Problem	Grade
1	02 /30
2	16 /30
3	21 /30
Total	39 /90

- Do not peek at the exam until you are told to begin. You will have approximately 50 minutes to complete the exam.
- Don't spend too much time on any one problem. Solve 'easy' problems first. Go for partial credit!
- **HINT:** Focus on the concepts involved in the problem, the tools to be used, and the set-up. If you get these right, all that's left is algebra.
- **Have Fun!**

- 1a) (10 points) A uniform disk of charge  $Q$  and radius  $R$  spins about its perpendicular symmetry axis with an angular velocity  $\vec{\omega}$  (as shown in the left diagram above). Derive the (vector) magnetic dipole moment of the distribution.

$$\mu = NIA \quad (+)$$

$$\vec{\mu} = Q \vec{\omega}$$

$$I \equiv \frac{Q}{\pi R^2}, \quad A = \pi R^2 \rightarrow$$

$$\vec{\tau} = \vec{\mu} \times \vec{B}$$

$$\tau = \mu |B| \sin\theta$$

$$\vec{B} = \frac{\mu_0 I}{4\pi} \int \frac{d\vec{r} \times \vec{r}}{r^2}$$

$$B = \frac{\mu_0 Q}{4\pi^2 R^4} \int d\vec{s}$$

$$B = \frac{\mu_0 Q}{4\pi^2 R^3}$$

$$\frac{|\tau|}{|B|} = \mu$$

$$\frac{|\tau|}{\frac{\mu_0 Q}{4\pi^2 R^3}} \rightarrow \frac{4\pi^2 R^3 |\tau|}{\mu_0 Q} = \mu$$

- 1b) (10 points) A uniform sphere of charge  $Q$  and radius  $R$  spins about an axis that passes through its center with an angular velocity  $\vec{\omega}$  (as shown in the right diagram above). How large a contribution to the total magnetic dipole moment of the sphere will the infinitesimally-thin disk shown in the right diagram make?

$$disk = \frac{Q}{\pi R^2}$$

$$d\vec{B} = \frac{\mu_0 I_{disk} Q}{4\pi^2 R^2} \frac{d\vec{L}}{R^2} \quad (+)$$

$$d\vec{B} =$$

$$\frac{1}{d\vec{B}} = \frac{4\pi^2 R^4}{\mu_0 I_{disk} Q d\vec{L}}$$

- 1c) (5 points) Derive the (vector) magnetic dipole moment of the spinning spherical distribution.

$$\mu = NIA \quad (+1)$$

$$\tau = \vec{\mu} \times \vec{B}$$

$$\vec{B} = \frac{\mu_0 I_{\text{enc}}}{4\pi} \int \frac{d\vec{l}' \times \vec{r}'}{R^2}$$

$$\vec{B} = \frac{\mu_0 I_{\text{enc}}}{4\pi R^2} \int d\vec{l}$$

$$\vec{B} = \frac{\mu_0 I_{\text{enc}}}{4\pi R^2} \frac{4}{3} \pi R^3$$

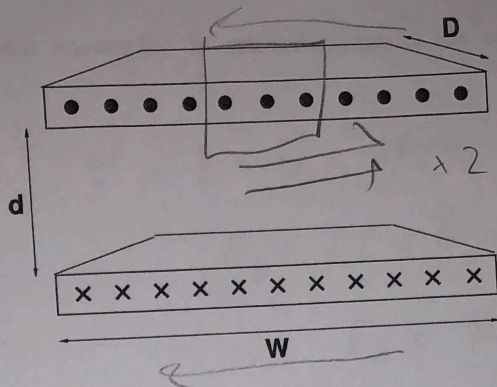

$$\vec{B} = \frac{\mu_0 I_{\text{enc}}}{3} R$$

$$\frac{|\tau|}{B} = \mu$$

$$\frac{3\tau}{\mu_0 I_{\text{enc}} R} = \mu$$

- 1d) (5 points) When placed in a uniform magnetic field  $B$ , the sphere precesses with an angular frequency  $\Omega$ . Assuming its mass is also uniformly distributed, find the charge-to-mass ratio for the sphere.

$$+0$$

18

2) Two thin, parallel, conducting sheets of dimension  $D \times W$  are separated by a distance  $d$  as shown ( $D \gg W \gg d$ ). The sheets each carry a linear current density  $K$ , one into the plane of the page, one out, as shown.

