &= 2\pi \left(ax + \frac{a-1}{2}x^2 - \frac{1}{3}x^3\right)\Big|_0^a \\ &= 2\pi \left(a^2 + \frac{a^2(a-1)}{2} - \frac{a^3}{3}\right) = \frac{a^2(a+3)}{3}\pi. \end{aligned}$$



20. $f(x) = 1 - x^2$, $[-1, 1]$, $x = c$ with $c > 1$

SOLUTION A sketch of the solid is shown below. Each shell has radius $c - x$ and height $1 - x^2$, so the volume of the solid is

$$2\pi \int_{-1}^1 (c-x)\left(1-x^2\right) dx = 2\pi \int_{-1}^1 \left(x^3 - cx^2 - x + c\right) dx = 2\pi \left(\frac{1}{4}x^4 - \frac{c}{3}x^3 - \frac{1}{2}x^2 + cx\right)\Big|_{-1}^1 = \frac{8c\pi}{3}.$$

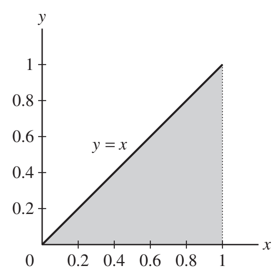


In Exercises 21–26, sketch the enclosed region and use the Shell Method to calculate the volume of rotation about the x-axis.

21. $x = y$, $y = 0$, $x = 1$

SOLUTION When the region shown below is rotated about the x-axis, each shell has radius y and height $1 - y$. The volume of the resulting solid is

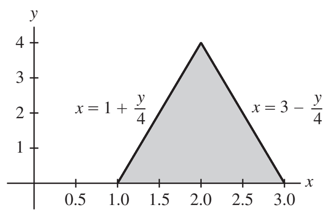
$$2\pi \int_0^1 y(1-y)\,dy = 2\pi \int_0^1 (y - y^2)\,dy = 2\pi \left(\frac{1}{2}y^2 - \frac{1}{3}y^3\right)\Big|_0^1 = \frac{\pi}{3}.$$



22. $x = \frac{1}{4}y + 1$, $x = 3 - \frac{1}{4}y$, $y = 0$

SOLUTION When the region shown below is rotated about the x-axis, each shell has radius y and height $2 - \frac{1}{2}y$. The volume of the resulting solid is

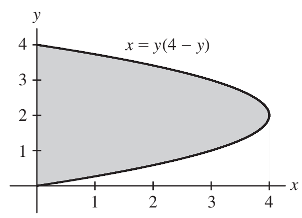
$$2\pi \int_0^4 y\left(2 - \frac{1}{2}y\right) dy = 2\pi \int_0^4 \left(2y - \frac{1}{2}y^2\right) dy = 2\pi \left(y^2 - \frac{1}{6}y^3\right)\Big|_0^4 = \frac{32\pi}{3}.$$



23. $x = y(4 - y), \quad y = 0$

SOLUTION When the region shown below is rotated about the x-axis, each shell has radius y and height $y(4 - y)$. The volume of the resulting solid is

$$2\pi \int_0^4 y^2(4 - y)\,dy = 2\pi \int_0^4 (4y^2 - y^3)\,dy = 2\pi \left(\frac{4}{3}y^3 - \frac{1}{4}y^4\right)\Big|_0^4 = \frac{128\pi}{3}.$$



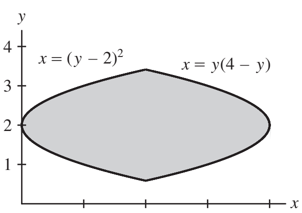
24. $x = y(4 - y), \quad x = (y - 2)^2$

SOLUTION Setting $y(4 - y) = (y - 2)^2$ yields

$$y^2 - 4y + 2 = 0 \quad \text{or} \quad y = 2 \pm \sqrt{2}.$$

When the region shown below is rotated about the x-axis, each shell has radius y and height $-2y^2 + 8y - 4$. The volume of the resulting solid is

$$2\pi \int_{2-\sqrt{2}}^{2+\sqrt{2}} y(-2y^2 + 8y - 4)\,dy = 2\pi \int_{2-\sqrt{2}}^{2+\sqrt{2}} (-2y^3 + 8y^2 - 4y)\,dy = 2\pi \left(-\frac{1}{2}y^4 + \frac{8}{3}y^3 - 2y^2\right)\Big|_{2-\sqrt{2}}^{2+\sqrt{2}} = \frac{64\pi\sqrt{2}}{3}.$$



25. $y = 4 - x^2, \quad x = 0, \quad y = 0$

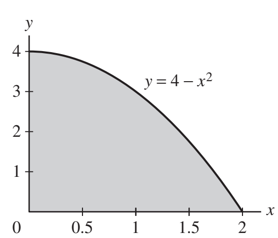
SOLUTION When the region shown below is rotated about the x-axis, each shell has radius y and height $\sqrt{4 - y}$. The volume of the resulting solid is

$$2\pi \int_0^4 y\sqrt{4 - y}\,dy.$$

Let $u = 4 - y$. Then $du = -dy$, $y = 4 - u$, and

$$2\pi \int_0^4 y\sqrt{4 - y}\,dy = -2\pi \int_4^0 (4 - u)\sqrt{u}\,du = 2\pi \int_0^4 \left(4\sqrt{u} - u^{3/2}\right)\,du$$

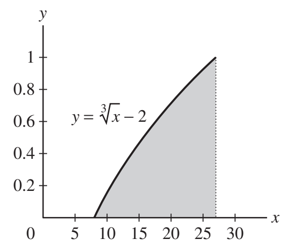
$$= 2\pi \left(\frac{8}{3}u^{3/2} - \frac{2}{5}u^{5/2}\right)\Big|_0^4 = \frac{256\pi}{15}.$$



26. $y = x^{1/3} - 2, \quad y = 0, \quad x = 27$

SOLUTION When the region shown below is rotated about the x-axis, each shell has radius y and height $27 - (y+2)^3$. The volume of the resulting solid is

$$2\pi \int_0^1 y \cdot \left(27 - (y+2)^3\right) dy = 2\pi \int_0^1 \left(19y - 12y^2 - 6y^3 - y^4\right) dy$$
$$= 2\pi \left(\frac{19}{2}y^2 - 4y^3 - \frac{3}{2}y^4 - \frac{1}{5}y^5\right)\Big|_0^1 = \frac{38\pi}{5}.$$



27. Use both the Shell and Disk Methods to calculate the volume obtained by rotating the region under the graph of $f(x) = 8 - x^3$ for $0 \le x \le 2$ about:

(a) the x-axis

(b) the y-axis

SOLUTION

(a) x-axis: Using the disk method, the cross sections are disks with radius $R = 8 - x^3$; hence the volume of the solid is

$$\pi \int_0^2 (8 - x^3)^2\, dx = \pi \left(64x - 4x^4 + \frac{1}{7}x^7\right)\Big|_0^2 = \frac{576\pi}{7}.$$

With the shell method, each shell has radius y and height $(8-y)^{1/3}$. The volume of the solid is

$$2\pi \int_0^8 y\,(8-y)^{1/3}\, dy$$

Let $u = 8 - y$. Then $dy = -du$, $y = 8 - u$ and

$$2\pi \int_0^8 y\,(8-y)^{1/3}\, dy = 2\pi \int_0^8 (8-u) \cdot u^{1/3}\, du = 2\pi \int_0^8 (8u^{1/3} - u^{4/3})\, du$$
$$= 2\pi \left(6u^{4/3} - \frac{3}{7}u^{7/3}\right)\Big|_0^8 = \frac{576\pi}{7}.$$

(b) y-axis: With the shell method, each shell has radius x and height $8 - x^3$. The volume of the solid is

$$2\pi \int_0^2 x(8 - x^3)\, dx = 2\pi \left(4x^2 - \frac{1}{5}x^5\right)\Big|_0^2 = \frac{96\pi}{5}.$$

Using the disk method, the cross sections are disks with radius $R = (8-y)^{1/3}$. The volume is then given by

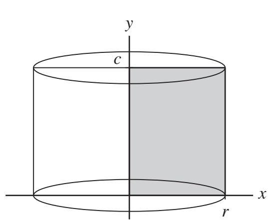
$$\pi \int_0^8 (8-y)^{2/3}\, dy = -\frac{3\pi}{5}(8-y)^{5/3}\Big|_0^8 = \frac{96\pi}{5}.$$

28. Sketch the solid of rotation about the y-axis for the region under the graph of the constant function $f(x) = c$ (where $c > 0$) for $0 \le x \le r$.

(a) Find the volume without using integration.

(b) Use the Shell Method to compute the volume.

SOLUTION



(a) The solid is simply a cylinder with height c and radius r. The volume is given by $\pi r^2 c$.
(b) Each shell has radius x and height c, so the volume is

$$2\pi \int_0^r cx\,dx = 2\pi \left(c\frac{1}{2}x^2 \right)\Big|_0^r = \pi r^2 c.$$

29. The graph in Figure 11(A) can be described by both $y = f(x)$ and $x = h(y)$, where h is the inverse of f. Let V be the volume obtained by rotating the region under the graph about the y-axis.
(a) Describe the figures generated by rotating segments $\overline{AB}$ and $\overline{CB}$ about the y-axis.
(b) Set up integrals that compute V by the Shell and Disk Methods.

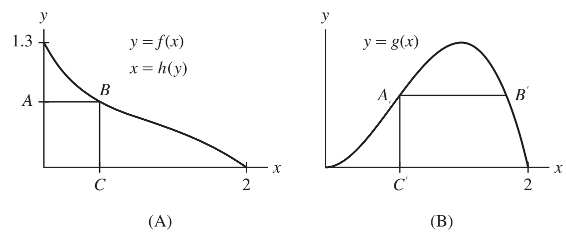


FIGURE 11

SOLUTION

(a) When rotated about the y-axis, the segment $\overline{AB}$ generates a disk with radius $R = h(y)$ and the segment $\overline{CB}$ generates a shell with radius x and height $f(x)$.
(b) Based on Figure 11(A) and the information from part (a), when using the Shell Method,

$$V = 2\pi \int_0^2 xf(x)\,dx;$$

when using the Disk Method,

$$V = \pi \int_0^{1.3} (h(y))^2\,dy.$$

30. Let W be the volume of the solid obtained by rotating the region under the graph in Figure 11(B) about the y-axis.
(a) Describe the figures generated by rotating segments $\overline{A'B'}$ and $\overline{A'C'}$ about the y-axis.
(b) Set up an integral that computes W by the Shell Method.
(c) Explain the difficulty in computing W by the Washer Method.

SOLUTION

(a) When rotated about the y-axis, the segment $\overline{A'B'}$ generates a washer and the segment $\overline{C'A'}$ generates a shell with radius x and height $g(x)$.
(b) Using Figure 11(B) and the information from part (a),

$$W = 2\pi \int_0^2 xg(x)\,dx.$$

(c) The function $g(x)$ is not one-to-one, which makes it difficult to determine the inner and outer radius of each washer.

31. Let R be the region under the graph of $y = 9 - x^2$ for $0 \le x \le 2$. Use the Shell Method to compute the volume of rotation of R about the x-axis as a sum of two integrals along the y-axis. *Hint:* The shells generated depend on whether $y \in [0, 5]$ or $y \in [5, 9]$.

SOLUTION The region R is sketched below. When rotating this region about the x-axis, we produce a solid with two different shell structures. For $0 \le y \le 5$, the shell has radius y and height 2; for $5 \le y \le 9$, the shell has radius y and height $\sqrt{9 - y}$. The volume of the solid is therefore

$$V = 2\pi \int_0^5 2y\,dy + 2\pi \int_5^9 y\sqrt{9 - y}\,dy$$

For the first integral, we calculate

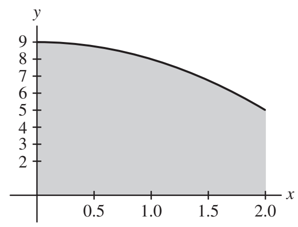
$$2\pi \int_0^5 2y\,dy = 2\pi y^2 \Big|_0^5 = 50\pi.$$

For the second integral, we make the substitution $u = 9 - y$, $du = -dy$ and find

$$\begin{aligned} 2\pi \int_5^9 y\sqrt{9-y}\,dy &= -2\pi \int_4^0 (9-u)\sqrt{u}\,du \\ &= 2\pi \int_0^4 (9u^{1/2} - u^{3/2})\,du \\ &= 2\pi \left(6u^{3/2} - \frac{2}{5}u^{5/2}\right)\Big|_0^4 \\ &= 2\pi \left(48 - \frac{64}{5}\right) = \frac{352\pi}{5}. \end{aligned}$$

Thus, the total volume is

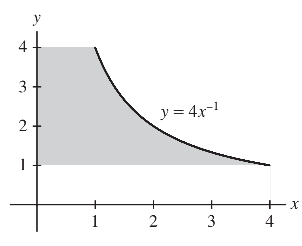
$$V = 50\pi + \frac{352\pi}{5} = \frac{602\pi}{5}.$$



32. Let R be the region under the graph of $y = 4x^{-1}$ for $1 \le y \le 4$. Use the Shell Method to compute the volume of rotation of R about the y-axis as a sum of two integrals along the x-axis.

