

**Problem 1.** In the lab, you encounter a solenoid with unknown inductance. You measure the solenoid with an ohmmeter and find it has internal resistance  $R$ . To determine its inductance, you connect the solenoid in series with a known capacitor  $C$  and an AC signal generator (AC voltage source) set to frequency  $\omega$ .

- (6) (a) If the current amplitude is  $I_0$ , find the voltage amplitude  $|V_C|$  across the capacitor.
- (6) (b) With the same current, find the total voltage amplitude  $|V_{\text{tot}}|$  across both the solenoid and capacitor in terms of the unknown inductance  $L$  and the known circuit parameters.
- (6) (c) Suppose you don't know the current amplitude, but you measure the two voltage amplitudes in (a) and (b). Find the inductance  $L$  of the solenoid using these measurements and the known parameters.

$$(a) \quad \tilde{V} = \tilde{I} \tilde{Z} \quad \tilde{Z}_C = -\frac{i}{\omega C} \rightarrow |\tilde{Z}_C| = \frac{1}{\omega C}$$

$$|V_C| = I_0 |\tilde{Z}_C|$$

$$= \boxed{I_0 / \omega C}$$

(b) series RLC circuit

$$|\tilde{Z}_{\text{tot}}| = \sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}$$

$$|V_{\text{tot}}| = I_0 |\tilde{Z}_{\text{tot}}| = \boxed{I_0 \sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}}$$

(c) Take

$$\frac{|V_{\text{tot}}|}{|V_c|} = \frac{I_0 \sqrt{R^2 + (\omega L - \frac{1}{\omega C})^2}}{I_0 / (\omega C)} = \omega C \sqrt{R^2 + (\omega L - \frac{1}{\omega C})^2}$$

and solve for  $L$ . (Setup worth most of points, but some points for correct algebra.)

$$\text{Let } \alpha = \frac{|V_{\text{tot}}|}{|V_c|} = \omega C \sqrt{R^2 + (\omega L - \frac{1}{\omega C})^2}$$

$$\rightarrow \alpha^2 = \omega^2 C^2 (R^2 + (\omega L - \frac{1}{\omega C})^2)$$

$$\frac{\alpha^2}{\omega^2 C^2} - R^2 = (\omega L - \frac{1}{\omega C})^2$$

$$\omega L - \frac{1}{\omega C} = \pm \sqrt{\frac{\alpha^2}{\omega^2 C^2} - R^2}$$

$$L = \frac{1}{\omega^2 C} \pm \frac{1}{\omega} \sqrt{\frac{1}{\omega^2 C^2} \frac{|V_{\text{tot}}|^2}{|V_c|^2} - R^2}$$

**Problem 2.** The magnetic field of a monochromatic, plane EM wave in vacuum is

$$\vec{B}_{\text{inc}}(x, t) = B_0 \hat{y} \cos(kx - \omega t) \quad (1)$$

- (6) (a) Find the electric field  $\vec{E}_{\text{inc}}$  of this wave.
- (6) (b) Find the Poynting vector  $\vec{S}_{\text{inc}}$  for this wave.
- (6) (c) Suppose this wave is totally reflected by a thin sheet of a perfect conductor occupying the  $yz$  plane at  $x = 0$ . What is the force per unit area on this sheet due to the EM field?
- (6) (d) When the wave reflects from the conductor at  $x = 0$ , a reflected plane wave traveling opposite the direction of the incident wave is formed. The total electric field  $\vec{E}_{\text{tot}}$  is a superposition of the incident and reflected fields,  $\vec{E}_{\text{tot}} = \vec{E}_{\text{inc}} + \vec{E}_{\text{ref}}$ . Take for granted that the total electric field parallel to the surface of a perfect conductor is zero, and find the reflected field  $\vec{E}_{\text{ref}}$ .

(a)  $\vec{B}_0 = \frac{1}{c} \hat{k} \times \vec{E}_0 \quad | \quad \cos(kx - \omega t) \rightarrow \hat{k} \text{ points in } +x\text{-direction}$

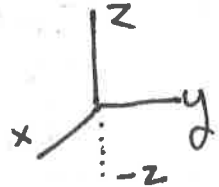

Magnitude:  $E_0 = c B_0$

Direction:  $\hat{y} = \hat{x} \times \hat{E}_0$

by right-hand rule,  
 $\hat{x} \times (-\hat{z}) = \hat{y}$ ,

so  $\hat{E}_0 = -\hat{z}$

$$\vec{E}_{\text{inc}} = -c B_0 \hat{z} \cos(kx - \omega t)$$

(b)

$$\vec{S}_{\text{inc}} = \frac{1}{\mu_0} \vec{E}_{\text{inc}} \times \vec{B}_{\text{inc}}$$

$$= \frac{1}{\mu_0} c B_0^2 \hat{x} \cos^2(kx - \omega t)$$

(c) force per area = pressure

$$\begin{aligned} P_{\text{ref}} &= 2 \frac{\langle S \rangle_T}{c} \\ &= \frac{2}{c} \frac{c B_0^2}{\mu_0} \underbrace{\langle \cos^2(kx - \omega t) \rangle_T}_{= 1/2} \\ &= \frac{2 B_0^2}{\mu_0} \cdot \frac{1}{2} \\ &= \boxed{\frac{B_0^2}{\mu_0}} \end{aligned}$$