8

2a) (10 points) Use your knowledge of the magnetic field in and around long, wide current sheets to obtain a qualitative description of the magnetic field in the region between the sheets and in the regions outside the sheets. Follow that up by actually finding the magnetic field in each of those regions.

$$\oint \vec{B} \cdot d\vec{s} = \mu_0 I_{enc} \rightarrow I_{enc} = Kx \quad K = \frac{NI}{L}$$

$$2Bx = \mu_0 Kx$$

$$B = \frac{1}{2} \mu_0 K$$

$$\left. \begin{array}{l} \vec{B}_{top \text{ (outside)}} = \frac{1}{2} \mu_0 K \\ \vec{B}_{bottom \text{ (outside)}} = \frac{1}{2} \mu_0 K \end{array} \right\} \begin{array}{l} \times \\ -z \end{array}$$

$$B_{in \text{ between}} = \frac{1}{2} \mu_0 K + \frac{1}{2} \mu_0 K$$

$$B_{in \text{ between}} = \mu_0 K$$

2b) (10 points) Use Faraday's law to calculate the self-inductance of the arrangement.

6

$$\epsilon_i = - \frac{d\Phi_B}{dt}, \quad L = \left| \frac{\sum \epsilon_i}{\frac{dI}{dt}} \right|$$

$$n = \frac{N}{L}$$

$$\Phi_B = dW \cdot B$$

$$\Phi_B = dW \mu_0 K$$

$$\frac{d\Phi_B}{dt} = dW \mu_0 n \frac{dI}{dt}$$

$$Wd \sim d\vec{A} \perp \vec{B} \\ \text{so } \vec{B} \cdot d\vec{A} = 0?$$

$$L = \frac{(dW \mu_0 n \frac{dI}{dt})}{\frac{dI}{dt}}$$

$$K = \frac{NI}{W} \rightarrow K = nI$$

$$L = dW \mu_0 n = dW \mu_0 \left( \frac{K}{W} \right) = dW \mu_0 \left( \frac{nI}{W} \right)$$

2

✓ -2

2

• 2c) (10 points) Verify your answer for the self-inductance of the arrangement by using energy considerations.

$U = \frac{1}{2} LI^2$  ✓  
*inductor*

$F \cdot \vec{v} = \text{Work}$

$k = \frac{IN}{w}$   
 $\frac{k w}{N} = I$

$F_B = I \vec{L} \times \vec{B} = \left(\frac{kL}{N}\right)(w)(\mu_0 k)$

$F_B = \frac{k^2 w^2}{\frac{k w}{I}} \mu_0 k$

X

$\frac{1}{2} LI^2 =$

$k = \frac{IN}{w}$

$\frac{k w}{I} = N \rightarrow \frac{1}{N} = \frac{I}{k w}$

$F_B = k w I \mu_0 k$

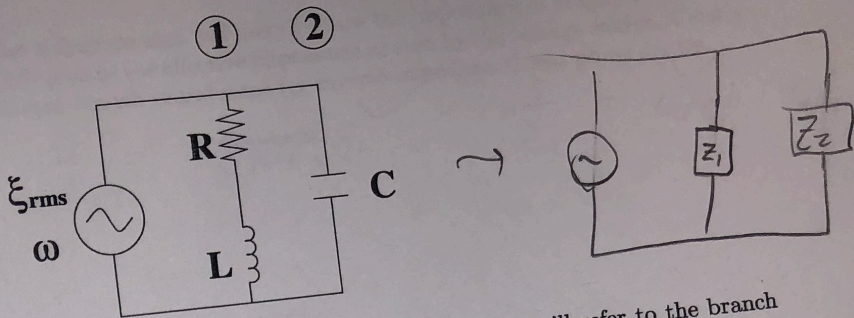

$F_B = k^2 w I \mu_0$

$\frac{1}{2} LI^2 = k^2 w I \mu_0 \vec{v} \rightarrow \vec{v} = \frac{dQ}{dt} = I$

$\frac{1}{2} LI^2 = k^2 I^2 w \mu_0$

X

$L = 2 k^2 w \mu_0$  X

3) The following questions all refer to the circuit shown above. For convenience, we'll refer to the branch that contains the resistor and inductor as branch 1 and the branch that contains the capacitor as branch 2.