SOLUTION The region R is sketched below. When rotating this region about the y-axis, we produce a solid with two different shell structures. For $0 \le x \le 1$, the shell has radius x and height 3; for $1 \le x \le 4$, the shell has radius x and height $4x^{-1} - 1$. The volume of the solid is therefore

$$\begin{aligned} V &= 2\pi \int_0^1 3x\,dx + 2\pi \int_1^4 x(4x^{-1} - 1)\,dx \\ &= 2\pi \int_0^1 3x\,dx + 2\pi \int_1^4 (4 - x)\,dx \\ &= 2\pi\, \frac{3}{2}x^2\Big|_0^1 + 2\pi \left(4x - \frac{1}{2}x^2\right)\Big|_1^4 \\ &= 3\pi + 2\pi\left(8 - \frac{7}{2}\right) = 12\pi. \end{aligned}$$



In Exercises 33–38, use the Shell Method to find the volume obtained by rotating region A in Figure 12 about the given axis.

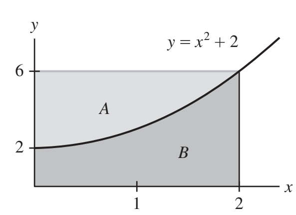


FIGURE 12

33. y-axis

SOLUTION When rotating region A about the y-axis, each shell has radius x and height $6-(x^2+2)=4-x^2$. The volume of the resulting solid is

$$2\pi\int_0^2 x(4-x^2)\,dx = 2\pi\int_0^2 (4x-x^3)\,dx = 2\pi\left(2x^2-\frac{1}{4}x^4\right)\Big|_0^2 = 8\pi.$$

34. $x=-3$

SOLUTION When rotating region A about $x=-3$, each shell has radius $x-(-3)=x+3$ and height $6-(x^2+2)=4-x^2$. The volume of the resulting solid is

$$2\pi\int_0^2 (x+3)(4-x^2)\,dx = 2\pi\int_0^2 (4x-x^3+12-3x^2)\,dx = 2\pi\left(2x^2-\frac{1}{4}x^4+12x-x^3\right)\Big|_0^2 = 40\pi.$$

35. $x=2$

SOLUTION When rotating region A about $x=2$, each shell has radius $2-x$ and height $6-(x^2+2)=4-x^2$. The volume of the resulting solid is

$$2\pi\int_0^2 (2-x)\left(4-x^2\right)\,dx = 2\pi\int_0^2 \left(8-2x^2-4x+x^3\right)\,dx = 2\pi\left(8x-\frac{2}{3}x^3-2x^2+\frac{1}{4}x^4\right)\Big|_0^2 = \frac{40\pi}{3}.$$

36. x-axis

SOLUTION When rotating region A about the x-axis, each shell has radius y and height $\sqrt{y-2}$. The volume of the resulting solid is

$$2\pi\int_2^6 y\sqrt{y-2}\,dy$$

Let $u=y-2$. Then $du=dy$, $y=u+2$ and

$$2\pi\int_2^6 y\sqrt{y-2}\,dy = 2\pi\int_0^4 (u+2)\sqrt{u}\,du = 2\pi\left(\frac{2}{5}u^{5/2}+\frac{4}{3}u^{3/2}\right)\Big|_0^4 = \frac{704\pi}{15}.$$

37. $y=-2$

SOLUTION When rotating region A about $y=-2$, each shell has radius $y-(-2)=y+2$ and height $\sqrt{y-2}$. The volume of the resulting solid is

$$2\pi\int_2^6 (y+2)\sqrt{y-2}\,dy$$

Let $u=y-2$. Then $du=dy$, $y+2=u+4$ and

$$2\pi\int_2^6 (y+2)\sqrt{y-2}\,dy = 2\pi\int_0^4 (u+4)\sqrt{u}\,du = 2\pi\left(\frac{2}{5}u^{5/2}+\frac{8}{3}u^{3/2}\right)\Big|_0^4 = \frac{1024\pi}{15}.$$

38. $y=6$

SOLUTION When rotating region A about $y=6$, each shell has radius $6-y$ and height $\sqrt{y-2}$. The volume of the resulting solid is

$$2\pi\int_2^6 (6-y)\sqrt{y-2}\,dy$$

Let $u=y-2$. Then $du=dy$, $6-y=4-u$ and

$$2\pi\int_2^6 (6-y)\sqrt{y-2}\,dy = 2\pi\int_0^4 (4-u)\sqrt{u}\,du = 2\pi\left(\frac{8}{3}u^{3/2}-\frac{2}{5}u^{5/2}\right)\Big|_0^4 = \frac{256\pi}{15}.$$

In Exercises 39–44, use the most convenient method (Disk or Shell Method) to find the volume obtained by rotating region B in Figure 12 about the given axis.

39. y-axis

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is parallel to the axis of rotation, we will use the Shell Method. Each shell has radius x and height $x^2 + 2$. The volume of the resulting solid is

$$2\pi \int_0^2 x(x^2+2)\,dx = 2\pi \int_0^2 (x^3+2x)\,dx = 2\pi \left(\frac{1}{4}x^4 + x^2\right)\Big|_0^2 = 16\pi.$$

40. $x = -3$

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is parallel to the axis of rotation, we will use the Shell Method. Each shell has radius $x - (-3) = x + 3$ and height $x^2 + 2$. The volume of the resulting solid is

$$2\pi \int_0^2 (x+3)(x^2+2)\,dx = 2\pi \int_0^2 (x^3+3x^2+2x+6)\,dx = 2\pi \left(\frac{1}{4}x^4 + x^3 + x^2 + 6x\right)\Big|_0^2 = 56\pi.$$

41. $x = 2$

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is parallel to the axis of rotation, we will use the Shell Method. Each shell has radius $2 - x$ and height $x^2 + 2$. The volume of the resulting solid is

$$2\pi \int_0^2 (2-x)\left(x^2+2\right)\,dx = 2\pi \int_0^2 \left(2x^2 - x^3 + 4 - 2x\right)\,dx = 2\pi \left(\frac{2}{3}x^3 - \frac{1}{4}x^4 + 4x - x^2\right)\Big|_0^2 = \frac{32\pi}{3}.$$

42. x-axis

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is perpendicular to the axis of rotation, we will use the Disk Method. Each disk has outer radius $R = x^2 + 2$ and inner radius $r = 0$. The volume of the solid is then

$$\begin{aligned}\pi \int_0^2 (x^2+2)^2\,dx &= \pi \int_0^2 (x^4+4x^2+4)\,dx \\ &= \pi \left(\frac{1}{5}x^5 + \frac{4}{3}x^3 + 4x\right)\Big|_0^2 \\ &= \pi\left(\frac{32}{5} + \frac{32}{3} + 8\right) = \frac{376\pi}{15}.\end{aligned}$$

43. $y = -2$

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is perpendicular to the axis of rotation, we will use the Disk Method. Each disk has outer radius $R = x^2 + 2 - (-2) = x^2 + 4$ and inner radius $r = 0 - (-2) = 2$. The volume of the solid is then

$$\begin{aligned}\pi \int_0^2 \left((x^2+4)^2 - 2^2\right)\,dx &= \pi \int_0^2 (x^4+8x^2+12)\,dx \\ &= \pi \left(\frac{1}{5}x^5 + \frac{8}{3}x^3 + 12x\right)\Big|_0^2 \\ &= \pi\left(\frac{32}{5} + \frac{64}{3} + 24\right) = \frac{776\pi}{15}.\end{aligned}$$

44. $y = 8$

SOLUTION Because a vertical slice of region B will produce a solid with a single cross section while a horizontal slice will produce a solid with two different cross sections, we will use a vertical slice. Now, because a vertical slice is perpendicular to the axis of rotation, we will use the Disk Method. Each disk has outer radius $R = 8 - 0 = 8$ and inner radius $r = 8 - (x^2 + 2) = 6 - x^2$. The volume of the solid is then

$$\pi \int_0^2 \left(8^2 - (6-x^2)^2\right) dx = \pi \int_0^2 (28 + 12x^2 - x^4)\, dx$$
$$= \pi \left(28x + 4x^3 - \frac{1}{5}x^5\right)\Big|_0^2$$
$$= \pi \left(56 + 32 - \frac{32}{5}\right) = \frac{408\pi}{5}.$$

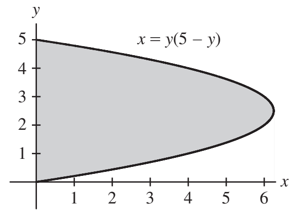
In Exercises 45–50, use the most convenient method (Disk or Shell Method) to find the given volume of rotation.

45. Region between $x = y(5-y)$ and $x = 0$, rotated about the y-axis

SOLUTION Examine the figure below, which shows the region bounded by $x = y(5-y)$ and $x = 0$. If the indicated region is sliced vertically, then the top of the slice lies along one branch of the parabola $x = y(5-y)$ and the bottom lies along the other branch. On the other hand, if the region is sliced horizontally, then the right endpoint of the slice always lies along the parabola and left endpoint always lies along the y-axis. Clearly, it will be easier to slice the region horizontally.

Now, suppose the region is rotated about the y-axis. Because a horizontal slice is perpendicular to the y-axis, we will calculate the volume of the resulting solid using the disk method. Each cross section is a disk of radius $R = y(5-y)$, so the volume is

$$\pi \int_0^5 y^2(5-y)^2\, dy = \pi \int_0^5 (25y^2 - 10y^3 + y^4)\, dy = \pi \left(\frac{25}{3}y^3 - \frac{5}{2}y^4 + \frac{1}{5}y^5\right)\Big|_0^5 = \frac{625\pi}{6}.$$



46. Region between $x = y(5-y)$ and $x = 0$, rotated about the x-axis

SOLUTION Examine the figure from the previous exercise, which shows the region bounded by $x = y(5-y)$ and $x = 0$. If the indicated region is sliced vertically, then the top of the slice lies along one branch of the parabola $x = y(5-y)$ and the bottom lies along the other branch. On the other hand, if the region is sliced horizontally, then the right endpoint of the slice always lies along the parabola and left endpoint always lies along the y-axis. Clearly, it will be easier to slice the region horizontally.

Now, suppose the region is rotated about the x-axis. Because a horizontal slice is parallel to the x-axis, we will calculate the volume of the resulting solid using the shell method. Each shell has a radius of y and a height of $y(5-y)$, so the volume is

$$2\pi \int_0^5 y^2(5-y)\, dy = 2\pi \int_0^5 (5y^2 - y^3)\, dy = 2\pi \left(\frac{5}{3}y^3 - \frac{1}{4}y^4\right)\Big|_0^5 = \frac{625\pi}{6}.$$

47. Region in Figure 13, rotated about the x-axis

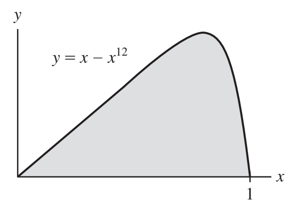


FIGURE 13

SOLUTION Examine Figure 13. If the indicated region is sliced vertically, then the top of the slice lies along the curve $y = x - x^{12}$ and the bottom lies along the curve $y = 0$ (the x-axis). On the other hand, if the region is sliced horizontally, the equation $y = x - x^{12}$ must be solved for x in order to determine the endpoint locations. Clearly, it will be easier to slice the region vertically.