(d)  $\vec{E}_{\text{ref}}$  travels in  $-x$  direction. We know

$$\boxed{\vec{E}_{\text{ref}} = \vec{E}_{\text{ref},0} \cos(kx + \omega t)}$$

What is  $\vec{E}_{\text{ref},0}$ ? ( $\vec{E}_{r,0}$  for brevity)

$$\vec{E}_{\text{tot}} = \vec{E}_{i,0} \cos(kx - \omega t) + \vec{E}_{r,0} \cos(kx + \omega t)$$

We know  $\vec{E}_{\text{tot}}$  parallel to conductor, since  $\vec{E}$  must be perpendicular to  $\hat{x}$ . So at conductor ( $x=0$ )

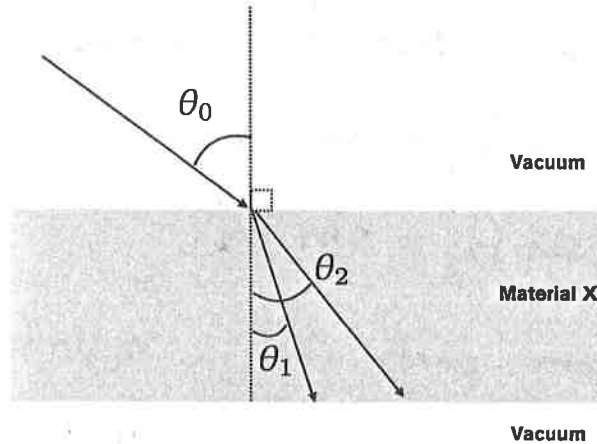

$$\vec{E}_{\text{tot}}(x=0) = \vec{E}_{i,0} \cos(-\omega t) + \vec{E}_{r,0} \cos \omega t = 0$$

$$\begin{aligned} \Rightarrow \vec{E}_{r,0} &= -\vec{E}_{i,0} \\ &= -(-c B_0 \hat{z}) \\ &= \boxed{c B_0 \hat{z}} \end{aligned}$$

**Problem 3.** Two monochromatic light waves of different wavelengths  $\lambda_1$  and  $\lambda_2$  in vacuum are both incident at angle  $\theta_0$  on rectangular prism of Material X. Material X is dispersive, and its index of refraction depends on the vacuum wavelength  $\lambda$  as

$$n(\lambda) = \frac{3}{2} + \frac{X}{\lambda^2}, \quad (2)$$

with  $X > 0$  an *unknown* positive constant. Because  $n$  depends on  $\lambda$ , the two waves are refracted at different angles  $\theta_1$  and  $\theta_2$  in Material X, with  $\theta_2 > \theta_1$ .

- (6) (a) Use Snell's law to find the values of the index of refraction  $n_1 = n(\lambda_1)$  and  $n_2 = n(\lambda_2)$  in terms of the incident and refracted angles.

For the two wavelengths,  $\lambda_1$  and  $\lambda_2$ :

- (4) (b) Which wavelength is larger?  
 (4) (c) Which wavelength of light travels faster in Material X?  
 (4) (d) In the figure above, which of the wavelengths, if any, will undergo total internal reflection at the bottom surface of the prism?

(a) Snell's law :

$$\sin \theta_0 = n_1 \sin \theta_1 \rightarrow$$

$$\sin \theta_0 = n_2 \sin \theta_2 \rightarrow$$

$$\boxed{n_1 = \frac{\sin \theta_0}{\sin \theta_1}}$$

$$\boxed{n_2 = \frac{\sin \theta_0}{\sin \theta_2}}$$

(b) Since  $\theta_2 > \theta_1$ ,  $n_1 > n_2$

since  $n \sim \frac{1}{\lambda^2}$ , larger  $n \sim$  smaller  $\lambda$

$$\Rightarrow \boxed{\lambda_2 > \lambda_1}$$

$$(c) \quad n_1 > n_2$$

$$v_1 = \frac{c}{n_1}, \quad v_2 = \frac{c}{n_2}$$

so  $v_1 < v_2$

(d) Apply Snell's law to bottom surface:

$$n_1 \sin \theta_1 = \sin \theta_1'$$

$$n_2 \sin \theta_2 = \sin \theta_2'$$

But from part (a),  $n_1 \sin \theta_1 = \sin \theta_0$

$$n_2 \sin \theta_2 = \sin \theta_0$$

so outgoing angle for both rays is  $\theta_0 < \frac{\pi}{2}$ .

$\Rightarrow$   $\boxed{\text{no T.I.R. for either wavelength}}$