• 3a) (5 points) Find the RMS current through branch 1 and through branch 2.

$$I_{rms} = \frac{I_{max}}{\sqrt{2}}$$

$$I_{max1} = \epsilon_{max} \left( \frac{1}{Z_1} \right), \quad I_{max2} = \epsilon_{max} \left( \frac{1}{Z_2} \right)$$

$$Z_2 = X_C = \frac{1}{\omega C}$$

$$I_{max2} = \epsilon_{max} \sqrt{R^2 + X_L^2} \text{ use "E}_{rms}" \text{ please}$$

$$X_L = \omega L$$

$$Z_1 = \sqrt{R^2 + X_L^2}$$

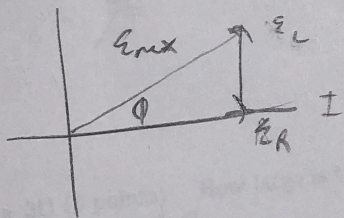

$$I_{max2} = \epsilon_{max} \frac{1}{X_C} = \epsilon_{max} \omega C$$

$$X_C = \frac{1}{\omega C}$$

$$I_{RMS1} = \frac{\epsilon_{max}}{\sqrt{R^2 + (\omega L)^2}}, \quad I_{RMS2} = \frac{\epsilon_{max} \omega C}{\sqrt{2}}$$

+5

• 3b) (5 points) Will the current through branch 1 lead or lag the voltage across it? By how much?

The current will lag the voltage across it by  $\phi$  where  $\phi$  is:

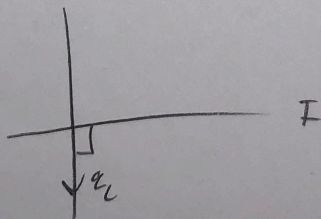

$$\phi = \tan^{-1} \left( \frac{I_{across} \omega L}{I_{across} R} \right) = \tan^{-1} \left( \frac{\omega L}{R} \right)$$

+5

$$\epsilon_L = I_{across} X_L = I_{across} \omega L$$

$$\epsilon_R = I_{across} R$$

• 3c) (5 points) Will the current through branch 2 lead or lag the voltage across it? By how much?

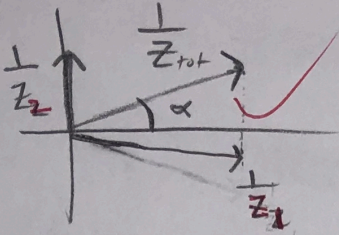

The current through branch 2 will lead the voltage across it by  $90^\circ$

+5

- 3d) (5 points) Sketch the phasor diagram that will describe how the impedance in branch 2 combines with the impedance in branch 1 to give us the effective impedance as seen by the voltage source. Clearly label the diagram with the relevant branch impedances (or inverse-impedances) and phase angles.

$$\frac{1}{Z_1} = \frac{1}{\sqrt{R^2 + \omega^2 L^2}}, \quad \frac{1}{Z_2} = \omega C$$

+5

- 3e) (5 points) At what frequency will the effective impedance seen by the source look purely resistive?

$$X_L = X_C \rightarrow \omega L = \frac{1}{\omega C} \rightarrow \omega^2 L C = 1$$

$$\omega = \sqrt{\frac{1}{LC}} \rightarrow \frac{2\pi}{T} = \sqrt{\frac{1}{LC}} \rightarrow T = \frac{2\pi}{\sqrt{\frac{1}{LC}}}$$

$$\omega = \frac{2\pi}{T}$$

+1

- 3f) (5 points) How large is the effective impedance when the driving frequency is tuned so that it is purely resistive?

$$|Z_{tot}| = \sqrt{R^2}$$

$$Z_{tot} = R$$

$$Z_{tot} = \sqrt{R^2 + \omega^2 L^2 + \omega^2 C^2}$$

$$Z_{tot} = R \quad \text{X}$$

$$\vec{\mu} = NIA$$

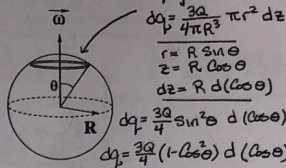

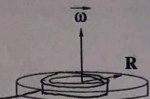

for a spinning ring:  $Q, \vec{\omega}, R$

$$\vec{\mu} = \frac{Q\vec{\omega}}{2\pi} \pi R^2$$

$$\vec{\mu} = \frac{1}{2} QR^2 \vec{\omega}$$

$$dq = \sigma da$$

$$dq = \frac{Q}{\pi R^2} 2\pi r dr \rightarrow dq = \frac{2Qr dr}{R^2}$$

$$dq = \rho dv$$

$$dq = \frac{3Q}{4\pi R^3} \pi r^2 dz$$

$$r = R \sin \theta$$

$$z = R \cos \theta$$

$$dz = R d(\cos \theta)$$

$$dq = \frac{3Q}{4} \sin^2 \theta d(\cos \theta)$$

1c) (5 points) Derive the (vector) magnetic dipole moment of the spinning spherical distribution.