Now, suppose the region in Figure 13 is rotated about the x-axis. Because a vertical slice is perpendicular to the x-axis, we will calculate the volume of the resulting solid using the disk method. Each cross section is a disk of radius $R = x - x^{12}$, so the volume is

$$\pi \int_0^1 \left(x - x^{12}\right)^2 dx = \pi \left(\frac{1}{3}x^3 - \frac{1}{7}x^{14} + \frac{1}{25}x^{25}\right)\Big|_0^1 = \frac{121\pi}{525}.$$

48. Region in Figure 13, rotated about the y-axis

SOLUTION Examine Figure 13. If the indicated region is sliced vertically, then the top of the slice lies along the curve $y = x - x^{12}$ and the bottom lies along the curve $y = 0$ (the x-axis). On the other hand, if the region is sliced horizontally, the equation $y = x - x^{12}$ must be solved for x in order to determine the endpoint locations. Clearly, it will be easier to slice the region vertically.

Now suppose the region is rotated about the y-axis. Because a vertical slice is parallel to the y-axis, we will calculate the volume of the resulting solid using the shell method. Each shell has radius x and height $x - x^{12}$, so the volume is

$$2\pi \int_0^1 x(x - x^{12})\,dx = 2\pi \left(\frac{1}{3}x^3 - \frac{1}{14}x^{14}\right)\Big|_0^1 = \frac{11\pi}{21}.$$

49. Region in Figure 14, rotated about $x = 4$

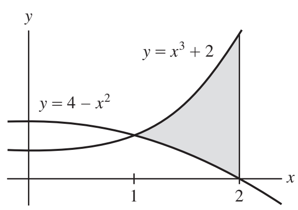

FIGURE 14

SOLUTION Examine Figure 14. If the indicated region is sliced vertically, then the top of the slice lies along the curve $y = x^3 + 2$ and the bottom lies along the curve $y = 4 - x^2$. On the other hand, the left end of a horizontal slice switches from $y = 4 - x^2$ to $y = x^3 + 2$ at $y = 3$. Here, vertical slices will be more convenient.

Now, suppose the region in Figure 14 is rotated about $x = 4$. Because a vertical slice is parallel to $x = 4$, we will calculate the volume of the resulting solid using the shell method. Each shell has radius $4 - x$ and height $x^3 + 2 - (4 - x^2) = x^3 + x^2 - 2$, so the volume is

$$2\pi \int_1^2 (4 - x)(x^3 + x^2 - 2)\,dx = 2\pi \left(-\frac{1}{5}x^5 + \frac{3}{4}x^4 + \frac{4}{3}x^3 + x^2 - 8x\right)\Big|_1^2 = \frac{563\pi}{30}.$$

50. Region in Figure 14, rotated about $y = -2$

SOLUTION Examine Figure 14. If the indicated region is sliced vertically, then the top of the slice lies along the curve $y = x^3 + 2$ and the bottom lies along the curve $y = 4 - x^2$. On the other hand, the left end of a horizontal slice switches from $y = 4 - x^2$ to $y = x^3 + 2$ at $y = 3$. Here, vertical slices will be more convenient.

Now suppose the region is rotated about $y = -2$. Because a vertical slice is perpendicular to $y = -2$, we will calculate the volume of the resulting solid using the disk method. Each cross section is a washer with outer radius $R = x^3 + 2 - (-2) = x^3 + 4$ and inner radius $r = 4 - x^2 - (-2) = 6 - x^2$, so the volume is

$$\pi \int_1^2 \left((x^3 + 4)^2 - (6 - x^2)^2\right)\,dx = \pi \left(\frac{1}{7}x^7 - \frac{1}{5}x^5 + 2x^4 + 4x^3 - 20x\right)\Big|_1^2 = \frac{1748\pi}{35}.$$

In Exercises 51–54, use the Shell Method to find the given volume of rotation.

51. A sphere of radius r

SOLUTION A sphere of radius r can be generated by rotating the region under the semicircle $y = \sqrt{r^2 - x^2}$ about the x-axis. Each shell has radius y and height

$$\sqrt{r^2 - y^2} - \left(-\sqrt{r^2 - y^2}\right) = 2\sqrt{r^2 - y^2}.$$

Thus, the volume of the sphere is

$$2\pi \int_0^r 2y\sqrt{r^2 - y^2}\,dy.$$

Let $u = r^2 - y^2$. Then $du = -2y\,dy$ and

$$2\pi \int_0^r 2y\sqrt{r^2 - y^2}\,dy = 2\pi \int_0^{r^2} \sqrt{u}\,du = 2\pi \left(\frac{2}{3}u^{3/2}\right)\Big|_0^{r^2} = \frac{4}{3}\pi r^3.$$

52. The "bead" formed by removing a cylinder of radius r from the center of a sphere of radius R (compare with Exercise 59 in Section 6.3)

SOLUTION Each shell has radius x and height $2\sqrt{R^2-x^2}$. The volume of the bead is then

$$2\pi \int_r^R 2x\sqrt{R^2-x^2}\,dx.$$

Let $u = R^2 - x^2$. Then $du = -2x\,dx$ and

$$2\pi \int_r^R 2x\sqrt{R^2-x^2}\,dx = 2\pi \int_0^{R^2-r^2} \sqrt{u}\,du = 2\pi \left(\frac{2}{3}u^{3/2}\right)\Big|_0^{R^2-r^2} = \frac{4}{3}\pi(R^2-r^2)^{3/2}.$$

53. The torus obtained by rotating the circle $(x-a)^2+y^2=b^2$ about the y-axis, where $a>b$ (compare with Exercise 53 in Section 5.3). *Hint:* Evaluate the integral by interpreting part of it as the area of a circle.

SOLUTION When rotating the region enclosed by the circle $(x-a)^2+y^2=b^2$ about the y-axis each shell has radius x and height

$$\sqrt{b^2-(x-a)^2} - \left(-\sqrt{b^2-(x-a)^2}\right) = 2\sqrt{b^2-(x-a)^2}.$$

The volume of the resulting torus is then

$$2\pi \int_{a-b}^{a+b} 2x\sqrt{b^2-(x-a)^2}\,dx.$$

Let $u = x - a$. Then $du = dx$, $x = u + a$ and

$$\begin{aligned} 2\pi \int_{a-b}^{a+b} 2x\sqrt{b^2-(x-a)^2}\,dx &= 2\pi \int_{-b}^{b} 2(u+a)\sqrt{b^2-u^2}\,du \\ &= 4\pi \int_{-b}^{b} u\sqrt{b^2-u^2}\,du + 4a\pi \int_{-b}^{b} \sqrt{b^2-u^2}\,du. \end{aligned}$$

Now,

$$\int_{-b}^{b} u\sqrt{b^2-u^2}\,du = 0$$

because the integrand is an odd function and the integration interval is symmetric with respect to zero. Moreover, the other integral is one-half the area of a circle of radius b; thus,

$$\int_{-b}^{b} \sqrt{b^2-u^2}\,du = \frac{1}{2}\pi b^2.$$

Finally, the volume of the torus is

$$4\pi(0) + 4a\pi\left(\frac{1}{2}\pi b^2\right) = 2\pi^2 ab^2.$$

54. The "paraboloid" obtained by rotating the region between $y = x^2$ and $y = c$ ($c > 0$) about the y-axis

SOLUTION When we rotate the region in the first quadrant bounded by $y = x^2$ and $y = c$ about the y-axis, each shell has a radius of x and a height of $c - x^2$. The volume of the paraboloid is then

$$2\pi \int_0^{\sqrt{c}} x(c-x^2)\,dx = 2\pi \int_0^{\sqrt{c}} (cx - x^3)\,dx = 2\pi \left(\frac{1}{2}cx^2 - \frac{1}{4}x^4\right)\Big|_0^{\sqrt{c}} = \frac{1}{2}\pi c^2.$$

Further Insights and Challenges

55. The surface area of a sphere of radius r is $4\pi r^2$. Use this to derive the formula for the volume V of a sphere of radius R in a new way.

(a) Show that the volume of a thin spherical shell of inner radius r and thickness Δr is approximately $4\pi r^2 \Delta r$.

(b) Approximate V by decomposing the sphere of radius R into N thin spherical shells of thickness $\Delta r = R/N$.

(c) Show that the approximation is a Riemann sum that converges to an integral. Evaluate the integral.

SOLUTION

(a) The volume of a thin spherical shell of inner radius r and thickness Δx is given by the product of the surface area of the shell, $4\pi r^2$ and the thickness. Thus, we have $4\pi r^2 \Delta x$.

(b) The volume of the sphere is approximated by

$$R_N = 4\pi \left(\frac{R}{N}\right) \sum_{k=1}^{N} (x_k)^2$$

where $x_k = k\frac{R}{N}$.

(c) $V = 4\pi \lim_{N\to\infty} \left(\frac{R}{N}\right) \sum_{k=1}^{N} (x_k)^2 = 4\pi \int_0^R x^2\,dx = 4\pi \left(\frac{1}{3}x^3\right)\Big|_0^R = \frac{4}{3}\pi R^3.$

56. Show that the solid (an **ellipsoid**) obtained by rotating the region R in Figure 15 about the y-axis has volume $\frac{4}{3}\pi a^2 b$.

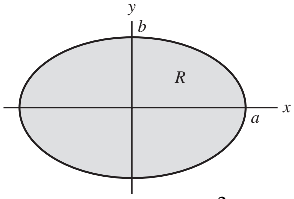

FIGURE 15 The ellipse $\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1$.

SOLUTION Let's slice the portion of the ellipse in the first and fourth quadrants horizontally and rotate the slices about the y-axis. The resulting ellipsoid has cross sections that are disks with radius

$$R = \sqrt{a^2 - \frac{a^2 y^2}{b^2}}.$$

Thus, the volume of the ellipsoid is

$$\pi \int_{-b}^{b} \left(a^2 - \frac{a^2 y^2}{b^2}\right) dy = \pi \left(a^2 y - \frac{a^2 y^3}{3b^2}\right)\Big|_{-b}^{b} = \pi \left[\left(a^2 b - \frac{a^2 b}{3}\right) - \left(-a^2 b + \frac{a^2 b}{3}\right)\right] = \frac{4}{3}\pi a^2 b.$$

57. The bell-shaped curve $y = f(x)$ in Figure 16 satisfies $dy/dx = -xy$. Use the Shell Method and the substitution $u = f(x)$ to show that the solid obtained by rotating the region R about the y-axis has volume $V = 2\pi(1 - c)$, where $c = f(a)$. Observe that as $c \to 0$, the region R becomes infinite but the volume V approaches 2π.

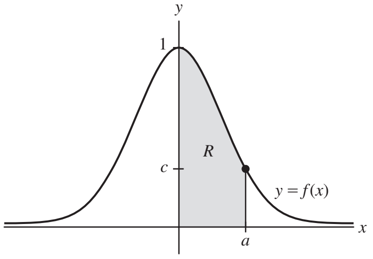

FIGURE 16 The bell-shaped curve.

SOLUTION Let $y = f(x)$ be the exponential function depicted in Figure 16. When rotating the region R about the y-axis, each shell in the resulting solid has radius x and height $f(x)$. The volume of the solid is then

$$V = 2\pi \int_0^a x f(x)\,dx.$$

Now, let $u = f(x)$. Then $du = f'(x)\,dx = -xf(x)\,dx$; hence, $xf(x)dx = -du$, and

$$V = 2\pi \int_1^c (-du) = 2\pi \int_c^1 du = 2\pi(1 - c).$$

6.5 Work and Energy

Preliminary Questions

1. Why is integration needed to compute the work performed in stretching a spring?

SOLUTION Recall that the force needed to extend or compress a spring depends on the amount by which the spring has already been extended or compressed from its equilibrium position. In other words, the force needed to move a spring is variable. Whenever the force is variable, work needs to be computed with an integral.

2. Why is integration needed to compute the work performed in pumping water out of a tank but not to compute the work performed in lifting up the tank?

SOLUTION To lift a tank through a vertical distance d, the force needed to move the tank remains constant; hence, no integral is needed to calculate the work done in lifting the tank. On the other hand, pumping water from a tank requires that different layers of the water be lifted through different distances, and, depending on the shape of the tank, may require different forces. Thus, pumping water from a tank requires that an integral be evaluated.

3. Which of the following represents the work required to stretch a spring (with spring constant k) a distance x beyond its equilibrium position: kx, $-kx$, $\frac{1}{2}mk^2$, $\frac{1}{2}kx^2$, or $\frac{1}{2}mx^2$?

SOLUTION The work required to stretch a spring with spring constant k a distance x beyond its equilibrium position is

$$\int_0^x ky\,dy = \frac{1}{2}ky^2\Big|_0^x = \frac{1}{2}kx^2.$$

Exercises

1. How much work is done raising a 4-kg mass to a height of 16 m above ground?

SOLUTION The force needed to lift a 4-kg object is a constant

$$(4\text{ kg})(9.8\text{ m/s}^2) = 39.2\text{ N}.$$

The work done in lifting the object to a height of 16 m is then

$$(39.2\text{ N})(16\text{ m}) = 627.2\text{ J}.$$

2. How much work is done raising a 4-lb mass to a height of 16 ft above ground?

SOLUTION The force needed to lift a 4-lb object is a constant 4 lb. The work done in lifting the object to a height of 16 ft is then

$$(4\text{ lb})(16\text{ ft}) = 64\text{ ft-lb}.$$

In Exercises 3–6, compute the work (in joules) required to stretch or compress a spring as indicated, assuming a spring constant of $k = 800$ N/m.

3. Stretching from equilibrium to 12 cm past equilibrium

SOLUTION The work required to stretch the spring 12 cm past equilibrium is

$$\int_0^{0.12} 800x\,dx = 400x^2\Big|_0^{0.12} = 5.76\text{ J}.$$

4. Compressing from equilibrium to 4 cm past equilibrium

SOLUTION The work required to compress the spring 4 cm past equilibrium is

$$\int_0^{-0.04} 800x\,dx = 400x^2\Big|_0^{-0.04} = 0.64\text{ J}.$$

5. Stretching from 5 cm to 15 cm past equilibrium

SOLUTION The work required to stretch the spring from 5 cm to 15 cm past equilibrium is

$$\int_{0.05}^{0.15} 800x\,dx = 400x^2\Big|_{0.05}^{0.15} = 8\text{ J}.$$

6. Compressing 4 cm more when it is already compressed 5 cm

SOLUTION The work required to compress the spring from 5 cm to 9 cm past equilibrium is

$$\int_{-0.05}^{-0.09} 800x\,dx = 400x^2\Big|_{-0.05}^{-0.09} = 2.24\text{ J}.$$

7. If 5 J of work are needed to stretch a spring 10 cm beyond equilibrium, how much work is required to stretch it 15 cm beyond equilibrium?

SOLUTION First, we determine the value of the spring constant as follows:

$$\int_0^{0.1} kx\,dx = \frac{1}{2}kx^2\Big|_0^{0.1} = 0.005k = 5\text{ J}.$$

Thus, $k = 1000$ N/m. Next, we calculate the work required to stretch the spring 15 cm beyond equilibrium:

$$\int_0^{0.15} 1000x\,dx = 500x^2\Big|_0^{0.15} = 11.25\text{ J}.$$

8. To create images of samples at the molecular level, atomic force microscopes use silicon micro-cantilevers that obey Hooke's Law $F(x) = -kx$, where x is the distance through which the tip is deflected (Figure 6). Suppose that 10^{-17} J of work are required to deflect the tip a distance 10^{-8} m. Find the deflection if a force of 10^{-9} N is applied to the tip.

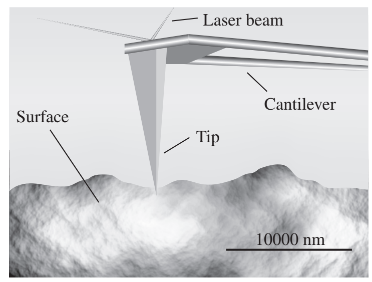

FIGURE 6

SOLUTION First, we determine the value of the constant k. Knowing it takes 10^{-17} J of work to deflect the tip a distance 10^{-8} m, it follows that

$$\frac{1}{2}k(10^{-8})^2 = 10^{-17} \quad \text{or} \quad k = \frac{1}{5}\text{ N/m}.$$

Now, the deflection produced by a force of 10^{-9} N can be determined as

$$x = \frac{F}{k} = \frac{10^{-9}}{1/5} = 5 \times 10^{-9}\text{ m}.$$

9. A spring obeys a force law $F(x) = -kx^{1.1}$ with $k = 100$ N/m. Find the work required to stretch a spring 0.3 m past equilibrium.

SOLUTION The work required to stretch this spring 0.3 m past equilibrium is

$$\int_0^{0.3} 100x^{1.1}\,dx = \frac{100}{1.1}x^{2.1}\Big|_0^{0.3} \approx 7.25\text{ J}.$$

10. Show that the work required to stretch a spring from position a to position b is $\frac{1}{2}k(b^2 - a^2)$, where k is the spring constant. How do you interpret the negative work obtained when $|b| < |a|$?

SOLUTION The work required to stretch a spring from position a to position b is

$$\int_a^b kx\,dx = \frac{1}{2}kx^2\Big|_a^b = \frac{1}{2}k(b^2 - a^2).$$

When $|b| < |a|$, the "negative work" is the work done by the spring to return to its equilibrium position.

In Exercises 11–14, use the method of Examples 2 and 3 to calculate the work against gravity required to build the structure out of a lightweight material of density 600 kg/m^3.

11. Box of height 3 m and square base of side 2 m

SOLUTION The volume of one layer is $4\Delta y$ m^3 and so the weight of one layer is $23520\Delta y$ N. Thus, the work done against gravity to build the tower is

$$W = \int_0^3 23520y\,dy = 11760y^2\Big|_0^3 = 105840\text{ J}.$$

12. Cylindrical column of height 4 m and radius 0.8 m

SOLUTION The area of the base is 0.64π m^2, so the volume of each small layer is $0.64\pi\,\Delta y$ m^3. The weight of one layer is then $3763.2\pi\,\Delta y$ N. Finally, the total work done against gravity to build the tower is

$$\int_0^4 3763.2\pi y\,dy = 30105.6\pi\text{ J} \approx 94579.5\text{ J}.$$

13. Right circular cone of height 4 m and base of radius 1.2 m

SOLUTION By similar triangles, the layer of the cone at a height y above the base has radius $r = 0.3(4 - y)$ meters. Thus, the volume of the small layer at this height is $0.09\pi(4 - y)^2 \Delta y$ m^3, and the weight is $529.2\pi(4 - y)^2 \Delta y$ N. Finally, the total work done against gravity to build the tower is

$$\int_0^4 529.2\pi(4 - y)^2 y\, dy = 11289.6\pi \text{ J} \approx 35467.3 \text{ J}.$$

14. Hemisphere of radius 0.8 m

SOLUTION The area of one layer is $\pi(0.64 - y^2)$ m^2, so the volume of each small layer is $\pi(0.64 - y^2)\Delta y$ m^3. The weight of one layer is then $5880\pi(0.64 - y^2)\Delta y$ N. Finally, the total work done against gravity to build the tower is

$$\int_0^{0.8} 5880\pi(0.64 - y^2) y\, dy = 602.112\pi \text{ J} \approx 1891.6 \text{ J}.$$

15. Built around 2600 BCE, the Great Pyramid of Giza in Egypt (Figure 7) is 146 m high and has a square base of side 230 m. Find the work (against gravity) required to build the pyramid if the density of the stone is estimated at 2000 kg/m^3.

FIGURE 7 The Great Pyramid in Giza, Egypt.

SOLUTION From similar triangles, the area of one layer is

$$\left(230 - \frac{230}{146} y\right)^2 \text{ m}^2,$$

so the volume of each small layer is

$$\left(230 - \frac{230}{146} y\right)^2 \Delta y \text{ m}^3.$$

The weight of one layer is then

$$19600\left(230 - \frac{230}{146} y\right)^2 \Delta y \text{ N}.$$

Finally, the total work needed to build the pyramid was

$$\int_0^{146} 19600\left(230 - \frac{230}{146} y\right)^2 y\, dy \approx 1.84 \times 10^{12} \text{ J}.$$

16. Calculate the work (against gravity) required to build a box of height 3 m and square base of side 2 m out of material of variable density, assuming that the density at height y is $f(y) = 1000 - 100y$ kg/m^3.

SOLUTION The volume of one layer is $4\Delta y$ m^3 and so the weight of one layer is $(4000 - 400y)\Delta y$ N. Thus, the work done against gravity to build the tower is

$$W = \int_0^3 (4000 - 400y) y\, dy = \left(2000y^2 - \frac{400}{3} y^3\right)\Big|_0^3 = 14400 \text{ J}.$$

In Exercises 17–22, calculate the work (in joules) required to pump all of the water out of a full tank. Distances are in meters, and the density of water is 1000 kg/m^3.

17. Rectangular tank in Figure 8; water exits from a small hole at the top.

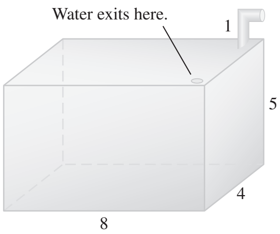

FIGURE 8

SOLUTION Place the origin on the top of the box, and let the positive y-axis point downward. The volume of one layer of water is $32\Delta y$ m^3, so the force needed to lift each layer is

$$(9.8)(1000)32\Delta y = 313600\Delta y \text{ N}.$$

Each layer must be lifted y meters, so the total work needed to empty the tank is

$$\int_0^5 313600y\,dy = 156800y^2\Big|_0^5 = 3.92 \times 10^6 \text{ J}.$$

18. Rectangular tank in Figure 8; water exits through the spout.

SOLUTION Place the origin on the top of the box, and let the positive y-axis point downward. The volume of one layer of water is $32\Delta y$ m^3, so the force needed to lift each layer is

$$(9.8)(1000)32\Delta y = 313600\Delta y \text{ N}.$$

Each layer must be lifted $y + 1$ meters, so the total work needed to empty the tank is

$$\int_0^5 313600(y+1)\,dy = 156800(y+1)^2\Big|_0^5 = 5.488 \times 10^6 \text{ J}.$$

19. Hemisphere in Figure 9; water exits through the spout.

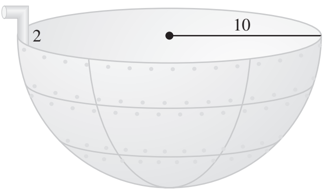

FIGURE 9

SOLUTION Place the origin at the center of the hemisphere, and let the positive y-axis point downward. The radius of a layer of water at depth y is $\sqrt{100 - y^2}$ m, so the volume of the layer is $\pi(100 - y^2)\Delta y$ m^3, and the force needed to lift the layer is $9800\pi(100 - y^2)\Delta y$ N. The layer must be lifted $y + 2$ meters, so the total work needed to empty the tank is

$$\int_0^{10} 9800\pi(100 - y^2)(y+2)\,dy = \frac{112700000\pi}{3} \text{ J} \approx 1.18 \times 10^8 \text{ J}.$$

20. Conical tank in Figure 10; water exits through the spout.

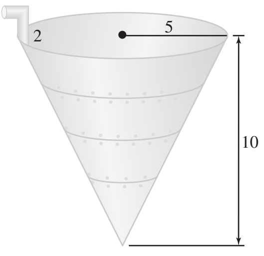

FIGURE 10

SOLUTION Place the origin at the vertex of the inverted cone, and let the positive y-axis point upward. Consider a layer of water at a height of y meters. From similar triangles, the area of the layer is

$$\pi\left(\frac{y}{2}\right)^2 \text{ m}^2,$$

so the volume is

$$\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ m}^3.$$

Thus the weight of one layer is

$$9800\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ N}.$$

The layer must be lifted $12 - y$ meters, so the total work needed to empty the tank is

$$\int_0^{10} 9800\pi\left(\frac{y}{2}\right)^2 (12 - y)\, dy = \pi(3.675 \times 10^6) \text{ J} \approx 1.155 \times 10^7 \text{ J}.$$

21. Horizontal cylinder in Figure 11; water exits from a small hole at the top. *Hint:* Evaluate the integral by interpreting part of it as the area of a circle.