$$\vec{\mu} = \int d\vec{\mu} = \frac{3}{16} QR^2 \vec{\omega} \int_{-1}^1 (1-x^2)^2 dx$$

$$x = \cos \theta$$

$$dx = -d(\cos \theta)$$

$$\vec{\mu} = \frac{3}{8} QR^2 \vec{\omega} \int_0^1 (1-2x^2+x^4) dx$$

$$\vec{\mu} = \frac{1}{5} QR^2 \vec{\omega}$$

1a) (10 points) A uniform disk of charge  $Q$  and radius  $R$  spins about its perpendicular symmetry axis with an angular velocity  $\vec{\omega}$  (as shown in the left diagram above). Derive the (vector) magnetic dipole moment of the distribution.

Build the disk up with infinitesimal rings... ( $dq, \vec{\omega}, r$ )

$$d\vec{\mu} = \frac{1}{2} dq r^2 \vec{\omega}$$

$$d\vec{\mu} = \frac{1}{2} \frac{2Q}{R^2} r^3 dr \vec{\omega}$$

$$\vec{\mu} = \int d\vec{\mu} = \frac{Q\vec{\omega}}{R^2} \int_0^R dr r^3$$

$$\vec{\mu} = \frac{1}{4} QR^2 \vec{\omega}$$

direction checks out for  $\pm Q$  ✓

1b) (10 points) A uniform sphere of charge  $Q$  and radius  $R$  spins about an axis that passes through its center with an angular velocity  $\vec{\omega}$  (as shown in the right diagram above). How large a contribution to the total magnetic dipole moment of the sphere will the infinitesimally-thin disk shown in the right diagram make?

For an infinitesimal disk ( $dq, r, \vec{\omega}$ )...

from top diagram,

$$r = R \sin \theta$$

$$d\vec{\mu} = \frac{1}{2} dq r^2 \vec{\omega}$$

$$d\vec{\mu} = \frac{1}{2} \frac{3Q}{4} (1-\cos^2 \theta) d(\cos \theta) R^2 (1-\cos^2 \theta) \vec{\omega}$$

$$d\vec{\mu} = \frac{3}{16} QR^2 \vec{\omega} (1-\cos^2 \theta)^2 d(\cos \theta)$$

1d) (5 points) When placed in a uniform magnetic field  $B$ , the sphere precesses with an angular frequency  $\Omega$ . Assuming its mass is also uniformly distributed, find the charge-to-mass ratio for the sphere.

Recall from lecture,  $\Omega = \gamma B_z$  where  $\gamma = \frac{\vec{\mu}}{I} = \frac{\frac{1}{5} QR^2 \vec{\omega}}{\frac{2}{5} m R^2 \vec{\omega}} = \frac{1}{2} \frac{Q}{m}$

$$\Omega = \frac{1}{2} \frac{Q}{m} B$$

$$\frac{Q}{m} = \frac{2\Omega}{B}$$

2c) (10 points) Verify your answer for the self-inductance of the arrangement by using energy considerations.

$$U_B = \frac{1}{2\mu_0} B^2$$

$$U_B = \frac{1}{2} \mu_0 K^2$$

$$U_B = \frac{1}{2} \mu_0 \frac{I^2}{W^2}$$

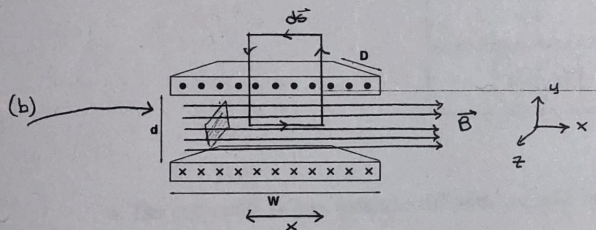

$U_B$  is uniform!  
 $U_B = \int u_B dv$   
 $U_B = u_B \int dv$   
 $U_B = U_B (Vol)$

$$U_B = \frac{1}{2} \mu_0 \frac{I^2}{W^2} dDw$$

but  $U_B = \frac{1}{2} LI^2$  (since we picked up all the energy)

So...

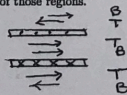

$$L = \frac{\mu_0 D d}{W}$$

2) Two thin, parallel, conducting sheets of dimension  $D \times W$  are separated by a distance  $d$  as shown ( $D \gg W \gg d$ ). The sheets each carry a linear current density  $K$ , one into the plane of the page, one out, as shown.

2a) (10 points) Use your knowledge of the magnetic field in and around long, wide current sheets to obtain a qualitative description of the magnetic field in the region between the sheets and in the regions outside the sheets. Follow that up by actually finding the magnetic field in each of those regions.