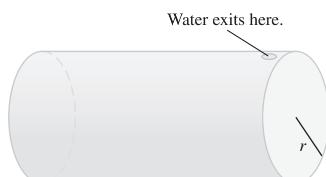

FIGURE 11

SOLUTION Place the origin along the axis of the cylinder. At location y, the layer of water is a rectangular slab of length ℓ, width $2\sqrt{r^2 - y^2}$ and thickness Δy. Thus, the volume of the layer is $2\ell\sqrt{r^2 - y^2}\Delta y$, and the force needed to lift the layer is $19{,}600\ell\sqrt{r^2 - y^2}\Delta y$. The layer must be lifted a distance $r - y$, so the total work needed to empty the tank is given by

$$\int_{-r}^{r} 19{,}600\ell\sqrt{r^2 - y^2}(r - y)\, dy = 19{,}600\ell r\int_{-r}^{r}\sqrt{r^2 - y^2}\, dy - 19{,}600\ell\int_{-r}^{r} y\sqrt{r^2 - y^2}\, dy.$$

Now,

$$\int_{-r}^{r} y\sqrt{r^2 - y^2}\, du = 0$$

because the integrand is an odd function and the integration interval is symmetric with respect to zero. Moreover, the other integral is one-half the area of a circle of radius r; thus,

$$\int_{-r}^{r}\sqrt{r^2 - y^2}\, dy = \frac{1}{2}\pi r^2.$$

Finally, the total work needed to empty the tank is

$$19{,}600\ell r\left(\frac{1}{2}\pi r^2\right) - 19{,}600\ell(0) = 9800\ell\pi r^3 \text{ J}.$$

22. Trough in Figure 12; water exits by pouring over the sides.

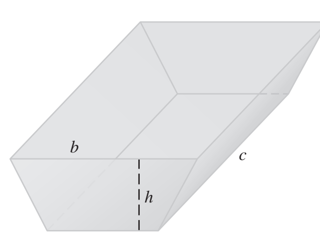

FIGURE 12

SOLUTION Place the origin along the bottom edge of the trough, and let the positive y-axis point upward. From similar triangles, the width of a layer of water at a height of y meters is

$$w = a + \frac{y\,(b-a)}{h}\ \text{m}^2,$$

so the volume of each layer is

$$c\left(a + \frac{y\,(b-a)}{h}\right)\Delta y\ \text{m}^3.$$

Thus, the force needed to lift the layer is

$$9800c\left(a + \frac{y\,(b-a)}{h}\right)\Delta y\ \text{N}.$$

Each layer must be lifted $h - y$ meters, so the total work needed to empty the tank is

$$\int_0^h 9800(h-y)c\left(a + \frac{y\,(b-a)}{h}\right)dy = 9800\,c\left(\frac{ah^2}{3} + \frac{bh^2}{6}\right)\ \text{J}.$$

23. Find the work W required to empty the tank in Figure 8 through the hole at the top if the tank is half full of water.

SOLUTION Place the origin on the top of the box, and let the positive y-axis point downward. Note that with this coordinate system, the bottom half of the box corresponds to y values from 2.5 to 5. The volume of one layer of water is $32\Delta y$ m^3, so the force needed to lift each layer is

$$(9.8)(1000)32\Delta y = 313{,}600\Delta y\ \text{N}.$$

Each layer must be lifted y meters, so the total work needed to empty the tank is

$$\int_{2.5}^5 313{,}600y\,dy = 156{,}800y^2\Big|_{2.5}^5 = 2.94 \times 10^6\ \text{J}.$$

24. Assume the tank in Figure 8 is full of water and let W be the work required to pump out half of the water through the hole at the top. Do you expect W to equal the work computed in Exercise 23? Explain and then compute W.

SOLUTION Recall that the origin was placed at the top of the box with the positive y-axis pointing downward. Pumping out half the water from a full tank would involve y values ranging from $y = 0$ to $y = 2.5$, whereas pumping out a half-full tank would involve y values ranging from $y = 2.5$ to $y = 5$. Because pumping out half the water from a full tank requires moving the layers of water a shorter distance than pumping out a half-full tank, we do not expect that W would be equal to the work computed in Exercise 23.

To compute W, we proceed as in Exercise 17 and Exercise 23, to find

$$W = \int_0^{2.5} 313{,}600y\,dy = 980{,}000\ \text{J}.$$

It is reassuring to note that

$$\text{Work(Exercise 23)} + \text{Work(Exercise 24)} = \text{Work(Exercise 17)}.$$

25. Assume the tank in Figure 10 is full. Find the work required to pump out half of the water. *Hint:* First, determine the level H at which the water remaining in the tank is equal to one-half the total capacity of the tank.

SOLUTION Our first step is to determine the level H at which the water remaining in the tank is equal to one-half the total capacity of the tank. From Figure 10 and similar triangles, we see that the radius of the cone at level H is $H/2$ so the volume of water is

$$V = \frac{1}{3}\pi r^2 H = \frac{1}{3}\pi\left(\frac{H}{2}\right)^2 H = \frac{1}{12}\pi H^3.$$

The total capacity of the tank is $250\pi/3$ m^3, so the water level when the water remaining in the tank is equal to one-half the total capacity of the tank satisfies

$$\frac{1}{12}\pi H^3 = \frac{125}{3}\pi \quad \text{or} \quad H = \frac{10}{2^{1/3}}\ \text{m}.$$

Place the origin at the vertex of the inverted cone, and let the positive y-axis point upward. Now, consider a layer of water at a height of y meters. From similar triangles, the area of the layer is

$$\pi\left(\frac{y}{2}\right)^2\ \text{m}^2,$$

so the volume is

$$\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ m}^3.$$

Thus the weight of one layer is

$$9800\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ N}.$$

The layer must be lifted $12 - y$ meters, so the total work needed to empty the half-full tank is

$$\int_{10/2^{1/3}}^{10} 9800\pi\left(\frac{y}{2}\right)^2 (12 - y)\, dy \approx 3.79 \times 10^6 \text{ J}.$$

26. Assume that the tank in Figure 10 is full.

(a) Calculate the work $F(y)$ required to pump out water until the water level has reached level y.

(b) CAS Plot $F(y)$.

(c) What is the significance of $F'(y)$ as a rate of change?

(d) CAS If your goal is to pump out all of the water, at which water level y_0 will half of the work be done?

SOLUTION

(a) Place the origin at the vertex of the inverted cone, and let the positive y-axis point upward. Consider a layer of water at a height of y meters. From similar triangles, the area of the layer is

$$\pi\left(\frac{y}{2}\right)^2 \text{ m}^2,$$

so the volume is

$$\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ m}^3.$$

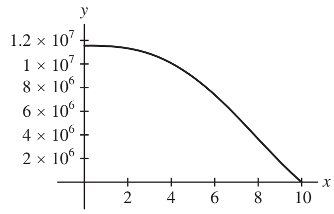
Thus the weight of one layer is

$$9800\pi\left(\frac{y}{2}\right)^2 \Delta y \text{ N}.$$

The layer must be lifted $12 - y$ meters, so the total work needed to pump out water until the water level has reached level y is

$$\int_y^{10} 9800\pi\left(\frac{y}{2}\right)^2 (12 - y)\, dy = 3{,}675{,}000\pi - 9800\pi y^3 + \frac{1225\pi}{2} y^4 \text{ J}.$$

(b) A plot of $F(y)$ is shown below.



(c) First, note that $F'(y) < 0$; as y increases, less water is being pumped from the tank, so $F(y)$ decreases. Therefore, when the water level in the tank has reached level y, we can interpret $-F'(y)$ as the amount of work per meter needed to remove the next layer of water from the tank. In other words, $-F'(y)$ is a "marginal work" function.

(d) The amount of work needed to empty the tank is $3{,}675{,}000\pi$ J. Half of this work will be done when the water level reaches height y_0 satisfying

$$3{,}675{,}000\pi - 9800\pi y_0^3 + \frac{1225\pi}{2} y_0^4 = 1{,}837{,}500\pi.$$

Using a computer algebra system, we find $y_0 = 6.91$ m.

27. Calculate the work required to lift a 10-m chain over the side of a building (Figure 13) Assume that the chain has a density of 8 kg/m. *Hint:* Break up the chain into N segments, estimate the work performed on a segment, and compute the limit as $N \to \infty$ as an integral.

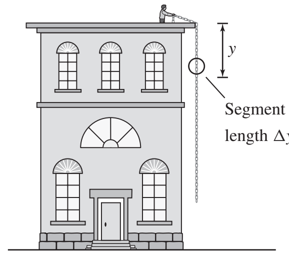


FIGURE 13 The small segment of the chain of length Δy located y meters from the top is lifted through a vertical distance y.

SOLUTION In this example, each part of the chain is lifted a different distance. Therefore, we divide the chain into N small segments of length $\Delta y = 10/N$. Suppose that the ith segment is located a distance y_i from the top of the building. This segment weighs $8(9.8)\Delta y$ kilograms and it must be lifted approximately y_i meters (not exactly y_i meters, because each point along the segment is a slightly different distance from the top). The work W_i done on this segment is approximately $W_i \approx 78.4 y_i \Delta y$ N. The total work W is the sum of the W_i and we have

$$W = \sum_{j=1}^{N} W_i \approx \sum_{j=1}^{N} 78.4 y_j \, \Delta y.$$

Passing to the limit as $N \to \infty$, we obtain

$$W = \int_0^{10} 78.4 \, y \, dy = 39.2 y^2 \Big|_0^{10} = 3920 \text{ J}.$$

28. How much work is done lifting a 3-m chain over the side of a building if the chain has mass density 4 kg/m?

SOLUTION Consider a segment of the chain of length Δy located a distance y_j meters from the top of the building. The work needed to lift this segment of the chain to the top of the building is approximately

$$W_j \approx (4\Delta y)(9.8) y_j \text{ J}.$$

Summing over all segments of the chain and passing to the limit as $\Delta y \to 0$, it follows that the total work is

$$\int_0^3 4 \cdot 9.8 y \, dy = 19.6 y^2 \Big|_0^3 = 176.4 \text{ J}.$$

29. A 6-m chain has mass 18 kg. Find the work required to lift the chain over the side of a building.

SOLUTION First, note that the chain has a mass density of 3 kg/m. Now, consider a segment of the chain of length Δy located a distance y_j feet from the top of the building. The work needed to lift this segment of the chain to the top of the building is approximately

$$W_j \approx (3\Delta y) 9.8 y_j \text{ ft-lb}.$$

Summing over all segments of the chain and passing to the limit as $\Delta y \to 0$, it follows that the total work is

$$\int_0^6 29.4 y \, dy = 14.7 y^2 \Big|_0^6 = 529.2 \text{ J}.$$

30. A 10-m chain with mass density 4 kg/m is initially coiled on the ground. How much work is performed in lifting the chain so that it is fully extended (and one end touches the ground)?

SOLUTION Consider a segment of the chain of length Δy that must be lifted y_j feet off the ground. The work needed to lift this segment of the chain is approximately

$$W_j \approx (4\Delta y) 9.8 y_j \text{ J}.$$

Summing over all segments of the chain and passing to the limit as $\Delta y \to 0$, it follows that the total work is

$$\int_0^{10} 39.2 y \, dy = 19.6 y^2 \Big|_0^{10} = 1960 \text{ J}.$$

31. How much work is done lifting a 12-m chain that has mass density 3 kg/m (initially coiled on the ground) so that its top end is 10 m above the ground?

SOLUTION Consider a segment of the chain of length Δy that must be lifted y_j feet off the ground. The work needed to lift this segment of the chain is approximately

$$W_j \approx (3\Delta y)9.8y_j \text{ J}.$$

Summing over all segments of the chain and passing to the limit as $\Delta y \to 0$, it follows that the total work is

$$\int_0^{10} 29.4y\,dy = 14.7y^2\Big|_0^{10} = 1470 \text{ J}.$$

32. A 500-kg wrecking ball hangs from a 12-m cable of density 15 kg/m attached to a crane. Calculate the work done if the crane lifts the ball from ground level to 12 m in the air by drawing in the cable.

SOLUTION We will treat the cable and the wrecking ball separately. Consider a segment of the cable of length Δy that must be lifted y_j feet. The work needed to lift the cable segment is approximately

$$W_j \approx (15\Delta y)9.8y_j \text{ J}.$$

Summing over all of the segments of the cable and passing to the limit as $\Delta y \to 0$, it follows that lifting the cable requires

$$\int_0^{12} 147y\,dy = 73.5y^2\Big|_0^{12} = 10{,}584 \text{ J}.$$

Lifting the 500 kg wrecking ball 12 meters requires an additional 58,800 J. Thus, the total work is 69,384 J.

33. Calculate the work required to lift a 3-m chain over the side of a building if the chain has variable density of $\rho(x) = x^2 - 3x + 10$ kg/m for $0 \le x \le 3$.

SOLUTION Consider a segment of the chain of length Δx that must be lifted x_j feet. The work needed to lift this segment is approximately

$$W_j \approx \left(\rho(x_j)\Delta x\right) 9.8x_j \text{ J}.$$

Summing over all segments of the chain and passing to the limit as $\Delta x \to 0$, it follows that the total work is

$$\begin{aligned}\int_0^3 9.8\rho(x)x\,dx &= 9.8\int_0^3 \left(x^3 - 3x^2 + 10x\right)dx\\ &= 9.8\left(\frac{1}{4}x^4 - x^3 + 5x^2\right)\Big|_0^3 = 374.85 \text{ J}.\end{aligned}$$

34. A 3-m chain with linear mass density $\rho(x) = 2x(4-x)$ kg/m lies on the ground. Calculate the work required to lift the chain so that its bottom is 2 m above ground.

SOLUTION Consider a segment of the chain of length Δx that must be lifted x_j feet. The work needed to lift this segment is approximately

$$W_j \approx \left(\rho(x_j)\Delta x\right) 9.8x_j \text{ J}.$$

Summing over all segments of the chain and passing to the limit as $\Delta x \to 0$, it follows that the total work needed to fully extend the chain is

$$\begin{aligned}\int_0^3 9.8\rho(x)x\,dx &= 9.8\int_0^3 \left(8x^2 - 2x^3\right)dx\\ &= 9.8\left(\frac{8}{3}x^3 - \frac{1}{2}x^4\right)\Big|_0^3 = 308.7 \text{ J}.\end{aligned}$$

Lifting the entire chain, which weighs

$$\int_0^3 9.8\rho(x)\,dx = 9.8\int_0^3 \left(8x - 2x^2\right)dx = 9.8\left(4x^2 - \frac{2}{3}x^3\right)\Big|_0^3 = 176.4 \text{ N}$$

another two meters requires an additional 352.8 J of work. The total work is therefore 661.5 J.

Exercises 35–37: The gravitational force between two objects of mass m and M, separated by a distance r, has magnitude GMm/r^2*, where* $G = 6.67 \times 10^{-11}\ \mathrm{m^3kg^{-1}s^{-1}}$.

35. Show that if two objects of mass M and m are separated by a distance r_1, then the work required to increase the separation to a distance r_2 is equal to $W = GMm(r_1^{-1} - r_2^{-1})$.

SOLUTION The work required to increase the separation from a distance r_1 to a distance r_2 is

$$\int_{r_1}^{r_2} \frac{GMm}{r^2}\,dr = -\frac{GMm}{r}\bigg|_{r_1}^{r_2} = GMm(r_1^{-1} - r_2^{-1}).$$

36. Use the result of Exercise 35 to calculate the work required to place a 2000-kg satellite in an orbit 1200 km above the surface of the earth. Assume that the earth is a sphere of radius $R_e = 6.37 \times 10^6$ m and mass $M_e = 5.98 \times 10^{24}$ kg. Treat the satellite as a point mass.

SOLUTION The satellite will move from a distance $r_1 = R_e$ to a distance $r_2 = R_e + 1{,}200{,}000$. Thus, from Exercise 35,

$$W = (6.67 \times 10^{-11})(5.98 \times 10^{24})(2000)\left(\frac{1}{6.37 \times 10^6} - \frac{1}{6.37 \times 10^6 + 1{,}200{,}000}\right) \approx 1.99 \times 10^{10}\ \mathrm{J}.$$

37. Use the result of Exercise 35 to compute the work required to move a 1500-kg satellite from an orbit 1000 to an orbit 1500 km above the surface of the earth.

SOLUTION The satellite will move from a distance $r_1 = R_e + 1{,}000{,}000$ to a distance $r_2 = R_e + 1{,}500{,}000$. Thus, from Exercise 35,

$$W = (6.67 \times 10^{-11})(5.98 \times 10^{24})(1500) \times \left(\frac{1}{6.37 \times 10^6 + 1{,}000{,}000} - \frac{1}{6.37 \times 10^6 + 1{,}500{,}000}\right)$$
$$\approx 5.16 \times 10^9\ \mathrm{J}.$$

38. The pressure P and volume V of the gas in a cylinder of length 0.8 meters and radius 0.2 meters, with a movable piston, are related by $PV^{1.4} = k$, where k is a constant (Figure 14). When the piston is fully extended, the gas pressure is 2000 kilopascals (one kilopascal is 10^3 newtons per square meter).

(a) Calculate k.

(b) The force on the piston is PA, where A is the piston's area. Calculate the force as a function of the length x of the column of gas.

(c) Calculate the work required to compress the gas column from 0.8 m to 0.5 m.

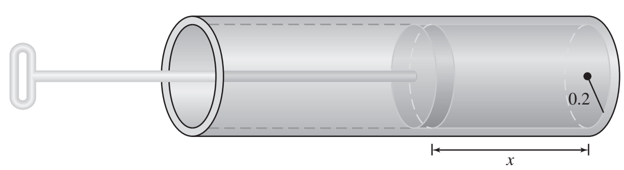

FIGURE 14 Gas in a cylinder with a piston.

SOLUTION

(a) We have $P = 2 \times 10^6$ and $V = 0.032\pi$. Thus

$$k = 2 \times 10^6 (0.032\pi)^{1.4} = 80{,}213.9.$$

(b) The area of the piston is $A = 0.04\pi$ and the volume of the cylinder as a function of x is $V = 0.04\pi x$, which gives $P = k/V^{1.4} = k/(0.04\pi x)^{1.4}$. Thus

$$F = PA = \frac{k}{(0.04\pi x)^{1.4}} 0.04\pi = k(0.04\pi)^{-0.4} x^{-1.4}.$$

(c) Since the force is pushing against the piston, in order to calculate work, we must calculate the integral of the opposite force, i.e., we have

$$W = -k(0.04\pi)^{-0.4} \int_{0.8}^{0.5} x^{-1.4}\,dx = -k(0.04\pi)^{-0.4} \frac{1}{-0.4} x^{-0.4}\bigg|_{0.8}^{0.5} = 103{,}966.7\ \mathrm{J}.$$

Further Insights and Challenges

39. Work-Energy Theorem An object of mass m moves from x_1 to x_2 during the time interval $[t_1, t_2]$ due to a force $F(x)$ acting in the direction of motion. Let $x(t)$, $v(t)$, and $a(t)$ be the position, velocity, and acceleration at time t. The object's kinetic energy is $\text{KE} = \frac{1}{2}mv^2$.

(a) Use the change-of-variables formula to show that the work performed is equal to

$$W = \int_{x_1}^{x_2} F(x)\,dx = \int_{t_1}^{t_2} F(x(t))v(t)\,dt$$

(b) Use Newton's Second Law, $F(x(t)) = ma(t)$, to show that

$$\frac{d}{dt}\left(\frac{1}{2}mv(t)^2\right) = F(x(t))v(t)$$

(c) Use the FTC to prove the Work-Energy Theorem: The change in kinetic energy during the time interval $[t_1, t_2]$ is equal to the work performed.

SOLUTION

(a) Let $x_1 = x(t_1)$ and $x_2 = x(t_2)$, then $x = x(t)$ gives $dx = v(t)\,dt$. By substitution we have

$$W = \int_{x_1}^{x_2} F(x)\,dx = \int_{t_1}^{t_2} F(x(t))v(t)\,dt.$$

(b) Knowing $F(x(t)) = m \cdot a(t)$, we have

$$\begin{aligned} \frac{d}{dt}\left(\frac{1}{2}m \cdot v(t)^2\right) &= m \cdot v(t)\,v'(t) && \text{(Chain Rule)} \\ &= m \cdot v(t)\,a(t) \\ &= v(t) \cdot F(x(t)) && \text{(Newton's 2nd law)} \end{aligned}$$

(c) From the FTC,

$$\frac{1}{2}m \cdot v(t)^2 = \int F(x(t))\,v(t)\,dt.$$

Since $KE = \frac{1}{2}\,m\,v^2$,

$$\Delta KE = KE(t_2) - KE(t_1) = \frac{1}{2}m\,v(t_2)^2 - \frac{1}{2}m\,v(t_1)^2 = \int_{t_1}^{t_2} F(x(t))\,v(t)\,dt.$$

(d)

$$\begin{aligned} W &= \int_{x_1}^{x_2} F(x)\,dx = \int_{t_1}^{t_2} F(x(t))\,v(t)\,dt && \text{(Part (a))} \\ &= KE(t_2) - KE(t_1) \\ &= \Delta KE && \text{(as required)} \end{aligned}$$

40. A model train of mass 0.5 kg is placed at one end of a straight 3-m electric track. Assume that a force $F(x) = (3x - x^2)$ N acts on the train at distance x along the track. Use the Work-Energy Theorem (Exercise 39) to determine the velocity of the train when it reaches the end of the track.

SOLUTION We have

$$W = \int_0^3 F(x)\,dx = \int_0^3 (3x - x^2)\,dx = \left(\frac{3}{2}x^2 - \frac{1}{3}x^3\right)\Big|_0^3 = 4.5 \text{ J}.$$

Then the change in KE must be equal to W, which gives

$$4.5 = \frac{1}{2}m(v(t_2)^2 - v(t_1)^2)$$

Note that $v(t_1) = 0$ as the train was placed on the track with no initial velocity and $m = 0.5$. Thus

$$v(t_2) = \sqrt{18} = 4.242641 \text{ m/sec.}$$

41. With what initial velocity v_0 must we fire a rocket so it attains a maximum height r above the earth? *Hint:* Use the results of Exercises 35 and 39. As the rocket reaches its maximum height, its KE decreases from $\frac{1}{2}mv_0^2$ to zero.

SOLUTION The work required to move the rocket a distance r from the surface of the earth is

$$W(r) = GM_e m\left(\frac{1}{R_e} - \frac{1}{r + R_e}\right).$$

As the rocket climbs to a height r, its kinetic energy is reduced by the amount $W(r)$. The rocket reaches its maximum height when its kinetic energy is reduced to zero, that is, when

$$\frac{1}{2}mv_0^2 = GM_e m\left(\frac{1}{R_e} - \frac{1}{r + R_e}\right).$$

Therefore, its initial velocity must be

$$v_0 = \sqrt{2GM_e\left(\frac{1}{R_e} - \frac{1}{r + R_e}\right)}.$$

42. With what initial velocity must we fire a rocket so it attains a maximum height of $r = 20$ km above the surface of the earth?

SOLUTION Using the result of the previous exercise with $G = 6.67 \times 10^{-11}$ m^{3}kg^{-1}s^{-2}, $M_e = 5.98 \times 10^{24}$ kg, $R_e = 6.37 \times 10^6$ m and $r = 20{,}000$ m,

$$v_0 = \sqrt{2GM_e\left(\frac{1}{R_e} - \frac{1}{r + R_e}\right)} = 626 \text{ m/sec.}$$

43. Calculate **escape velocity,** the minimum initial velocity of an object to ensure that it will continue traveling into space and never fall back to earth (assuming that no force is applied after takeoff). *Hint:* Take the limit as $r \to \infty$ in Exercise 41.

SOLUTION The result of Exercise 41 leads to an interesting conclusion. The initial velocity v_0 required to reach a height r does not increase beyond all bounds as r tends to infinity; rather, it approaches a finite limit, called the escape velocity:

$$v_{\text{esc}} = \lim_{r\to\infty}\sqrt{2GM_e\left(\frac{1}{R_e} - \frac{1}{r + R_e}\right)} = \sqrt{\frac{2GM_e}{R_e}}$$

In other words, v_{esc} is large enough to insure that the rocket reaches a height r for every value of r! Therefore, a rocket fired with initial velocity v_{esc} never returns to earth. It continues traveling indefinitely into outer space.

Now, let's see how large escape velocity actually is:

$$v_{\text{esc}} = \left(\frac{2 \cdot 6.67 \times 10^{-11} \cdot 5.989 \times 10^{24}}{6.37 \times 10^6}\right)^{1/2} \approx 11{,}190 \text{ m/sec.}$$

Since one meter per second is equal to 2.236 miles per hour, escape velocity is approximately $11{,}190(2.236) = 25{,}020$ miles per hour.