Outside a long, wide sheet of current, the magnetic field is uniform, oriented along the sheet, directed by the right hand rule with the current. The contributions from the top (T) & bottom (B) sheet are equal in magnitude & directed as shown. The net field outside the sheets is zero.

referring to the ampere loop up top,

$$\oint \vec{B} \cdot d\vec{s} = \mu_0 I_{enc}$$

$$Bx = \mu_0 Kx$$

$$B = \mu_0 K$$

$$\vec{B} = \mu_0 K \hat{x} \text{ between plates}$$

$$\vec{B} = 0 \text{ outside plates}$$

2b) (10 points) Use Faraday's law to calculate the self-inductance of the arrangement.

$\mathcal{E}_i = -\frac{d\Phi_B}{dt}$  where the relevant area is perpendicular to  $B$  and spans the height & length of the arrangement,

$$\mathcal{E}_i = -\frac{d}{dt} (B D d)$$

$$\mathcal{E}_i = -\frac{d}{dt} (\mu_0 K D d)$$

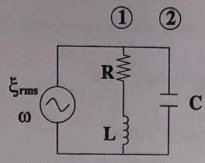

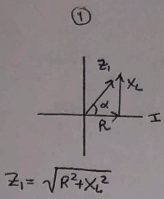

$$\mathcal{E}_i = -\frac{d}{dt} (\mu_0 \frac{I}{W} D d)$$

$$\mathcal{E}_i = -\mu_0 \frac{D d}{W} \frac{dI}{dt}$$

$$L = \left| \frac{\mathcal{E}_i}{dI} \right|$$

$$L = \frac{\mu_0 D d}{W}$$

$X_L = \omega L$   
 $X_C = 1/\omega C$

$Z_2 = X_C$

3) The following questions all refer to the circuit shown above. For convenience, we'll refer to the branch that contains the resistor and inductor as branch 1 and the branch that contains the capacitor as branch 2.

- 3a) (5 points) Find the RMS current through branch 1 and through branch 2.

$I_{rms} = \frac{E_{rms}}{Z}$

$I_{rms,1} = \frac{E_{rms}}{\sqrt{R^2 + (\omega L)^2}}$   
 $I_{rms,2} = E_{rms} \omega C$

Grades: For full credit, all derived answers must be in terms of R, ω, L, C → No X's or Z's

- 3b) (5 points) Will the current through branch 1 lead or lag the voltage across it? By how much?

with current as the reference for the series phase diagram, it looks like

Current lags Voltage by  $\alpha$ , where  
 $\tan \alpha = \frac{\omega L}{R}$

Consistent with 'RLC'

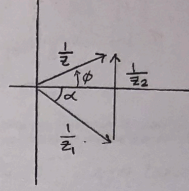

- 3c) (5 points) Will the current through branch 2 lead or lag the voltage across it? By how much?

Branch 2 only has the Capacitor...

Current leads Voltage by  $90^\circ$

'ice'

- 3d) (5 points) Sketch the phasor diagram that will describe how the impedance in branch 2 combines with the impedance in branch 1 to give us the effective impedance as seen by the voltage source. Clearly label the diagram with the relevant branch impedances (or inverse-impedances) and phase angles.

$\frac{1}{Z_1} = \frac{1}{\sqrt{R^2 + (\omega L)^2}}$   
 $\frac{1}{Z_2} = \omega C$   
 $\tan \alpha = \frac{\omega L}{R}$

- 3e) (5 points) At what frequency will the effective impedance seen by the source look purely resistive?

From the diagram:  $\frac{1}{Z_2} = \frac{1}{Z_1} \sin \alpha$   
 $\frac{1}{Z_2} = \frac{\omega L}{Z_1^2}$   
 $\omega C = \frac{\omega L}{R^2 + (\omega L)^2}$

$\frac{Z_1}{R} \sin \alpha = \frac{\omega L}{Z_1}$

$\omega = \sqrt{\frac{1}{LC} - \left(\frac{R}{L}\right)^2}$

- 3f) (5 points) How large is the effective impedance when the driving frequency is tuned so that it is purely resistive?

$\frac{1}{Z} = \frac{1}{Z_1} \cos \alpha$   
 $\frac{1}{Z} = \frac{R}{Z_1^2}$   
 $(\omega L)^2 = \frac{L}{C} - R^2$   
 $R^2 + (\omega L)^2 = \frac{L}{C}$   
 $Z_1^2 = \frac{L}{C}$

$Z = \frac{RC}{L}$