CHAPTER REVIEW EXERCISES

1. Compute the area of the region in Figure 1(A) enclosed by $y = 2 - x^2$ and $y = -2$.

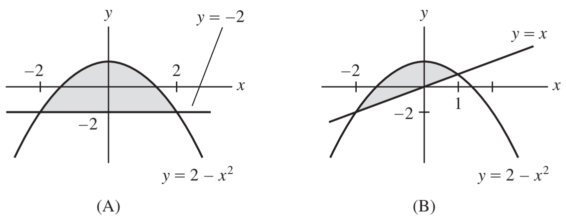

FIGURE 1

SOLUTION The graphs of $y = 2 - x^2$ and $y = -2$ intersect where $2 - x^2 = -2$, or $x = \pm 2$. Therefore, the enclosed area lies over the interval $[-2, 2]$. The region enclosed by the graphs lies below $y = 2 - x^2$ and above $y = -2$, so the area is

$$\int_{-2}^{2}\Big((2 - x^2) - (-2)\Big)\,dx = \int_{-2}^{2}(4 - x^2)\,dx = \left(4x - \frac{1}{3}x^3\right)\Bigg|_{-2}^{2} = \frac{32}{3}.$$

2. Compute the area of the region in Figure 1(B) enclosed by $y = 2 - x^2$ and $y = x$.

SOLUTION The graphs of $y = 2 - x^2$ and $y = x$ intersect where $2 - x^2 = x$, which simplifies to

$$0 = x^2 + x - 2 = (x + 2)(x - 1).$$

Thus, the graphs intersect at $x = -2$ and $x = 1$. As the graph of $y = x$ lies below the graph of $y = 2 - x^2$ over the interval $[-2, 1]$, the area between the graphs is

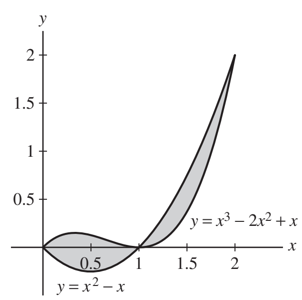
$$\int_{-2}^{1} \left((2 - x^2) - x\right)\, dx = \left(2x - \frac{1}{3}x^3 - \frac{1}{2}x^2\right)\Big|_{-2}^{1} = \frac{9}{2}.$$

In Exercises 3–12, find the area of the region enclosed by the graphs of the functions.

3. $y = x^3 - 2x^2 + x, \quad y = x^2 - x$

SOLUTION The region bounded by the graphs of $y = x^3 - 2x^2 + x$ and $y = x^2 - x$ over the interval $[0, 2]$ is shown below. For $x \in [0, 1]$, the graph of $y = x^3 - 2x^2 + x$ lies above the graph of $y = x^2 - x$, whereas, for $x \in [1, 2]$, the graph of $y = x^2 - x$ lies above the graph of $y = x^3 - 2x^2 + x$. The area of the region is therefore given by

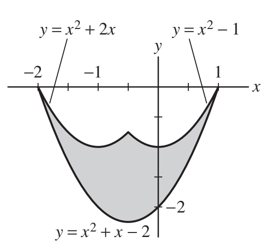
$$\begin{aligned}
\int_0^1 &\left((x^3 - 2x^2 + x) - (x^2 - x)\right)\, dx + \int_1^2 \left((x^2 - x) - (x^3 - 2x^2 + x)\right)\, dx \\
&= \left(\frac{1}{4}x^4 - x^3 + x^2\right)\Big|_0^1 + \left(x^3 - x^2 - \frac{1}{4}x^4\right)\Big|_1^2 \\
&= \frac{1}{4} - 1 + 1 + (8 - 4 - 4) - \left(1 - 1 - \frac{1}{4}\right) = \frac{1}{2}.
\end{aligned}$$



4. $y = x^2 + 2x, \quad y = x^2 - 1, \quad h(x) = x^2 + x - 2$

SOLUTION The region bounded by the graphs of $y = x^2 + 2x$, $y = x^2 - 1$ and $y = x^2 + x - 2$ is shown below. For each $x \in [-2, -\frac{1}{2}]$, the graph of $y = x^2 + 2x$ lies above the graph of $y = x^2 + x - 2$, whereas, for each $x \in [-\frac{1}{2}, 1]$, the graph of $y = x^2 - 1$ lies above the graph of $y = x^2 + x - 2$. The area of the region is therefore given by

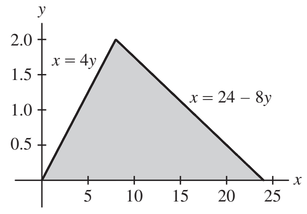
$$\begin{aligned}
\int_{-2}^{-1/2} &\left((x^2 + 2x) - (x^2 + x - 2)\right)\, dx + \int_{-1/2}^{1} \left((x^2 - 1) - (x^2 + x - 2)\right)\, dx \\
&= \left(\frac{1}{2}x^2 + 2x\right)\Big|_{-2}^{-1/2} + \left(-\frac{1}{2}x^2 + x\right)\Big|_{-1/2}^{1} \\
&= \left(\frac{1}{8} - 1\right) - (2 - 4) + \left(-\frac{1}{2} + 1\right) - \left(-\frac{1}{8} - \frac{1}{2}\right) = \frac{9}{4}.
\end{aligned}$$



5. $x = 4y, \quad x = 24 - 8y, \quad y = 0$

SOLUTION The region bounded by the graphs $x = 4y$, $x = 24 - 8y$ and $y = 0$ is shown below. For each $0 \le y \le 2$, the graph of $x = 24 - 8y$ lies to the right of $x = 4y$. The area of the region is therefore

$$A = \int_0^2 (24 - 8y - 4y)\, dy = \int_0^2 (24 - 12y)\, dy$$
$$= (24y - 6y^2)\Big|_0^2 = 24.$$



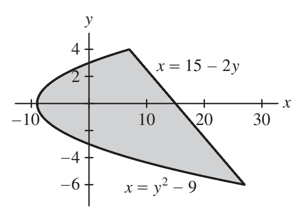
6. $x = y^2 - 9, \quad x = 15 - 2y$

SOLUTION Setting $y^2 - 9 = 15 - 2y$ yields

$$y^2 + 2y - 24 = (y + 6)(y - 4) = 0,$$

so the two curves intersect at $y = -6$ and $y = 4$. The region bounded by the graphs $x = y^2 - 9$ and $x = 15 - 2y$ is shown below. For each $-6 \le y \le 4$, the graph of $x = 15 - 2y$ lies to the right of $x = y^2 - 9$. The area of the region is therefore

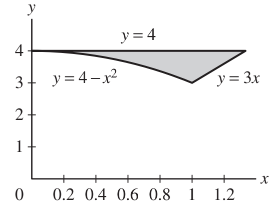
$$A = \int_{-6}^4 \left(15 - 2y - (y^2 - 9)\right) dy = \int_{-6}^4 (24 - 2y - y^2)\, dy$$
$$= \left(24y - y^2 - \frac{1}{3}y^3\right)\Big|_{-6}^4$$
$$= \left(\frac{176}{3} - (-108)\right) = \frac{500}{3}.$$



7. $y = 4 - x^2, \quad y = 3x, \quad y = 4$

SOLUTION The region bounded by the graphs of $y = 4 - x^2$, $y = 3x$ and $y = 4$ is shown below. For $x \in [0, 1]$, the graph of $y = 4$ lies above the graph of $y = 4 - x^2$, whereas, for $x \in [1, \frac{4}{3}]$, the graph of $y = 4$ lies above the graph of $y = 3x$. The area of the region is therefore given by

$$\int_0^1 (4 - (4 - x^2))\, dx + \int_1^{4/3} (4 - 3x)\, dx = \frac{1}{3}x^3\Big|_0^1 + \left(4x - \frac{3}{2}x^2\right)\Big|_1^{4/3} = \frac{1}{3} + \left(\frac{16}{3} - \frac{8}{3}\right) - \left(4 - \frac{3}{2}\right) = \frac{1}{2}.$$



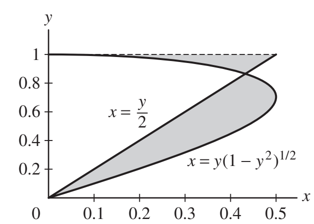
8. $\boxed{\text{GU}}$ $x = \frac{1}{2}y, \quad x = y\sqrt{1-y^2}, \quad 0 \le y \le 1$

SOLUTION The region bounded by the graphs of $x = y/2$ and $x = y\sqrt{1-y^2}$ over the interval [0, 1] is shown below. For $y \in [0, \frac{\sqrt{3}}{2}]$, the graph of $x = y\sqrt{1-y^2}$ lies to the right of the graph of $x = y/2$, whereas, for $y \in [\frac{\sqrt{3}}{2}, 1]$, the graph of $x = y/2$ lies to the right of the graph of $x = y\sqrt{1-y^2}$. The area of the region is therefore given by

$$\int_0^{\sqrt{3}/2} \left(y\sqrt{1-y^2} - \frac{y}{2} \right) dy + \int_{\sqrt{3}/2}^1 \left(\frac{y}{2} - y\sqrt{1-y^2} \right) dy$$

$$= \left(-\frac{1}{3}(1-y^2)^{3/2} - \frac{y^2}{4} \right) \Bigg|_0^{\sqrt{3}/2} + \left(\frac{y^2}{4} + \frac{1}{3}(1-y^2)^{3/2} \right) \Bigg|_{\sqrt{3}/2}^1$$

$$= -\frac{1}{24} - \frac{3}{16} + \frac{1}{3} + \frac{1}{4} - \frac{3}{16} - \frac{1}{24} = \frac{1}{8}.$$



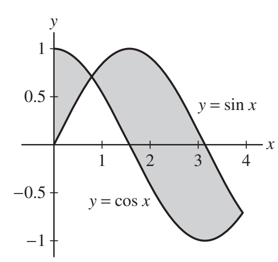
9. $y = \sin x, \quad y = \cos x, \quad 0 \le x \le \frac{5\pi}{4}$

SOLUTION The region bounded by the graphs of $y = \sin x$ and $y = \cos x$ over the interval $[0, \frac{5\pi}{4}]$ is shown below. For $x \in [0, \frac{\pi}{4}]$, the graph of $y = \cos x$ lies above the graph of $y = \sin x$, whereas, for $x \in [\frac{\pi}{4}, \frac{5\pi}{4}]$, the graph of $y = \sin x$ lies above the graph of $y = \cos x$. The area of the region is therefore given by

$$\int_0^{\pi/4} (\cos x - \sin x)\, dx + \int_{\pi/4}^{5\pi/4} (\sin x - \cos x)\, dx$$

$$= (\sin x + \cos x)\Big|_0^{\pi/4} + (-\cos x - \sin x)\Big|_{\pi/4}^{5\pi/4}$$

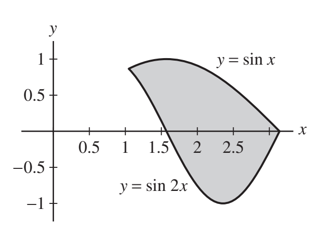
$$= \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2} - (0+1) + \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2} \right) - \left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2} \right) = 3\sqrt{2} - 1.$$



10. $f(x) = \sin x, \quad g(x) = \sin 2x, \quad \frac{\pi}{3} \le x \le \pi$

SOLUTION The region bounded by the graphs of $y = \sin x$ and $y = \sin 2x$ over the interval $[\frac{\pi}{3}, \pi]$ is shown below. As the graph of $y = \sin x$ lies above the graph of $y = \sin 2x$, the area of the region is given by

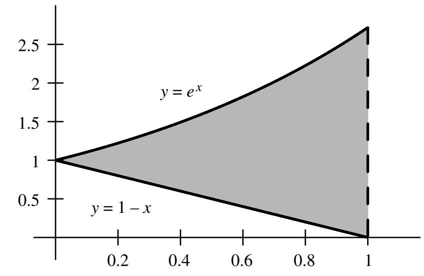
$$\int_{\pi/3}^{\pi} (\sin x - \sin 2x)\, dx = \left(-\cos x + \frac{1}{2}\cos 2x \right)\Bigg|_{\pi/3}^{\pi} = \left(1 + \frac{1}{2} \right) - \left(-\frac{1}{2} - \frac{1}{4} \right) = \frac{9}{4}.$$



11. $y = e^x, \quad y = 1 - x, \quad x = 1$

SOLUTION The region bounded by the graphs of $y = e^x$, $y = 1 - x$ and $x = 1$ is shown below. As the graph of $y = e^x$ lies above the graph of $y = 1 - x$, the area of the region is given by

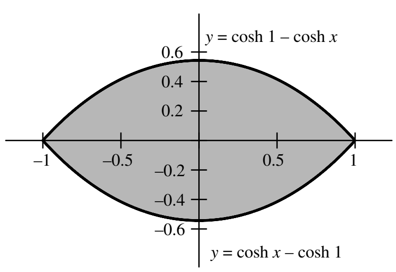
$$\int_0^1 \left(e^x - (1-x)\right)\, dx = \left(e^x - x + \frac{1}{2}x^2\right)\Big|_0^1 = \left(e - 1 + \frac{1}{2}\right) - 1 = e - \frac{3}{2}.$$



12. $y = \cosh 1 - \cosh x, \quad y = \cosh x - \cosh 1$

SOLUTION The region bounded by the graphs of $y = \cosh 1 - \cosh x$, $y = \cosh x - \cosh 1$ is shown below. As the graph of $y = \cosh 1 - \cosh x$ lies above the graph of $y = \cosh x - \cosh 1$, the area of the region is given by

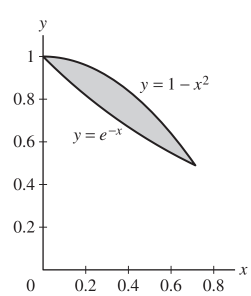
$$\begin{aligned}\int_{-1}^1 ((\cosh 1 - \cosh x) - (\cosh x - \cosh 1))\, dx &= (2x \cosh 1 - 2\sinh x)\Big|_{-1}^1 \\ &= (2\cosh 1 - 2\sinh 1) - (-2\cosh 1 + 2\sinh 1) \\ &= 4\cosh 1 - 4\sinh 1 = 4e^{-1}.\end{aligned}$$



13. GU Use a graphing utility to locate the points of intersection of $y = e^{-x}$ and $y = 1 - x^2$ and find the area between the two curves (approximately).

SOLUTION The region bounded by the graphs of $y = e^{-x}$ and $y = 1 - x^2$ is shown below. One point of intersection clearly occurs at $x = 0$. Using a computer algebra system, we find that the other point of intersection occurs at $x = 0.7145563847$. As the graph of $y = 1 - x^2$ lies above the graph of $y = e^{-x}$, the area of the region is given by

$$\int_0^{0.7145563847} \left(1 - x^2 - e^{-x}\right)\, dx = 0.08235024596$$



14. Figure 2 shows a solid whose horizontal cross section at height y is a circle of radius $(1+y)^{-2}$ for $0 \le y \le H$. Find the volume of the solid.

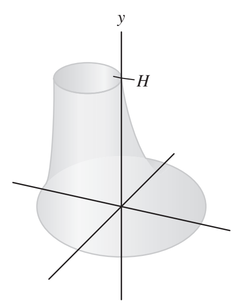


FIGURE 2

SOLUTION The area of each horizontal cross section is $A(y) = \pi(1+y)^{-4}$. Therefore, the volume of the solid is

$$\int_0^H \pi(1+y)^{-4}\,dy = \pi\left.\frac{(1+y)^{-3}}{-3}\right|_0^H = \pi\left(\frac{(1+H)^{-3}}{-3} + \frac{1}{3}\right) = \frac{\pi}{3}\left(1 - \frac{1}{(1+H)^3}\right).$$

15. The base of a solid is the unit circle $x^2 + y^2 = 1$, and its cross sections perpendicular to the x-axis are rectangles of height 4. Find its volume.

SOLUTION Because the cross sections are rectangles of constant height 4, the figure is a cylinder of radius 1 and height 4. The volume is therefore $\pi r^2 h = 4\pi$.

16. The base of a solid is the triangle bounded by the axes and the line $2x + 3y = 12$, and its cross sections perpendicular to the y-axis have area $A(y) = (y+2)$. Find its volume.

SOLUTION The volume of this solid is

$$V = \int_0^4 A(y)\,dy = \int_0^4 (y+2)\,dy = \left.\left(\frac{1}{2}y^2 + 2y\right)\right|_0^4 = 16.$$

17. Find the total mass of a rod of length 1.2 m with linear density $\rho(x) = (1 + 2x + \frac{2}{9}x^3)$ kg/m.

SOLUTION The total weight of the rod is

$$\int_0^{1.2} \rho(x)\,dx = \left.\left(x + x^2 + \frac{1}{18}x^4\right)\right|_0^{1.2} = 2.7552\text{ kg}.$$

18. Find the flow rate (in the correct units) through a pipe of diameter 6 cm if the velocity of fluid particles at a distance r from the center of the pipe is $v(r) = (3 - r)$ cm/s.

SOLUTION The flow rate through the pipe is

$$2\pi\int_0^3 r\,v(r)\,dr = 2\pi\int_0^3 (3r - r^2)\,dr = 2\pi\left.\left(\frac{3}{2}r^2 - \frac{1}{3}r^3\right)\right|_0^3 = 2\pi\left(\frac{27}{2} - 9\right) = 9\pi\,\frac{\text{cm}^3}{\text{s}}.$$

In Exercises 19–24, find the average value of the function over the interval.

19. $f(x) = x^3 - 2x + 2, \quad [-1, 2]$

SOLUTION The average value is

$$\frac{1}{2-(-1)}\int_{-1}^2 \left(x^3 - 2x + 2\right)\,dx = \frac{1}{3}\left.\left(\frac{1}{4}x^4 - x^2 + 2x\right)\right|_{-1}^2 = \frac{1}{3}\left[(4 - 4 + 4) - \left(\frac{1}{4} - 1 - 2\right)\right] = \frac{9}{4}.$$

20. $f(x) = |x|, \quad [-4, 4]$

SOLUTION The average value is

$$\frac{1}{4-(-4)}\int_{-4}^4 |x|\,dx = \frac{1}{8}\left(\int_{-4}^0 (-x)\,dx + \int_0^4 x\,dx\right) = \frac{1}{8}\left(\left.-\frac{1}{2}x^2\right|_{-4}^0 + \left.\frac{1}{2}x^2\right|_0^4\right) = \frac{1}{8}\left[(0+8) + (8-0)\right] = 2.$$

21. $f(x) = x\cosh(x^2)$, $[0, 1]$

SOLUTION The average value is

$$\frac{1}{1-0}\int_0^1 x\cosh(x^2)\,dx.$$

To evaluate the integral, let $u = x^2$. Then $du = 2x\,dx$ and

$$\frac{1}{1-0}\int_0^1 x\cosh(x^2)\,dx = \frac{1}{2}\int_0^1 \cosh u\,du = \frac{1}{2}\sinh u\Big|_0^1 = \frac{1}{2}\sinh 1.$$

22. $f(x) = \dfrac{e^x}{1+e^{2x}}$, $\left[0, \dfrac{1}{2}\right]$

SOLUTION The average value is

$$\frac{1}{\frac{1}{2}-0}\int_0^{1/2} \frac{e^x}{1+e^{2x}}\,dx.$$

To evaluate the integral, let $u = e^x$. Then $du = e^x\,dx$ and

$$\frac{1}{\frac{1}{2}-0}\int_0^{1/2} \frac{e^x}{1+e^{2x}}\,dx = 2\int_1^{\sqrt{e}} \frac{du}{1+u^2} = 2\tan^{-1}u\Big|_1^{\sqrt{e}} = 2\left(\tan^{-1}\sqrt{e} - \frac{\pi}{4}\right).$$

23. $f(x) = \sqrt{9-x^2}$, $[0, 3]$ *Hint:* Use geometry to evaluate the integral.

SOLUTION The region below the graph of $y = \sqrt{9-x^2}$ but above the x-axis over the interval $[0, 3]$ is one-quarter of a circle of radius 3; consequently,

$$\int_0^3 \sqrt{9-x^2}\,dx = \frac{1}{4}\pi(3)^2 = \frac{9\pi}{4}.$$

The average value is then

$$\frac{1}{3-0}\int_0^3 \sqrt{9-x^2}\,dx = \frac{1}{3}\left(\frac{9\pi}{4}\right) = \frac{3\pi}{4}.$$

24. $f(x) = x[x]$, $[0, 3]$, where $[x]$ is the greatest integer function.

SOLUTION The average value is

$$\begin{aligned}\frac{1}{3-0}\int_0^3 x[x]\,dx &= \frac{1}{3}\left(\int_0^1 x\cdot 0\,dx + \int_1^2 x\cdot 1\,dx + \int_2^3 x\cdot 2\,dx\right)\\ &= \frac{1}{3}\left(\frac{1}{2}x^2\Big|_1^2 + x^2\Big|_2^3\right) = \frac{1}{3}\left(2 - \frac{1}{2} + 9 - 4\right) = \frac{13}{6}.\end{aligned}$$

25. Find $\displaystyle\int_2^5 g(t)\,dt$ if the average value of $g(t)$ on $[2, 5]$ is 9.

SOLUTION The average value of the function $g(t)$ on $[2, 5]$ is given by

$$\frac{1}{5-2}\int_2^5 g(t)\,dt = \frac{1}{3}\int_2^5 g(t)\,dt.$$

Therefore,

$$\int_2^5 g(t)\,dt = 3(\text{average value}) = 3(9) = 27.$$

26. The average value of $R(x)$ over $[0, x]$ is equal to x for all x. Use the FTC to determine $R(x)$.

SOLUTION The average value of the function $R(x)$ over $[0, x]$ is

$$\frac{1}{x-0}\int_0^x R(t)\,dt = \frac{1}{x}\int_0^x R(t)\,dt.$$

Given that the average value is equal to x, it follows that

$$\int_0^x R(t)\,dt = x^2.$$

Differentiating both sides of this equation and using the Fundamental Theorem of Calculus on the left-hand side yields

$$R(x) = 2x.$$

27. Use the Washer Method to find the volume obtained by rotating the region in Figure 3 about the x-axis.

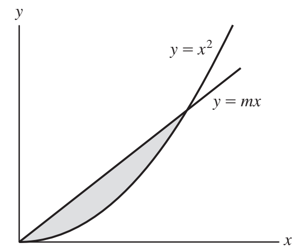

FIGURE 3

SOLUTION Setting $x^2 = mx$ yields $x(x-m) = 0$, so the two curves intersect at $(0, 0)$ and (m, m^2). To use the washer method, we must slice the solid perpendicular to the axis of rotation; as we are revolving about the y-axis, this implies a horizontal slice and integration in y. For each $y \in [0, m^2]$, the cross section is a washer with outer radius $R = \sqrt{y}$ and inner radius $r = \frac{y}{m}$. The volume of the solid is therefore given by

$$\pi\int_0^{m^2}\left((\sqrt{y})^2 - \left(\frac{y}{m}\right)^2\right)dy = \pi\left(\frac{1}{2}y^2 - \frac{y^3}{3m^2}\right)\Bigg|_0^{m^2} = \pi\left(\frac{m^4}{2} - \frac{m^4}{3}\right) = \frac{\pi}{6}m^4.$$

28. Use the Shell Method to find the volume obtained by rotating the region in Figure 3 about the x-axis.

SOLUTION Setting $x^2 = mx$ yields $x(x-m) = 0$, so the two curves intersect at $(0, 0)$ and (m, m^2). To use the shell method, we must slice the solid parallel to the axis of rotation; as we are revolving about the x-axis, this implies a horizontal slice and integration in y. For each $y \in [0, m^2]$, the shell has radius y and height $\sqrt{y} - \frac{y}{m}$. The volume of the solid is therefore given by

$$2\pi\int_0^{m^2} y\left(\sqrt{y} - \frac{y}{m}\right)dy = 2\pi\left(\frac{2}{5}y^{5/2} - \frac{y^3}{3m}\right)\Bigg|_0^{m^2} = 2\pi\left(\frac{2m^5}{5} - \frac{m^5}{3}\right) = \frac{2\pi}{15}m^5.$$

In Exercises 29–40, use any method to find the volume of the solid obtained by rotating the region enclosed by the curves about the given axis.

29. $y = x^2 + 2, \quad y = x + 4, \quad x$-axis
